To avoid simultaneity bias and curtail "specification searching" for optimal lags, explanatory variables were generally lagged one year except where theory or substance demanded otherwise. One occurred for age, which was measured so as to adjust empirically to cross-national differences in early retirement and pensioning practices and thus to minimize any underestimation of "automatic" age effects.[6] A second exception, the unemployment rate, is specified as a two-year moving average of unemployment at t and $t - 1$ because unemployment clearly has prompt "automatic" effects via unemployment compensation spending yet may elicit more discretionary policymaker responses after a year or so. Election periods, which may be targets for enhanced program benefits at t, as well as for economic stimulation by means of spending increases a year before, are for t and $t + 1$.[7]

The party strength measures reflect the potentially ample range in governments' lags in responding to environmental stimuli.[8] To take account of this, both governmental and oppositional party strength measures were cumulated over the range of years that proved consequential in exploratory distributed lag analyses of effects of partisan measures on welfare effort for years $t - 6$ through t.[9] Specifically, party strength measures were cumulated (i.e., averaged) for lags of one through four years ($t - 1$ through $t - 4$).

Turning to yearly operational definitions of party strength, parties were designated as left, center, or right using Castles and Mair's (1984) typology. More originally, strength itself was measured in terms of (1) party leadership of government and (2) party electoral and legislative strength in opposition (see Appendix). For each type of party, government leadership was measured as the proportion of years $t - 4$ through $t - 1$ during which a party led government in the sense of having a decisive majority of its cabinet positions. A type of party was judged to lead a government if it had at least 120% of the number of

cabinet portfolios of each other type; the present criterion yields a reasonable 26 (out of 414) nation-years of "indeterminate" government.[10]

With governmental leadership measured, we can turn to measuring governmental opposition and junior partnership. This combination of party statuses is measured as the four-year average (years $t - 1$ through $t - 4$) of two annual measures of the strength of parties *not* leading governments: the year's average of the party type's proportion of legislative seats and proportion of the popular vote in the last major election when the given party type did not govern.[11] Our measurement of opposition allows for effects of nongoverning parties (i.e., ones not leading governments) upon *effects* of governing ones to be gauged directly by means of the addition of a set of opposition–government product, or interaction, terms. For example, we operationalize classical "left contagion" as the interaction of left opposition and right governmental leadership by means of a term defined as the product of these two variables (i.e., left opposition × right governmental leadership, or *left–right*). The slope estimate for this term is interpretable as the effect of left party oppositional strength upon the (Left-contingent) effects of right party government upon welfare effort. Here, symmetry and thoroughness mandate three pairs of opposition–government interactions implying that left government effects on social welfare effort vary inversely with the strength of center and right oppositions, that right government effects vary directly with (i.e., are pressured in a positive direction by) the strength of center and left oppositions, and that center government effects vary directly with left opposition and inversely with right opposition.

Note that one of the four government leadership measures (left, center, right, or indeterminate) must be excluded from our regressions. More specifically, because government leadership measures are averaged from a mutually inclusive and exhaustive set of categories (i.e., left, center, right, indeterminate) whose scores sum to a constant 1.0 (across categories for each nation-year), estimates of partisan government effects are contrasts from a benchmark category. Moreover, in order to avert perfect multicollinearity among regressors, estimation of these contrasts requires that we omit one category of government leadership from our equations. We select the indeterminate category of government leadership as our benchmark and omitted category for two reasons. First, we expect left and center government effects on welfare effort similarly to exceed right and indeterminate ones, so that either the right or indeterminate category might serve. Second, the indeterminate category, unlike the right one, does not figure in our interaction hypotheses and, as a result, does not require specification among our regressors. Thus, omission of the indeterminate category is preferred to omission of the right one.[12]

Note that all three measures of opposition strength may be included together in our regressions. These measures are not constrained to sum to any particular total. Thus, values of one category are not fixed by values of the other two: degrees of freedom are sufficient for estimation of all three.

Specification

The general specification of our baseline model (or noninteractive) model, including signs for hypotheses, is as follows:

$$\begin{aligned}\text{Welfare effort} = a &+ B(1)\text{turnout} + B(2)\text{competition} \\ &+ B(3)\text{state employee} + B(4)\text{election period} \\ &+ B(5)\text{left gov't} + B(6)\text{center gov't} \\ &+/- B(7)\text{right gov't} + B(8)\text{ left opposition} \\ &+ B(9)\text{center opposition} \\ &+/- B(10)\text{ right opposition} + B(11)\text{left corporatism} \\ &+ B(12)\text{state centralization} \\ &+ B(13)\text{bureaucratic traditionalism} \\ &+ B(14)\text{Ln gross domestic product} \\ &+ B(15)\text{price levels} + B(16)\text{unemployment rate} \\ &+ B(17)\text{aged} + B(18)\text{openness} \\ &+/- B(19)\text{post-OPEC} \qquad (1)\end{aligned}$$

We have no favored hypotheses for right governments or oppositions.

Our opposition–government interaction model is more elaborate. To Equation 1 it adds product or interaction terms for pairs of interacting variables. Interpretations of estimates for them, as well as for variables multiplied to construct them, are complicated. In particular, estimates that come attached to government and government–opposition terms now serve to describe equations expressing *variable* welfare effects of partisan government strength as functions of oppositional strength. Most crucially, estimates for interaction terms are now slopes linking variable effects of governments led by particular parties in these functions to levels of oppositional strength for particular parties. Government estimates are now intercepts in these functions, *not* the so-called "main" effect that might be suggested by an analogy to interactions in analysis of variance tables.[13]

Estimation

The pooling of time series ($T = 23$ years) and cross-sections ($N = 18$ nations) permits large-sample analyses that draw on temporal and cross-national variation. However, equation errors will typically be heteroscedastic and autocorrelated within units, as well as autocorrelated across units, thereby degrading estimator precision (Kmenta 1988, chap. 12; Stimson 1985). To correct for these maladies, analyses are

performed using Park's generalized least squares model with corrections for (AR1) autoregressive, heteroscedastic, and contemporaneously/cross-sectionally correlated errors (see Kmenta 1988). Intercepts may also differ across units, yielding biased estimates. However, addition of the three political-institutional dimensions to this model should amply adjust for strictly cross-national differences in welfare effort, since these dimensions alone explain 60% of such variance. Finally, with regard to R-squareds, those in the tables are Buse R-squareds, which approximate the real R-squared conception of squared correlations between observed and predicted values of untransformed *Y*-values (White 1988). The Durbin–Watson *d*s are adjusted for gaps in our data—in this case for transitions between successive, "stacked" national times series.

Analytically, we first estimate a basic additive model and then estimate one that includes opposition–government interactions.[14] As a check on robustness, we next apply Tukey's (1958) "jackknife" to a key equation. The jackknife procedure tabulates destabilizations of estimates by excessively influential cases and provides alternative coefficient estimates that are robust in the face of such cases. To highlight robust findings, we reestimate the key equation after deletion of variables revealed unstable by jackknifing.

FINDINGS

Results support expectations, strongly rejecting most null hypotheses. Equations fit the data well, explaining over 90% of the variance in welfare effort; and they yield satisfactory Durbin–Watson *d*s (around 1.90).

In the additive equation of Table 3, column 1, nearly all hypotheses are supported at the .05 test level. Exceptions are provided by the unexpectedly negative (but insignificant) estimates for left opposition, state employees, and elections periods. Among variables for which we posed no hypotheses, the estimate for Right-led governments is close to zero and thus consistent with our discussion of government effects. The OPEC estimate is consistent with Roubini and Sachs' (1989) view that post-OPEC conditions exacerbated citizen wants. The right opposition estimate is positive.

With respect to the relative strength of effects, standardized slope estimates (betas) help clarify the relative magnitudes of effects of additive coefficients within an equation. This is especially the case in equations uncomplicated by interactions (Cohen and Cohen 1975). Thus, a ranking of the column 1 variables in terms of these betas may be instructive: aged population (.262), center government leadership (.237), state centralization and left corporatism (.238 and .221, respectively), price levels (.192), turnout (.131), state traditionalism and center party opposition (both .114), post-OPEC (.105), and left government (.104). The finding that the welfare impact of center governments exceeds that of left governments poses the one notable surprise. However, this ordering is consistent with findings and arguments in several studies (e.g., Wilensky 1981). Christian democratic and progressive liberal commitment to social amelioration (without a commensurate commitment to high-employment policies) goes far toward explaining this center government finding.

Turning to opposition–government interactions, we find five notable ones, four of them statistically significant interactions (see Table 3, col. 2). Specifically, we find negative *embourgeoisment* effects on left governments exerted by right, as well as center, oppositional strength. As center or right oppositional strength rises, left government expansion of welfare effort ebbs. In addition, we find positive "contagion from the Left" effects upon Center-, as well as Right-led governments, and marginally significant prowelfare pressures upon Right-led governments from center oppositions. With this strong evidence of the opposition–government interactions (which cause opposition estimates to denote effects of oppositions on indistinctly led, or "nonpartisan," governments) the left opposition estimate turns, somewhat anomalously, significantly *negative* while right, as well as center, opposition estimates remain significantly positive. However, the pattern is plausible: net of their impacts upon governments with distinct partisan leaderships and, in particular, governments of indeterminate leadership, left and right oppositions appear to make a "run for the middle" (Center): left parties retrench, while right ones reform (see Quinn and Shapiro 1991, on such "runs").[15]

Nonparty findings for interactive equations remain much like those for the additive equation (compare Table 3, cols. 1, 2). State employee and election period variables are insignificantly negative in both equations, calling into question the roles of reelectoral motivation and bureau voting heavily emphasized in some statist accounts of welfare state expansion. Otherwise, results are much as theory and the column 1 findings suggest. Voter turnout, electoral competition, and our dimensions of political institutions bolster welfare effort, as do affluence, price levels, unemployment, aged populations, and economic openess. Further discussion of findings, especially of the rather complex partisan ones, is in order. However, before proceeding, some diagnosis of estimate stability is wise.

First, we use the jackknife procedure to gauge stability across important subsets of cases (i.e., nations). A second procedure involves a reestimation of Table 3, column 2 after deletion of variables revealed unstable by jackknifing (Miller 1974; Tukey 1958). Consideration of estimate robustness, although tedious, will help us boil findings down to a relatively robust set.

Diagnoses

The jackknife reestimations entail (1) new estimates of slopes and t-statistics for each regressor in each of the 18 possible 17-nation subsets of the original

[a]Standardized coefficients, which vary largely between −1.0 and +1.0.
[b]Jackknife information consists, first, of the number of times that slope estimates for a variable fail to yield absolute t-values of 1.0 or more. It secondly includes (below these counts in parentheses) *signed* t-values computed by means of jackknife procedure (Tukey 1958, 135–48). All jackknifing is done here with nations as observations.
[c]R-squareds are Buse estimates of "real" R-squared (see Kmenta 1986, 616–85); Adjusted R-squareds are computed from these; and Durbin–Watson d is computed on corrected residuals and adjusted for "gaps" (or international variation) in stacked time series.
*$p \leq .05$, one-tailed test.

sample and (2) unique new jackknifed estimates of slopes and t-statistics for each variable for the complete population of cases (computed from the new estimates described in point 1).[16] We display information of type 1 in terms of counts of the number of times that t-statistics for given variables fall below 1.0 in absolute value. We display information of type 2 in terms of signed t-statistics for regressors, for these illuminate both the direction and statistical significance (and robustness) of coefficients. (See Table 3, col. 3 for jackknife results.)

The jackknife procedure suggests that several variables may have cross-nationally unstable estimates. First, electoral competition has an anomalously negative t-value of −5.841, while state employee and election period variables have numerous t-values less than 1.0 in absolute value. In addition, bureaucratic traditionalism and economic product both have anomalously negative jackknifed t-statistics (despite 18 correctly signed ones in each of the 18 subpopulations).[17] Left and center opposition terms and the Left–Right product terms show slight signs of instability (one or two "small" t-values each). The center and right government, right opposition and the Right–Left and Center–Right interactions show more troublesome signs of instability; that is, they display several "small" t-values and/or anomalously signed jackknifed statistics.[18]

Table 3, column 2 probably represents the most informative of our equations.[19] Nonetheless, examination of an equation from which cross-nationally unstable regressors have been removed has the possible advantage of deleting arguably extraneous variables and the certain advantage of highlighting ones on which evidence is robust. To identify such an equation, jackknife computations (some reported in col. 3) were used to specify the cross-nationally robust equation of column 4.[20]

This equation retains four of the previously six "environmental" variables: affluence, prices, aged population, and post-OPEC (but not unemployment or openness). It bears 13 of our 18 manifestly political variables: voter turnout, the three political-institutional dimensions, all six governmental and oppositional measures of party strength and three opposition–government interactions [Center–Left, Left–Center and Left–Right]). By omitting variables that are conventionally "relevant" to the prediction of welfare effort (despite their reliance on particular cases for relevance), the "short" equation does court specification bias. Yet, the short equation has heuristic value for highlighting the variables that withstood jackknife diagnoses even though it does not supplant the column 2 equation as our best-specified, least-biased, best-fitting, and, indeed, most informative equation. Although we must discount the estimates that do not make it past the jackknifing procedure into the column 4 equation, the column 2 equation has the best estimates.

Final patterns

Two forms of "contagion from the Left" are evident across all equations. In one, the strength of left parties excluded from governmental leadership pressures Right-led governments to augment welfare

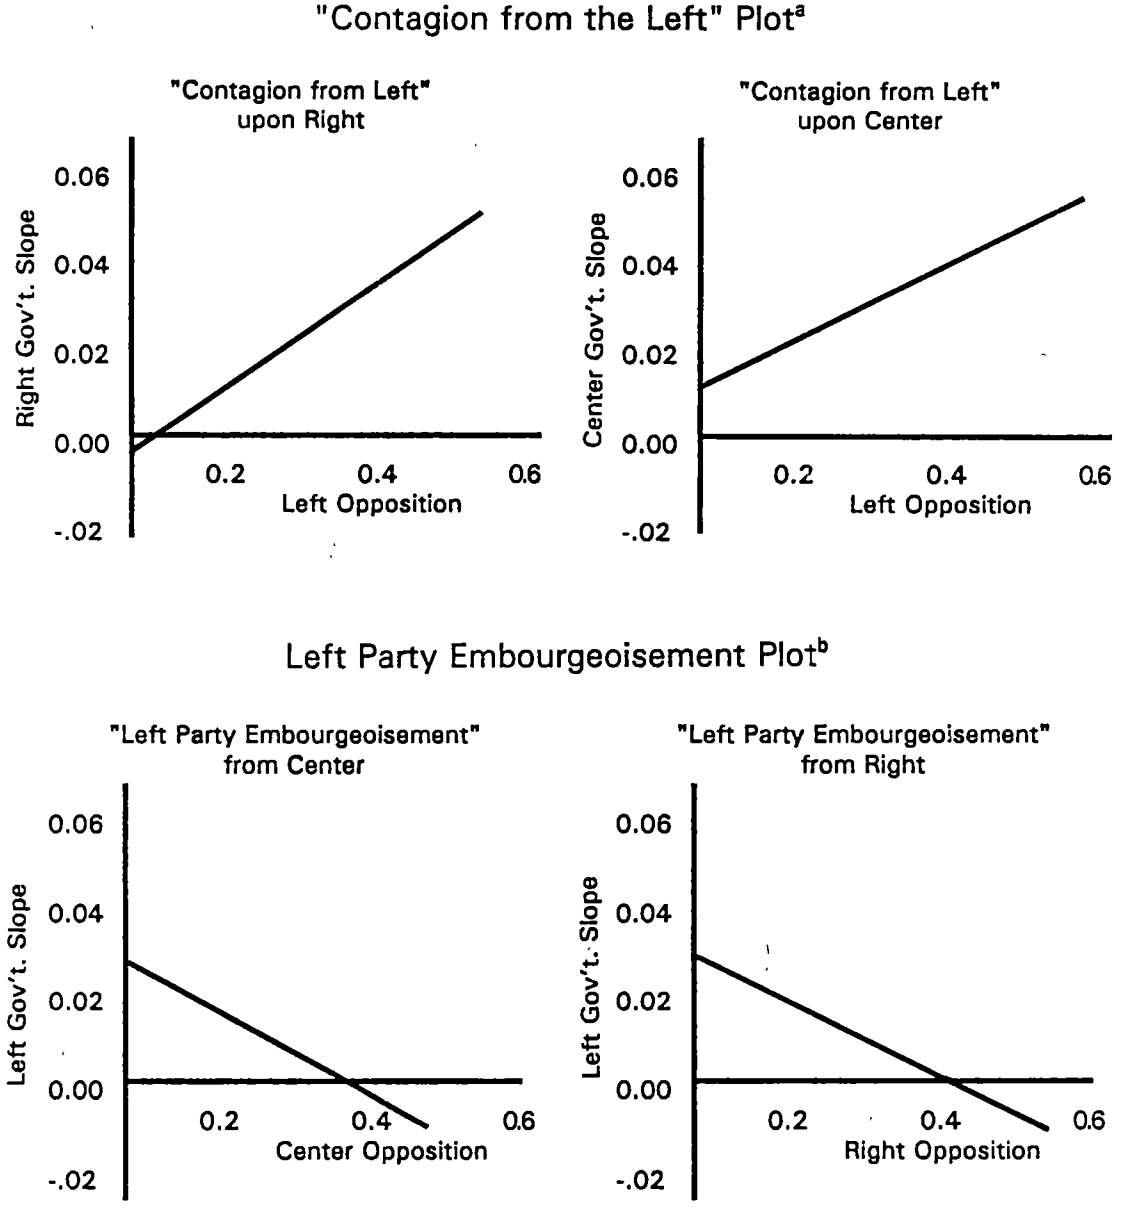
effort (see Figure 1, upper left-hand quadrant). Right government effects on welfare effort are negative (−.0055) in the absence of all left opposition (e.g., in the United States) in the preferred equation of column 2. However, they become positive with increases in left opposition (see Figure 1, upper left). Principal examples of strong prowelfare effects of right governments facing strong left oppositions occur for Australia and New Zealand in the 1960s (when left oppositional strength figures at times approached 49%) and Japan during late 1960s and 1970s when left oppositional strength peaked. In the second form of "contagion from the Left," left opposition effects on center governments' welfare effort roughly parallel those on right government welfare effort (see Figure 1, upper right). Principal examples of upward boosts in center welfare effort under the influence of strong left oppositions are Finland in the 1960s and, more fleetingly, Norway in 1970–72 and Sweden in 1981–82. (The most salient *lapses* of center party welfare effort where left oppositions are absent occur in the United States during the Carter and (late) Johnson administrations.)

Two forms of left *embourgeoisment* effects are present. Moderations of the prowelfare effects of Left-led governments by centrist oppositions and junior partners are present in all equations. In the equation of Table 3, column 2, left government effects, strongly positive (.0301) when center oppositions are null, decline quickly with increases in the strength of center oppositions, approaching zero as center "oppositions" reach high shares of seats and votes (i.e., 45%; see Figure 1, lower left-hand quadrant). The greatest moderations (and possible reversals) of left welfare effort under centrist pressures occur in Austria and Sweden. The second form of left *embourgeoisment* effects reinforces this picture of substantial, but readily compromised, left government support for welfare effort. As the lower right quadrant of Figure 1 indicates, our findings include a Right–Left interaction indicating that prowelfare effects of left governments are strong at the outset but decline toward zero (and beyond) as right "opposition" shares of votes and seats approach 45%. The greatest such attenuations of left welfare effort arise for the German Social Democratic party governments of the 1970s and Danish left governments of the early 1960s.

Overall, strong evidence emerges for strategic interactions among parties. In these interactions, dominant governing parties accommodate their policymaking orientations to those of parties in oppositional—and subordinate governmental—roles. Some interesting surprises emerge from these interactions. Left parties appear to submit to strong antiwelfare pressures from *all* oppositions. Despite typically clear left rule effects on welfare effort and favorable centrist orientations toward welfare effort when in office, center oppositions appear to dampen the welfare effort of left parties. Perhaps this occurs because the strong, longer-run welfare-spending legacies captured by our left corporatism variables can be effectively evoked by the center to claim middle-of-the-road swing voters. On the other hand, centrist welfare orientations are reinforced, rather than undercut, by left oppositional pressures.

Returning to nonpartisan variables, evidence for positive voter turnout effects is pervasive and robust. Evidence for prowelfare effects of political institutions is also strong. Significant positive estimates for social democratic corporatism, state administrative/political capabilities, and traditional policy legacies is everywhere strong and robust. Finally, evidence for the roles of socioeconomic forces is strong: affluence, the sizes of aged and unemployed populations, inflation, openness, and the increased material needs of the first post-OPEC decade all exert upward pressure on welfare effort.

CONCLUSION



Both electoral turnout and differences in the strengths and ideologies of parties matter for the share of national incomes spent by democracies on social welfare programs. Moreover, not only does the strength of governing parties matter, but the strength of oppositional parties and parties at the margins of ruling coalitions plays an important role in determining welfare effort. Dimensions of political institutions that include traditions of left party electoral success and working-class mobilization and interest representation, state administrative and political capacities for cohesive policymaking, and heavily bureaucratic and traditionally hierarchical state institutions also matter, along with a host of socioeconomic environmental conditions. However, neither the preelectoral budgetary machinations of incumbent politicians nor the bureau voting of public sector interest groups (each a focal activity in public choice theory) seems to matter for welfare effort. Similarly, party electoral competition, a centerpiece of much "democratic pluralist" theorizing, does not seem to matter for welfare effort.[21] These conclusions appear to hold, at least for the 18 largest affluent democracies between 1960 and 1982.

Consistent with recent claims by Pampel and Williamson (1989), voter turnout appears to have exerted an upward pressure on welfare effort. Even net of ample controls for political and environmental factors, the political democratic stress on turnout as a source of demands for social ammelioration is vindicated.

Consistent with partisan theory stressing center party delivery of income security outlays, our simple additive models indicate that Center-led governments on average generate higher levels of welfare effort than do other governments, left ones included (Wilensky 1981). However, consistent with the social democratic authors who acknowledge centrist as well as leftist advocacy of income security spending, our additive findings encompass clear left party effects on welfare effort (see Castles 1982; Stephens 1979; see also our earlier work, Hicks and Swank

FIGURE 1

Selected Conditional Slope Estimates for Types of Governments Plotted Against Contingencies

Note: [a]Estimates of opposition-contingent effects of partisan governments when oppositional conditions for them equal .0 (e.g., of right government effects when left opposition = 0) are the slope estimates attached to the relevant partisan government term (e.g., right government) in the estimation equation. Estimates for slopes of lines in our plots (e.g., for effects of right government *by* left opposition) are the slope estimates for the product terms (like Left–Right) for the pair. Further elaboration of interactions are available on request; see also Friedrich 1982; Lange and Garrett 1985.
[b]Partial plots of left governments' effects conditional on center opposition controlling for right opposition (on left of panel) and of left effects conditional on right opposition controlling for center opposition (on right).

1984). The finding that center effects not only complement left ones but actually exceed them should be no great surprise. Lack of consistent center (as opposed to left) full-employment policies has made centrist governments dependent upon income transfer programs for their pursuit of income security (Alvarez, Garrett, and Lange 1991; Janoski 1990). Furthermore, centrist welfare effort appears to be intensified by left oppositions and impervious to right ones, while left welfare effort appears to be dampened by center, as well as right, oppositions. In short, oppositional dynamics appear to buoy center party welfare effort but to depress left party welfare effort. Moreover, inclusion of left corporatism, a broad-ranging measure of left political strength, into our models slightly moderates estimates for short-run effects of left governments. Whether this moderation should be regarded as suppressing or sharpening the short-term effect of left government is unclear. What is clear is that our present introduction of left

corporatism extends—and thus augments, rather than limits—overall evidence for the policy relevance of social democracy.[22]

In interactive models, Left-led governments appear to affect welfare effort in inverse proportion to the strength of center and, perhaps, right oppositions, augmenting it when and where these oppositions are relatively weak and reducing it insofar as they are strong. Patterns of left government accommodation to oppositional strength pervade these analyses. (Whether left governments compensate victims of welfare retrenchment with alternative benefits we cannot say.) Complementing the patterns of left accommodation to center and right oppositions are patterns of "contagion from the Left." To the extent that left oppositions are electorally and legislatively strong, they pressure parties to their *right* to enhance welfare effort. As left opposition strengthens, otherwise weak or negative social spending impacts of right governments are lifted to substantially positive levels. Notable center party contributions to welfare effort are substantially multiplied when the Left is strong. Interestingly, governments without clear left, conservative, or centrist leadership appear to be as supportive of welfare effort as conservative governments. In addition, left and right oppositions appear to affect welfare policy in additional ways. Net of our evidence for oppositional pressures, we find indications that left and right parties also may sometimes woo voters and, when governments lack distinct partisan leadership, court inclusion in ruling coalitions by reversing characteristic welfare stands. Consistent with Quinn and Shapiro's (1991) "run for the middle," left oppositions sometimes facilitate welfare retrenchments, while right parties sometimes foster welfare expansion.

In short, the partisan character of governments, oppositions, and interactions between the two matter for welfare effort. Overall, the importance of left and center governments for the extent of welfare effort revealed by our simpler, additive findings reaffirms earlier findings (Castles 1982; Hicks and Swank 1984; Stephens 1979).[23] With regard to the interaction of governments and oppositions, our findings suggest a mix of party distinctiveness and interparty convergence in the policy enactments of party governments that resembles claims by recent Downsian theorists (e.g., Austen-Smith and Banks 1990). However, interparty convergences in our models of welfare effort are functions of specific differences of ideology and strength between governments and oppositions, such as are not highlighted in Downsian theory. True, our discussion of convergence is formulated in terms of a set of loosely coupled propositions (e.g., "contagion from the Left") that might benefit from, as well as inform, formal theorizing within the Downsian tradition. However, our treatment of these questions implies that extension of the Downsian tradition to the comparative study of policy determination may require some reformulation of conventional Downsian models.

Finally, our analyses suggest that political institutions matter a great deal for welfare effort. Cross-national differences in the three dimensions of political institutions identified here substantially differentiate states' social welfare effort provision. Social democratic corporatism, conceived in terms of the degree to which left parties and unions mobilize and incorporate industrial workers into national policy-making networks, appears, net of short-run partisan politics, to be a strong source of national differences in welfare effort. In addition, structurally centralized states with histories of early consolidation of major social security programs do, indeed, appear to capacitate national welfare effort, as many have suggested (Orloff and Skocpol 1984; Wilensky 1975). Lastly, bureaucratic traditionalism—a combination of a highly bureaucratized welfare administrations plus hierarchical, antidemocratic legacies, that apparently undergirds welfare state clientelism (Esping-Andersen 1990; Rokkan 1970)—enriches our conception of political institutions and further differentiates the welfare efforts of contemporary industrialized democracies.

Appendix:

Y *Welfare Effort.* Total social welfare expenditures as proportions of gross domestic product, from the ILO's *Cost of Social Security.*

X_1 *Turnout.* Valid voters as proportions of persons eligible for voting, from Mackie and Rose (1974); *European Journal of Political Research,* (selected years). Measurement at $t - 1$ in analyses.

X_2 *Party Competition.* Measures of competition among parties computed from data on mass voting for parties, as in Pampel and Williamson 1989, chap. 3 and Swank 1983. Sources are the same as those for X_1 and X_5 through X_{10}. Measured at $t - 1$ in analyses with the formula

$$1 - \sum_{i=1}^{N} (P_i - 1/N),^2$$

where N is number of parties and P_i is proportional vote for party i.

X_3 *State Employees.* All government civilian employees as proportions of population with data from OECD 1982, OECD's *Labor Force Statistics,* and various national statistical yearbooks. Measured at $t - 1$ in analyses.

X_4 *Election Period.* Equal to 1 if a year is an election year (in which presidential or general parliamentary elections occur) *or* a preelection year; otherwise 0. Election times from *Keesings Contemporary Archives* (selected years), and Mackie and Rose 1974; *European Journal of Political Research* (selected years).

X_5 *Left Party Government Leadership.* Four-year average ($t - 4$ through $t - 1$) of left party leadership of government, coded 1 for each year in which left party cabinet participation (portfolios as percentage of total cabinet portfolios) is more than 120% of center party participation and more than 120% of right party participation, otherwise 0.[24] Party classifications generally correspond to Castles and Mair 1984, although some minor divergences exist. On these differences see Swank 1988, 1992. Cabinet participation data come from Browne and Dreijmanis 1982 and *Keesings Contemporary Archives.*

X_6 *Center Party Government Leadership.* Strictly analogous to left party government leadership.

X_7 *Right Party Government Leadership.* Strictly analogous to left party government leadership.

X_8 *Left Opposition.* Electoral and legislative strength of left

parties (as categorized by Castles and Mair 1984) when not leading government and measured as an average of left party proportion of vote in last election and proportion of seats in lower house of legislature as ascertained from Mackie and Rose (1974), *European Journal of Political Research* (selected years). Averaged $t - 4$ through $t - 1$. Equal to 0 when left government leadership equal to 1.

X_9 *Center Opposition.* Strictly analogous to left opposition.

X_{10} *Right Opposition.* Strictly analogous to left opposition.[25]

X_{11} *Left Corporatism (Factor 1).* Factor-score scale measuring strength of long-term working-class mobilization and political economic integration (see Table 2). Union strength is measured using a modification of Cameron's index of union strength (1984, 165). This consists of the product of union density (in 1960) times the average of *three* scales of union centralization: organizational unity of labor, confederation power in central bargaining, and scope of collective bargaining. In order to stress the importance of union centralization and compensate for possible exaggeration of union centralization by Cameron in Denmark and the low countries, union centralization is measured a second time by means of a three-point (one-, two-, or three-level) scale devised by Wallerstein (1989). Left party strength is measured following Stephens's (1979) index of cumulative rule, as the number of years, 1946–60, marked by left party–led government. Left voter mobilization is measured as an index of left voting weighted by voter turnout, specifically as [(LPV + LCV)/2] × TO, where LPV is *left party votes* as a proportion of all votes (1957–60), LCV is Korpi's (1983) index of *class voting* around 1970 (assumed adequately to approximate cross-national variations in 1960 class voting), and TO is the average, proportional voter *turnout* for 1957–60.

X_{12} *State Centralization (Factor 2).* Factor-score scale measuring state centralization, central state prominence, and legacies of welfare program consolidation (see Table 2). In brief, state centralization is measured in three ways: (1) as a unitary/federal (UF) dichotomy (unitary = 1.00, otherwise .00) (see Lijphart 1984, Table 10.2 for categorization); (2) in terms of revenue centralization (RC) as the ratio of central governmental to all governmental revenues extracted in 1960 (see Lijphart 1984 and Pampel and Stryker 1988 for precedents and OECD's *National Accounts of OECD Nations* for data); (3) as a composite index of state centralization weighted by the size of the state centralized. Specifically, it is measured as [(UF + RC)/2] × GE, where GE is the *government employee* share in total employment, UF and RC are as defined, and all three elements of the index vary between .0 and 1.0 (see Table 2 on state centralization). Following Pampel and Stryker 1988, state bureaucratization is measured by stressing administrative costs of welfare spending as proportions of all welfare spending. Welfare program consolidation measures the legacy of a diversified welfare state by the number of years up to 1960 that a nation has had *all* of the following four major welfare programs: (1) social security retirement pensions; (2) unemployment compensation, (3) workman's compensation and (4) sickness and maternity care. Family allowances were dropped because they had still not been adopted by all affluent democracies by 1960. Of course, health programs were not universally adopted at the minimal level recorded by Social Security Administration (1981) data sources until the mid 1960s; but the number of post-1960 "years-to-adoption" is small and makes for minor measurement error. The pluralist concern with formal political institutions and their majoritarian/consensus interpretation is operationalized using the factor scores for Lijphart's majoritarian minimal winning coalition and majoritarian unitary factor-analytical dimensions (1984, chap. 13).

X_{13} *Bureaucratic Traditionalism (Factor 3).* Factor-score scale measuring extent of state traditionalism, bureaucratization, and majoritarian unitary government. State traditionalist legacy is measured as an additive index of three (standardized) items: (1) a five-point scale of the *extent of state absolutism* in the eighteenth and nineteenth centuries (Rokkan 1970, chap. 3, Table 1); (2) a five-point scale of *resistance to mass enfranchisement* (ibid., Table 2); and (3) a three-point scale of the extend of class rigidity (class systems as systems of status division; Lipset 1983). Although a straightforward, unweighted additive index was used, a principal components analysis indicated unidimensionality by yielding the following pattern of loadings: absolutism (.81); obstructed enfranchisement (.84), class rigidity (.80). Bureaucratization is measured as for X_{12}, and majoritarian unitary government as in Table 2 and Lijphart 1984.

X_{14} *Natural Logarithm of Real Gross Domestic Product/Population (lnGDP).* Through 1980, from Summers and Heston 1982. Thereafter computed as extrapolation of 1980 figures from growth rates from OECD 1986. Measured at $t - 1$.

X_{15} *Price Level.* Consumer price index from International Monetary Fund. Measured at $t - 1$ in analyses.

X_{16} *Unemployment Rate.* Unemployed as proportion of economically active population at t and $t - 1$, from OECD's *Main Economic Indicators.*

X_{17} *Aged Share of Population.* Proportion of population over 65 years of age, from United Nations' *Demographic Yearbook.* Measured at year ($t - 5$ through $t - 1$) with highest correlation with welfare effort in "aged" regression model.[26]

X_{18} *Openness.* Imports plus exports as proportions of gross domestic product, from OECD's *Main Economic Indicators.* Measured at $t - 1$ in the analyses.

X_{19} *Post-OPEC.* Equal to 1 for 1975 and later, otherwise 0.

Notes

We wish to acknowledge the helpful comments of John Freeman, Tom Lancaster and Arend Lijphart on drafts of this paper, as well as participants in the Conference on the Welfare State in Transition, Bergen, Norway (August 1989); a Welfare State Study Group seminar, Center for Policy Research and Urban Affairs, Northwestern University, Evanston, Illinois (January 1990); and the Department of Sociology seminar Emory University (Fall 1990). We also wish to acknowledge the industry of half a decade of research assistance, especially from Clark Denny, Richard Lee, Joya Misra, John Pitt, and Wesley Chapin and the generous typing of Cathy David and Margaret Stephens.

1. See Hicks, Swank, and Ambuhl 1989 and Pampel and Williamson 1989 for conflicting views on partisanship; see Garand 1988 and Korpi 1989 for conflicting views on state administrators; see Dye 1979 and Hicks and Swank 1984 for conflicting views on electoral factors.

2. As for Bismarckian "federalism," Taylor debunks it best: "Bismarck's constitution was supposed to be federal, but its federalism was fraudulent, window dressing to make the dictatorship of Prussia more respectable" (1946, 117).

3. Each of these perspectives acknowledges the welfare relevance of social welfare needs, economic capacities for welfare provision, and economic structure. Note that we attempt in our models to specify only *direct* (or "structural") influences upon policy. For example, party-channeled effects of openness suggested by Cameron (1978) are ignored.

4. There is a strong theoretical and empirical basis for ascribing center parties prowelfare policy goals. Baldwin's (1990) study of Scandinavian and British "welfare" politics highlights the middle-class appeal and secular center advocacy of social insurance policies as anodynes for middle-class risk while Stephens (1979) and Wilensky (1981) analyze and document similar consequences of the Christian (democratic) center.

5. For a detailed description of the items used to measure left corporatism, state capabilities, and traditionalist policy legacies, see X_{11}–X_{13} in the Appendix. Although these institutional measures are temporally invariant, they are not exempt from causally legible associations with welfare effort. We confine measurement to circa 1960, where strong temporal invariance can be assumed; and we extend it back earlier to wherever temporal variability or historical depth mandates

(e.g., to 1946 for left rule; to the eighteenth century for absolutism) and wherever data permit.

6. Age was measured for each nation at the year $t - 5$ through $t - 1$ for which the population share over 65 years of age most strongly affected welfare effort. Almon distributed-lag regression of effort upon population share at $t - 5$ through $t - 1$ was used to identify key years (Johnston 1984). Census use of interpolated values for annual population may, alas, offset our effort at precision. Also, economic product was measured as the natural logarithm of per capita gross domestic product because this defines slopes per unit of percentage change in "product," rather than per raw dollar changes in it and such changes are more likely to be linearly related to welfare effort (a proportion) than are changes in raw dollars: a change from $4,000 to $5,000 should matter more than one from $14,000 to $15,000.

7. For OPEC, an arguable fourth exception, years were coded "post-OPEC" starting in 1976 because simultaneous deterioration of income growth, inflation, and unemployment did not occur until 1975, and one-year response lags seemed apt.

8. Our measurement of party strength diverges from common single-year measures (e.g., Swank 1992). It particularly diverges from the "1946-to-present" cumulative measures in Pampel and Williamson (1989), which overreact to the limitations of "immediate" party effects with 35-plus year measures and *equate* the policy influences of recent, with those of decade-old, governments.

9. A regression was run with the regressors of the "basic" model and the Almon distributed lags for $t - 6$ through t for government and opposition items.

10. This seemingly permissive criterion was adopted after a more stringent one (e.g., greater than 50% of all cabinet portfolios) yielded more periods of indeterminate governmental leadership than was plausible. See also n. 24.

11. This measure combines strictly oppositional parties entirely excluded from governmental participation with junior partners in coalition governments, distinguishing for the first time the strengths of clearly governing parties and other parties. Note that for the typical two-house legislature, the lower house was used to focus measures for both votes and seats.

12. We have a further reason for excluding indeterminate governments: it allows for simultaneous tests of interactions for all three major types of parties. Also, interpretive focus, statistical tractability and numerical relevance ground our grouping of oppositional and junior partner parties in the measure of oppositional strength. Separate specifications of oppositional, junior partner, and leadership variables across left, center, and right parties (for nine terms) would exacerbate multicollinearity and complicate interpretation very seriously—prohibitively once interactions (as many as 12) were introduced. Grouping of governmental junior partners with governmental leaders would blur our focus on dominant partisan directions of governments. Finally, the legislative and electoral strength of junior partners relative to strictly oppositional ones is small (on average .02 as opposed to .17 per party type); and the variance explained by partner strength as opposed to strictly oppositional strength in the current oppositional measure is small as well (on average, 10%, as opposed to 90%). Note that ommission of (any) one of the three ostensibly redundant oppositional variables does not notably alter findings.

13. Detailed elaboration of the interaction model is available on request. See also Friedrich 1982.

14. We do so by excluding the measure for the benchmark category from the equations. We enter all six of the possible opposition–government interactions, then drop the one (with the *lowest* t-statistic) that does not have an (absolute) t-value greater than 1.0 (see Johnston 1984, 504–6). Then we repeat this procedure until only interaction terms with (absolute) t-values greater than 1.0 are retained. As a check on estimate stability, we also proceed with a forward, stepwise treatment on the interactions for both equations. This yields identical results. Yet we must caution that multicollinearity levels for these variables measured in terms of R-squared deletes (or "1-tolerance") are never less than .90. Hence, we cannot confidently assert that t-tests have the power for exclusions of opposition–government interactions to be compelling, only that retentions override serious loss of power due to multicollinearity and evince indications that multicollinearity has really taken a bite. As for eventually excluded variables, we cannot be certain that they do not result from multicollinearity.

15. Opposition findings are unaltered by deletion of any single opposition term, despite resulting reductions in multicollinearity (see n. 12, 14).

16. This procedure is executed as follows for the equation of Table 3, column 2. The equation is reestimated with each of its 18 nations removed in one of the 18 reestimations. Reestimations are examined qualitatively for departures from the estimates obtained in the original estimations with all 18 cases. Reestimations are also used to compute new jackknifed values of coefficient estimates (BJ) plus new test statistics for each new jackknifed coefficient. A given jackknifed coefficient estimate BJ equals the mean of the "pseudovalues" B_i*. $B_i* = 18(B) - 17(B_i')$, where B is the 18-case estimate of the coefficient in question and the B_i' are the 18 separate 17-case estimates (and $i = 1, 2, \ldots, 18$). The standard error for each of the BJ estimates is just the standard error of the B_i* that are averaged to define BJ. From the values of the BJ and their standard errors, t-statistics are computed.

17. As pseudovalues equal $B_i* = 18(B) - 17(B_i')$, where B is the 18-case estimate of the coefficient in question and the B_i, are the 18 separate 17-case estimates (and $i = 1, 2, \ldots, 18$), they may be distinctly signed from both the initial sample-wide and subsample estimates where the absolute values of $17(B_i')$ exceed those of $18(B)$. Since the jackknifed slopes (standard errors and t-values) are computed from the pseudovalues, jackknifed estimates may be marked by reversals of signs from full-sample and subsample estimates.

18. However, it merits noting that some of these variables were already insignificant in Table 3, column 2, and that no new instability is revealed for these. Moreover, although statistically insignificant estimates may be viewed skeptically, *significant* interactions are dubiously interpreted in the absence of additive estimates for their component parts (Friedrich 1982). These estimates anchor conditional effects of partisan governments to intercepts, as well as to levels of oppositions. For example, where left government and right oppositions interact, slope estimates for the left government term anchor the variation of left government effects (across levels of right opposition) by specifying these effects when right opposition is .0.

19. A variant of the column 2 equation that substituted the OECD measure of social welfare transfer expenditures for the ILO measure of social security spending (including in-kind benefits and services) yielded few new indications of instability. A dummy variable–generalized least squares variant was also run. This controls for 0–1 dummy variable regressors for 17 of our 18 nations, leaving strictly longitudinal, within-nation variance for other regressors to explain. It provides some immunization against any exclusions of causally relevant, cross-national differences from the matrix of regressors; but it also downwardly biases (in absolute value) all regressors with cross-national components to their variation, because it monopolizes all cross-national variation (Judge et al. 1985). This variant reinforces evidence of estimator stability.

20. To jackknife, all nonparty variables with t-statistics below 1.0 in absolute value in the jackknifed result of Table 3, column 3, were deleted; and jackknife computations were performed on the resulting specification. Then, using results of these jackknives, nonparty and party product (or interaction) term variables with absolute t-values below 1.0 were deleted, and jackknife computations performed again. As above, we refrained from removing additive "party" specifications with t-values below the 1.0 criterion level because of their integral part in the interpretation of interactions (see nn. 13, 18). Pertinent left government, right government, and

right opposition variables have significant jackknifed slopes and may well be "stable."

21. An anonymous reviewer suggested that the median voters for whom parties compete sometimes favor welfare retrenchment *and* that center parties represent broad middle-class constituencies (cf. "risk-class?". Baldwin 1990). This pair of insights offers a good puzzle for future study.

22. For a few years, findings from Pampel and Williamson (1989) have clouded "partisan–welfare" relations. They coded their party variables so that first center, and later nonright, governments serve as benchmarks. Their analyses reveal that left welfare effort is less than center effort (chap. 3, Table 3) and center less than nonright (chap. 3, Table 6); but their analyses do not reveal whether or not left welfare effort exceeds right effort (as in, e.g., Hicks and Swank 1984; Stephens 1979). Moreover, that study suffers from an unnecessarily small and arbitrary sample of 126 observation (18 every five years, 1950–80) and a rather thin specification of equations. Certainly, ours are the first *clear* findings of distinct yet "less-than-center" effects. As for left corporatism's impact on year-to-year left rule effects, optimal precision may call for a less governmentally centered specification of left corporatism. On the other hand, precision might warrant a yet fuller specification of nonleft traditions of political economic strength. Present specifications of policy-relevant institutions should not be regarded as definitive.

23. See note 21.

24. *Party Leadership. Australia* conservative 1960–72 and 1976–82, left 1973–75; *Austria* center 1966–69, left 1970–82, none 1960–65; *Belgium* center 1960–71, 1974–80, none 1972 and 1981–82, left 1973; *Canada* right 1960–63 and 1979–82, center 1963–78; *Denmark* left 1960–67 and 1972–82, right 1968–71; *Finland* left 1967–72, 1973–75, none 1964 and 1971, center 1960–63, 1965–66, and 1976–77; *France* right 1960–80, left 1981–82; *West Germany* right 1960–66 and 1982, none 1967–69, left 1970–81; *Ireland* right 1960–82; *Italy*: center 1960–82; *Japan*: right 1960–82; *Netherlands* center 1965–66 and 1978–82, left 1974–77, none 1961–64, 1967–72, and 1973; *New Zealand* right 1960–72, 1976–82, left 1973–75; *Norway* center 1966–82, right 1982, left 1960–65, 1971–72, and 1974–81; *Sweden* left 1960–75, center 1977–82; *Switzerland* center 1960–82; *United Kingdom* left 1965–69 and 1974–78, none 1970, right 1960–64, 1971–73, and 1979–82; *United States* center 1960–68 and 1977–80, right 1969–76 and 1981–82. For rationales and summary of leadership periods, see n. 11.

25. The product terms for opposition–government interactions are center opposition × left party government leadership (Center–Left), right opposition × left party government leadership (Right–Left), right opposition × center party government leadership (Right–Center), left opposition × center party government leadership (Left–Center), left opposition × right party government leadership (Left–Right), and center opposition × right party government leadership (Center–Right).

26. See n. 6 for operational details.

RESTRICTIVE LEGISLATIVE PROCEDURES IN FRANCE AND THE UNITED STATES

JOHN D. HUBER *University of Michigan*

I develop a framework for applying existing formal models of restrictive amendment procedures in Congress to the study of the French government's use of two restrictive legislative procedures, the package vote and the "guillotine". I test six hypotheses derived from existing formal models and from existing research on the French National Assembly. The analysis shows that the French government invokes the two procedures on the same types of distributive and jurisdictionally complex bills that frequently receive closed rules in Congress. The analysis also shows that the decision to use the restrictive procedures is strongly linked to the majority status of the government, suggesting they are used to preserve agreements between parties in the same way that restrictive amendment procedures are used to preserve agreements between individual members of Congress. Thus, existing formal models of legislative institutions can help us study how procedural structures shape strategic bargaining between political parties in parliamentary systems, especially during coalition and minority government.

Scholars widely recognize the fundamental role of formal institutional arrangements in democratic processes (Dahl 1989, pt. 4; Mayhew 1974; Riker 1980, 1986); and formal models of legislative choice have carefully explored how specific institutional structures shape legislative strategies and policy outcomes in the U.S. Congress. These models provide important insights into a wide variety of topics, including how institutional arrangements affect the distribution of benefits to congressional districts (Baron and Ferejohn 1989a, 1989b; Ferejohn, Fiorina, and McKelvey 1987; Shepsle and Weingast 1981; Weingast 1979); how institutional arrangements affect opportunities for congressional committees to exercise power against Congress (Denzau and Mackay 1983; Shepsle and Weingast 1987; Weingast and Marshall 1989); how institutional arrangements affect the efficient allocation of public resources (Baron 1990; Shepsle and Weingast 1984a; Weingast, Shepsle, and Johnson 1981); and how institutional arrangements encourage members of Congress to become policy experts (Gilligan and Krehbiel 1987, 1989). But although these formal studies make key contributions to our understanding of congressional politics, they have not been used to study how institutional arrangements shape legislative processes in parliamentary systems.[1]

The parochial application of existing formal models to Congress is unfortunate. On the one hand, comparative studies of parliamentary democracy suffer because they neglect the insights that emerge from the formal literature. On the other hand, formal studies of legislative institutions suffer because the failure to test existing models outside of Congress makes it difficult to determine if existing formal models in fact produce *general propositions* about institutional arrangements and choice processes. Consequently, claims about the comparative properties of institutional structures are difficult to defend; and theories about the choice between competing institutional arrangements are difficult to develop.

This research extends the application of formal models of legislative choice to the study of parliamentary politics. It focuses specifically on two procedures—the package vote and the "guillotine"—that sharply restrict the legislative role of the French National Assembly. I argue that existing models of congressional committees and closed amendment rules can be used to make predictions about the conditions that lead the French government (i.e., the prime minister and his cabinet) to invoke these two restrictive procedures. I then demonstrate that the French government's use of the package vote and the guillotine to resolve "distributive" problems is similar to the Congress members' use of closed rules to preserve distributive agreements. Since the logic underlying existing formal models of Congress can be used to explain the French government's use of restrictive procedures, the analysis suggests that future studies of parliamentary politics should look beyond the traditional focus on how institutional arrangements structure the hierarchical relationship between the executive and the parliament to a more general focus on how institutional arrangements constrain strategic interactions *between* parties.

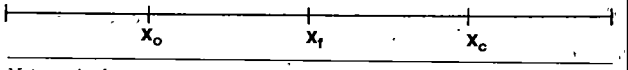
THE PACKAGE VOTE AND THE GUILLOTINE IN FRENCH POLITICS

As part of an effort to redress the problems of cabinet instability and legislative paralysis that were endemic to the French Fourth Republic, the authors of the Fifth Republic Constitution created a variety of institutions intended to enable the government to restrict the legislative role played by the National Assembly. The constitutional assault on the National Assembly

focused to a large extent on the right of deputies to amend legislation. Under the rules of the Fifth Republic, deputy amendments cannot have the net effect of increasing spending or decreasing revenue (Article 40); deputy amendments can be declared inadmissible if they have not been submitted to the relevant standing committee for consideration (Article 44); and deputy amendments must be in the "domain of law" rather than the "domain of regulation" (Articles 34 and 41). In addition, the Fifth Republic Constitution established two constitutional procedures, the package vote and the "guillotine," that permit the government to exclude otherwise admissible amendments. The package vote, found in Article 44.3 of the Constitution, permits the government to group articles and amendments selectively, excluding the amendments to which it is opposed. Under this procedure, the parliament must vote either to accept or to reject the government's policy. The *guillotine*, found in Article 49.3 of the Constitution, permits the government to "engage its responsibility,"[2] that is, to attach the fate of a bill to a censure vote in the National Assembly. Under this procedure, there is no vote on the bill itself. Instead, all debate ceases immediately; and if a motion of censure is not introduced and voted within a specified time limit, the bill is considered as adopted in the form designated by the government.[3] The package vote and guillotine, then, are both institutions that force the National Assembly to make an "up or down" choice on a policy package determined by the government.

Existing general studies of French politics treat both the package vote and the guillotine as part of the government's large procedural arsenal that renders the French parliament impotent (Andrews 1982; Ehrmann 1983, chap. 10; Williams 1968; Wright 1989, chap. 7). The only studies that focus *specifically* on the package vote and the guillotine are in French, and the most common theme in these studies relates to the "antidemocratic" effects of both institutions. The French studies criticize the institutions because they permit the government to protect its bills from changes by deputies in the National Assembly. Hence, the procedures move final policy outcomes away from the preferences of the directly elected deputies toward the preferences of the government. This usage incites complaints typified by that of Senator Guille, protesting in Senate debate the use of the package vote in 1962: "[The government] leaves us with a frustrating obligation, either to consent to what we judge bad and dangerous for France, or to reject what we estimate necessary and urgent for the French" (quoted in Avril 1965, 441).

The guillotine is generally perceived to be more antidemocratic than the package vote because, in addition to limiting parliamentary amendment activity, the guillotine permits laws to be adopted without the parliament's voting on them. Deputy Paul Reynaud's 11 January 1961 letter to Prime Minister Michel Debré sums up this criticism: "The promulgation of [Article 49.3] violates two principles which are at the core of all democratic regimes. . . . The first is formulated . . . by Article 3 of the Constitution: 'The national sovereignty is held by the people, who exercise it by their representatives or by way of referendum'. The second . . . is found in Article 34: 'The law is voted by Parliament'. These two principles were violated thanks to Article 49 of the Constitution."[4]



Reynaud was protesting the government's use of Article 49.3 to pass a bill relating to the *force de frappe*, which established France's nuclear weapons capability. Many deputies were hostile to the bill, and the government invoked the guillotine during the debate on a motion to send the bill back to committee before the bill was publicly debated in first reading. The government later invoked Article 49.3 during the second and third readings, so the *force de frappe* became the first bill ever to be adopted without a vote in the National Assembly (Lascombe 1981). In general, the procedure has been used on a wide variety of important bills, including bills related to the budget, social security, changes in French electoral law, the nationalization and denationalization of French industry, and private education.

Although the antidemocratic aspects of both procedures are widely discussed, scholars also recognize that the package vote and the guillotine can benefit deputies in parliament. This occurs when the government uses the procedures to protect its majority from potentially embarrassing votes on amendments posed by the opposition. Such usage has important stabilizing effects when the government's majority is divided or numerically weak (see Duverger 1987, 98–99; Parodi 1972, 26, 190–93; see also Avril 1965, 447). The procedures can also be useful in limiting or reversing changes made to a bill by the Senate or by a conference committee (*commission mixte paritaire*; see Avril 1971; Duverger 1987, chap. 4; Lascombe 1981).

In short, existing research argues that the guillotine and the package vote are used to protect the government's draft of bills from changes in parliament, to protect deputies in the majority from undesirable votes or debate, and to stabilize fragile government coalitions. These studies fail, however, to explain the conditions that actually lead the government to use the two restrictive procedures. For instance, although the studies suggest that the government uses the procedures to curtail parliamentary changes to government bills, they do not explain what types of bills are most likely to be subjected to the procedures. Similarly, although existing studies state that the procedures can be used to stabilize fragile coalitions, they do not predict how the government will use the procedures when it lacks majority support. We might expect, for example, that use of the guillotine declines during minority government because the government fears censure. We might also expect, however, that use of the guillotine increases during minority government because it may provide the only means for the government to enact bills opposed by parlia-

FIGURE 1

Strategic Committee Proposals under a Closed Rule

Note: x_o is the status quo, x_f is the ideal point of the floor, and x_c is the ideal point of the committee. If $|x - x_o| \leq |x_c - x_f|$, then a strategic closed-rule proposal by the committee is $x_f + |x_f - x_o|$.

ment. To fill such gaps in our understanding of the two procedures, we can turn to existing formal models of choice processes.

FORMAL MODELS OF RESTRICTIVE AMENDMENT PROCEDURES AND THE CASE OF FRANCE

Formal models have carefully examined the effects of restrictive amendment procedures on choice processes in the U.S. Congress. Much of this research follows Shepsle's pathbreaking (1979) analysis of structure-induced equilibrium, which demonstrates how policy choices can be understood as a function of the organization of committee systems and of the rules constraining the amendment process. Subsequent models have focused in particular on the importance of committee "gate keeping" power (the power of committees to refuse to report a bill to the floor), "open rules" (where the floor can offer amendments to a committee proposal), and "closed rules" (where the floor must vote either to accept or reject a committee's proposal without the opportunity to amend it).[5]

These models demonstrate that substantial insights into the role of restrictive procedures can be gained from considering strategic behavior by legislative actors.[6] Denzau and Mackay (1981), for instance, show that structure-induced equilibria may not exist when a legislator's preferences on one dimension are linked to preferences on other dimensions. Other models show that legislative rules placing restrictions on the parent body enable strategic committees to bring about outcomes that are not the most preferred policy of the floor (Baron and Ferejohn 1989a; Denzau and Mackay 1983). Under an open rule, a strategic committee will "close the gates" whenever the status quo is more desirable to the committee than is the floor median. Under a closed rule, if the floor's ideal point is between the committee's ideal point and the status quo, a strategic committee can exercise more influence over final policy than would be possible under an open rule. In Figure 1, for example, if preferences are symmetric and single-peaked, then a strategic committee can exercise influence under a closed rule that would be impossible under an open rule whenever the status quo lies in the interval stretching from x_o to x_f (where $|x_o - x_f| \leq |x_f - x_c|$). When the status quo is in this interval, the committee can make a proposal in the interval between x_f and x_c that is the same distance from the floor as was the status quo (so that the proposal by the committee is $x_f + |x_f - x_o|$), and this proposal will be adopted (see Denzau and Mackay 1983).

Existing models, then, demonstrate that in the pursuit of optimal policy outcomes, there are incentives for legislators to cut strategic deals, for the composition of majorities to change, and for actors to attempt to alter the dimensions on which tough legislative decisions are made. It is therefore important to understand not only the costs and benefits of strategic behavior, but also how legislators use legislative procedures to limit these costs and to enforce agreements.

Existing formal models of restrictive amendment procedures also shed light on the effects of uncertainty on procedural choice. We are particularly concerned in this study with uncertainty by the legislators about the preferences of the floor. Denzau and Mackay (1983) show that in a unidimensional world where committee members seek to maximize utility (given the committee's probabilistic beliefs about the floor's preferences), regardless of whether the amendment rule is open or closed, sincere behavior is optimal only if the committee believes with certainty that its ideal point coincides with the ideal point of the floor. Therefore, uncertainty introduces inertia into the system because it induces strategic committees to "close the gates" under an open rule. Similarly, uncertainty increases the likelihood that strategic committees will exploit the benefits of a closed rule.

The Case of France

Three differences between congressional and French politics must be considered before existing models of legislative choice can make sense in the French context. The first difference is the "unit of analysis." In Congress, the political actor is the individual legislator, whereas in parliamentary systems the most interesting and important unit of analysis is the political party (see, e.g., Powell 1989; Strom 1990a). In the French case, Converse and Pierce (1986) demonstrate the central role played by political parties in the representation process. The unified nature of party activity is evident in roll call voting analysis, where defections from party discipline are very rare (see Converse and Pierce 1986, 552–62; Wilson and Wiste 1976). Of course, political parties cannot be the only unit of analysis, because the discussion suggests that differences between the government and its parliamentary party (or parties) are sometimes resolved by the government's utilization of the package vote or the guillotine. Hence, the units of analysis in France are parties and the government.

The second difference is the dependence in parliamentary systems of the government on the confidence of parliament. The link between government survival and parliamentary confidence produces two dimensions of preference for each political party: (1) support or opposition for policy and (2) support

or opposition for the government.[7] For parties of the opposition, a proposed bill or amendment may represent an improvement over the status quo but nonetheless be rejected to keep clear for voters the distinction between government and opposition. Conversely, government parties in parliament may find a proposal worse than the status quo but nonetheless accept it to remain loyal to the government. The first dimension of choice clearly is tied to the (often Euclidean) spatial assumptions of most existing formal models. The second dimension of choice, however, implies an assumption of dichotomous preference—a party is either for or against the government.

The two dimensions of party utility in parliamentary systems may lead us to different expectations about the use of the guillotine, as opposed to the package vote. When the guillotine is invoked, there is no vote on the actual bill before parliament. Hence, the procedure does not require deputies to take an explicit policy position but, rather, a position regarding support for, or opposition to, the government. The package vote, on the other hand, requires that the deputies take an explicit policy position, because a vote on the bill itself occurs. There is not, however, a need to take a stand for or against the government. The two procedures therefore require choices on different dimensions of party preferences, one dimension related to policy and the other related to support for, or opposition to, the government. If different factors affect the two dimensions of choice, then the conditions leading the government to use the two procedures should not be the same.

The third difference between congressional and parliamentary politics relates to committees and amendment rules. The powers of standing committees in France are not at all similar to those of committees modeled in the existing formal literature. French committees cannot exercise gatekeeping power and are never granted a closed rule, because the government controls the parliamentary agenda (Article 42 of the Constitution). But existing formal models of committee power are applicable to France if we assume that the government is the "committee." Since the government controls the parliamentary agenda, it is endowed with both proposal and gatekeeping powers. In addition, when a government puts its own bill on the agenda, it is the text of the government's bill that serves as the basis for discussion (Article 48 of the Constitution), not the text of the committee's report of the bill.

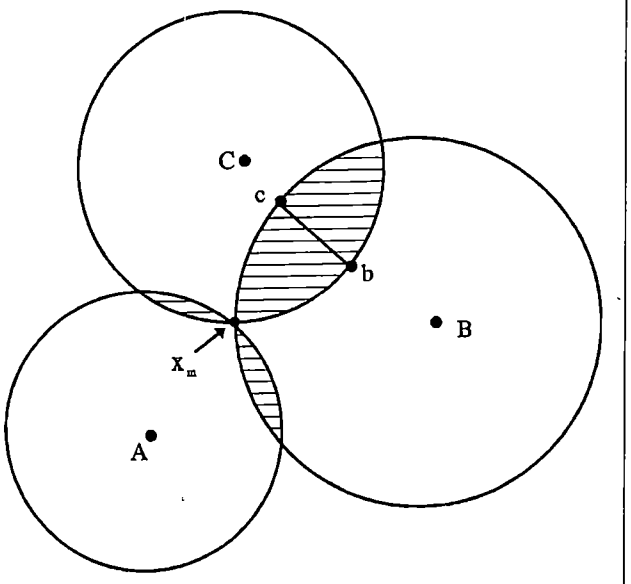
If we assume that the government fills the role of committees modeled in the existing formal literature, then the "closed rule" in the French context is imposed when the government invokes either of the two "take it or leave it" procedures: the package vote or the guillotine. Of course, it is important to note an inconsistency between the closed rule modeled in the existing literature and the "closed rules" examined in France. The guillotine, unlike a closed rule, requires the National Assembly to choose not between accepting and rejecting a policy, but, rather, between accepting and rejecting the government. And unlike committees in the existing formal literature, the French government selects its own amendment rule.

In short, although there are differences between French legislative institutions and the institutions examined in existing models of legislative choice, the case of France provides an important opportunity to test existing models outside the U.S. Congress.

HYPOTHESES ABOUT THE USE OF RESTRICTIVE PROCEDURES IN FRANCE

I draw on this discussion to develop six specific hypotheses about the conditions that lead the government to invoke the two restrictive procedures. The first three derive from existing formal research on restrictive amendment procedures; the fourth derives from both the formal literature and existing French politics research; the last two derive from existing research on French political institutions.

HYPOTHESIS 1. JURISDICTIONAL COMPLEXITY. *The probability that the government will use restrictive procedures on a bill increases as the number of issue dimensions pertaining to the bill increases.*



HYPOTHESIS 2. DISTRIBUTIVE BILLS. *The probability that the government will use restrictive procedures on a bill increases when the bill is distributive in nature.*

Hypotheses 1 and 2, discussed in detail by Krehbiel (1991; see also Denzau, Riker, and Shepsle 1985; Shepsle and Weingast 1984b), recognize that closed rules preserve "gains from trade" on dimensionally complex issues. Together, these two hypotheses represent a central result from existing formal models. An example of the logic underlying these hypotheses is given in Figure 2. Here, parties A, B, and C must choose a policy on two dimensions. If the two dimensions are voted one at a time under an open rule, the outcome will be x_m, the issue-by-issue median. However, any proposal in the shaded area (the win set of x_m) will defeat x_m. Hence, any two parties could benefit from gains engineered under a closed rule. For example, parties B and C could make a closed-rule proposal on the BC contract curve between the points b and c. Any point on the line between b and is c not only preferred by both B and C to x_m but is also Pareto-optimal in the sense that neither B nor C could be made better off without making the other party worse off. Both the package vote and the guillotine have the institutional structure necessary to preserve gains from trade in the manner suggested by this example.

Although the logic behind Hypotheses 1 and 2 is the same, jurisdictionally complex bills and distributive bills need to be kept conceptually distinct. A jurisdictionally complex bill touches on more than

FIGURE 2

Jurisdictional Complexity and Closed Rules

Note: x_m is the issue-by-issue median. The shaded area is the win + set of x_m.

one dimension of individual (or party) preference. For example, a bill concerning both the amount of money the state transfers to local communities for education and the total number of public education jobs paid by the state might touch on one dimension of choice related to the decentralization of political decision making and another dimension of choice regarding the amount of state money spent on education. A distributive bill, on the other hand, is one where the benefits are concentrated and the costs are spread out. Following the previous example, a distributive bill might be one where parliament must decide how geographically to distribute a fixed amount of state funds earmarked for education.

Students of parliamentary politics may be skeptical of Hypotheses 1 and 2 since parliaments clearly do not practice distributive politics like that in Congress. Although I do not want to suggest that French parliamentary politics is "distributive" in the U.S. congressional sense, it is important to recognize that parliaments must vote publicly on the distribution of limited public resources. Hence, although individual deputies may not frequently fight successfully on the floor of parliament for particularistic benefits, intuitions underlying Hypotheses 1 and 2 are relevant to parliamentary systems because they can help us to understand how governments use restrictive procedures to address problems between factions within a government party, between parties who are partners in a government coalition, and between the government and opposition parties during minority government.

HYPOTHESIS 3: GOVERNMENT STATUS. *As the government's status becomes weaker or more heterogeneous, the probability that restrictive procedures will be invoked on a bill increases.*

Hypothesis 3 is the only hypothesis strictly related to systemic rather than bill-specific factors. As I have noted, research on French institutions suggests that use of restrictive procedures is related to the government's status but does not provide a satisfying theoretical explanation of the relationship between systemic factors and the use of restrictive procedures. Existing formal research can help fill this theoretical void. In particular, formal research on the effects of uncertainty, strategic behavior, and dimensional complexity all lead to the development of Hypothesis 3.

Existing models show that as uncertainty about the preferences of the floor increases, the benefits to the proposer under a closed rule also increase. Hence, if we assume that a government is more uncertain about the preferences of the majority when the government coalition becomes more heterogeneous or loses its majority status, then closed rules should be used in such situations to combat uncertainty. Existing models also show that strategic amendment activity permits political actors to achieve more desirable policy outcomes than does sincere behavior. In parliamentary democracies, strategic behavior should increase during minority government because a wider variety of strategic coalitions are possible than is the case during majority government, when the roles of government and opposition parties are clearly delineated. Hence, restrictive procedures should be used by minority governments to combat strategic behavior by the opposition.

We can be more confident that the logic underlying formal models leads to Hypothesis 3 if there exists evidence of an increase in strategic voting behavior during minority government. Measuring strategic behavior is problematic, since it requires information about party preferences; but one possible approach in France is to assume that it is rarely sincere for the preferences of the Communists, a left-wing party, at once to differ from the Socialists and be the same as those of the conservative parties on the Right. This assumption, which is consistent with studies of the ideology of French parties and French party supporters (Converse and Pierce 1986), enables us to make inferences about strategic behavior from the voting records of the parties. Evidence of strategic behavior by the opposition parties exists if the Communists and the parties on the Right vote together to defeat the Socialists on motions, articles, or amendments during minority government (i.e., on votes that precede the final vote on a bill) but fail to defeat the Socialists in final votes on bills. Table 1 shows that the Socialists were defeated on motions, articles, and amendments 6% of the time in the first two years of minority government. As a point of reference, the first row of the table shows that this is substantially more often than was true during the Socialist major-

TABLE 1

Strategic Voting during Minority Government

TYPE OF GOVERNMENT	PERCENTAGE OF VOTES WON BY SOCIALISTS: AMENDMENTS, MOTIONS, ARTICLES	FINAL BILLS
Majority	99.2	100
Minority	94.0	99.5

Note: Data in the table are from over 500 votes randomly selected by me. The first row of the table covers the 1981–86 Socialist majority government. The second row of the table covers the 1988–June 1990 period of Socialist minority government.

ity government of 1981–86, which lost similar votes less than 1% of the time. However, in final votes on bills, the Communists and the parties on the Right joined together to defeat only one Socialist bill in over two hundred. Hence, the Communists and the conservative parties voted together only in votes that preceded the final decision on bills. The data in Table 1, then, suggest that minority government encourages strategic behavior by opposition parties; and we might expect the government to use restrictive procedures to combat this strategic behavior.

A final link between formal models and Hypothesis 3 derives from Budge and Fairlie's argument that parties in parliamentary systems are often linked to particular issues; that is, parties frequently "stress particular issues because they almost always work in their favor—they do, in a real sense 'own' them" (1983, 271; see also Budge, Robertson, and Hearl 1987). Parties on the Right, for example, can never hope to appear more committed to social reforms than parties on the Left; and parties on the Left can never hope to appear more committed to military defense than parties on the Right. If individual parties are primarily concerned with different dimensions of policy, then jurisdictional complexity increases with the number of parties in a government coalition. Hence, following Hypothesis 1, restrictive procedures can be used to preserve agreements between coalition parties during multiparty government.

HYPOTHESIS 4: URGENCY. *Restrictive procedures are used to hasten action on the floor of the National Assembly.*

This hypothesis derives from Baron and Ferejohn's (1989a, also 1989b) "divide the dollar" model, which shows that the benefits to all legislators of a closed rule increase as the costs of delay increase. In addition, French politics scholars argue that the procedures can be used to expedite the legislative process (Avril 1965; Duverger 1987, chap. 4). The package vote enables the National Assembly to avoid voting all of the amendments that are introduced by the opposition, while the guillotine immediately stops all debate on a bill.

HYPOTHESIS 5: AVOID POLITICAL EMBARRASSMENT. *The government will invoke restrictive procedures on bills to protect its majority from embarrassing votes and debates.*

This hypothesis cannot be derived from existing formal models because such models assume that voters or parties care only about final policy outcomes. Instead, the hypothesis derives strictly from the research on French politics I have discussed. The arguments presented above dovetail nicely with those of Baumgartner (1987, 1989), who argues that opposition deputies can use the French National Assembly as a tool for turning public opinion against government policies. The hypothesis predicts that as the controversy of an issue increases, pressures by parliament (and specifically the opposition) will increase in forms permitting the maximum focus of public attention on the issue. The government can react to limit the pressure by invoking the restrictive procedures. We should therefore expect the government to use the procedures on the bills that are most vigorously attacked by the opposition and during time periods when public debate on bills is most costly.

Since the logic behind Hypothesis 5 relates to protecting the government majority from undesirable votes or debate, it is difficult to generate different predictions for the two restrictive procedures. The package vote does not protect the majority from opposition attacks because under the procedure, authors can defend their amendments. It does, however, protect the majority from voting these amendments. The guillotine protects the majority not only from voting amendments but also from voting a bill itself. In addition, it protects the majority from protracted debate since all debate ceases immediately when the procedure is invoked. Under the guillotine, however, the opposition has wide latitude to criticize the majority during the debate on the censure motion that generally follows the use of the procedure.

HYPOTHESIS 6: POLICY DISTANCE. *The government will use restrictive procedures to prevent changes by the National Assembly to the government's draft of a bill; or, the probability that the government will invoke restrictive procedures on a bill increases as the preferences of the government and the National Assembly diverge.*

Hypothesis 6 emerges directly from the literature on French legislative politics, which argues that both types of restrictive procedures are used to protect the government's own bill from changes by a hostile National Assembly. This hypothesis is related to the frequent claim that both procedures (especially the guillotine) are antidemocratic.

THE RESULTS

Tables 2 and 3 give the results of multivariate analyses of Hypotheses 1–6 using data that I collected at the archives of the National Assembly in Paris. The

Note: The dependent variable takes the value 1 if the guillotine is used, 0 otherwise. Standard errors are given in parentheses. The italicized number in column 1 gives the change in the probability of observing the guillotine given a one-unit increase in the independent variable when the prior probability of observing a guillotine is .05 (5% of the bills in the sample are subjected to the guillotine).

data set includes information about amendment and procedural activity for 356 *projets de loi* (government bills) that were voted in first reading between the 21 March 1978 elections and the end of the legislative session in December 1989.[8] The bill is the unit of analysis, and the dependent variable takes the value one if the restrictive procedure is used and zero if it is not. The dichotomous nature of the dependent variable makes logit an appropriate model. Of the 356 bills, 37 (just over 10%) were subjected to one or both of the restrictive procedures. The frequency of French restrictive procedures is therefore greater in the restricted sample than the frequency of closed rules in Congress (1975–86), although a larger percentage of bills in Congress are subjected to modified restrictive rules (Bach and Smith 1988, 57).

I test Hypothesis 1 (that use of the guillotine should increase with a bill's jurisdictional complexity) by assuming that bills considered by more than one committee are jurisdictionally complex. Hence, *jurisdiction* is a dummy variable that takes the value one if the bill is referred to more than one committee, zero otherwise. I test Hypothesis 2 by assuming that Finance Committee bills are distributive, because they involve the levying of taxes and the distribution of money. *Distributive*, then, is a dummy variable that takes the value one if the bill's original jurisdiction is the Finance Committee, zero otherwise. The Finance Committee had original jurisdiction for 79 of the 356

bills in the sample, of which 12 were annual budget bills. Both *jurisdiction* and *distributive* should have positive coefficients if Hypotheses 1 and 2 are true.

The effects of government status (Hypothesis 3) are measured using two dummy variables. The first, *coalition*, takes the value one if the government is a coalition majority, zero otherwise. The second, *minority*, takes the value one if the government is a minority government, zero otherwise. The coefficients for each of these two variables are used to estimate the difference between the probability that a coalition or minority government will invoke a restrictive procedure and the probability that a single-party majority government will invoke a restrictive procedure.

I examine whether there is an increase in the utilization of restrictive procedures as legislative sessions approach their end to test Hypothesis 4 (that restrictive procedures are used to hasten decision making). *End session* therefore simply measures the number of days until the end of the parliamentary session and should have a negative coefficient if Hypothesis 4 is true.

Hypothesis 5 is difficult to test because of the problems inherent in determining the types of issues potentially subjecting the government to embarrassing debate or amendments. I consider two plausible approaches. The first measures the level of controversy raised by a bill as a function of the types of efforts made by the opposition to oppose the bill's adoption. *Controversy* measures four activities that the opposition can undertake to oppose a bill after the bill has come to the floor for discussion. The variable is constructed as follows: (1) If the number of amendments posed by the opposition is more than one standard deviation above the mean number of opposition amendments in the data set, the value one is added to the index; (2) if the number of suspensions of debate demanded by the opposition is more that one standard deviation above the mean number of suspensions demanded by the opposition in the data set, then the value one is added to the index;[9] (3) if the opposition demands a verification of the quorum, the value one is added to the index; and (4) if the opposition submits one (or more) of three preliminary motions (moving the previous question, moving the bill inadmissible, moving it be returned to committee for reconsideration) the value one is added to the index.[10] *Controversy* can take values of zero to four, with a higher value indicating a larger degree of controversy. If potential government embarrassment increases with the controversy of the measure, then *controversy* should have a positive coefficient.

Another measure of the potential embarrassment that a bill might cause the government relates to the timing of the bill with respect to the next election. If the government invokes restrictive procedures to avoid electorally difficult votes or debate, then the payoff of invoking the restrictive procedures should increase as elections approach. *Next election* measures the number of days from the time a bill is voted to the next parliamentary or presidential election and hence should have a negative coefficient to support Hypothesis 5.

I test Hypothesis 6 (that restrictive procedures are used by the government to protect its bill from change) by assuming that successful amendment activity is a proxy for differences between government and floor preferences. As the changes to the government's text of a bill increase, policy divergence increases. *Amendments* is simply the sum of all accepted amendments on a bill.

The final variable in the model, *report*, is a control variable not directly related to any of the six hypotheses. This variable measures the number of days between the submission of the bill by the government and the report by the relevant committee. It is a proxy for the importance of the bill to the government, because the government determines when bills are reported and debated in the National Assembly (and hence can call for its most important bills quickly while leaving less important ones buried in committee). *Report* should have a negative coefficient if the probability of restrictive procedures increases with the importance of the bill to the government.

Tables 2 and 3 give four specifications of the statistical model analyzing the government's decision to invoke the package vote and the guillotine, respectively. Column 1 in both tables includes all the independent variables, and the italicized number in column 1 gives the expected increase or decrease in the probability of observing the package vote or the guillotine, given a one-unit increase in each independent variable. The italicized number is calculated based on the assumption that the prior probability of observing the package vote is .07 (since 7% of the bills in the sample are subjected to the package vote) and that the prior probability of observing the guillotine is .05 (since 5% of the bills in the sample are subjected to the guillotine).

First consider Hypotheses 1 and 2. For the package vote, all specifications in Table 2 support Hypothesis 2. Column 1 shows that if a bill is submitted to the Finance Committee, the probability that the bill will be subjected to the package vote increases by 46%. Hypothesis 1 also receives some support in the model, with *jurisdiction* having the expected sign, albeit with a coefficient substantially smaller than that of *distributive* and with a standard error that leaves doubt about its statistical significance. However, an examination of columns 2 and 3 shows that the poor performance of *jurisdiction* in column 1 is probably due to multicollinearity between *jurisdiction* and *distributive*. In column 2, *distributive* is suppressed and *jurisdiction* is highly statistically significant with a coefficient substantially larger than is the case when *distributive* is included. In column 3, *jurisdiction* is suppressed and the coefficient of *distributive* is even larger than is the case in column 1. Although the data do not permit us to sort out the independent effects of jurisdictional complexity and distributive consequences, the specifications in columns 2 and 3 do give us reason to believe that both variables are important to the government's package vote decision. This

interpretation is supported by simply noting that 24% of jurisdictionally complex bills in the sample are subjected to the package vote, whereas only 3% of bills that are not jurisdictionally complex are subjected to the package vote.

The guillotine data do not support Hypotheses 1 and 2 to the extent that is true in the case of the package vote. Table 3 shows that *distributive* is statistically significant with the expected sign, supporting Hypothesis 2 but that the effect is much smaller in magnitude than is the case for the package vote. The data for the guillotine, on the other hand, do not support Hypothesis 1. The parameter estimate for *jurisdiction* is not statistically significant (and has the wrong sign) in all specifications of the model, including columns 2 and 3, which attempt to examine the effect of multicollinearity between *jurisdiction* and *distributive* on the parameter estimates for these two variables. In sum, two key hypotheses from existing formal models of closed rules (Hypothesis 1 regarding jurisdictional complexity and Hypothesis 2 regarding the distributive characteristics of bills) are supported by the tests for the package vote. The same is not true for the guillotine.

Next consider Hypothesis 3. The parameter estimates for the variables related to the status of the government support the hypothesis in the case of the package vote. The effect of minority government on the probability of the package vote is very large: if the prior probability of observing a package vote is .07 under a single-party majority government, the probability is .96 under a minority government. The existence of a coalition government also increases the probability of the package vote, but to a lesser extent than is the case with minority government. The existence of minority government also has a large and statistically significant effect on the government's decision to use the guillotine; but Table 3 shows that the existence of coalition government does not have a significant impact on the government's decision calculus.

The results pertaining to minority government deserve special comment because they are significant to our understanding of French politics in two respects. First, Wright (1989), Andrews (1982), and Frears (1981) each argue that parliamentary impotence in the Fifth Republic is due largely to the existence of a progovernmental majority; and they predict that this impotence may disappear in the absence of such a majority. The data presented indicate that this might not be true, because during minority government, the government's widespread use of restrictive procedures can limit the legislative role of parliamentary parties. Second, the government's frequent resort to the guillotine during minority government may have positive implications for cabinet stability. The guillotine enables opposition parties to oppose bills and then abstain on Article 49.3 censure motions. Hence, opposition parties can avoid both bringing down the government and paralyzing the legislative process without supporting either the government or its policies. The fact that French institutional arrangements create this strategy for opposition parties should make minority government in France more stable than might otherwise be possible.

The hypothesis that restrictive procedures are used to expedite the legislative process (Hypothesis 4) is tested by *end session*. Columns 1–4 indicate that the government's propensity to utilize the package vote is not affected by the government's desire to expedite the legislative process. Similarly, Table 3 shows that the guillotine is not used with increasing frequency as the legislative session draws to an end. These results are perhaps not surprising, given uncertainty in existing research about the extent to which the procedures can actually be used to hasten the process. The package vote does not limit the right of authors either to introduce or to defend amendments (Carcassonne 1988, 336), and the guillotine entails the delays of a censure motion.

With respect to Hypothesis 5, the coefficients for *controversy* are somewhat difficult to interpret given the nature of the variables; but their effects are clearly significant for both the package vote and the guillotine. In the case of the package vote, when the value of *controversy* is four (its maximum value), the probability of the package vote is .92 (.07 + .85). Hence, the effect of full-fledged opposition efforts to draw attention to a bill on the probability of the package vote are very important. The same is true for the guillotine, although the magnitude of the effect is smaller.

The number of days until the next election is also used to test Hypothesis 5. The variable is statistically significant in the expected direction for the package vote, although the magnitude of the effect is small. In the case of the guillotine, the coefficient is not statistically significant and has the wrong sign. The direction of the effect may suggest that the government does not like to use the guillotine as elections approach since its usage may send a sign that the government is without a majority for its policies. In fact, in the sample data, if there are less than two hundred days until the next election, less than 2.5% of all bills are subjected to the guillotine, while if there are more than five hundred days until the next election, almost 7% of all bills are subjected to the guillotine.

The number of adopted amendments is used to test Hypothesis 6, which states that the use of restrictive procedures should increase as the policy preferences of the government and the National Assembly diverge. Table 2 shows that the amendment variable is statistically significant with the expected sign. To interpret the magnitude of the effect, it is useful to note that if the number of successful amendments on a bill is equal to the mean number of successful amendments in the sample (i.e., 27 amendments adopted), then the probability of the package vote increases by only .03 over the case where no amendments are adopted. However, if the number of successful amendments is exactly one standard deviation above the average number of adopted amendments (i.e., 68 amendments adopted), then the probability

of the package vote increases by .13 over the case where there are no amendments.

Hypothesis 6 does not receive support from the data in the case of the guillotine. In Table 3, the parameter estimates for *amendments* are never statistically significant and have the wrong sign. Tables 2 and 3 therefore suggest that the government's use of the package vote is linked to the policy preferences of the legislative actors, but the government's use of the guillotine is not. This interpretation is further supported by the fact that in the sample 44 amendments are reserved, on average, when the government invokes the package vote, but not the guillotine, on a bill, whereas only two amendments are reserved, on average, when the government invokes the guillotine, but not the package vote. The statistical analysis therefore highlights the fact that use of the guillotine touches dimensions of preference related both to government support and policy outcomes, while use of the package vote touches policy preferences almost exclusively.

As a measure of policy divergence between the government and the National Assembly, *amendments* may raise certain objections. Successful amendments by the National Assembly to the government text may not, for example, be a good proxy for the differences between government and National Assembly preferences, because if a bill is multidimensional, a large number of amendments may not entail a large divergence between government and floor preferences. Similarly, large bills may be subjected to more amendments of all types than are small bills. Since the effects of amendment activity may be difficult to interpret, it is desirable to estimate the model without *amendments* to determine whether the inclusion or exclusion of this variable significantly effects the estimation of the other variables. This is done in column 4 of Tables 2 and 3. It is reassuring to note that the coefficients and standard errors of all the variables remain relatively stable for both the package vote and the guillotine when the amendment variable is suppressed.

Finally, the control variable in the model, *report* is not statistically significant for either the package vote or the guillotine. Therefore, if *report* is a good proxy for the importance of the bill to the government, then the importance of the bill does not affect the government's procedural choice when we control for other factors.

CONCLUSION

The analysis presented suggests that the government's use of the package vote *and* the guillotine is associated with the distributive consequences of bills, the level of controversy raised by bills, and the existence of minority government. The analysis also demonstrates that the package vote and the guillotine arise under different circumstances and are not procedurally interchangeable. The government's use of the guillotine (but not of the package vote) seems to decline as elections approach. More importantly, the government's use of the package vote (but not of the guillotine) increases with the jurisdictional complexity of bills, divergences between the policy preferences of the government and the National Assembly, and the existence of coalition government. The package vote, then, appears to be more "antidemocratic" than the guillotine in the sense that as the policy preferences of the government and the National Assembly diverge, the government uses the package vote with increasing frequency to reserve majority and opposition amendments. We might therefore conclude that the package vote is an institution used by the government *against* its own majority in the National Assembly, whereas the guillotine is an institution used by the government to *protect* its majority in the National Assembly from undesirable votes or debate.

The examination of the conditions that lead the government to invoke the two restrictive procedures reveals a similarity between congressional politics and parliamentary politics that is previously ignored by both Congress and comparative scholars. This similarity emerges from considering two results in the empirical analysis. First, the probability of both the package vote and the guillotine increases on controversial bills and on bills sent to the Finance Committee; and the probability of the package vote increases on bills sent to more than one committee. In Congress, controversial bills, bills referred to multiple committees, and bills referred to the "prestige" committees (e.g., Budget, Ways and Means, and Appropriations) are most likely to be subjected to closed or restrictive rules (see Bach and Smith 1988). French restrictive procedures, then, are used on the same sorts of bills that are subjected to restrictive amendments rules in Congress. Second, when we control for the characteristics of bills, the majority status of the government strongly affects the probability with which the government will resort to restrictive procedures. When the government has more than one party, use of the package vote increases; and when the government has only minority support, use of both the package vote and the guillotine increases. Hence, it seems that restrictive procedures in parliamentary systems may be used to preserve agreements *between parties* in the same way that restrictive voting procedures are used to preserve agreements between individual members of Congress.

Together, these two findings suggest a new focus in future studies of parliamentary politics. In the past, studies of legislative politics in parliamentary democracies generally examine the extent to which legislative power is concentrated in the hands of either the parliament or the executive;[11] and studies focusing specifically on parliamentary institutional arrangements often focus on how legislative rules affect the vertical relationship between executives and parliaments.[12] This study suggests that institutional arrangements play important roles in structuring not only legislative–executive relationships but also strategic interactions between parties that are

partners in coalitions and between government and opposition parties during minority government. Consequently, it is important to explore more generally how institutions shape legislative strategies and final policy outcomes when issues divide the government and parliament, parties within a government coalition, and (during minority government) the government and the opposition. This analysis suggests that such further research might clearly reveal claims about the antidemocratic nature of institutions like the package vote and the guillotine to be misguided. Instead, restrictive amendment procedures in parliamentary systems, like restrictive amendment procedures in Congress, might very well be found to enhance the efficiency of legislative bargaining processes and the stability of legislative outcomes. Further comparative research on this question is clearly feasible, since procedures like the French guillotine also exist in Germany (Dalton 1989, 59–60), Belgium, Finland, Italy, and the Netherlands (Inter-Parliamentary Union 1986, Table 40).

The analysis presented also has implications for the formal study of legislative institutions. The formal hypotheses related to jurisdictional complexity, distributive consequences, and the nature of the government coalition are all supported by the package vote data, providing new evidence that efforts to model legislative institutions are in fact producing general propositions about choice processes. At the same time, the guillotine data fail to support hypotheses related to jurisdictional complexity and coalition government, raising important questions about the circumstances under which we can apply existing models to parliamentary arenas.

It is not surprising that existing models explain the use of the package vote better than the use of the guillotine. First, the package vote procedure is directly tied to the policy content of bills, whereas the utilization of the guillotine is not; that is, use of the package vote requires the National Assembly to vote either for or against the government's package, whereas use of the guillotine does not require a vote on the bill but, rather (potentially), a vote on a censure motion. Since most existing formal models assume that party utility is strictly a function of short-term outcomes in a well-defined policy space, it seems logical that empirical results for institutions that touch directly on policy preferences (i.e., the package vote) are better explained by existing formal models than are empirical results for institutions such as the guillotine, which touch less clearly on policy preferences.

Second, use of the guillotine carries with it much higher political costs than does use of the package vote. Both procedures can give a public impression that the government lacks a majority for its policy, is internally divided, or is authoritarian against the directly elected representatives of the voters. But the costs of using Article 49.3 are higher because it invites the most "political" act in parliament—a motion of censure. Consequently, use of the procedure receives much greater attention and criticism from the media. Evidence of the higher political costs of the guillotine comes from simply noting that the guillotine is used much less frequently. From 1959 to 1990, the package vote was used 236 times while the guillotine was used 64 times (Maus 1988, 160, 181–82; Secrétariat Général de l'Assemblée Nationale 1988, 1989, 1990). Since existing formal models do not associate costs with the actual utilization of restrictive procedures, it is not surprising that the use of an institution heavy with such costs (e.g., the guillotine) is less empirically consistent with predictions of existing formal models than is the use of an institution for which the costs of utilization are low (e.g., the package vote). The differences between the package vote results and the guillotine results therefore suggest that it might be fruitful for future formal models of parliamentary politics to explore the inclusion of officeholding preferences into the objective functions of parties, as well as to examine the potential political costs associated with using particular types of procedures.

To conclude, my effort to use existing formal models of congressional politics to study the French government's use of restrictive procedures suggests that the emphasis in previous comparative research on the differences between congressional and parliamentary politics has perhaps led us to overlook potentially important similarities in the two types of systems. Specifically, the data suggest that restrictive legislative procedures are used on the same types of issues for the same types of reasons in the French National Assembly and in Congress. Future studies of parliamentary systems could therefore reap benefits by using the intuitions from formal models to study the types of issues that divide parties, and to explore how institutional arrangements are designed to permit competing parties to make and to preserve policy agreements. At the same time, future efforts to develop formal theories about how procedural structures shape the nature and stability of policy outcomes would be enhanced if attempts were made to develop models of noncongressional institutions and conduct additional tests of existing models in noncongressional settings.

Notes

An earlier version of this paper was presented at the 1990 annual meeting of the American Political Science Association in San Francisco. I received helpful comments on earlier drafts from Bill Andrews, David Austen-Smith, Larry Bartels, Randy Calvert, Gary Cox, Lucy Drotning, Bing Powell, Kaare Strom, and William Riker. The Foundation Nationale des Sciences Politiques and the staff at the Archive of the French National Assembly provided excellent assistance with data collection, and Jean-Luc Parodi provided indispensable guidance during my stay in Paris. I am grateful for research support from the French government's Bourse Chateaubriand and from the National Science Foundation (SES-8906734).

1. Formal models of coalition formation are an exception (see, esp. Austen-Smith and Banks 1988, 1990; Baron 1991; and Laver and Shepsle 1990). These studies do not, however, examine legislative politics after government formation is complete.

2. This is a literal translation from the French, for which I cannot suggest an appropriate English term.

3. The name *guillotine* does not come from cynical French political observers who see a parallel between the political procedure found in Article 49.3 and another political procedure commonly employed during the eighteenth-century "Reign of Terror." Instead, the name is taken from a close cousin that exists in Great Britain. The British guillotine, however, simply stops all debate on a bill. There is no formal procedure to attach the vote on the bill to a confidence vote (although the British government can state that it will resign if the bill is not adopted).

4. The full text of the letter is reprinted in Maus 1988, p. 183.

5. See Krehbiel 1989 for an excellent review of the formal literature on restrictive legislative institutions. Dion (1992) analyzes the robustness of Shepsle's structure-induced equilibrium.

6. A *sincere* legislative actor proposes, or votes for, his or her most preferred outcome at every stage in the legislative process, whereas a *strategic* legislative actor proposes or votes for alternatives (or amendments) that may not be most preferred at the intermediate stage in order to maximize utility of the final outcome.

7. See Strom 1990b for an excellent discussion of the office-seeking, vote-seeking, and policy-seeking motivations of political parties in parliamentary systems.

8. Several criteria were used to select the bills. First, since the National Assembly seldom plays a large role in foreign affairs, bills originally assigned to either the Defense Committee or to the Foreign Affairs Committee were not included. Second, to avoid the possibility that National Assembly activity reflects efforts to reverse changes made by the Senate, only bills originally submitted to the National Assembly were included. A random sample of the remaining bills were selected; but all finance bills, which dominate the legislative agenda each autumn, were included.

9. Article 58.3 of the Rules of the National Assembly permits the president of a parliamentary group (or his or her designee) to demand at any time a suspension of parliamentary debate for the purpose of a parliamentary group meeting.

10. If a party moves the previous question or moves that a bill is inadmissible (see Rules of the National Assembly, Article 91), a vote on the motion must occur before the individual articles are debated and voted (Article 104.2). The adoption of either type of motion defeats the bill. Parties can also move that bills be returned to committee for further consideration (Article 91.6–8). All three types of motions provide an opportunity for the opposition to criticize a measure publicly before any changes to the bill are made.

11. See, e.g., Lijphart, 1984 and Powell 1982, chap. 4.

12. See, e.g., Loewenberg and Patterson, 1979 and Mezey 1979.

PROTESTANT THOUGHT AND REPUBLICAN SPIRIT: HOW LUTHER ENCHANTED THE WORLD

JOSHUA MITCHELL *George Washington University*

Arguments about the emergence of modern political theory often claim that Protestantism's significance was that it evacuated the political world, that a more properly political ethic took its place, a "disenchanted" one. I shall consider Luther's understanding of biblical history, thoughts on the Christian prince, and view of the "bonds of union" between Christians in order to understand the relationship between the political and spiritual realms. I suggest that even though Luther argues for the separation of the two realms, his political realm is by no means disenchanted. His politics can only be understood in light of his claims about the purview of God the Father and God the Son. "Political vacuum theories," I suggest, misconstrue the relationship between politics and religion in Protestant thought.

It was Rousseau's claim that Christianity produces no "bonds of unions" between human beings (1984, 183). Bonds of union, he thought, must come from a source other than Christian religion if they are to be politically vital and without virulent excess. Christian religion, he thought,

> having no specific connection with the body politic, leaves the law with only the force the law itself possesses, adding nothing to it; and hence one of the chief bonds necessary for holding any particular society together is lacking. Nor is this all: for far from attaching the hearts of citizens to the state, this religion detaches them from it as from all other things of this world; and I know of nothing more contrary to the social spirit. (1984, 182)

Machiavelli, steering only a slightly different course, thought Christianity untenable because it was unable to guide the prince or would-be prince. That the necessities, the verities, of political life might be known required the exposition he would provide. Christianity invariably fails the political actor. Machiavelli would convey a new knowledge:

> Since my intent is to write something useful to whoever understands it, it appeared to me more fitting to go directly to the effectual truth of the thing than to the imagination of it. And many have imagined republics and principalities that have never been seen or known to exist in truth; for it is so far from how one lives to how one should live that he who lets go of what is done for what should be done learns his ruin rather than his preservation. For a man who wants to make a profession of good in all respects must come to ruin among many who are not good. (1985, 61)

Notwithstanding their many differences, Rousseau and Machiavelli accord in their view that a properly republican ethic must replace a politics *entranced* by principles now anathema to it, principles that can only cripple and diminish political life. Christianity is without bonds of union; Christianity cannot guide the prince. Effective political action demands that the verities of politics not be conflated or confused with those of religion—if the latter can be said to exist at all.

While this general argument about properly political action is one of long-standing pedigree, it has a peculiar resonation with the Protestant *theological* claim that the two realms, spiritual and carnal, must be separated that each may do its own work. Indeed, in Rousseau's thought there is a strange mixture of Protestant sensibility and republican spirit, a mixture lacking in Machiavelli's thought—perhaps because the Christianity of which he conceived belonged to the Roman Church. Whether he intended it or not, Rousseau sounds Protestant when he speaks of the true religion (which would complement his vigorous polity) as being, "without temples, altars or rituals, and limited to the inward devotion to the supreme God and the eternal obligations of morality [as it is found in the] pure and simple religion of the Gospel" (1984, 181).

This peculiar alliance of Protestant thought and Republican spirit is worth considering, not merely because it raises questions about Rousseau's ambivalence toward Christianity but also because the supposition has long been in force that Protestant thought *did* evacuate the political world and that a more properly political ethic was established as a consequence of that evacuation. Protestantism disenchanted the world, it removed the binding injunctions of God from the sphere of worldly activity, and left humankind on its own, without divine support. What Rousseau only hoped for—an inward devotion (Protestantism purified, perhaps) supplementing a purely political ethic—is often taken to be a description of the actual relationship between Protestant thought and Republican spirit. And this has given rise to one or another version of what may appropriately be called *political vacuum theories.*

POLITICAL VACUUM THEORIES

Nature abhors a vacuum, and so do political theorists. Political vacuum theories suggest that the political consequences (unintended, to be sure) of Protes-

tantism's insistence upon separating the spiritual and carnal realms was a vacuum of worldly authority in which a vital political ethic could reemerge. The recurring supposition in these readings is that Aristotle was right: to be human is to be a *zoon politikon* (1958, 5). Augustine's (later, the Reformation's) effort to orient the soul toward the Civitas Dei and away from the things of this world which "sway in their temporal instability" (1984, 5) could, for a time, supplant but not ultimately supersede this human verity. Fifteen centuries of bad (political) faith are brought to an end, ironically, by the very success of Luther and the other reformers' anxious struggle to rediscover and proclaim anew, as Augustine had once (1961, 212), the distinction between the carnal and spiritual realms, a distinction which the Roman Church had all but effaced.

As I have said, the supposition of political vacuum theories is that the political reemerges after an overlong hiatus. Wolin, for example, argues that Luther depoliticized theology while Machiavelli detheologized politics (1961, 142–44). Both assaults served to remove the religious obstacles to the reemergence of the political. Where the scholar sympathetic to Weber's (1958) view of history might announce—and perhaps decry—the onset of the world's *disenchantment* in the face of the onslaught, Wolin and other political vacuum theorists are untroubled by this development. One theorist's loss is another's gain. For the political vacuum theorists, disenchantment heralds not loss but rather recovery.

Sabine, while perhaps not as trenchant as Wolin, sees the significance of Protestantism in much the same way: Luther's withdrawal into the religious sphere left the world to its own devices. "Luther's stress upon the pure inwardness of religious experience inculcated an attitude of quietude and quiescence toward worldly power. Religion perhaps gained in spirituality, but the state certainly gained in power" (1937, 363).

Skinner not unlike Sabine, claims that "the main influence of Lutheran political theory in early modern Europe lay in the direction of encouraging and legitimating the emergence of united and absolutist monarchies" (1980, vol. 2, 113). The autonomy of politics, the infelicity of deriving political obligation from God's Word, marks the onset of modern political thought. "Any attempt to excavate the foundations of modern political thought needs to begin with the recovery and translation of Aristotle's *Politics*, and the consequent re-emergence of the idea that political philosophy constitutes an independent discipline worthy of study in its own right" (p. 349).

Pocock's arguments are consistent with the political vacuum theory, as well (1973, 148–201; 1975). In his view, Augustine initiates an epoch in which history gives way to eschatology (1975, 33). The events in the City of Man acquire whatever significance they may have in the light of their bearing upon the City of God, in which each individual soul may participate. Public history—the secular events that have shaped a people over time—is subordinated to the private search for redemption. Here is the "separation of redemption and history, salvation from society, soul and body" (ibid., 35).[1] Pocock's story is "of the revival in the early modern West of the ancient ideal of *homo politicus* (the *zoon politikon* of Aristotle), who affirms his being and his virtue by the medium of political action" (ibid., 550). While he does not trace the reemergence of a properly political ethic to Luther and the Reformation, he, too, supposes that Christianity (in its Augustinian mode, upon which Luther clearly relied) divested politics of its import to human life.

This *pneumatic* view of Christianity—whether one dates it from Augustine or Luther and the Reformation—has become an axiom on the basis of which theories of the emergence of modern political thought are developed. There is a prima facie case for this view, of course. At first blush it is uncontroversial; even a cursory glance toward Luther reveals his opposition to the Catholic analogical understanding and his insistence (qualified in important ways) that Law and Gospel—the carnal and the spiritual realm, the Old and the New Testaments—are, or pertain to, different orders that must not be conflated.

Luther's insistence upon separating the two realms, however, only captures a portion of what needs to be grasped to understand the subtle relationship between politics and religion in his thought and, by extension, in Protestant thought. The great paradox in Luther (his distinctions notwithstanding) is that the world is *not* disenchanted. A purely political ethic (and here, of course, Aristotle, whom Luther detested [1961a, 470–71] is the counterpoint) could not be countenanced. This is the theoretical perplexity that any interpretation of Luther must address. Luther's pronouncements of the stark disjunction between the two worlds must be juxtaposed with his view that *this* world is not emancipated from the other. Luther does, it is true, adduce a theological argument for separating the two worlds that each may be granted what it is due. This world, however, does not become disenchanted as a consequence of separating religious and worldly affairs. Needless to say, the theoretical significance of the underlying unity of these seemingly opposed notions bears on the question of the disenchantment of the world that Protestantism purportedly occasions. It is my contention here that Protestant thought does not disenchant the Roman Church–dominated world but, rather, enchants the world in a different manner than does the Roman Church. How this assertion bears on political vacuum theories is apparent and will be considered more fully in the Conclusion.

LUTHER'S UNDERSTANDING OF BIBLICAL HISTORY

It is perhaps not immediately clear why speculation about biblical history is pertinent to political theory; yet Protestant thought—theological and philosophi-

cal—has been preoccupied with it right from the beginning. Roughly, analogy is to Aquinas and the Roman Church what the dialectic of history is to Luther and Protestant theology, namely, a way to comprehend the relationship between the orders of reality. The dialectic Luther adduces—the theory of history that comprehends the meaning of Christ's *preservation and annulment* of the Old Law (Matt. 5:17)—is one that political theorists have sadly neglected. Yet *the* Reformation question was about the meaning of Christ's preservation and annulment. Were political theorists to recognize this, the extensive passages in, for example, Hobbes and Locke about the Old and New Testaments could be understood in their proper context, rather than dismissed as archaic or veiled discourse. Hobbes and Locke, like Hegel later on (1948), write of biblical history and the meaning of Christ's fulfillment of the Law not because it is a polite convention that must be observed but because massive political implications follow from the answer one provides (for a fuller discussion, see Mitchell 1991).

Luther's view of this dialectic is complicated; yet it is essential to understand its features if we are to establish the context within which he situates his politics.

For Luther, there are three moments of history, each of which has its corresponding "light" or truth: the Old Testament epoch, before Christ; the New Testament epoch, after the Incarnation; and the moment of the final revelation. The first light is the light of *nature*. By this light the meaning of suffering and injustice in the carnal realm, in the world, remains incomprehensible. Within the moment of history in which this first light shines, suffering and injustice are unsuccessfully treated as matters of offense against God. Here are the Jews.

Right conduct, works, and obedience to the Law, however, fail to recompense. It is by the light of *grace*—the promise of the New Testament—that suffering and injustice become comprehensible for the first time. What is more clearly revealed by this light is that God deplores not the death *of* his people but the death *in* his people (Luther 1961e, 391). The debt of suffering and injustice incurred cannot be discharged unless linked to a inward spiritual journey. By enduring hardships and not opposing the inscrutable will of God, the meaning of suffering and injustice is illuminated.

The light of the Old Testament is supplanted by one that illuminates the mystery of God more fully but not yet completely. Hence the need for a third light, more illuminating still than the lights of nature and grace. At the end of history, by the light of *glory*, the mystery of the God who has only partially revealed himself by his Word is illuminated (Luther 1961b, 202–3). The Word, long silenced by the cessation of prophecy and apostolic writing, gives way to the revelation of God that the Word had only partially, though increasingly, disclosed.

Because of the dialectical character of biblical history, each successive light or moment of history cannot be comprehended by the former. Importantly, however, the successive lights are *portended* by the former. The danger, according to Luther, is that Christians will attempt to comprehend the *new* spiritual truth in terms of the Law, the truth of this (post-Incarnation) moment of history in terms of what came before it. The passages on putting new wine in old bottles (Matt. 9:17; Mark 2:22, John 3:6), as well as Hegel's later injunction that "only spirit comprehends spirit" (1948, 255), reinforce the point Luther tries to make. Representationally, the temptation is for the Christian, like Adam, to hide from God (Gen. 3:7–9). And in this epoch, the "terrors of conscience" animate them, in effect, to hide themselves from their spiritual nature (which is disclosed through *passive* Christian righteousness) and to seek refuge in the *active* righteousness of works (Luther 1961d, 79), the pre-Incarnation way to atone for sin:

> Man's weakness and misery is so great, that in the terrors of conscience and the danger of death, we behold nothing else but our works, our worthiness and the law. . . . Thus man's reason cannot restrain itself from the sight and beholding of this active reason or working righteousness . . . nor lift up her eyes to the beholding of passive or Christian righteousness. (1961c, 101)

This picture is complicated, however, by the fact that while Christians attain a foothold in the spiritual realm through Christ in this epoch, they do not become *as God*. Christians retain a "remnant of sin" because they still possess a carnal body. The finite human being remains finite despite the righteousness attained through Christ. In Paul's words, "I see another law in my members, warring against the law of my mind, and bringing me into captivity to the law of sin which is in my members" (Rom. 7:23). The second, penultimate spiritual moment, consequently, remains shrouded in mystery and sin despite the depth of soul attained by the Christian. Christ and the truth of the New Testament deepen the Christian,[2] but fundamental mystery still abounds. The guide, in the midst of this mystery, can only be the Word, the meaning of which will be fully disclosed only at the time of the final Revelation.

TEMPORAL AUTHORITY AND THE ENCHANTMENT OF POLITICS

The political implication of the denial that new wine can be put in old bottles, that post-Incarnation spirit can be comprehended by pre-Incarnation Law, is that temporal authority should not to be allowed to judge the "secret, hidden, spiritual matter" of faith (Luther 1961e, 385). The physical power that is the medium of temporal authority cannot in principle, and ought not in practice, be used to confront the believer. The physical power of earthly kings is of a different order from the spiritual power Christians "possess" through Christ. Heresy, consequently, can never be prevented by force (p. 389). Worldly government extends to life and property, but over the soul it holds

no sway; belief and unbelief are matters of conscience, not power (p. 385).[3]

That Luther (and Locke) should implore that the two realms be separated already implies that they have been confused, mixed together in a way that denies precisely what Christ announced: a separation of the carnal and spiritual realms.[4] The carnal and the spiritual realms have been so confused by humankind, Luther says, that bishops rule over cities while lords rule over the human souls (ibid., 389). The religious task is to separate the two realms so that salvation may be achieved—from which it must be concluded that the justification for separating the political and theological realms is theological, *not* political.[5]

Care must be exercised here, however; for while the post-Incarnation spiritual domain of God the Son is "new wine," the "old bottle" of politics that cannot hold it is despiritualized but not desanctified (as political vacuum theories would have it). In Luther's terms, while the government that rules over Christian souls is an invisible government where "all are alike subject to each other" (1961e, 391), nevertheless, because the great majority of human beings will never be Christian, the invisible government that ministers to the piety of Christian souls must be supplemented by a visible government that produces peace. And this visible government is justified not on "purely" political grounds but, rather, on the basis of God the Father's pre-Incarnation covenant with the children of Israel. There is a need for the *temporal* sword for the children of the world, but this is decidedly not a *secular* sword. Hobbes, of course, would later make much of the Mosaic covenant with God the Father in the *Leviathan*, Parts 2 and 4, as well as in portions of *De Cive*, in order to make precisely this point: the real foundation of government is established in the paradigmatic act of the Mosaic covenant linking the citizens to God the Father through an awful Moses/Leviathan.

Returning to Luther, in biblical terms, Moses' Law was given to the children of this world that there might be order; and this sword is not abolished by Christ. Moses' Law still applies to the unrighteous. The fulfillment of the Law by the Gospel purported to be offered by Matthew's Christ (5:17) pertains to Christians only. The sword, therefore, is necessary for the unrighteous and justified by "divine ordinance" (1961e, 411). Indeed, the wrath of the Father, acting through the temporal prince, is necessary to constrain the Nietzschean beast within. "If anyone attempted to rule the world by the Gospel and abolish all temporal law and sword, . . . he would be loosing the ropes and chains of the wild savage beast and letting them bite and mangle everyone" (p. 370).

Were we to stop here it could be said already that Luther did not wish a wholly disenchanted politics in order to attend more fully to the spiritual realm. The Law is superseded for Luther, but he does not completely sever the link between "spirit" and worldly government. Rather, worldly government is given a meaning other than that adduced by the Roman Church. It is comprehended as a moment within the purview of God the Father—a moment that is part of the higher unity of the Trinity yet different from God the Son, who occasions the separation of the spiritual and carnal realms. Worldly government is for the unrighteous. Following Augustine, only true Christians are citizens of the Heavenly City. The post-Incarnation truth is for the few; but because the few must live with the rest, the pre-Incarnation justification of the right to rule granted by God the Father still stands. All this, I should add, reinforces what I suggested earlier—that speculation about the meaning of Christ's fulfillment of the Old Law is political theory disguised in a form that modern commentators often fail to recognize.

I have pointed out why the carnal, earthly realm cannot rule over the spiritual realm: it cannot comprehend it (new wine cannot flow into old bottles). Against the Roman Church, however, Luther argues that the obverse is equally untenable: where the spiritual has dominion over and in the carnal realm, the result is calamitous. This approach, too, would destroy the distinction between the two realms. When this happens, "the door is opened for every kind of knavery" in its name (1961e, 371–72).

> I maintain, that since the temporal authorities are ordained by God to punish evil-doers and to protect the law abiding, so we ought to leave them free to do their work, without let or hindrance everywhere in Christian countries, and without partiality, whether for pope, bishops, pastors, monks, nuns or anyone else. (1961a, 410)

The work of temporal authorities is one thing; that of the spiritual kingdom, another. By leaving temporal authorities free to take care of their affairs (again, this is justified on the basis of the right to rule established in the Old Testament), obstacles to salvation are removed. By insisting that the Church have no say in temporal matters, the work of this world is left to those most able *and authorized* to perform it. Separate the two realms and both operate without doing violence to the other. The possession and use of power in the realm of politics is justified by the Old Testament, and the spiritual power that fulfills the Old is established by the New. God the Father comprehends power, and God the Son comprehends spirit.

On the basis of this argument for separating the two realms, it should be evident that living under the jurisdiction of God the Father is clearly different from living under God the Son. Living under the Father, however, is decidedly not the same as living in a disenchanted world. What political theorists have failed to grasp is that the distinction between enchantment and disenchantment does not map onto Luther's distinction between carnal and spiritual, between God the Father and God the Son. The carnal realm is not spiritual, to be sure (though it portends it); but the former is nevertheless comprehended by a moment of the triune God.

This point is helpful, if not crucial; but it does not

take us as far as we need to go. Worldly government, we have seen, finds its authorization in God the Father. Here is a justification for rule over the unrighteous. But what of the righteous, of Christians? What are their bonds of union? These are questions that can be best answered, I think, by looking first at the Christian prince (the person who is both Christian *and* prince, the person who acts *in* the carnal realm but is not *of* it) and then considering the bonds of union between the righteous (Christians), who are not compelled to occupy the limit position that the Christian prince must.

THE CHRISTIAN PRINCE

The prince, as I have mentioned, receives authorization for the use of his power from the Old Testament. This does not mean, however, that all things are permissible, as some German princes erroneously inferred from Luther's stark separation between spiritual and carnal realms (1961e, 365–66). Precisely where the limitations of their power lie will not concern me here. Of greater theoretical significance is Luther's discussion of the *Christian* prince; for in this figure must be found both (political) power and (spiritual) power, which latter at first appears to require an utter rejection of worldly power. The theoretical difficulty is how to be both Christian and prince, how to live in accordance with both the pre- and post-Incarnation dispensations.

When Luther appeals to Christian princes to liberate the German Christians who "are oppressed by distress and affliction" (1961a, 404) he is asking them to exercise power in accord with a spiritual realm uncovered only in the abyss of *powerlessness* and denial of the world. In the Christian prince—that locus of the extraordinary conflation of the two realms—was to be found a release from the yoke German Christendom had borne.

First and foremost, because physical power (of the sort possessed by earthly kings) can only be used to oppose, to stand against, great evil will result if this form of power alone is relied upon. The prince cannot *simply* oppose; such opposition is the way of the world, not the spirit. We must not use our own power to oppose the Church, wrote Luther; for "the greater the power we employ, the greater disaster we suffer, unless we act humbly and in fear of God" (1961a, 406). Humility and fear are, of course, the functional equivalents of the pity Rousseau speaks of in *Emile* (1978, 220–30): they arrest pride before the person whom pride dominates gets lost in the temptations of the world. But power must be exercised, nevertheless; for physical power is needed to oppose the equally physical power exercised by the Roman Church over the German states.

This may seem like a trivial matter to the modern ear, but it was not trivial to Luther; for the prince who relied only on the physical power at *his own* disposal was bound to lose sight of the Source of all power and so suffer hubris, thus foreclosing an encounter with the abyss of Christ, which alone could make him a Christian prince. Weber's definition of political power as "the monopoly of the legitimate use of physical force within a given territory" (1946, 78) may seem axiomatic to us today; but the idea would have seemed ludicrous to Luther. (We tend not even to see it as a theoretical difficulty.) Luther would say that the Weberian view could only countenance hubris and that it is un-Christian—to which Weber would emphatically answer "Yes."

The intractability is resolved by enjoining princes to rely on the power of God, not their own power, to oppose the oppressors: "We must not begin by assuming we possess much strength or wisdom, even if we had all the authority in the world. For God cannot and will not suffer a goodly enterprise to be begun if we trust in our own strength and wisdom. God will surely abase such pride" (Luther 1961a, 405). The power that is to be used *in* the world must come from beyond it;[6] only when the power used to oppose the Roman Church comes from God, in other words, *can* German Christendom be released. The foreign threat can be averted only with God's assistance. A higher power must be the source of worldly power if worldly power is to have a beneficent effect at all. Only with assistance from God can a true defense be made against "the ravening wolves who come dressed in sheep's clothing" (p. 422).

In domestic affairs, too, both power itself and (more importantly) the pattern of its use must come from God, rather than from the prince's person. The Christian prince must act in a manner befitting both an earthly king and a Christian subject. The prince must exercise power, it is true; but the use to which such power is put is informed by the prince's experience as a Christian. He is not powerless toward his subjects, but his servitude before Christ establishes the true nature of his relationship with his own subjects. Christology offers a pattern for polity.[7] The Word, at any rate, offers guidance. Because God once spoke as an ass, for example, the prince must respect people of even the lowest station; but because God's highest angel fell, the prince must trust no one (Luther 1961e, 395). Christian subjects, Luther enjoins, are both Christian and subjects. In their latter capacity they occasionally conspire to acquire the power of earthly kings. Respect and distrust go hand in hand. Here we see the political wariness of Federalist 10 (1961, 77–84) still wearing overtly theological garb. Both are dubious about the beneficence of human motivation—and yet both would carve out a domain in which the self was sacrosanct.

Guidance for political life, I have said, comes from the Word. This does not mean, however, that the actual laws instituted by the Christian princes must be taken verbatim from the Bible. Tocqueville reminds us, after all, that the Gospel enjoins only general principles (1966, 445). The right of making law is justified by the Word of God, but the content of such laws is not to be found in Scripture itself.

Just as new wine cannot be put in old bottles, so, too, the spiritual lesson of Christ that must serve as a

guide to the Christian prince cannot be reduced to the letter, to lawful commands. This was Hegel's point in "The Spirit of Christianity and Its Fate" (1948, 209); and it is a crucial insight for the reformers. Reformation political theology could not simply construct a politics drawn from Scripture alone. Strauss completely misunderstood this when he said that had Locke wished to develop a political theory based on the Bible, he would have written a *Politique tirée des propres paroles de l'Écriture Sainte* (like Bossuet) rather than the *Two Treatises* (1974, 205). Locke and the other reformers could not lift chapter and verse from Scripture and make them political laws; for that would have violated the very principle that the Reformers insisted upon, namely, that the spirit and the Law are different yet dialectically related. The laws of the Christian prince, therefore, divulge something of a living tension between the letter of the Law and the spirit that informs it—one that is resolvable only by relying upon God rather than self:

> We should keep written laws subject to reason, whence indeed they have welled as from the spring of justice, and not make the spring dependent on its rivulets, nor make reason captive to the letter.
>
> I know of no law to prescribe for a prince, but will simply instruct him what the attitude of his heart and mind ought to be . . . so that if he governs himself thereby, God will surely grant him the power to carry out all laws . . . in a proper and Godly way. (Luther 1961e, 394, 402).

The laws of the Christian prince, then, are not simply his own. They issue from his person but are guided by God; and in the post-Incarnation epoch such "guidance" should involve a recapitulation in the (domestic) political domain of the pattern established by Christ and all Christians: "Thus a prince should in his heart empty himself of his power and authority, and interest himself in the need of his subjects, dealing with it as though it were his own need. Thus Christ did unto us; and these are the proper works of Christian love" (ibid.).

BETWEEN THE RIGHTEOUS: BONDS OF UNION IN CHRIST

For Luther, Christians cannot have a genuine affiliation with others without the assistance of Christ. Only through a "marriage" between a single Christian and Christ where no others are involved does the basis for human community come to view. At one level, of course, this tentatively confirms what Rousseau would later insist—that the "other" for Christians is Christ, not other citizens—from which no genuine political affiliation could come. But this is not the whole of the matter. Indeed, Rousseau's error stems from not seeing how the pattern of the singular relationship, the marriage, turns back onto the world, so to speak, and offers a pattern for the right relationship between human beings.

In a word, the obligations that bind one human being to another derive from the relationship between the individual Christian and Christ. Through a marriage with Christ that excludes all others, the Christian is able to—and indeed must—include all others; the pattern established by the bridegroom (Christ) is reproduced in the bride's (the Christian's) relationship to all others:

> As our heavenly Father has in Christ freely come to our aid, we also ought freely to help our neighbor through our body and works, and each should become as it were a Christ to the other that we may be Christs to one another and Christ may be the same in all, that is, that we may be truly Christian. (Luther 1961d, 76)

The marriage with Christ, as it turns out, provides the basis for a twin orientation—toward the Divine and toward all others: "A Christian lives not in himself, but in Christ and his neighbor. . . . He lives in Christ through faith, in his neighbor through love. By faith he is caught up beyond himself unto God. By love he descends beneath himself unto his neighbor" (ibid., 80).

The relationship to the neighbor is not based on love alone, however. The righteous Christian has no need for the sword and would endure suffering from it if it came to that. With regard to self, the Christian must be powerless; but with regard to the neighbor, the Christian must punish the enemy who harms. There is no right of revolt (this would come later with Locke), but there is the right to protect: "[Although] you have no need [of the temporal sword and the law] and are not to have them, [you are] to serve those who have not progressed as far as you and still need them. Although you do not need to have your enemy punished, your weak neighbor does" (ibid., 374).

These examples should make clear that the coming to presence of the spiritual realm, the marriage with Christ with which Luther was so concerned, was to *bear fruit* in the (carnal) realm—the central motif of the Gospel of Matthew. It is to be the occasion for reproducing the pattern established by Christ in the relationship with the neighbor. The Christian "labors on earth not for himself but for his neighbor" (ibid., 373). Through Christ the Christian enters the spiritual realm, which occasions both freedom from, and supersession over, the carnal realm; the Christian attains a freedom from all *things*, that is, everything carnal. Here, the Christian reproduces the pattern established by Christ and, like Him, becomes a servant to all. Christians depart from the carnal world to return to it grounded in the spiritual realm that provides the wherewithal for their authentic return. Only "a pattern set up in the heavens" (Plato 1985, 284) makes possible genuine sociality.

CONCLUSION

Consider Rousseau's thoughts on Christian politics in *The Social Contract*:

> But I err in speaking of a Christian Republic; for each of these terms contradicts the other. Christianity preaches only servitude and submission. Its spirit is too favorable to tyranny for tyranny not to take advantage of it. True Christians are made to be slaves; they know it and they hardly care; this life has too little value in their eyes. (1984, 184)

While partially correct on the matter of servitude and submission, he clearly failed to understand that even the seeming otherworldliness of Protestant Christianity, insisting on a separation of the political and religious realm, could provide the bonds of union for a community. Rousseau recognized Protestantism's separation between the two realms but did not recognize the bearing of God the Son (in addition to that of God the Father) upon political life.

Straining Rousseau somewhat, in the idiom I have been using here, the problem he sought to redress was that God the Son had overpowered God the Father, that people had turned to the utterly internal realm of faith (the Son) to the detriment of political life (the Father). This is, of course, ironic; for Luther had argued that while God the Father authorized earthly kings to chastise the unrighteous, genuine community was possible only through God the Son.[8] The bonds of union that Rousseau thought so essential could only come, according to Luther, from the mediator of faith (the Son), who also occasions a City of God *next to* the City of Man. Were Luther to answer Rousseau he might have said that if Christians were only servile and unable to form a viable political community, it was because they understood the path (servitude), but not what it led to (being brothers in Christ). In effect, the problem would be that they were not Christian enough. As Christ was a stumbling block to the Jews (1 Cor. 1:22–23), so was He to Rousseau also.

My intention here, however, is not simply to contrast Luther and Rousseau. It is to suggest that the kind of error Rousseau makes—that of attributing to Protestantism a wholly otherworldly orientation—is the same kind of error made by adherents of one or another version of the political vacuum theory about which I spoke at the outset. Protestantism does not disenchant the political world; the world is the Father's, spirit is the Son's.[9] The republican spirit that Rousseau so hoped to see supplement the "pure and simple religion of the Gospel" (1984, 181) cannot be understood to have diffused into the evacuated political space left in the wake of Protestantism's separation of the political and religious realm. A wholly disenchanted republican politics does not emerge victorious as a result of Protestantism's attempt to return to an uncorrupted Christianity; that is, if the republican spirit came to predominate in certain regions, the mechanism by which it came to do so was not an evacuation of religious content from the political sphere accomplished by Protestant thought. The world remains enchanted in Protestant thought, for different reasons than it had been in Catholic thought, to be sure; but the prima facie case that Protestantism's indictment of the world is equivalent to its desantification does not hold up under scrutiny. For the unrighteous, the world remains under the sway of God the Father; for the righteous few, the world may perhaps for a time be modeled after the pattern established by God the Son.

Notes

1. A perusal of Augustine's *City of God* 5.12–19 (1961, 196–212) suggests that the contrasts Pocock makes are simply too stark. Augustine suggests that Rome itself was necessary in order for salvation through Christ to occur. The biblical passage here is Galatians 4:4 ("But when the fullness of time had come, God sent forth His Son"). Augustine argues—much as Tocqueville would later (1966, 446)—that there was something about Rome's activities in the world that made it possible for Christianity to take hold. *The fullness of time* suggests that at a certain moment the carnal world was able to accommodate spirit. And Augustine thought that the greatness of Rome was that it prepared the way in time for the advent of Christ. His interest was not wholly in turning allegiance away from the City of Man (Rome, literally and symbolically); for it was through Rome, through the carnal realm, that the spiritual realm came to presence. In a word, contra Pocock, the separation between redemption and history, salvation and society, soul and body, is not unequivocal. As Augustine well knew and noted in his *Confessions* (1961, 100), the road to God must pass through Rome (literally and symbolically).

2. Consider Nietzsche on this matter, especially in regard to my earlier comments about the second light of history (the light of grace of Christianity) disclosing the meaning of suffering. "The meaninglessness of suffering," Nietzsche says, "*not* suffering itself, was the curse that lay over man so far—*and the ascetic ideal* [Christianity] *offered man meaning*" (1967, 162). This ascetic ideal "brought fresh suffering with it, deeper, more inward, more poisonous, more life destructive suffering: it placed all suffering under the perspective of *guilt*" (ibid.). This agreement between Luther and Nietzsche about the deepening of humankind accomplished by Christianity may be their only common ground. Nietzsche's contempt for the Reformation, that epoch in which the notion of the equality of all finally triumphed, is all too apparent (ibid., 54).

3. Locke would later make a similar claim in his *Letter Concerning Toleration* (1955, 18). His argument there and in *The Reasonableness of Christianity* (1803) is based on a reading of Christ's fulfillment of the Old Law and in *this* respect covers no new theoretical ground. I have discussed this elsewhere (Mitchell, 1990).

4. Hobbes, of course, was at great pains to deny that there was a spiritual realm at all. Christianity, in a word, did not occasion a separation between two realms. Prior to Christ, as well as after his first coming, there is only the world—the carnal realm (1962, 340).

5. See Smith 1991 for the disturbing implications this has for the constitutional debate about religious freedom. On his view, religious freedom today, "at least as it has come to be understood, forbids governmental reliance upon religious justifications as a basis for public policies or decisions. Therein lies the paradox—our constitutional commitment to religious freedom undermines its own foundation; it cancels itself out by precluding government from recognizing and acting upon the principle justification supporting that commitment" (p. 200). Theologically, the world (politics) cannot stand without a deeper (nonpolitical) foundation.

6. Compare this to Augustine's "When You are our strength we are strong, but when our strength is our own we are weak" (1961, 89).

7. The Leviathan about which Hobbes speaks can be seen as a recapitulation of this pattern. The Leviathan, king of the children of pride, like Christ, takes in upon himself the pride of the children. What Hobbes wanted above all was to quell

human pride; he thought a Leviathan who, like Christ, was a mortal–God (1962, 132), was the only figure capable of doing so. Hobbes's genius and Achilles heel was to have transposed a religious symbol into a temporal one. Instead of a religious mode of atonement for the problem of pride, he offers one that is temporal.

8. Locke would later argue the same point. Prior to Christ and Christian virtue, he asserts, the Law "reached no farther than those things, that would serve to tie men together in subjection" (1803, 225).

9. Most importantly, because the Word was *made flesh* in the Son (John 1:14), those who confess the way of Christ are offered a way—indeed the only genuine way—to form a community. From Augustine to Luther to Bonhoeffer (1955) in the twentieth century, this does not change.

THE THEODICY OF THE *SECOND DISCOURSE*: THE "PURE STATE OF NATURE" AND ROUSSEAU'S POLITICAL THOUGHT

JOHN T. SCOTT *Loyola University of Chicago*

Since Rousseau, and perhaps because of him, political theory has often been characterized by a disjunction between considerations of human nature and questions of justice and law. Yet, reexamining the Second Discourse *as a theodicy forces us to rethink how the essential questions of political theory are related just where they seem to become separated. The core of the theodicy is Rousseau's view that we are, by nature, physical beings embedded unproblematically in nature—good, or ordered, beings in a good, or ordered, whole. Although Rousseau presents his explicitly political thought as a juridical doctrine seemingly separated from his understanding of human nature and history, his political thought is founded upon his portrait of man's existence in the "pure state of nature." This portrait serves as a positive formal model to enable us to remake our corrupted existence through the legitimate state—itself modeled by Rousseau on the divine or natural whole.*

As citizens and students of the liberal regimes of modern times, we are heirs to a problematic political project and political science. Modernity, especially as it comes out of the Enlightenment, might be characterized as an undertaking both dedicated to the establishment of liberty and founded upon a reductionist study of humans and their political life. The problematic character of modernity and liberalism is thrust to our attention today as those who have thrown off their shackles look to our political experience and political science for guidance at the same time that they question its substance and sufficiency. Now is the time not for self-satisfaction but self-knowledge.

Jean-Jacques Rousseau faced the dilemmas of modern politics and political science with a clarity seldom rivaled. He was the first important critic of modernity and liberalism within the modern and liberal fold itself. Rousseau is at the font of the peculiar self-questioning character of modernity and perhaps its most profound and influential critic. His acute queries and his troubled gaze have influenced critics of modernity on both left and right, and his questions continue to be our own. In order to begin better to understand our predicament and ourselves, therefore, a serious consideration of the political thought of Rousseau is warranted. I want to begin such a consideration here through an inquiry into the relationship between Rousseau's understanding of human nature and his political theory.

The relationship between Rousseau's discussion of human nature and history in his *Discourse on Inequality*, or *Second Discourse*, and his explicitly political thought as presented especially in his *Social Contract* is a vexed issue in the scholarship of his thought. Why does he write the *Social Contract* as if he had never written the *Second Discourse*? More specifically, why does what he describes as the core of his thought as a whole—the natural goodness of man, and the personal dependence which is the primary cause of our degeneration from good to evil beings—seem to be virtually absent from the most comprehensive presentation of his political thought? This issue can be rephrased to bear on the development of political theory after Rousseau and to address our need to understand how we have arrived where we are today.

Readers of Western political thought since the time of Hobbes have become accustomed to the concept of the *state of nature*. Hobbes portrays the state of nature to make us squarely face ourselves, giving us a correct understanding of our nature and its bearing for the proper erection of the state. Similarly, Locke made the state of nature central to his theory, in particular using it to show the origin of property in appropriation and the need to secure it and ourselves through the formation of a political society. In other words, Hobbes, Locke, and their successors used the state of nature at the same time as a juridical concept and a hermeneutic to explore human nature, two issues that are inextricably related in their thought. Rousseau, however, offers not one state of nature but two. In the part 1 of the *Second Discourse* he describes our original or natural condition through a portrait of savage man's basically solitary existence in the *pure state of nature*. In the part 2 he discusses the *state of nature* simply—the prepolitical condition eventually ended by the social contract. The state of nature in the second sense, shorn of almost everything except its status as a legal concept, is what Rousseau brings to the *Social Contract*, thus splitting his inquiry into human nature from his political theory. The relevance of the pure state of nature and our natural goodness is unclear in Rousseau's thought—a question raised by Voltaire when he quipped that Rousseau's work made him want to walk on all fours, though he regretted that his ill health prevented him from doing so (cited in Rousseau 1959–69, vol. 3, p. 1379).

The bifurcation of questions about human nature and concepts of justice and law apparent in Rousseau's work has infected political thought to this day. This split has been exacerbated by Rousseau's introduction into political thought of the notion of humanity as a historical phenomenon. He summarizes the lesson he would have the reader of the *Second Discourse* take from the "immense space" between the two states of nature he offers: "the human race of one age" is not "the human race of another" (1964, 178). We are historical beings. His pronouncement has radically affected the place of the social contract in political thought in particular and the character of political thought in general. The concept of the state of nature was sublated into the dialectic of history and the history of philosophy or dismissed as a wrong-headed hermeneutic, a quaint or even reactionary chimera, as when Marx wrote: "Let us not go back to a fictitious primordial condition. . . . We proceed from an economic fact *of the present*" (1964, 107). Even with the waning of the historical schools, we are left with an almost universal explicit or implicit acceptance of historicism, a heritage traceable to Rousseau. Where it survives as a concept in political thought, the state of nature remains a mere hypothetical legal starting point, independent of any elaboration of the truth about human nature (e.g., Rawls 1971). In sum, contemporary political theory is generally characterized by a reluctance to inquire into human nature and an emphasis on questions of justice, fairness, procedure, and the like detached from any explicit theory of our nature.

If questions about human nature and such concepts of political theory as justice and law are discussed separately today, the appearance of their separation in the political theory of Rousseau is deceptive. Rousseau's political thought and his constructive philosophy in general are founded upon his understanding of our original nature as seen in his portrait of natural man's existence in the pure state of nature. By examining how Rousseau's legalistic political theory is related to his understanding of human nature, I hope to throw light on how these questions of politics are inseparable from those of human nature at the point in the history of political thought where they seem to become separated. Whatever the validity of Rousseau's own understanding of human nature, he forces us to rethink how the essential questions of political theory are related.

I will argue that the bearing of Rousseau's pure state of nature for his political thought can be seen by examining how he conceives his demonstration that we are naturally "good" to be a justification of nature, or (as he explained his work to Voltaire) a justification of God and his providence (1959–69, vol. 4, p. 1061)—in short, how the *Second Discourse* is intended to be a theodicy. The core of Rousseau's theodicy is his conception that we are by nature physical beings embedded unproblematically in the physical whole of nature. By nature, we are good, or ordered, beings in a good, or ordered, whole. Rousseau's portrait of our original position as good beings in a good natural whole serves (especially in contrast to Hobbes and Locke) as a positive formal model to enable us to remake our corrupted existence through the legitimate state, itself modeled by Rousseau on the divine or natural whole.

ROUSSEAU'S METHOD IN THE *SECOND DISCOURSE*

The announced subject of the *Second Discourse* is the origin and foundations of inequality among men. At the outset of the work Rousseau asks, "How can the source of inequality among men be known unless one begins by knowing men themselves? And how will man manage to see himself as nature formed him, through all the changes that the sequence of time and things must have produced in his original constitution, and to separate what he gets from his own stock from what circumstances and his progress have added to or changed in his primitive state?" (1964, 91). In order to see man as nature formed him, therefore, Rousseau must strip away the changes produced by our "progress." The *Second Discourse* takes the form of a history of mankind from our original condition to our present state.

Rousseau claims that his account in the *Second Discourse* is "conjectural" or "hypothetical." The character of his hypotheses about our original condition and subsequent development is a difficult and contentious subject. Rousseau's intentions regarding the historical status of his account are not, however, relevant for the present discussion because of how his historical and psychological investigations in the work are related. For example, after revealing that the "human race of one age" is not "the human race of another," he explains how the attentive reader will come to this conclusion: "He will explain how the soul and human passions, altering imperceptibly, change their nature so to speak; why our needs and our pleasures change their objects in the long run; why, original man vanishing by degrees, society no longer offers to the eyes of the wise man anything except an assemblage of artificial men and factitious passions which are the work of all these new relations and have no true foundation in nature" (1964, 178). The *Second Discourse* is not essentially or only a historical account, but is most importantly a psychological inquiry into human nature as it may be found universally through proper investigation.[1]

History, for Rousseau, is the successive conditions that decisively shape what the individual comes to be with his fellows. We are historical beings in the sense that the extent and direction of the development of the individual are determined by the extent and character of his relations with his fellows, (i.e., the particular condition into which he is born), especially how those relations and conditions determine the character and extent of his needs, passions, and reason. Rousseau uses a revealing image to elucidate the manner of his search at the outset of the *Second*

Discourse: "Like the statue of Glaucus, which time, sea, and storms had so disfigured that it looked less like a god than a wild beast, the human soul, altered in the bosom of society . . . has, so to speak, changed its appearance to the point of being nearly unrecognizable" (1964, 91). We change "in the bosom of society"; society dramatically (and perhaps irreversibly for the individual) changes what "man" appears to be. We must remove the "encrustations" of society in order to see our true form. Rousseau's description of our original nature and condition and the conditions of our subsequent development is an account not only of what we were and have become but of what we still are. In other words, every child begins life at the point as natural man and would develop into that being apart from the conditions that will actually cause him to develop differently. This is the premise of Rousseau's *Emile*. "Emile is not a savage to be relegated to the desert," Rousseau writes: "He is a savage made to inhabit cities" (1979a, 205). The genetic account of the *Emile* and the historical account of the *Second Discourse* are compatible and complementary (see Starobinski 1964, lv; idem 1988, 12–21).

Rousseau's explanation of how we are historical beings is related to his criticism of his predecessors and indicates the method he uses in his work. He claims that "the philosophers who have examined the foundations of society have all felt the necessity of going back to the state of nature, but none of them has reached it." They have not "found" the state of nature because they have not hypothesized that human nature is actually radically different from what it appears to be: "All of them, finally, speaking of need, avarice, oppressions, desires, and pride, have carried over to the state of nature ideas they had acquired in society: they spoke about savage man and they described civil man" (p. 102). Rousseau claims to be the first to have correctly seen human nature. Speaking of himself in the *Dialogues*, he writes:

> The prejudices that did not subjugate him, the factitious passions to which he was not prey did not hide from his eyes as they did from others those original traits so generally forgotten or misjudged. These traits so novel for us and so true once they are traced could still find, deep in people's hearts, the attestation of their correctness, but they would never have sought them out themselves if the historian of nature had not started by removing the rust that hid them. (1990a, 213–4)

Those who have failed to see themselves, then, have failed to remove the "rust" that has obscured their true nature. They have taken appearance for reality: "They all seek their happiness in appearances, none is concerned about reality. They all place their being in appearance" (*ibid.*).

Rousseau maintains that previous thinkers failed to recognize that "the human race of one age" is not "the human race of another," that "the soul and human passions, altering imperceptibly, change their nature so to speak." By looking at men as we see them around us, we only see individuals that are the product of certain conditions found at a certain time. This is the error made by Hobbes, who claimed that "whosoever looketh into himself . . . he shall thereby read and know, what are the thoughts, and Passions of all other men," so that his state of nature is an "Inference, made from the passions" (*Leviathan*, intro., chap. 13). Despite an apparently similarity of method, however, Rousseau and Hobbes come to drastically different conclusions. In an unpublished writing, the so-called *État de guerre*, he groups his predecessors together, the natural law theorists along with the philosophers of the state of nature, and explains that they all make the same methodological error in their use of the "analytic method." The "error of Hobbes and the philosophers" is to have confounded "natural man with the men that they have before their eyes, and of transporting into one system a being that can subsist only in another" (1959–69, vol. 3, p. 611–12). As Rousseau warned a critic of the *Second Discourse*, "Men differ so much according to times and places that . . . inferences from the particular to the universal are liable to lead to quite contradictory and inconclusive conclusions" (p. 235).

Through his own portrait of savage man's solitary existence in the pure state of nature, then, Rousseau recounts the conditions that will reveal our fundamental nature. His own inquiry into the various causes that shape human nature leads him even so far as to wonder whether any of the faculties taken by his predecessors to be distinctively human are in fact constitutive of mankind.

PHYSICAL MAN AND MORAL MAN

Rousseau claims in the *Second Discourse* that "the philosophers who have examined the foundations of society have all felt the necessity of going back to the state of nature." However, it is not true that "all" the philosophers have felt the need to investigate the state of nature in this way, or even at all. The scholastics and later natural law theorists and jurists, for example, considered the state of nature and even pure state of nature, but not as a necessity in explaining the foundations of society. Only with Hobbes and Locke, most prominently, could such a method be said to have become obligatory for understanding human nature and politics. Rousseau therefore indicates that his true antecedents are Hobbes and Locke, while at the same time, by referring to both the state of nature and pure state of nature, he evokes his more traditional predecessors. Rousseau's transformation of the the terms of the natural law theorists points to how he will challenge the understanding of nature and human nature implicit in perhaps all previous views of human nature.

Aquinas and Suarez—later, Hooker, Grotius, and Pufendorf, among others—all considered the state of nature in one way or another. They conceived of that state as the human condition prior to the Fall (the state of innocence, as opposed to the state of sin and to the state of grace or redemption). They also sometimes entertained, in addition, a wholly speculative

and hypothetical pure state of nature, or the state of nature without or prior to divine dispensation. Neither this strictly conjectural pure state of nature nor the lost state of nature as conceived by these thinkers could provide much practical guidance for political society, precisely because these conditions were viewed as either hypothetical (i.e., conflicting with the scriptural account) or irretrievably lost because of man's Fall. The principal role of the hypotheses about these two conditions in these theories, then, was to elucidate the character of the universally available and applicable natural law.[2]

Rousseau indicates his awareness of the background of the concept of the state of nature when he writes, "It did not even enter the minds of most of our philosophers to doubt that the state of nature had existed, even though it is evident from reading the Holy Scripture that the first man . . . was not himself in that state; and that giving the writings of Moses the credence that any Christian philosopher owes them, it must be denied that even before the flood men were ever in the pure state of nature." His complaint, however, is not that the philosophers of the state of nature have proceeded in supposed ignorance of or opposition to Scripture, but that they have not pursued their inquiries far enough in that direction: "They spoke about savage man and they described civil man" (1964, 102–3).

Unlike those who first discussed the state of nature and pure state of nature, Rousseau's pure state of nature is not the condition without or prior to divine dispensation but without or prior to any truly social or moral relations among humans. The pure state of nature in the *Second Discourse* is the condition where humans exist as purely physical beings, that is, possessed solely of the instincts, passions, and faculties with which they are endowed by (physical) nature. Humans originally or naturally lack moral needs or passions, that is, needs or passions with particular, conscious regard for their fellow humans. Such needs and passions, Rousseau argues, only develop when individuals begin to have constant relations with their fellow humans. Rousseau defines a moral being as "intelligent, free, and considered in its relations with other beings" (1964, 94). The natural man whom he describes in the pure state of nature is manifestly not a moral being according to his definition: while he may be said to be "free" in the sense that he enjoys "natural freedom" (p. 127)—or what Rousseau equates with "an unlimited right to everything that tempts him and that he can get" (*Social Contract* 1.8), he is not "intelligent" nor does he have "relations with other beings" or the passions associated with such relations.

The distinction between the physical and the moral in general is intimated by Rousseau at the outset of the *Second Discourse* in a way that presages the structure of the work as a whole: "I conceive of two sorts of inequality in the human species: one, which I call natural, or physical, because it is established by nature and consists in the difference of ages, health, bodily strength, and qualities of mind or soul; the other, which may be called moral or political inequality, because it depends upon a sort of convention and is established, or at least authorized, by the consent of men" (1964, 101). The natural, or physical, being of man consists of attributes "established by nature" in the individual, including both bodily and psychological attributes. In part 1 Rousseau speaks of man in the pure state of nature as a physical being with solely the endowments of physical nature. The moral, in turn, seems to be divided into two sorts: that which is moral in the sense "established" by "a sort of convention" as men begin to associate together and another, more "political" form that is moral in the sense of being "authorized, by the consent of man." In part 2 Rousseau shows individuals coming together and becoming moral beings in the first sense, eventually to become political beings through the convention of the social contract (hence moral in the second sense; see *Social Contract* 1.8). The distinction Rousseau draws between physical or natural inequality and moral inequality is therefore founded on his understanding of the way our passions and faculties change character as we develop from physical to moral beings: "The same study of original man, of his true needs, and of the principles underlying his duties, is also the only good means one could use to remove those crowd of difficulties which present themselves concerning the origin of moral inequality" (1964, 96). The apparent historical structure of the *Second Discourse* with its progress from the pure state of nature to the state of nature to the civil state parallels and obscures a more fundamental argument about human nature and the (historical) conditions that shape it. The dichotomy between the physical and the moral runs throughout Rousseau's writings and is, I believe, the most fundamental argument about human nature in the *Second Discourse*.

While today we may not be so sensitive to the radical character of Rousseau's argument that we are by our original nature merely physical beings, the novelty and importance of Rousseau's argument about human nature was not lost on his contemporaries, as is made especially clear by one of the more orthodox readers of the *Second Discourse*, the Abbé Castel. Castel, an acquaintance of Rousseau's, was best known for his translations of Newton, his own work on optics, and his "ocular clavicord," which Rousseau ridicules in his *Essay on the Origin of Languages*. A year after the appearance of Rousseau's *Second Discourse*, Castel published a reply to the work, *L'homme moral opposé à l'homme physique de M. Rousseau*.[3]

As the title of Castel's work indicates, he takes particular exception to Rousseau's distinction between our physical and moral being and virtual glorification of the physical. He accuses Rousseau of seeing only the animal in man and not the image of God. He asks Rousseau at the outset, "Do you thus regard man as a wholly physical being?" and later calls him "the apologist of bestialness" (1782, 129, 182). "Nothing proves better that you harm religion,"

he admonishes Rousseau, "than that you take as positive the state of your solitary and animal savage as being the state of primitive innocence, as being the state itself of felicity itself and a terrestrial paradise" (pp. 144–45, 263–65). He contrasts Rousseau's solitary being in the pure state of nature with the social and familial being of Scripture and the natural law theorists ("It is not good for man to be alone," Genesis 2:18). He especially objects to the "brutality" of Rousseau's discussion of human sexuality and claims that the distinction Rousseau draws between physical and moral love clearly shows how he has misunderstood human nature (pp. 136, 159–89, 316–24). Finally, Castel perceptively observes that Rousseau's portrayal of man as a physical being that is somehow good is connected to his statement in the *Second Discourse* about "the little care taken by nature to bring men together." Far from "justifying" nature, as Rousseau claims to do through his work, Castel claims that his misdirected thesis about our physical nature as solitary and somehow good beings "calumniates nature itself, and God too" (p. 167).

From Rousseau's perspective, all of his predecessors have overestimated the needs, passions, and rational capacity natural to us. More importantly, they have assumed that we are naturally social or moral beings in one way or another—that we have social and moral passions and faculties. In other words, his predecessors have all assumed humans to be moral beings in the qualified sense he employs. Rousseau offers a radical reinterpretation of human nature through his portrait of natural man as a physical phenomenon in the pure state of nature. He presents a new understanding of our place in the natural whole that will, he claims, prove that we are naturally good, that our ills come from ourselves, and that nature is thereby justified.

NATURAL MAN AS PHYSICAL PHENOMENON IN THE PURE STATE OF NATURE

The Character of the Natural Whole

Rousseau begins his account of the pure state of nature with a description of natural man. Stripping him of "all the supernatural gifts he could have received and of all the artificial faculties he could only have acquired by long progress—considering him, in a word, as he must have come from the hands of nature," he finds "an animal": "I see him satisfying his hunger under an oak, quenching his thirst at the first stream, finding his bed at the foot of the same tree that furnished his meal; and therewith his needs are satisfied" (1964, 105). From the very outset of his portrayal of our natural condition, Rousseau shows us to exist peacefully and unproblematically in the abode of nature.

Rousseau's first portrait of our natural condition reveals a hospitable nature in which our needs are readily satisfied: "The earth, abandoned to its natural fertility and covered by immense forests never mutilated by the axe, offers at every step storehouses and shelters to animals of all species" (1964, 105). Nature and human intervention or art are here opposed: nature provides sufficient food and shelter for man and the other animals, while the axe "mutilates." Rousseau adds a note to his description of nature's plenty suggesting that it is Locke, in particular, whom he is opposing: "the fruits of trees furnish animals with more abundant food than other forms of vegetation can: an experiment I made myself, in comparing the products of two fields equal in size and quality, the one covered with chestnut trees and the other sown with wheat" (p. 187). This experiment appears to be derived from a comparison suggested by Locke to prove precisely the opposite point about natural fertility versus human cultivation. In England, Locke says, an acre of cultivated land "that bears here Twenty Bushels of Wheat" so that "the Benefit Mankind receives . . . in a Year, is worth £5" can be compared to the produce of the same acreage of comparable uncultivated land in America, the produce of which he says would be "possibly not worth a Penny; at least, I may truly say, not 1/1000 the value of the cultivated land" (*Second Treatise* 5. par. 43). Whereas Rousseau suggests nature's plenty and the destructive character of man's artful intervention, Locke implies a parsimonious nature that must be cultivated by us if it is be of any use. The full significance of Locke's argument about our place in nature and relation to nature's God—and thus of Rousseau's response to it—can be gleaned from a closer examination of Locke's theory of property as presented in the *Second Treatise*.

Locke initially speaks of the "Plenty God had given" us and his example of that plenty is the "Acorns he pickt up under an Oak." Acorns are Locke's first and archetypical example of natural appropriation of property by labor, in this case the eating of what is originally common, thereby making it intimately private.[4] Locke's state of nature seems at first to be one of provident plenty, but this impression is soon undermined. Acorns become Locke's primary example not only of man's natural right to appropriate the goods of nature through labor but of his absolute need to do so: they are representative of the scanty provision of nature. The initial appropriation of acorns as food is only the first sort of necessary labor. We must earn our bread by the sweat of our brows not because of any divine punishment but because of the character of the divine or natural whole. Locke uses the example of America given in his comparison of cultivated and uncultivated land: although nature has furnished the Americans "as liberally as any other people, with the materials of Plenty," because they have not cultivated the land, "a King of a large and fruitful Territory there feeds, lodges, and is clad worse than a day Labourer in *England*." He also recurs to the example of acorns as the "Plenty" given to these Americans by nature: "Acorns, Water, and Leaves, or Skins, must be our Bread, Drink and Clothing, did not *labour* furnish us

with these [latter,] more useful Commodities. For whatever Bread is more worth than Acorns, . . . that is wholly *owing to labour*"; for "*labour makes the far greatest part of the value* of things, we enjoy in this World," since "Nature and the Earth furnished only the almost worthless Materials, as in themselves" (*Second Treatise* 5; see Pangle 1988). Locke's portrait of our unaltered place in nature and his emphasis on the benefits of appropriation or human art increasingly becomes an indictment of the providence of nature and nature's God. Rousseau's description of natural man "satisfying his hunger under an oak," in turn, is a vindication of the providence of nature.[5] In going back to the pure state of nature, Rousseau argues that Locke has misunderstood the character of the natural whole within which we exist.

More important than his argument about the character of the natural whole, however (for Locke allows that nature's provisions may be sufficient for man's bare needs), Rousseau objects that Locke and others have underestimated our ability to provide for ourselves in our natural condition and (most significantly) overestimated and mistaken the natural needs and passions for which we must provide: "Let us therefore take care not to confuse savage man with the men we have before our eyes" (1964, 111). Rousseau even imagines a fight between these two and argues that it would be tremendously unequal. This comparison is not only meant to support his argument that savage man can survive in his solitary existence in the pure state of nature but to point to a more fundamental difference between these beings. He concludes the comparison by explaining that savage man is an animal who (especially as compared to civil man) has "the advantage of always carrying oneself, so to speak, entirely with one" (p. 107). Savage man is an entirety, a being who lives as a physical whole in the natural whole. Rousseau explains the difference between civil and savage man similarly in *Emile*. Civil man, he says, "is only a fractional unity" whose "value is determined by his relation to the whole, which is the social body," while savage man "is entirely for himself. He is a numerical unity, the absolute whole" (1979a, 39–40).

Natural man is a purely physical being, and his relations with his fellows are limited to the physical. He discerns only "physical good and evil" and makes comparisons of "force" in his encounters with other beings (Rousseau 1964, 107). His fellow humans are equivalent in his mind to physical objects. Only when he develops moral passions, notably pride (*amour-propre*), do such encounters become more than purely "natural events" (p. 222). Until then he makes no moral judgments based on either intentionality or acquired notions of "the useful, the suitable, and the good" (see Rousseau 1979a, 39, 166–67, 213). Throughout his account, then, Rousseau argues that humans are limited by nature to needs for which they can easily provide and lack the needs and passions for which they might need others—moral needs and passions. His argument about the character of human needs, passions, and reason is the crux of his argument about human nature and his quarrel with his predecessors.

Human Needs, Passions, and Reason

Rousseau presents his account of the character and extent of our natural faculties and passions in explicit disagreement with Hobbes. He makes his criticism by utilizing the same basic understanding of the dynamics of human psychology that Hobbes himself employed against his predecessors—most importantly, the ancients and the natural law theorists. His argument with Hobbes about the extent and character of our natural faculties and passions points to their different understandings of our nature and place in nature.

In Hobbes's account of the state of nature, man's asocial and self-regarding passions make that condition a state of war not only in the juridical sense of lacking a superior to judge or of being "without a common Power to keep them all in awe" but also in the more tangible sense of living in an uncertain and violent condition of "continuall feare, and danger of violent death; And the life of man, solitary, poore, nasty, brutish, and short" (*Leviathan* 13). Humans are asocial in the sense that each individual looks primarily to his own self-preservation. This asociality results in a contest over scarce natural resources for both present and future consumption or enjoyment. Foresight and the related quest for power to obtain goods makes all resources, in principle, scarce. Hobbes concludes, "I put for a generall inclination of all mankind, a perpetuall and restlesse desire of Power after power, that ceaseth only in death" (chap. 11). Men are also self-regarding: they have a "mutual will of hurting" arising from both fear and vainglory. There are thus three main sources of quarrels: competition, diffidence, and glory (scarcity, fear, and pride). The very passions and faculties that make the state of nature incommodious Hobbes points to as separating humans from the beasts: he describes man variously as the sole animal with *vanity*, especially in contending for preeminence in reason; *speech* in the sense of a conventional art of words; and both *reason* and the natural *passion of curiosity*—foresight about causes and effects in general and thus the ability to develop Science (chaps. 2–6, 12, 27). The faculties Hobbes points to as distinctive of humans obviously require social relations. When he claims that humans are naturally asocial, then, Hobbes does not deny that they live in constant, if unstable, relations with their fellows. He means that individuals are naturally selfish and self-regarding, or prideful (see *De cive* 1.2, addendum). Indeed, Hobbes's description of the state of nature seems to presuppose that we normally or naturally live in some sort of families and social groups (see *Leviathan* 20). By pushing Hobbes's argument about our natural asociality even further, Rousseau comes to deny that we possess the speech or reason that Hobbes believes is not only natural to humans but distinctive of them.

Rousseau first introduces his quarrel with Hobbes

when he imagines the "unequal fight" between a savage and a civil man: "Hobbes claims that man is naturally intrepid and seeks only to attack and fight"—against which, Rousseau cites Cumberland and an "illustrious philosopher" (Montesquieu) that "nothing is so timid as man in the state of nature" (1964, 106–7).[6] He suggests in a note to this passage that Hobbes has mistaken savage man for civil man because he has incorrectly understood the natural state of the human psyche: "All knowledge that requires reflection, all knowledge acquired only by the linking of ideas and perfected only successively, seems to be altogether beyond the reach of savage man for want of communication with his fellow men—that is to say, for want of the instrument which is used for that communication and for want of the needs which make it necessary" (pp. 188–89). As a being who carries himself entirely with himself, savage man does not require the assistance of his fellow humans physically, emotionally, or otherwise. His thorough integrity is based most importantly on his lack of the "needs" that lead to association with his fellow humans in the first place.

Rousseau develops his argument against Hobbes about the natural state of our minds by adopting the general theory of the dynamics of the mind employed by Hobbes, Locke, and others against their own predecessors. "Whatever the moralists may say about it," Rousseau begins, "human understanding owes much to the passions, which by common agreement also owe much to it" (1964, 115–16). The moralists assume in one way or another that humans are naturally and in some way primarily rational. They argue that we are universally subject to the moral dictates of the natural law as discovered by reason. Following Hobbes, in particular, then, Rousseau criticizes these thinkers for establishing the natural law so that "it is impossible to understand the law of nature and consequently to obey it without being a great reasoner and a profound metaphysician: which means precisely that men must have used, for the establishment of society, enlightenment which only develops with great difficulty and in very few people in the midst of society itself" (p. 94). As we have seen, however, Rousseau's own definition of a moral being is more capacious. He therefore pushes the psychological theory of Hobbes and Locke further, accusing them of failing to realize that humans are not by nature moral beings in any sense.

Rousseau plumbs further the insight of Hobbes and Locke by analyzing the relationships among needs, passion, and reason. First of all, the passions influence reason: "It is by their activity that our reason is perfected; we seek to know only because we desire to have pleasure." These passions, in turn, are based on desires; hence, "it is impossible to conceive why one who had neither desires nor fears would go to the trouble of reasoning." These desires are based on "needs," both natural ("by the simple impulsion of nature") and conventional ("through the ideas one can have of them"). Man is by nature limited to his natural needs: "His desires do not exceed his physical needs: the only goods he knows in the universe are nourishment, a female, and repose; the only evils he fears are pain and hunger. I say pain and not death and its terrors because an animal will never know what it is to die; and knowledge of death is one of the first acquisitions that man has made in moving away from the animal condition" (1964, 115–16). Rousseau's remark about man's lack of any fear of death is directed against Hobbes, who would make the fear of death the most forceful element of human psychology. To his statement that natural man's desires "do not exceed his physical needs," Rousseau attaches a short note that elucidates his disagreement with Hobbes and others:

> That seems totally evident to me, and I am unable to conceive whence our philosophers can derive all the passions they impute to natural man. With the sole exception of the physically necessary, which nature itself demands, all our other needs are such only by habit, having previously not been needs, or by our desires; and one does not desire that which he is not capable of knowing. From which it follows that savage man, desiring only the things he knows and knowing only those things the possession of which is in his power or easily acquired, nothing should be so tranquil as his soul and nothing so limited as his mind. (p. 213)

Rousseau turns Hobbes's reasoning against the moralists against him. "Hobbes saw very clearly the defect of all modern definitions of natural right," Rousseau says, but he "improperly included in the savage man's care of self-preservation the need to satisfy a multitude of passions which are the product of society and which have made laws necessary. . . . Hobbes did not see that the same cause that prevents savages from using their reason, as our jurists claim, prevents them at the same time from abusing their faculties, as he himself claims" (1964, 129). Hobbes and (less so) Locke describe our natural condition as improvident not only because of the scarce provision of natural goods but also because of the rich provision of contentious passions. Rousseau argues, in turn, that our unique "faculty of self-perfection, a faculty which, with the aid of circumstances, successively develops all the others" (p. 114), is activated only through the social or moral relations that arise from the contact with our fellows that we lack in our natural condition; that is, our uniquely malleable needs and passions develop and change their character to become moral needs and passions. As basically solitary beings, humans are devoid of reason, speech, foresight, contentious passions, and pride. The absence of these faculties and passions is what most importantly enables us to live a basically solitary and peaceful existence in our natural condition. By denying that we naturally have these needs, passions, and faculties, Rousseau is again able to describe the pure state of nature as a providential condition.

Sex and Moral Proofs in Matters of Physics

Rousseau cannot deny that humans completely lack needs or passions for one another, for the species depends upon them. Rousseau remarks that among man's "physical needs" is "a female." In the *Second Discourse* Rousseau speaks, at least initially, almost always of "man"—the male.[7] He speaks almost exclusively of males in his description of savage man's existence in the pure state of nature because he wants his account to be as far as possible genderless (as he sees it). "In everything not connected with sex," he claims in *Emile*, woman is man" (1979a, 357). In the *Second Discourse*, he explains that only after the establishment of families was "the first difference was established in the way of life of the two sexes, which until this time had had but one" (1964, 147). Rousseau describes natural man as a male at least in part because males can more easily be conceived of as solitary. When females are considered as females, questions arise concerning the ability of mothers to survive alone while caring for infants, the relatively long period of infancy among humans, and thus the possible need for relatively stable families and perhaps more extended social groups if humans are to survive.

Rousseau's psychological argument is presented in tandem with his characterization of our basically solitary natural existence and may even appear to depend upon it. However, he does not absolutely insist on his claim about our natural solitude. For example, he summarizes his argument about man in his original condition, "Let us conclude that wandering in the forests, without industry, without speech, without domicile, without war and without liaisons, with no need of his fellowmen, likewise with no desire to harm them, *perhaps* never even recognizing anyone individually, savage man, subject to few passions and self-sufficient, had only the sentiments and intellect suited to his state" (1964, 137; emphasis mine; see also p. 119). This passage also reveals that it is less important for Rousseau that his savage be solitary than that whatever minimal relations he might have with his fellow humans do not serve to develop his mental and psychological state. Rousseau's argument is thus not primarily that savage man does lead a solitary existence but that he is capable of doing so because of the character of his faculties and passions (see Masters 1968, 130–36, 172–75).

Rousseau directs his argument that constant relations between men, women, and children are not natural against Locke, who seems to assume the existence of relatively stable families and other social groups to be characteristic of our natural condition. How Rousseau makes his argument further elucidates his conception of the difference between our physical and moral being and of the mistake of Hobbes, Locke, and others.

Rousseau's discussion of the character and extent of sexual and familial relations in the pure state of nature is an outgrowth of his description of the relations among needs, passions, and reason. Reason and speech are intimately related. Languages obviously require some sort of social relations, and the family is the place we most associate with learning to speak. Rousseau thus raises the problem of language in conjunction with his denial of any stable social or familial relations in the state of nature. He offers his own description of life in the pure state of nature: "In the primitive state, having neither houses, nor huts, nor property of any kind, everyone took up his lodging by chance and often for only one night. Males and females united fortuitously, depending on encounter, occasion, and desire, without speech being a very necessary interpreter of the things they had to say to each other; they left each other with the same ease" (1964, 120–21). In a note to this statement, Rousseau transcribes at length a passage from Locke's chapter "Of Political or Civil Society" in the *Second Treatise*.[8] The part of passage to which Rousseau replies in detail pertains to Locke's claim about the nature of our sexual and familial relations, apparently even in the state of nature. Locke argues that the "chief, if not the only, reason" for the longer conjunction of male and female among humans than other animals is "because the female is capable of conceiving, and is commonly with child again and brings forth, too, a new birth, long before the former is out of dependency for support on his parent's help, and able to shift for himself," so that the father, in order "to take care for those he hath begot, and to undertake that care for a long time, is under an obligation to continue in conjugal society with the same woman by whom he has got them, and to remain in that society much longer than other creatures" (Rousseau 1964, 213–14).

Most importantly for the present purpose, Rousseau undermines the assumptions that he claims Locke makes about our natural psychological state: "Locke proves at most that there could well be in a man a motive for remaining attached to a woman when she has a child; but he does not prove at all that he must have been attached to her before the delivery and during the nine months of pregnancy." According to Rousseau, therefore, Locke "evidently supposes what is in question"—not only the existence of some kind of relatively stable society, which would provide the basis for such knowledge and foresight, but the very reason and foresight in the first place. Rousseau states that "this kind of memory, by which one individual gives preference to another for the act of procreation, requires, as I prove in the text, more progress or corruption in human understanding than can be supposed in man in the state of animality in question here" (1964, 218–19).

When he alludes to what he "proves" in the text, Rousseau is referring to the distinction he draws between physical love and moral love somewhat after this note. There he asserts that by nature the sexes have no need for any prolonged association because they have no more than an occasional need to couple in order to preserve the species. Physical love, or simple copulation, is limited to purely physical im-

pulses and relations. Moral love, in turn, is based on reasons and opinions conceived through the imagination; and these only develop in society. Limited to the physical in love, male and female in their natural state meet sporadically and, with their physical needs satisfied and no knowledge of the possible consequences of their act, they return to their basically solitary existence (1964, 134–36).

The distinction Rousseau draws between physical and moral love is part of the more general dichotomy between the physical and the moral in the *Second Discourse*. His allusion to what he "proves" about physical and moral love helps us to understand what he says at the outset of his criticism of Locke in the note: "I shall observe first that moral proofs do not have great force in matters of physics, and that they serve rather to give a reason for existing facts than to prove the real existence of those facts" (1964, 215–16). Once again, Rousseau is accusing Locke of making the same sort of mistake as the natural law theorists, or those whom Rousseau earlier termed the moralists. Assuming humans always to have been the beings he sees around him, Locke has improperly attributed to us faculties and passions that (Rousseau argues) we do not possess by our original nature.

Rousseau reiterates his general criticism of Locke at the very end of the note in a different form:

> Locke's reasoning therefore falls apart, and all the dialectic of the philosopher has not saved him from the error committed by Hobbes and others. They had to explain a fact of the state of nature, that is to say, of a state where men lived isolated and where a given man has no motive for living near another given man, nor perhaps to live near one another, which is much worse; and they did not think of carrying themselves back beyond the centuries of society, that is to say, of those times when men have always had a reason to live near one another, and when a given man often has a reason for living beside a man or a given woman. (1964, 219–20)

Despite his suggestion that Locke and Hobbes have made a historical mistake, not "carrying themselves back beyond the centuries of society," Rousseau's argument against Locke's understanding of man's *psychological* state is evident, as well. When he criticizes Locke for not going "back" far enough, he indicates that Locke has not properly conceived of how different conditions (conditions that tend to develop in a certain general direction over time) affect the character and extent of man's "needs." The change that takes place in man's "need" for his fellow human, especially that for a particular member of the opposite sex, is crucial. (Note the change from two given men in the first state to a "given man" and a "given woman" in the second.) In other words, Rousseau denies that humans by nature have what he calls moral needs or passions—needs and passions with particular, conscious regard for other individuals, of which moral love is his archetypical example.

Rousseau's argument about moral proofs in matters of physics can be generalized and applied to his criticism of the views of Hobbes and Locke (among others) about mankind's relation to the natural whole within which they exist. The state of nature as envisioned by Hobbes and Locke hides within it a cryptoteleology. Supposing that because of the character of nature or because of the passions natural to humans the state of nature is inimical to us, their state of nature is paradoxically teleological in that its insufficiencies point to another condition that is in a sense higher—the end of the state of nature through the artifice of the social contract. Rousseau, in contrast, describes how we can survive as purely physical beings in our natural state, as good beings that exist unproblematically in nature and that need never have developed out of that condition.

THE NATURAL GOODNESS OF MAN

Rousseau claims that he has demonstrated that man is naturally good and that he has thereby justified nature (1964, 193). He later explains that the natural goodness of man is central to his system of thought, as when he exposed the "fundamental principle" of all of his writings, namely, "that man is naturally good, loving justice and order, that there is no original perversity in the human heart, and that the first movements of nature are always right" (1959–69, vol. 4, pp. 935–36).[9] Rousseau's demonstration of the natural goodness of man in the *Second Discourse* consists in his portrait of savage man's natural condition in the pure state of nature as a physical being embedded in (physical) nature. Before turning to the meaning of his claim to have thus justified nature and even God, let me take up what Rousseau means by our natural goodness.

We usually brand attributions of goodness as moral judgments—even as matters of "value" distinct from those of "fact." Rousseau, however, does not use *good* in a moral sense and even takes it in a sense compatible with matters of physics. Rousseau's conception of goodness becomes clear when, after his description of the pure state of nature, he wonders what kind of mortality we could be said to possess by nature:

> It seems at first that men in that state, not having amongst themselves any moral relationship or known duties, could be neither good nor evil, and had neither vices nor virtues: unless, taking these words in a physical sense, one calls vices in the individual the qualities that can harm his own preservation, and virtues the those that can contribute to it; in which case, it would be necessary to call the most virtuous the one who least resists the simple impulses of nature. (1964, 128)

Although Rousseau immediately claims that he will speak "without departing from the ordinary meaning" of these words, it is clear, since he understands natural man to be a purely physical being, that he also means us to take these terms in the "physical sense" he suggests.

An indication of Rousseau's novel use of these terms is seen by the objections of the Abbé Castel. He complains that Rousseau's savage has "nothing of the moral, of human, of theological or divine; nor any

more of duties, morals, relations; nor any more of good, that is to say, of bad. For here is the system of M. Rousseau well explained in detail and well announced: according to him, the good is bad and the bad is good" (1782, 182–83). Similarly, Diderot, appears to have been thinking along the same lines in his article "Droit naturel" for the *Encyclopedia*, which has been read as a reaction to Rousseau's arguments in the *Second Discourse* "If man is not free or if his instantaneous determinations, or even his oscillations, arise from something material that is external to his soul, he will have in them neither reasoned goodness nor wickedness, even though they may have in them animal goodness or wickedness" (1975, vol. 7, p. 25; see Masters 1968, 261–65).

We are good, says Rousseau, in that we do not resist "the simple impulses of nature." Through our spontaneous instinct for self-preservation alone and perhaps also restrained by natural pity, we are by nature good for ourselves (well-ordered and self-sufficient) and good, or at least not harmful, for others (see Melzer 1990, 15–17; see also Masters 1968, 151–57). We are good by the "two principles anterior to reason"—the desire for self-preservation and pity—which Rousseau explains he has found "by meditating on the first and simplest operations of the human soul" (1964, 95). Together they compose the "maxim of natural goodness": "Do what is good for you with the least possible harm to others" (p. 133).[10] We do not by nature need to force ourselves, through reason or otherwise, to act in a manner that is good. Such force, whether external force applied through education or threat or internal "self-forcing," Rousseau is fond of pointing out, is found in the original sense of *virtue* (see Rousseau 1979a, 444–45). He therefore reserves the terms *virtue* and *vice* for moral beings, that is, humans with the needs and passions that develop in and through their relations with their fellow humans and that cause them to be good neither for themselves nor others.

Rousseau makes his argument about the natural goodness of man in disagreement with Hobbes: "Above all, let us not conclude with Hobbes that because man has no idea of goodness he is naturally evil; that he is vicious because he does not know virtue; . . . nor that, by virtue of the right he reasonably claims to things he needs, he foolishly imagines himself to be the sole proprietor of the whole universe." Rousseau thus concludes, "One could say that savages are not evil precisely because they do not know what it is to be good: for it is neither the growth of enlightenment nor the restraint of law, but the calm of passions and the ignorance of vice which prevents them from doing evil" (1964, 128–30). Ironically, then, the Abbé Castel claims that even Hobbes is "not impious, in that he supposes man capable of impiety. Man having himself neither virtues nor vices, nor moral relations, nor known duties, could not be impious, whatever he should do, not being more than a brute beast and animal" (1782, 171–72). As a number of modern interpreters of Rousseau have noted, his savage man's goodness is amoral, premoral, or even subhuman (e.g., Masters 1968, 152; Starobinski 1964, lxiv; Strauss 1953, 271).

THE THEODICY OF THE *SECOND DISCOURSE*

Rousseau claims that through his portrait of our original nature as asocial, physical, and good beings that he has "justified" nature and even God and his providence. He raises the issue of providence in the *Second Discourse* just before alerting us to his use of *good* in a physical sense. He explains that "from the little care taken by nature to bring men together from mutual needs and to facilitate their use of speech, one at least sees how little is prepared their sociability, and how little it contributed to everything men have done to establish social bonds." Thus Rousseau, the Abbé Castel claims, calumniates God and nature; but Rousseau maintains that nature has thus been kind to us: we are placed in this natural condition "by a very wise providence." To the argument that such a being would be miserable, he says, "Now I would really like someone to explain to me what type of misery there can be for a free being whose heart is at peace and whose body is healthy?" (1964, 126–28). Rousseau reiterates the soundness of man's physical endowments, both mental and bodily, and the harmony in which he lives as an unproblematic whole in the natural whole.

Rousseau treats the question of divine or natural providence in his 1756 letter to Voltaire in response to the latter's poem on the Lisbon earthquake. How can human misery and death be consistent with a beneficent God or well-ordered nature? Rousseau points to the argument in the *Second Discourse*, a work Voltaire had characterized as a "work against the human race." No one, Voltaire wrote, had ever used so much intelligence to make man a beast (quoted in Rousseau 1959–69, vol. 3, 1379). Rousseau's answer is simple: "If it is better for us to be than not to be, this would be enough to justify our existence, even though we would have no compensation to expect for the ills that we have to suffer." Voltaire and others, he says, are wrong to accuse God or nature because "in the comparison of goods and evils," they "always forget the sweet sentiment of existence" (ibid., vol. 4, pp. 1062–63; see Rousseau 1979b, 68–69). In the *Second Discourse*, Rousseau describes the psychological condition of natural man in the pure state of nature: "His soul agitated by nothing, is given over to the sole sentiment of its present existence" (1964, 117). The providence of nature and nature's God exists for us in our natural condition as physical beings unproblematically embedded in the physical whole of nature.

In his letter to Voltaire, Rousseau explains that God's providence is impersonal, "general," and wholly physical in character, that is, not specifically concerned with the individual: "It is to be believed that particular events are nothing here below in the eyes of the master of the universe, that his provi-

dence is only universal, that he is content to preserve the genera and the species and to preside over the whole without being disturbed by the manner in which each individual spends this brief life" (1959–69, vol. 4, p. 1069). Thus, even though Rousseau seems to assume a high infant mortality in our natural condition—"Nature . . . renders strong and robust those who are well constituted and makes all the others perish" (1964, 106; see p. 111)—what is more important is the survival of the species: "The proof that all is well ordered derives from a general and incontestable fact: that all the species survive" (1959–69, vol. 3, p. 237). What is most important in considering the providence of nature or nature's God is the order of the whole. In almost equating goodness with order, both in his discussion of the natural goodness of man and the goodness of nature as a whole, Rousseau appeals to a traditional theological concept. In the "Profession of Faith of the Savoyard Vicar" in *Emile*, for example, he has the vicar explain that "the love of order which produces order is called *goodness;* and the love of order which preserves order is called *justice*" (1979a, 282; emphasis original). He alludes to this same conception in the *Second Discourse* when he writes that men do not naturally have the reason to conceive of "maxims of justice and reason drawn from the love of order in general or from the known will of his creator" (1964, 119). The order of nature, including human nature, is found in our original or natural condition as physical beings embedded unproblematically in the physical whole of nature. We are thus a good part of a good nature: "The first movements of nature are always good and right" (1959–69, vol. 4, pp. 935–36; see Rousseau 1979a, 92).

Previous interpreters who have attended to Rousseau's understanding of his work as a theodicy have come to a different conclusion. Rather than understanding Rousseau's conception of our natural goodness and his justification of nature or God as referring to our original position in nature, they have seen his solution to the problem of evil and providence as eschatological: as coming at the end as a restitution of order. This view gains credence from the argument about providence made by Rousseau's Savoyard vicar. Chief among these interpreters is Ernst Cassirer. Cassirer correctly sees that Rousseau's unique solution to the problem of evil (society as the cause of our ills) is central to his thought. However, he incorrectly believes that Rousseau's resolution of the problem of evil is found in our ultimate reformation in the ethical society where the categorical imperative (the general will) reigns. For Rousseau, he asserts, the goodness of man "was not an original quality of feeling but a fundamental orientation and a fundamental destiny of man's will" and was grounded "in man's capacity for self-determination . . . in the recognition of an ethical law" (Cassirer 1989, 104–5; see also Cassirer 1951, 147, 153–58 and Hendel 1934). More recently, Andrzej Rapaczynski (1987) has made a similar argument, finding in the vicar's eschatological providentialism a clue to Rousseau's thoughts about the human problem.

Cassirer and others have erred, first, because they have misunderstood or misrepresented Rousseau's conception of our historical nature. Seeing in Rousseau the predecessor to Kant, Hegel, and even Marx, all of whom in different ways viewed providence as a historical phenomenon (see Kant 1983, 53–55), Cassirer and others' interpretations of Rousseau have a distorted, proleptic character. Rousseau does not view history primarily as the process of our perfection (for he is decidedly pessimistic about our "progress") but the addition of encrustations on our original nature through changes in the determinants of the extent and character of our malleable passions and faculties, our historical being. He reveals our original condition and our historical nature so that we may see that our ills are not inevitable, that we are good, and that nature is justified. His portrait of nature and of human nature is useful not as a focus of nostalgia but as a model for the conditions of our happiness, in accordance with which it is possible to manipulate the determinants of our nature.

Second, they have erred because their interpretations are based, in part, upon a mistaken assumption about Rousseau's intentions in offering the teaching about providence he has the Savoyard vicar offer and the relationship of that teaching to his own understanding. The vicar argues that an eschatological and restitutive moral providence is the solution to the problem of disorder and evil among men (1979a, 278–82). Cassirer and others have seized upon the vicar's argument as substantially Rousseau's own. The exact relationship between Rousseau and his vicar is an extremely difficult and much-debated subject. However, Rousseau's remark in his letter to Voltaire that our existence is justified "even though we would have no compensation to expect for the ills that we have to suffer" (i.e., even without a doctrine of compensation from a caring deity) indicates that he offers a strictly natural justification of nature and providence.[11] Finally, Rousseau's disagreement with the vicar about the "end" at which providence is found or justified is attested to by the sole reference to the "Profession of Faith" elsewhere in *Emile*. In a passage that explicitly recalls the *Second Discourse* (where he also states that Hobbes called the wicked man "a robust child," p. 129), Rousseau explains, against Hobbes, that children are naturally good: "All wickedness comes from weakness. . . . Of all the attributes of the all-powerful divinity, goodness is the one without which we can least conceive it . . . . See hereafter the Profession of Faith of the Savoyard Vicar" (1979a, 67). The vicar states that "the supremely good Being, because He is supremely powerful, ought also to be supremely just" and goes on to relate goodness with order and justice with the preservation of order. The context of the reference earlier in the work points to Rousseau's solution of the problem of evil and understanding of providence as lying in our beginning as a good part of a good nature.

The notion of providence seems to require an intelligent and willing being and thus to be misapplied to nature. Just as his quarrel with Hobbes shows how Rousseau could speak of goodness in a physical sense, so it reveals what sense it makes to speak of natural "providence." This can be seen by contrasting Rousseau's view of human nature and our place in nature with Hobbes's.

Hobbes discusses the issue of providence and man's place in nature and relation to God as the "author of nature" in *Leviathan* 31, "Of the Kingdome of God by Nature." Hobbes notes the metaphorical application of the term *providence* to the "Power of God" as the "Author of Nature." Nonetheless, he proceeds to consider "the Right of Nature, whereby God reigneth over men, and punisheth those that break his Lawes," which he reduces to God's "Irresistible Power." Central here is Hobbes's reduction of right to power, evident earlier in the work in his discussion of natural right (chaps. 14, 21; see also Spinoza, *Theologico-Political Treatise* 6, 16). Rewards and punishments are central to every conception of providence, most especially the rewards and punishments of an afterlife thought necessary to resolve the problem of evil and justify God and his providence: "Punishments are consequent to the breach of Lawes; Natural Punishments must be necessarily consequent to the breach of the lawes of Nature; and therefore follow them as their naturall, not arbitrary effects" (*Leviathan* 31). However, with Hobbes's essential reduction of natural law to a "general rule of reason" or prudence, and incorporation of natural law into natural right (chap. 14), natural rewards and punishments become equivalent to simple pleasure and pain as events in the "chayn of Consequences" of our actions or as consequences of our motion simply (chap. 31). For Hobbes, however, our natural condition is a state of war of every man against every man because of the passions and faculties natural to us. Though intended to procure pleasure or at least avoid pain, our actions produce pain and even death. Our natural condition is not a providential one in any positive sense. Rather than ordered beings in an ordered whole, Hobbes finds beings whose natural impulses lead them to disorder and death.[12]

Like Hobbes, Rousseau's conception of natural providence is metaphorical. Unlike Hobbes, however, natural providence has a positive character. For Rousseau, our natural passions and needs lead to our survival and even flourishing. Only when we depart from nature with our fellows out of the hands of nature's providence does a process begin that makes "a being evil while making him sociable, and from such a distant origin finally bring man and the world to the point where we see them" (1964, 140). Or, as Rousseau explains of his system, all of his writings have been founded on "the great principle that nature made men happy and good, and that society depraves him and makes him miserable" (1990a, 213). Rousseau's portrait of our natural, providential condition in the pure state of nature serves as a positive model for the remaking of our miserable existence.

THE BEARING OF ROUSSEAU'S PURE STATE OF NATURE

The state of nature constitutes what might be called a negative standard in the political theories of Hobbes and Locke. The state of nature is no longer a hypothetical prelapsarian state of innocence created by God and lost by men as in the scriptural and natural law traditions that they confronted, but a state of want and war. The state of nature in their theories is far from the creation of a provident Deity; it is scanty in its physical provision and rich in its provision of quarrelsome human passions. Hobbes in particular replaces the reasoned duties and ends of the natural law theorists with the solid and sublime beginnings of the passions, especially the fear of pain and death. Reason serves as the guide—the star and compass—to the ends determined by the passions. Right—each individual's natural right to self-preservation and the means to it—is prior to duty. But thus, there appear to be no true ends in themselves: the most important end is paradoxically the beginning point of *the* end—death. Life becomes characterized by a desire to maintain motion; the most important goal is to avoid the end of motion.

The negative standard of the state of nature that may be said to be characteristic of the thought of Hobbes and Locke affects the bearing of liberal thought. The primacy of natural right along with the state of nature with which it is frequently allied might be said to provide no positive standard for politics.[13] They provide to the natural individual a sort of fence that cannot be crossed or a way of judging the relationship between the individual and the state. They do not tell us what sort of political entity to construct except (for the most part) to say what cannot be done. They do not offer any, or much, advice about what sort of life the citizens of the state should lead or what type of beings they should be. There is in liberal thought and its emphasis on natural right a tendency, as in Hobbes, to provide for the continuation of motion without giving that motion any determinate direction or end. The existence of the individual is characterized by the *pursuit* of happiness, while happiness itself remains indeterminate.

Rousseau shares much with his predecessors in the liberal tradition of the state of nature and the social contract. For example, his state of nature also eventually becomes a condition of want and war that must be overcome through art or convention. However, he goes further back to the pure state of nature, a new revelation of what sort of beings we truly are by nature. His natural man is a physical being who exists unproblematically as a good being embedded in a good nature. He is a being characterized by wholeness. Rousseau's pure state of nature and our place

within it are positive standards, of sorts, for his constructive philosophy, which is concerned not only with life, liberty, and the pursuit of happiness but with happiness itself. He envisions the palliation or reconstruction of our corrupted existence by remaking our malleable or "perfectible" nature by imitating our natural condition as whole beings embedded unproblematically in the whole of nature—albeit on different foundations from those of our physical existence in the pure state of nature. Thus, although Rousseau calls the savage societies of the state of nature the "happiest and most durable epoch" for mankind (1964, 151) and although some interpreters have recognized how those primitive societies serve as a model for at least a portion of Rousseau's constructive thought (e.g., Shklar 1985), still, even that community with its relatively whole or unified beings living in a whole shares a formal similarity with our natural existence in the pure state of nature.

That Rousseau views the existence of natural man as a positive standard has, of course, often been noted. So far, however, interpreters have concentrated on the unity of soul of the individual alone as Rousseau's standard (Melzer 1990; see also Strauss 1953). They have failed to understand how his view of our place in nature in general serves as a positive standard, a theodicy. This criticism applies to Starobinski's (1988) somewhat similar interpretation; for his reading of Rousseau as concerned with a "transparent" relationship of an individual with his fellows and surroundings and the problem of the "obstruction" in that relationship is at bottom a radically individualistic reading of Rousseau (as should be evident from his psychoanalytic approach to Rousseau to begin with). Only the present interpretation can fully account for both the unity of intention and similarity of method behind the various solutions Rousseau offers in his constructive philosophy. He entertains three distinct and ultimately problematic possibilities of our "perfectibility," all in some sense imitations of the savage man's existence in the pure state of nature: the solitary walker (*Reveries of the Solitary Walker*), the retreat of the domestic society (*Emile* and *Julie, ou la nouvelle Héloïse*), and the legitimate political association (*Social Contract*). Let me say something about Rousseau's political solution for our ills.

THE PURE STATE OF NATURE AND ROUSSEAU'S POLITICAL PHILOSOPHY

Rousseau's political teaching in the *Social Contract* seems to be elaborated independently of the psychological and historical investigation of the *Second Discourse* and, indeed, of the main tenets of his system of the natural goodness of man. Thus, even where the historical and psychological arguments appear in his explicitly political work, they are phrased narrowly: the social contract becomes necessary when the obstacles to self-preservation become too great (e.g., *Social Contract* 1.6). However, as Arthur Melzer (1990) has perceptively argued in his recent work, the cast of Rousseau's argument is misleading. Most importantly, Rousseau can be seen to be concerned in the *Social Contract* to alleviate, among other things, the main cause of our evils as we have developed into moral beings, namely, personal dependence. "Man is born free, and everywhere he is in chains. One who believes himself the master of others is nonetheless a greater slave than they," Rousseau announces in his opening words. Even mastery is a form of slavery because of personal dependence. Although his paradoxical statement that "whoever refuses to obey the general will shall be constrained to do so by the entire [political] body; which means only that he will be forced to be free," is infamous, its continuation is less well known: "For this is the condition that . . . guarantees him against all personal dependence" (1.8). As Melzer notes, Rousseau can present his political teaching in the *Social Contract* as though it were separate from the main tenets of his system and based on the narrow problem of self-preservation, because "the political requirements of preservation and happiness perfectly coincide" (1990, 114–15). Building on Melzer's interpretation, I shall add that in his political thought, Rousseau intends to solve the problem of personal dependence by making the state an imitation of the divine or natural whole.

Rousseau would palliate the ills from personal dependence by making the citizens of his regime as far as possible independent of one another and dependent upon the laws alone. The laws ought to make the relationship of the citizens to one another "as small as possible" and the relationship of the citizens to the state and its laws "as large as possible" (*Social Contract* 2.12). The independent civil freedom of the citizens in Rousseau's state is an imitation of the independent natural freedom of the savage in the pure state of nature (see 1.8, 2.11). Rousseau intimates in *Emile* how the relationship of the citizens to the political whole within which they live is intended to be an imitation of savage man's existence in the pure state of nature:

> Dependence on things, since it has no morality, is in no way detrimental to freedom and engenders no vices. Dependence on men, since it is without order, engenders all the vices, and by it, master and slave are mutually corrupted. If there is any means of remedying this ill in society, it is to substitute law for man and to arm the general wills with a real strength superior to the action of every particular will. If the laws of nations could, like those of nature, have an inflexibility that no human force could ever conquer, dependence on men would then become dependence on things again; in the republic all the advantages of the natural state would be united with those of the civil state, and freedom which keeps man exempt from vices would be joined to the morality which raises him to virtue. (1979a, 85)

In the first draft of the *Social Contract* and in a parallel passage in his essay "Political Economy," Rousseau explains, in his discussion of "the marvels of the laws," that we must "imitate here on earth the

immutable decrees of the divinity." "It is this celestial voice" of the laws, he explains, "that tells each citizen the precepts of public reason, and teaches him to behave according to the maxims of his own judgment and not to be constantly in contradiction with himself" (1978, 177–78).

The laws of Rousseau's political whole are to be modeled on the laws of the divine or natural whole; and our relationship to them is similar except that in the case of the civil state, the citizens themselves may legislate them through our general will as sovereign. The parallel between the political whole and the divine or natural whole in Rousseau's conception is further strengthened when we consider that the origin of the general will, the source of the laws, as a theological term concerning the divine will and providence, a heritage most thoroughly investigated by Patrick Riley (1986). The "voice of the people is the voice of God," Rousseau exclaims in his "Political Economy" (1978, 213; see Rousseau 1959–69, vol. 3, pp. 862–63), giving the traditional formula a new and radical meaning.

CONCLUSION

I began by wondering about the relationship between Rousseau's description of human nature through his depiction of our natural condition in the pure state of nature and his political thought. Despite certain appearances to the contrary, his juridical political theory and the legitimate state he derives from it, far from having been developed in isolation from his demonstration of the natural goodness of man, depends decisively upon it. Rousseau's projected solutions to our ills, including his political remedy, are formally modeled on the natural condition of the human race as a good part of a good nature—as we can see when we understand that Rousseau intends the *Second Discourse* to be a theodicy.

The connection between Rousseau's reflections on human nature and his political theory force us to reconsider how these subjects may be inseparable, even at the point in the history of political thought where they appear to diverge. Indeed, since Rousseau's understanding of human nature is bound up with his conception of nature and questions about the divine, he offers an opportunity to consider a return to the grand philosophical tradition in politics. As our liberal politics and political science triumph, it is imperative that we come to understand their foundations better, build on them more solidly, assess their possible structural limitations, and grasp their possibilities.

Notes

Previous versions of this paper were presented at the Workshop in the History of Political Thought at the University of Chicago and the 1991 American Political Science Association annual meeting in Washington. I should like to thank, for their comments and suggestions, Nathan Tarcov, Joseph Cropsey, Carol Fiedler, Roger Masters, Vickie Sullivan, and James B. Murphy.

1. Throughout this paper I will discount the quasi-Lamarckian theory of the changes in our physical constitution through time that Rousseau seems to contemplate in the *Second Discourse* but puts aside (1964, 104–5, 183–86, 203–9). In any case, if Rousseau puts forward his hypotheses about human history in general and changes in our constitution in particular in a scientific sense (as I believe he does), the thesis that I will maintain is the main one of the *Second Discourse*, namely, that we are by nature physical beings, would only be strengthened.

2. For background on the state of nature and the pure state of nature, see Gierke 1950, 96–105 and notes; Gourevitch 1988, 25–33; Strauss 1953, 184–85. For the original formulations, see Aquinas, *Summa theologica* I–II. 109.8, as well as 102. 3–12, 109. 2–4; Suarez, *De legibus ac Deo legislatore* 1.3.11–12, 2.8.8–9; Hooker, *Of the Laws of Ecclesiastical Polity* 1.10.1; Grotius, *De jure belli ac pacis* 2.5.15, 3.7.1; Pufendorf, *De officio hominis et civis* 2.1.1–7; idem *De jure naturæ et gentium* 2.2.1–4.

3. Castel's work was originally published in Toulouse in 1756 as *L'homme morale opposé à l'homme physique; ou Réfutation du discours sur l'origine de l'inégalité: Lettres philosophiques.* It is included in a supplemental volume (no. 29) to the 1782 *Collection complètes des oeuvres de J.-J. Rousseau* edited by Moultou and Peyrou, to which I refer here. My attention was first drawn to Castel by Hamilton 1975, 86–89.

4. Locke perhaps chooses acorns as his representative example of property by appropriation because of Pufendorf's parallel use of acorns in his theory of property deriving from the universal consensus of mankind (*De jure naturae et gentium* 4.4.13). This parallel was drawn to my attention by Peter Laslett (Locke 1988, 288n.), who, in turn, takes it from John Gough (1950, 78n.). The centrality of the oak and acorn to descriptions of man's primitive state is also to be found in Lucretius: "Their hearts were content to accept as a gift what the sun and showers had given, and the earth had produced spontaneously. Often they stayed their hunger among the acorn-laden trees" (*De rerum natura* 5.937–40). It may have been Lucretius who suggested this image to Pufendorf, who quotes this passage from Lucretius at length in his *De jure naturae et gentium* (2.2.2). It has often been noted that Rousseau's depiction of man's natural state is modeled on the fifth book of Lucretius' poem (e.g., Morel 1909; Strauss 1953, 264, 271); and among the many parallels between the accounts is this picture of man resting beneath an oak. However, although Lucretius and the other Epicureans, like Rousseau, deny natural teleology, their account of man is not wholly antiteleological: unlike Rousseau, they locate our natural condition not in our beginnings but in our fulfillment, or *summum bonum,* which is not found in our beginnings (see Melzer 1990, 122). Rousseau thus understands the Epicureans to "deny all providence" (1959–69, vol. 3, p. 46n.).

5. I shall use the metaphor of "providence" when analyzing nature in Rousseau's understanding, for this is what his claim in the *Second Discourse* to have "justified" nature must mean. The account in the *Second Discourse* is a strictly natural one, hence Rousseau does not explicitly discuss God or divine providence in the work. In his 1756 letter to Voltaire, which I shall discuss, he extends his claim about the *Second Discourse* and says that he has justified God and divine providence in some way, as well.

6. By citing Montesquieu against Hobbes, Rousseau might be said to exploit a breach in Hobbes's theory of the state of nature opened but not fully exploited by Montesquieu. In the first book of his *Spirit of the Laws,* Montesquieu takes exception to Hobbes's characterization of man's polemic nature: "But one feels that what can happen to men only after the establishment of societies, which induced them to find motives for attacking others and for defending themselves, is attributed to them before that establishment." By Hobbes's premises about the primacy of the desire for self-preservation, Montesquieu says, one should, instead, see that man is extremely diffident, not quarrelsome, in his natural state (1.2;

see 30.19). Rousseau's complaint against Hobbes and Locke is similar. Montesquieu does not, however, provide an explanation of how man developed from that condition to the one described by Hobbes and acknowledged by Montesquieu as later (though not originally) correct. Rousseau may be said to offer such an explanation in the *Second Discourse*. His explanation is both historical (How did diffident and basically solitary men come together in the savage societies that eventually decline into a condition of war?) and, more importantly, psychological (How did man change from a timid and wholly asocial being to a contentious and other-regarding being?).

7. This apparently highly gender-specific description of the savage has been noted by a number of readers and received different reactions. Some have chastised Rousseau for taking the male as somehow representative of humanity and excoriated him for taking the female to be the deficient sex, in particular, in his statements about the education of Sophie in *Emile* 5 (e.g., Keohane 1980). Others applaud him for what is seen to be an ultimately genderless description of savage humans and accuse him of inconsistency in his discussion of the differences and inequalities between the sexes after they have developed (e.g., Okin 1979, 108–11). Without attempting here to defend or accuse Rousseau in these matters, it should be noted that his analysis of the differences between the sexes relies on his understanding of the interaction between nature and convention, especially of how conventional differences between men and women may or may not be founded on natural distinctions brought out only in unnatural conditions. In other words, Rousseau's discussion of human sexuality, whatever its ultimate validity, centers around issues still in contention.

8. Rousseau transcribes an anonymous French translation of Locke's *Second Treatise* 7. pars. 79–80. The translation is fairly close to the original and will be followed here as translated by Masters in Rousseau 1964.

9. While Rousseau claims that together his works form a "system," he is not a "systematic" philosopher in the sense, say, of such seventeenth-century thinkers as Leibniz or Malebranche. He distinguishes between the "systematic spirit" and the "spirit of observation": the former is characterized by the tendency to construct systems from abstract and universal rules and hasty overgeneralizations; the latter, to which he adheres, entails careful empirical observation and cautious generalizations (1959–69, vol. 4, pp. 1090–93). Rousseau's discussion of theodicy and providence is therefore, quite different from that of, Leibniz, for example, as Rousseau himself implies (see vol. 3, pp. 232–34). Whereas Leibniz might be said to begin from questions of metaphysics and even logic, reasoning deductively from a priori attributes of the divinity (e.g., in his *Theodicy*), Rousseau characteristically begins with the human problem and our very real ills. For the character of Rousseau's system, see Lanson 1912, 7; Machado 1968, 33–36, 83–85; Melzer 1990, 9–12; Starobinski 1988, 40–41.

10. While pity serves as the basis for human morality, it does not itself appear to be a moral sentiment or passion in Rousseau's understanding. There is some question to what extent Rousseau believed that pity would be active among the savage men of the pure state of nature. For at least reasons of exposition, the activity of pity he suggests in the *Second Discourse* (1964, 131–33) seems significantly different from his account in the *Essai sur l'origine des langues* (1990b, chap. 9) and *Emile* (1978, 221–23), where he denies its initial activity, although I would argue that close examination of his argument in the *Second Discourse* would remove this apparent contradiction. Finally, and in a manner that may explain both why pity is not a moral sentiment and the ambiguities of his presentation, Rousseau suggests in *Emile* that all the passions, apparently including pity, can be derived from the natural sentiment of self-love (1979a, 212–13).

11. I show at length elsewhere through a close analysis of his letter to Voltaire, the "Profession of Faith," and other writings that Rousseau offers a strictly natural account of the whole and our place in it (Scott 1992). Rousseau puts forward his arguments about an immortal soul and a caring Deity with particular moral providence as at best doubtful and indicates that he does not ultimately believe them. He presents these arguments as useful and even essential for the virtue and happiness of most individuals and all political communities. This is the spirit in which he discusses civil religion in the *Social Contract* (4.8).

12. Hobbes has a parallel discussion in *De cive* 15. Pufendorf locates divine providence in our being led to sociability through our natural reason and natural law (*De officio hominis et civis* 1.3.10–11).

13. This cannot be said without qualification (for at least Locke), however; for the natural freedom he shows us to enjoy in the state of nature is the model for his description of civil freedom. This is true of Montesquieu, as well (*Spirit of the Laws* 11.3–5). Rousseau's understanding of the relationship between natural and civil freedom is similar (*Social Contract* 1.8).

POSTMODERNISM AND THE PUBLIC SPHERE

DANA R. VILLA *Amherst College*

The idea of the public sphere, of an institutionalized arena of discursive interaction, is central to democratic theory and practice. The modern age has, however, witnessed the erosion of a public realm distinct from the state and the market. In response to this erosion, public realm theory, notably the work of Arendt and Habermas, attempts to theorize the minimal conditions necessary for a discursive realm free of structural coercion or manipulation. The resulting normative conception of the public sphere has come under sharp attack by postmodern theorists, including Foucault, Lyotard, and Baudrillard, who question the basic presuppositions of public realm theory. I examine their objections and show how the public realm theory of Arendt can be viewed as motivated by concerns similar to the postmoderns'. Against Habermas, I argue that Arendt's public realm theory is less concerned with the question of legitimation than with the theorization of an agonistic political subjectivity.

As a motto, "the recovery of the public realm" captures, more or less adequately, the primary goal of Hannah Arendt's political philosophy and the critical theory of Jürgen Habermas. Both Arendt and Habermas see the public sphere as a specifically political space distinct from the state and the economy, an institutionally bounded discursive arena that is home to citizen debate, deliberation, agreement, and action. Yet they also see this sphere as overwhelmed by the antipolitical forces unleashed by modernity. For Arendt, the modern rise of "the social" effaces what was once a strong distinction between the public and the private and tears down the boundary between the realms of necessity and freedom (1957, 33–49). The result is that the public sphere is "devoured" by "household" concerns—the maintenance of life and economic reproduction—and politics is reduced to the function of "household administration," a function fulfilled by the state (pp. 45–47).

For Habermas, modernity is essentially an epoch of rationalization, as Weber described it. Yet this rationalization is one-sided. The universalization of instrumental rationality—its application to all spheres of social life—converts practical/political questions into technical ones (Habermas 1970, 96). The result is the destruction of the space of democratic decision making, a realm now "colonized" by technical–administrative imperatives (Benhabib 1986, chap. 7; Habermas 1985, 1989).

Reacting to these trends and the withdrawal of the political in the modern age, Arendt and Habermas refined their respective conceptions of the public sphere in order to provide rigorous criteria for determining a *genuine* public realm. By insisting upon the distinctiveness of this realm and the kind of interaction that occurs within it, Arendt and Habermas are able to elucidate the necessary minimal conditions for (to use Arendt's phrase) "the sharing of words and deeds"; that is, by theorizing the conditions necessary for uncoerced deliberation and decision amongst diverse equals, Arendt and Habermas provide an ideal of the public sphere that serves to highlight the forms of asymmetry, coercion, violence, and communicative distortion that presently characterize *our* public realm.

I shall examine Arendt's and Habermas' related conceptions of the public realm and postmodern theory's skeptical response to them. Increasingly, poststructuralist, or postmodern, theorists have raised objections to the fundamental presuppositions of the *type* of project Arendt and Habermas are engaged in. I shall examine what I consider to be the three most basic and forceful objections raised by poststructuralism/postmodernism against Arendt and Habermas. The first, originating in the work of Foucault, I shall refer to as the *power* objection, which radically questions the idea(l) of a coercion-free space of deliberation by retheorizing the nature of power in the modern age (Foucault 1977, 1980a, 1980b, 1982). The second objection, the *epistemological*, finds its most forceful formulation in the work of Lyotard, who challenges the very possibility of a unified, consensus-based public realm in an age that has witnessed the death of legitimating metanarratives and the corresponding fragmentation of the discursive realm into irreducibly heterogeneous language games (1984, 1985, 1988). The third objection, the *ontological*, in some ways the most telling, can be derived from the work of Deleuze or the popularization of certain Deleuzian themes in Baudrillard (Baudrillard 1983; Baudrillard 1988, chaps. 5, 7; Deleuze 1980). This objection questions the peculiar reality attributed to the public realm as a "common space of appearances" (Arendt), a *world* without transcendental or metaphysical support yet available to all its citizens/inhabitants. From the point of view of Deleuze or Baudrillard, the Arendtian conviction that "appearance . . . constitutes reality" betrays a "nostalgia for reality," for a world well lost (Arendt 1957, 57; Baudrillard 1988, chap. 7). This nostalgia appears to permeate Arendt's entire project (the analysis of modernity in terms of "worldlessness"), and Haber-

mas is able to evade it only by offering an abstractly procedural account of discursive rationality.

While these objections are powerful, I believe they are also answerable, at least from the point of view of Arendt's project. Indeed, I will argue that the apparently clear opposition between Arendt and Habermas on the one hand and poststructuralism/postmodernism on the other has been overdrawn thanks, in large part, to the polemical stance taken by Habermas in *The Philosophical Discourse of Modernity* (1987). In that work, Habermas creates a stark opposition between communicative and subject-centered reason, between the paradigms of mutual understanding or intersubjectivity and that of the philosophy of consciousness (chap. 11). In his view, neither Hegel nor Marx succeeded in extricating themselves from the "horizon of the self-reference of the knowing and acting subject"; but then, neither do such critics of the philosophy of consciousness and the modern project as Heidegger, Derrida, and Foucault. All remain, from the Habermasian perspective, either caught up in the metaphysics of subjectivity (Hegel and Marx with their demiurgic conceptions of self-externalizing subjects) or endlessly tracing the transcendental/empirical bounds of the "humanist" paradigm (Heidegger, Derrida, Foucault). According to Habermas, the postmoderns, like their predecessors, fail to effect the transition to "the paradigm of mutual understanding" and remain locked within an exhausted episteme (pp. 295–96, 310).

This mapping of the world of modern/postmodern theory neatly locates Arendt's work on the intersubjective side of the divide. I shall question the adequacy of this mapping, suggesting that the Arendtian theorization of the public realm harmonizes in unexpected ways with the critics of the strong normative conception of the public sphere. This invites a rethinking of the relation between public realm theory and postmodernism/poststructuralism (see my earlier discussion, Villa 1992).

ARENDT, HABERMAS, AND THE NORMATIVE CONCEPTION OF THE PUBLIC SPHERE

In his appreciation of Hannah Arendt's contribution to the theorization of power, Habermas emphasizes how she "dissociates the concept of power from the teleological model of action" (1983, 173). Contra Max Weber, who "defined power as the possibility of forcing one's own will, whatever it maybe, on the conduct of others," Habermas argues that Arendt "understands power as the capacity to agree in uncoerced communication on some community action" (p. 171). Habermas is referring to Arendt's "On Violence," where she draws a rigorous distinction between *power*, (defined as "the human ability not just to act, but to act in concert") and strength, force, and violence—all of which are uniquely instrumental (Arendt 1968b, 143). This definition points to a model of action quite different from the teleological one, whose means–end structure makes the achievement of a pregiven goal the organizing principle of all action. In contrast, Arendt understands action as "the sharing of words and deeds" among equals. In Habermas' formulation, action is essentially *communicative*. On *this* model—the communicative versus the teleological or instrumental—"the parties are oriented toward agreement and not just toward their respective success" (1983, 173). *Political* power—the power to act together, to act in concert—is generated through the common action of individuals whose interaction is structured in accordance with norms of reciprocity, respect, and equality and for whom agreement or consensus stands "as an end in itself for all parties" (p. 175).

This reading of Arendt's theory of action and concept of power stresses the parallels between her reassertion of the Aristotelian distinction between praxis and *poiesis* and Habermas' fundamental distinction between communicative and instrumental action. It focuses upon the dialogical dimension of Arendt's understanding of politics and asks us to view her notion of the public sphere as one that sets the basic conditions for what Habermas refers to as "coercion-free communication." This is important; for unless political action as communication *is* coercion-free, the consensus that issues from it will have no binding force: it will simply be another expression of insidious or overt violence. Habermas sees the delineation of the public sphere presented in Arendt's *Human Condition* as a phenomenologically inspired attempt to "read off the general structures of unimpaired intersubjectivity in the formal properties of communicative action or *praxis*" (Habermas 1983, 175). Unsurprisingly, Habermas interprets Arendt's conception of the public realm as a prefiguration of his own "ideal speech situation"—the counterfactual elucidation of the formal conditions of coercion-free communication, abstracted (so he claims) from the very structure of communicative action (1987, 315). Theory functions, in both cases, to uncover the gap between current practice and the implicit telos of communicative interaction, the reaching of a "rationally motivated agreement" (p. 315).

While I shall argue that the "consensus" model of politics Habermas attributes to Arendt is problematic, one must acknowledge that Habermas does capture an important dimension of Arendt's theorization of the public realm, as I have argued elsewhere (Villa 1992). In *The Human Condition* and *On Revolution* Arendt consistently emphasizes the idea of the public realm as a space of "tangible freedom"—a space that is physically separate from those of work and labor, bounded or constituted by law, and that can serve as an arena or stage for political action. Not only coercion and violence but all relations of hierarchy or command are excluded from this sphere. The public realm is the space of freedom precisely because it creates an artificial *equality* among persons whose individual talents make them naturally unequal and because it preserves the human condition of *plurality*

by relating and separating persons simultaneously. The public realm is that artificial "world" common to us as citizens, an "in-between" that makes both equality and individuality possible (1957, 7, 26, 52; 1963, 31–32).

Here we encounter the seemingly irreducible *spatiality* of the public realm as conceived by Arendt. Unless this sphere has the power to gather us together, to remove each of us from the private while simultaneously guaranteeing each of us a distinct *place* in this "common world," genuine politics is not possible. Where this sphere is invaded by matters and ends that are not essentially open to debate, plurality is effectively neutered and the public realm loses its three-dimensionality: the "world" ceases to be constituted from a variety of perspectives (1957, 55; see Villa 1992, 286–87). Where this space is forcibly collapsed or eliminated (as Arendt argues it is under totalitarianism), the "boundaries and channels of communication between individual men" are replaced by "a band of iron which holds them so tightly together that it is as though their plurality had disappeared into One Man of gigantic dimensions" (Arendt 1968c, 164). The space between individuals is destroyed, with the result that action is no longer possible. So long as the spatial dimension of the public realm is preserved and the "boundaries and channels of communication" remain intact, freedom in the distinctively Arendtian sense is possible.

Richard Bernstein has argued that Arendt's depiction of the public realm in terms of plurality and equality results in a normative conception of politics that is virtually indistinguishable from that of Habermas (1983, 182–223; 1986, 221–37). Plurality and equality open a space of deliberation oriented toward mutual agreement in which the "force of the better argument" (Habermas) can carry the day. Bernstein glosses Arendt's claim that "debate is the very essence of political life" by offering, as a characterization of what happens in the Arendtian public space, that politics

> involves "no rule," the mutual and joint action grounded in human plurality and the isonomy of citizens where individuals debate and attempt to persuade each other. Persuasion, not force or violence, is the quintessence of political life. Persuasion is not the manipulation of others by image-making. Persuasion involves free, open debate among equals in which we seek to form, clarify and test opinions. (1986, 224)

This gloss has the effect of identifying Arendt's public realm with an arena of communicative rationality in which opinion is gradually purified through the "non-coercively unifying, consensus-building force of a discourse in which participants overcome their at first subjectively biased views in favor of a rationally motivated agreement" (Habermas 1987, 315). While Arendt formally eschews Habermas' moral cognitivism, Bernstein points out that this reading finds support in her Kantian theory of "impartial" political judgment (1983, 216–23; 1986, 228–31).

If Bernstein reveals a fundamental continuity between the Arendtian and Habermasian conceptions of the public realm, Seyla Benhabib reinforces that assimilation by arguing that Arendt's concept of plurality must be seen in opposition to the Hegelian–Marxian model of a "supersubject" externalizing and reappropriating itself, a model that reduces plurality to transsubjectivity (1986, 243–44). The phenomenon of plurality, the basic constitutive condition of politics, is covered over by the "work model of action"—Hegel's and Marx's version of the traditional teleological concept. By emphasizing intersubjectivity and the communicative conception of action, the phenomenological ground of politics is recovered: "The communicative model of action does justice to the experiences of human plurality, . . . for communication is the medium through which plurality is revealed. In acting and speaking we show who we are and our differences from each other" (p. 244). The public realm, understood as a discursive space characterized by symmetry, nonhierarchy and reciprocity, both presupposes, and makes possible, plurality and so provides the opportunity for a politics based on mutual recognition and respect for difference.[1]

Postmodern Objections to the Normative Conception of the Public Realm

The account of public realm theory so far offered dwells on the similarities between Arendt and Habermas. In turning to postmodern objections to this type of theory, I shall continue to ignore, for the time being, the substantial differences between them.

Foucault's work can be understood as a sustained critique of public realm theory and its normative presuppositions. As has been widely noted, Foucault's theorization of modern disciplinary power begins with what Nancy Fraser has called a "bracketing of the problematic of legitimacy" (1989, 19; Taylor 1984). By setting aside the fundamental liberal distinction between legitimate and illegitimate power, Foucault brings to light the "local, continuous, productive, capillary and exhaustive" character of modern power (Fraser 1989, 32; see Foucault 1980b, 93–108, 119). Power's "tightly knit grid of material coercions"—its various microtechniques for the production of docile bodies and self-surveilling subjects—remain invisible so long as we treat it as sovereignty (Foucault 1980b, 105). Yet it is just this anachronistic model of state power based on contract and intended for the preservation of rights that liberal theory asserts again and again by its imposition of the legitimacy problematic. In so doing, the liberal paradigm—the "juridical apparatus"—conceals the increasingly insidious forms of modern discipline and domination (Foucault 1980a, 81–91).

Neither Habermas nor Arendt relies upon the discourse of rights to make their critical points, nor can either be accused of holding a "sovereign model" of power. Both point to the possibility of a positive—as opposed to a merely negative or repressive—power, a power that arises from communicative in-

teraction, from "acting together, acting in concert" (Arendt 1968b, 143; 1968c, 172).[2] The negative or repressive aspects are located elsewhere, and identified with strength, violence, hierarchy, and so on. However, from the Foucauldian point of view, this positive conception of power is too clean. It is anachronistic, a democratic analogue to the state-centered liberal model. Both models of power—the positive one proposed by public realm theory and the negative one upheld by liberalism—blind us to the constitutive workings of modern power and its fundamental role in the production of subjects. Thus, the liberal "bounding" of negative/repressive state power through the notion of rights finds its mirror image in public realm theory's specification of the necessary formal conditions for "unforced agreement." In other words, the public realm theory of Arendt and Habermas simply shifts the "power-free zone" of liberalism (power understood as legitimate coercion) from the private realm to the public, redefining power now as to the "ability to act." Indeed, insofar as the public realm is purified of subjective/strategic interests, it is more rigorously coercion-free than the "power-free" private sphere of liberalism. In both conceptions, however, the error is to pretend that we can use power without its using us.

The severe limitations of public realm theory in coming to grips with the nature of modern power are most apparent in its naive reliance upon conditions of symmetry, nonhierarchy, and reciprocity as adequate guarantees of a "coercion-free" space. As Fraser points out, in a "fully 'panopticized' society, hierarchial, asymmetrical domination of some persons by others would have become superfluous; all would surveil and police themselves" (1989, 49; see Dews 1987, 157, 160–61). Foucault enables us to see how hierarchy and asymmetry (the two primary villains according to public realm theory) are not essential to the smooth functioning of disciplinary power. The formation of autonomous individuals—their subjectification—is not so easily detached from their subjugation (Foucault 1977, 29–30; 1980b, 98). Thus, while it is possible to imagine the realization of the ideal speech situation, this would be nothing more than the achievement of "pseudoautonomy in the conditions of pseudosymmetry" (Fraser 1989, 49).[3] A Foucauldian would therefore insist that public realm theory deal with the normalizing character of communicative action. The criterion of consensus is too blunt an instrument for this task, since it leaves unexamined the self-surveillance of the civically virtuous citizen (who has internalized the hegemonic conception of the public good) or communicatively rational agent (who has internalized the hegemonic conception of what constitutes "the better argument").[4]

The second type of postmodernist objection to the normative conception of the public sphere also focuses upon the ideal of consensus—but from an epistemological, as opposed to a power, perspective. Habermas' strategy for rescuing practical/political questions from technocratic usurpation—for preserving the public realm from system colonization—can be reduced to two basic theoretical moves. The first, which draws on Arendt's distinction between acting and making, involves distinguishing between two types of rationalization in modernity: system and communicative rationalization (Habermas 1970, 92–97; Habermas 1985; Wellmer 1985, 35–66). This distinction enables us to view the "disenchantment" of practical discourse in the modern age as a process separate from, yet parallel to, the growth of purposive rationality: *communicative* rationalization consists in the growing endorsement of the principle that validity claims can and ought to be redeemed only through the medium of reflexive speech. The reference to traditional grounds of validation, which presume a prediscursive legitimacy, is no longer possible.

The appeal to communicative rationality (to legitimation through open dialogue and consensus) works, however, only if Habermas is able to convince us that this rationality is universal (and so able to guarantee the possibility of reaching a *genuine* agreement) yet nonsubstantive. Otherwise, he is open to the Nietzschean/Weberian objection that any noninstrumental concept of reason is dogmatic. Habermas' deployment of what he believes is a philosophically viable procedural account of rationality enables him (so he claims) to take full account of the "disenchantment of the world" and the modern separation of value spheres, while avoiding the Nietzschean or Weberian conclusion that will or decision is the only possible source of meaning in a disillusioned age (Benhabib 1986, 258–263; Habermas 1973, chap. 7). A proceduralist account of discursive rationality enables escape from the polytheism of values—Weber's "warring gods"—that characterizes postmodernity. As long as there are standards of argumentative rationality implicit in speech, we will be able to distinguish a genuine consensus from a false one and decisions based on reason from those based upon will or coercion—right from might.

Lyotard, in particular, is sympathetic to the Habermasian attempt to escape the universalization of functionalist reason, the legitimation of knowledge by power. Indeed, his analysis of the principle of "performativity" in *The Postmodern Condition* mirrors much of the standard Frankfurt School critique (1984, xxiv, 47). Nevertheless, he is extremely skeptical of Habermas' attempt to transfer formal rules for what constitutes a genuine consensus from the scientific or theoretical community to the sphere of politics (p. 30).

Lyotard is, first, dubious about the Habermasian picture of the legitimation of scientific discourse (the privileged model of argumentative rationality). "Paralogy," or "permanent revolution," is opposed to consensus (1984, 60–67; Rorty 1985). Second, and more important for my purposes, he points out how Habermas' attempt to avoid an irreversible fragmentation of the public sphere by providing a procedural mechanism that mediates between the "warring gods" and specifies the formal properties of the

"better argument" is, in fact, parasitic upon an Enlightenment metanarrative of emancipation. This metanarrative, Lyotard asserts, *was* capable of integrating the language games of science and politics through its deployment of consensus via open debate as *the* criterion of legitimate knowledge and institutions (1984, 32, xxiv). Yet once this metanarrative comes under suspicion (and, as Lyotard famously defines it, postmodernity *is* "incredulity toward metanarratives"), the idea that a model of argumentative rationality and agreement derived from science can provide context-independent criteria of validity is itself cast in doubt.

The Habermasian end run around decisionism and the "polytheism of values" depends upon the availability of a metadiscourse that could, potentially, render the "heteromorphorous" language games of social life—each with its own context-dependent rules of legitimation, competence, and application—commensurable. Against the assumption that "discourse" holds the key to identifying context-independent criteria of validity, Lyotard states that "there is no reason to think that it would be possible to determine metaprescriptives common to all of these language games or that a reasonable consensus like the one in force at a given moment in the scientific community could embrace the totality of metaprescriptions regulating the totality of statements circulating in the social collectivity" (1984, 47; see also 1985, 58). Habermas cannot conceive of legitimation in terms other than a "search for universal consensus." As a result, he *must* assume "that it is possible for all speakers to come to agreement on which rules or metaprescriptions are universally valid for language games" (Lyotard 1984, 47).

For Lyotard, this assumption reduces the irreducible heterogeneity of language games. It is an attempt to neutralize the "diversity of discursive species," each subject to its own set of pragmatic rules. Moreover, Habermas assumes that "the goal of dialogue is consensus," that "humanity as a collective (universal) subject seeks its common emancipation through the regularization of 'moves' permitted in all language games, and that the legitimacy of any statement resides in its contributing to that emancipation" (ibid:, 65–66). *This* assumption not only does violence to the heterogeneity of language games, it does violence to the heterogeneity of the players—their plurality—by subjecting all to a regime of discursive practice designed to overcome what Lyotard sees as the *agonistic* dimension of those games (p. 10). The spontaneity, initiation, and difference that characterize agonistic speech are repressed as a model of Kuhnian "normal science" is imposed upon the public sphere. Because of this flattening, antiagonistic, antiinitiatory character of the consensus model, Lyotard concludes that "consensus has become an outmoded and suspect value" and opts instead for a "pagan" politics that breaks decisively with all attempts to ground action and practical decision in a theoretical discourse of justice or legitimacy (1984, 66; 1985, 19–43, 28).

From Lyotard's perspective, the fragmentation of the public sphere—the emergence of discordant language games that results from the postmodern death of totalizing metanarratives—opens the way to forms of political practice and judgment freed from the tyranny of science or *episteme* (1984, 28–29; 1985, 27, 58). "Paganism"—Lyotard's code word for an antifoundationalist politics of opinion, of judgment "without criteria"—rescues the political by unmasking the ideal of a grounded consensus and the theoreticist/Platonist constraints it implies. Lyotard's epistemological rejoinder to the Habermasian construction of the public sphere parallels Foucault's objection in its bracketing of the legitimation problematic. (Lyotard sees this problematic as encompassing any attempt to derive the political from the theoretical, the just from the true, even where "truth" is seen as a function of consensus; see 1985, 25.)[5] Public realm theory conceals the disciplinary underside of "acting together" and covers over the antiagonistic, antiinitiatory implications that flow from the regularization of moves in any language game.

The final objection to public realm theory raised by postmodernism is ontological, so-called because it is directed against the specific reality claimed for the public sphere and the objects within it. It is more directly applicable to Arendt's theory, which presents us with what could be called an ontology of the public realm. Eschewing Habermas' attempt to delineate the public sphere in terms of a specific form of interaction and the rationality appropriate to it, Arendt defines the public phenomenologically, as a "common space of appearances." Plurality has a constitutive, as well as a consensual, dimension. Deliberation and debate from a diversity of perspectives constitutes a "shared world of appearance," a world whose reality is a function of incessant speech about that which lies between us (Arendt 1957, 50–58). From Arendt's point of view, that which "appears in public and can be seen and heard by everybody" is "real." This conviction is expressed in her dictum that "for us, appearance—something that is being seen and heard by others as well as ourselves—constitutes reality" (p. 50).

In making this claim, Arendt is self-consciously aligning herself with Nietzsche's undermining of the Platonic metaphysical distinction between appearance and reality (1977, vol. 1, 10). But where Nietzsche sees this distinction as expressing an ascetic devaluation of life, Arendt sees it as expressing a philosophic hostility to politics. Her desire to "save the phenomena"—her insistence that meaning and reality reside *in* the appearances, not behind or above them—follows Nietzsche's revaluation of the world of becoming (Villa 1992, 287–88). However, Arendt backs away from the conclusion Nietzsche drew when he traced the nihilistic logic set in motion by the institutionalization of the Platonic distinction, the two-thousand-year process by which the "real world becomes a fable": "We have abolished the real world: what world is left? The apparent world perhaps?

. . . But no! with the real world we have abolished the apparent world!" (1979, 41). For Nietzsche, try as we might to divorce it from any transcendental signified, our concept of appearances is irreducibly metaphysical. To presume, as Arendt does, that one can hold onto an "objective," shared world of appearances once all anchors to a transcendental reality are cut loose is, ultimately, to remain entangled in the web of metaphysics.

Arendt believes that the reality of the world, of a common space of appearances, is guaranteed so long as this in-between is the arena for spirited debate and deliberation. Where public spirit and "care for the world" animate a community, Arendt believes, the *sensus communis* remains strong, providing a nontranscendental ground for action and judgment (1957, 208–9, 274–85; 1968a, 221; 1982, 66–72). Such a "common feeling for the world" transcends the local, concretely contextual nature of Aristotelian ethos. At the same time, it makes no claim to providing a cognitive ground for moral/political judgment. Yet this "feeling for the world" is vulnerable, the easy victim of the modern subjectification of the real that Arendt traces in *The Human Condition* (1957, chap. 6, esp. 280–88). Hence the mournful Arendtian leitmotif of modern "worldlessness," the peculiar alienation from the world that accompanies the withering away of "common sense."

Here Deleuze's interpretation of Nietzsche and Baudrillard's theorization of simulacra show us how the "loss of the world" remains trapped within the logocentric/metaphysical logic of the sign. From this perspective, Arendt does not overcome the terms, she merely inverts them. The Arendtian public sphere is a space of genuine appearances, of signs whose play and self-referentiality is restricted by their being "seen and heard by everyone." This implies and preserves an opposition between an authentic, real in-between and its inauthentic, manipulated counterpart—the former both condition and result of action and speech, the latter nothing more than the proliferation of signs/images that only serve further to destroy our feeling for the world. Baudrillard's point is that this way of looking at things (of seeing the "world" as increasingly "dimmed-down" or covered over) does not make a final break with the representational episteme. Postmodernity, on the other hand, has left the "order of appearance" behind: "reality" (including the reality of appearances Arendt wants to preserve) is presently generated as a simulation effect. The "decisive turning point," Baudrillard states, is "the transition from signs which dissimulate something to signs which dissimulate that there is nothing" (1988, 170). Arendt's ontology of the public realm prevents us from seeing just how well and truly lost the world is. Her nostalgia for the "world," for worldliness, is a nostalgia for a common referent—a nostalgia that power is able to exploit for its own ends, in order to "rejuvenate the fiction of the real" (ibid., 178).

REDRAWING THE MAP: RESPONSES AND REPOSITIONINGS

I began by suggesting that the relation between public realm theory and postmodernism/poststructuralism was more complex than Habermas' mapping of it allowed. By starkly opposing the paradigm of the philosophy of the subject and that of mutual understanding, Habermas can present postmodernism/poststructuralism as the coda to an exhausted project, the closure of subject-centered reason, rather than what comes after (1987, 296). Public realm theory stands, in contrast, ready to aid in the positive realization of the modern project, abandoning totalizing critique for the new paradigm.[6]

The danger of this polemical opposition is that it blinds us to the possibility of a different configuration. Once we detach Arendt's conception of the public realm from the problematic that Habermas constructs, a more complex articulation of public realm theory and postmodernism/poststructuralism becomes possible. If we step back from the issues of legitimation and consensus, Arendt's theory reveals a narrative structure that hooks up, in unexpected ways, with the concerns of postmodern/poststructuralist critics.

With respect to Foucault's power objection, one must first acknowledge that Arendt and Foucault are simply talking about different things when they use the word *power*.[7] True, Arendt's related concepts of violence, strength, authority, and so on are scarcely suited to capture the mechanisms that Foucault wants to investigate. Nevertheless, it is obviously inappropriate to presume a common referent here and then to argue that one theorist is right, the other wrong. More important, however, is that Habermas is wrong to treat Arendt's definition of power ("the ability to act together, to act in concert") as implying a consensus-centered conception of the public realm. From Arendt's point of view, plurality is not just a condition, but also an *achievement* of political action and speech: these activities give public expression to difference. The theory of political action presented in *The Human Condition* takes as its ideal an agonistic subjectivity that prizes the opportunity for individualizing action (1957, chaps. 2, 4). Contra Habermas, Arendt views action as an end in itself: its value in no way hinges upon the formation of a rational general will. Like Foucault and Lyotard, she fears that the regularization/rationalization of communicative action leads to the creation of docile subjects.

This concern about the denaturing consequences of a regularized, consensual politics comes across most strongly in Arendt's analysis of postrevolutionary American politics in *On Revolution*. Here she traces how the advent of a representative system transforms the public sphere, substituting voting and judicial decision making for spontaneous, agonistic action (1963, chap. 6). The loss of the "revolutionary spirit" yields a routinized politics of interests and general welfare: *actors* are transformed into *clients* who are

more or less effective in persuading a de facto oligarchy to favor their particular interests. The overall effect of the representative system is, from Arendt's perspective, virtually to eradicate the public space for agonistic action and to redirect political or public energies to the pursuit of private or social goals. The result is an essentially passive, depoliticized citizen body.

The regularization of politics (the containment of its spontaneous, popular, and agonistic dimensions) by the mechanism of representation points us to that larger, peculiarly modern threat to the public sphere—the rise of the social. With the emergence of this inclusive, hybrid realm in the modern age, the conditions of possibility for either a genuine public or private sphere are undermined. Moreover, the ubiquitous functionalization that accompanies the rise of the social imposes its own constraints on agonistic political action. As Arendt puts it:

> It is decisive that society, on all its levels, excludes the possibility of action, which formerly was excluded from the household. Instead, society expects from each of its members a certain kind of behavior, imposing innumerable and various rules, all of which tend to "normalize" its members, to make them behave, to exclude spontaneous action or outstanding achievement. (1957, 40)

It is here that Arendt's concerns most nearly intersect with Foucault's. Once we see Arendt's public realm as a space for agonistic action denatured by the normalizing power of the social, we can make suggestive connections to the Foucauldian story about the take-off of disciplinary power in the modern age. Arendt hardly shares Foucault's desire to develop a politics of everyday life. Nevertheless, they are both concerned to tell the story of how an essentially theatrical space (the agonistic public realm of Arendt, the premodern public realm of spectacle in Foucault) is colonized by a new form of disciplinary or "socializing" power, a power that substitutes an institutionally dispersed and normalizing regime of panoptic visibility for a centralized space in which *action* is seen and heard by all. The telos of this transformation, for both Arendt and Foucault, is the better preservation, cultivation, and management of the state's most precious resource, its populace. There is, I would suggest, a direct line to be drawn from Arendt's conception of the state as "national household" to Foucault's notion of biopower (Foucault 1980a, 140–43; 1988).

Foucault and Arendt are linked, moreover, by a concern to preserve forms and spaces of popular, spontaneous action ("counter-power") from encroaching bureaucratic structures. (Compare, for example, Arendt's emphasis on the spontaneous, popular nature of revolutionary action in *On Revolution* to Foucault's defense of direct forms of popular justice in *Power/Knowledge*; see Arendt 1963, chap. 6 and Foucault 1980b, 27–32.) Reading Arendt and Foucault in this manner suggests that Arendt's highly specific, exclusive notion of political action is not *contradicted* by Foucault's account of power. Rather, they present complementary narratives about the closure of the space for action in the modern age. From this standpoint, the Foucauldian concept of "resistance"—of local struggle against power/knowledge regimes—can be seen as a successor concept to Arendt's notion of political action. Where the space for action is usurped—where action in the strict sense is *no longer possible*—resistance becomes the primary vehicle of spontaneity and agonistic subjectivity.[8]

The reading I have just sketched moves Arendt's public realm theory from the legitimation problematic to that of agonistic subjectivity. The "structures of unimpaired intersubjectivity" that Habermas stresses give way to a performance-centered conception of action framed in terms of a narrative about the closure of the public space in the modern period. This displacement reveals similar continuities with Lyotard's project. A consistent theme in Arendt's work is the hostility of truth to politics. At no point in her thought on the nature of political action does she embrace moral cognitivism or indicate a belief in *theoretical* criteria that could distinguish a genuine from an inauthentic consensus. For Habermas, the Arendtian repudiation of the will to truth in politics is evidence of an anachronistic (Aristotelian) conception of theory (1983, 194). This objection, however, surely misses the point. The reason that Arendt sees "a yawning abyss between knowledge and opinion that cannot be closed by rational argument" is that her conception of political action is antiteleological (p. 194). Like Lyotard, she disputes the Habermasian assumption that "the goal of dialogue is consensus." Her account emphasizes action as an end in itself—the *performance*, as opposed to the *product*, of praxis.

Arendt, then, shares Lyotard's generally agonistic conception of speech. For both, "to speak is to fight, in the sense of playing, and speech acts fall within the domain of a general agonistics" (Lyotard 1984, 10; see Arendt 1957, 41–42). Moreover, her emphasis on the initiatory dimension of action ("to act . . . means to take an initiative, to begin") parallels Lyotard's focus upon the speaker's ability and need to create new moves, invent new criteria (Arendt 1957, 177; Lyotard 1985, 61). Arendt views the obsession with forming a rational general will as inevitably normalizing and destructive of plurality. In order to preserve this plurality from the regularizing force of consensus and theory, she endorses a "pagan" politics of opinion, of judgment "without criteria." Lyotard's slogan that there can be no "derivation of the political from the theoretical" captures the spirit of Arendt's own vehement anti-Platonism (Lyotard 1985, 26–27).

But if Lyotard's idea of a politics founded "on the basis of opinion" seems largely derivative of Arendt, there remains one seemingly irreconcilable difference. Lyotard celebrates the fragmentation of the public space; he glories in the heterogeneity this fragmentation produces. The only criteria of legitimacy he recognizes are local and context-specific, first-order narratives, as opposed to metanarratives/metadiscourses. In *Just Gaming*, this position brings

him very close to identifying the Aristotelian idea of an ethos as the sine qua non of a politics "without the Idea of Justice" (1985, 26). Arendt, whose own theory of political judgment presents a similar mix of Aristotelian, Kantian, and Nietzschean elements, avoids the relativist consequences of postmodern pluralism by appealing to the Kantian idea of a *sensus communis*, a common feeling for the world, which provides a nontranscendental basis for judgments making a universal claim of validity (Arendt 1968a, 220–21; see Villa 1992, 301–2). Lyotard views the appeal to the *sensus communis* as an act of bad faith: the withering away of common sense in postmodernity means, simply, that "there cannot be a *sensus communis*" (1985, 14). According to Lyotard, there is no escaping the fact that *we* "are in the position of Aristotle's prudent individual, who makes judgments about the just and the unjust without the least criterion" (ibid.).

As in the case of Foucault, the opposition here is less dramatic than it first appears. Arendt does not dogmatically assert the existence of "a common feeling for the world" in a last-ditch effort to avoid acknowledging the inescapable fragmentation of the public sphere. If, as with Foucault, we see Arendt as essentially providing a narrative about modernity, then we also can see that she hardly disputes the postmodern assertion that reliance upon the *sensus communis* is no longer possible. The last part of *The Human Condition* is an extended meditation on how the energies of modernity have worked to dissipate our feeling for the world. The "worldliness" presupposed by the *sensus communis* is *not* a distinguishing characteristic of the *animal laborans* and the late modern polity. Indeed, Arendt would go further than Lyotard on this score: the "blurring of boundaries" effected by the modern rise of the social destroys the integrity of language games and local contexts. The ground necessary for anything approximating an ethos is lacking (Arendt 1957, chap. 2, sec. 6 and chap. 3, sec. 17).

This brings us, finally, to the ontological objection. If, as I have suggested, Arendt's public realm theory shares the Foucauldian/Lyotardian concern with the preservation of agonistic subjectivity—if we see her as calling for a politics that stresses plurality, difference, spontaneity, and initiation against the regularizing apparatus of consensus—*then* the relation between her theory and poststructuralism/postmodernism is quite different from that suggested by the Habermasian mapping. Can a similar "shift" be effected with respect to the ontological objection? I would answer *no*: here we confront *the* insurmountable difference between Arendt's public realm theory and postmodernism. This difference is *not*, as some might suggest, the result of a misplaced foundationalism or realism on Arendt's part. Rather, it is a question of profoundly different attitudes toward a single phenomenon, the "de-worlding of the world" (to use Heidegger's phrase). Arendt mourns what the postmodern celebrates, the loss of certain ontological dimensions of human existence (action, the shared public world, the self as performance). The postmodern blurring of boundaries, the effacement of any meaningful distinction between the authentic and the inauthentic—reality and its simulacra—renders the Arendtian idea of the phenomenal integrity of a distinctly *political* realm simply nostalgic.[9] Arendt chooses, if not to *recover* the public realm, at least to preserve its memory. The "affirmative nihilists" of postmodernity wish to have done with such guilty nostalgia, viewing it as one more symptom of essentialism. There *is* a choice here, but it is not the one offered by Habermas. It is the choice between a politics of mourning and a politics of parody, a politics that remembers the *res publica* and a politics engaged in the endless subversion of codes.[10]

Notes

I thank Bill Connolly, Fred Dolan, Bob Gooding-Williams, Tom Dumm, and Austin Sarat for their comments and criticisms.

1. In a recent essay, Benhabib (1992) contrasts Arendt's model of an agonistic public space to Habermas' "discursive" model. Having previously argued that Habermas' theory of communication does justice to the phenomenon of plurality (Benhabib 1986), she attempts to show how the agonistic dimensions of Arendt's conception presuppose untenable distinctions (e.g., between the social and political) and exclusions. The upshot of both treatments is that Habermas absorbs what is valuable in Arendt's public realm theory, while avoiding its more "anachronistic" (Greek) features. In contrast, I believe Habermas has radically foreshortened the phenomenon of plurality and that the expression of this phenomenon demands something like Arendt's agonistic conception of political action. Cf. Connolly 1991.

2. In this regard, see the interview between Foucault and Rabinow, Charles Taylor, Martin Jay, and Richard Rorty (Foucault 1984, 373–80). Foucault is asked to comment upon the "Arendtian/Habermasian" conception of power (p. 377). His response is minimal: he admits the need to hold onto the notion of "consensual politics" as a regulatory principle, a statement that echoes his view in "The Subject and Power" (1982), where he takes a stand against nonconsensual power relations while remaining wary of the concept of consensus *überhaupt*. He fudges the question with specific regard to Arendt by stating: "It seems to me that in many of the analyses that have been made by Arendt, or in any case from her perspective, the relation of domination has been constantly dissociated from the relation of power. Yet I wonder whether this distinction is not something of a verbal one" (p. 378).

3. It should be added that Fraser rejects this possibility.

4. Hence, Foucault's ambivalent or ironic attitude toward the notion of consensuality. See n. 2. See Dumm 1988.

5. This bracketing leads Seyla Benhabib to mount a criticism of Lyotard parallel to Fraser's critique of Foucault. See Benhabib 1984, 114–15.

6. In fairness to Habermas, it should be noted that this mapping (at least as regards public realm theory) has been largely accepted by poststructuralist/postmodernist critics.

7. Janicaud (1992) points out that the critique Habermas offers of Foucault's theory of power substitutes the German *macht* for the French *pouvoir*, thereby eliding the distinction between *puissance* (strength) and *pouvoir* (power). This elision, similarly found in the English translation, facilitates the critique of Foucault as "normatively confused," a charge made by Habermas (1987), Fraser (1989), and Taylor (1984). But, Janicaud points out, *pouvoir* is typically reserved for "specific juridical–political forms and moralities" (1992, 284). Thus, while Foucault and Arendt use *power* to designate two

different phenomena (the juridical–disciplinary apparatus and concerted popular action), there is hardly the generalized conflation of power, strength, violence, and so on in Foucault that some of his critics charge. As Foucault makes clear in a number of places (esp. 1982, 220), he is sensitive to the kind of distinctions Arendt makes in "On Violence"; indeed, he considers them essential. The fact that he prefers to call popular action, à la Arendt, "counter-power" needs to understood against the background of his thesis concerning the ubiquitous, capillary, and productive nature of disciplinary power.

8. I should note that for Arendt, resistance *is* a form of action (1968a, pref.).

9. There is an obvious parallel here to Derrida's charge that Heidegger, while deconstructing the metaphysics of presence, nevertheless betrays a nostalgia for presence in his employment of the metaphorics of nearness and farness (of Being). See Derrida 1976, 22, 143; Derrida 1980, 130, 133. For a response to Derrida's critique, see White 1991, 65.

10. Fraser (1990) offers a critique of the Habermasian public sphere along quasi-Lyotardian lines, one that suggests an alternative beyond the purely mournful or subversive attitudes I have sketched. Arguing that the accordance of normative status to a singular, comprehensive public sphere enables domination via discursive means, Fraser opts for a more flexible theorization of the public sphere that makes room for a plurality of competing publics. This move from a strong normative conception to a more phenomenological account has the virtue of expanding our view of available and politically relevant discursive spaces by including "subaltern counterpublics" as crucial alternative forms of publicity. Fraser believes that participatory parity is better achieved by the cultivation of multiple publics that interact agonistically, rather than by the attempt to encompass all within one deliberative paradigm. Whether or not one finds Fraser's attempt to split the difference between postmodernism and public realm theory persuasive, it does serve to highlight one important consequence of Arendt's shift away from the legitimation problematic. Once this shift is made, the idea of the "public sphere" ceases to function in an essentially normative capacity. No longer setting the standards for genuine agreement or a just being-together (except in a minimal way, e.g., the prohibition of force and violence), public realm theory, in Arendt's hands, transforms itself into narrative, telling a story that keeps alive the memory of an agonistic public realm. If we overcome Arendt's nostalgia for an integral public realm, narratives such as those offered in *The Human Condition* and *On Revolution* can be seen as enabling us to identify, and see as significant, practices and spaces that would otherwise be overlooked: wherever we find agonistic spontaneity, resistance, and theatricality, there we find a *political* practice. The result is the cultivation of an agonistic political ethos that avoids claiming more for "subversive practices" than these practices can bear but that also eschews the alternative of mournful withdrawal.

RESEARCH NOTES

SOCIOECONOMIC CLASS BIAS IN TURNOUT, 1964–1988: THE VOTERS REMAIN THE SAME

JAN E. LEIGHLEY *Texas A&M University*
JONATHAN NAGLER *University of California, Riverside*

We address the question of whether class bias in the American electorate has increased since 1964. We analyze the Census Bureau's Current Population Survey and the National Election Studies for seven consecutive presidential elections, 1964–88. Our results show that conclusions regarding changes in class bias are sensitive to which measure of socioeconomic class is used—income, education, or occupation. We argue that income is the appropriate measure since government policies that discriminate based on socioeconomic class are most likely to do so based on income and there are measurement problems associated with using either education or occupation over time. Our analysis shows that there has been almost no change in class bias in the electorate since 1964.

Who votes? has endured as a central question throughout several decades of electoral research. Much of this research has focused primarily on the demographic correlates of voter turnout. The common wisdom that education, income, and age are positively associated with turnout in presidential and off-year elections has been demonstrated most persuasively by Wolfinger and Rosenstone (1980) and supported by a score of other analyses (Cassel and Hill 1981; Conway 1981; Teixeira 1987; see also our work, Leighley and Nagler 1992).

While these analyses imply that voters are of higher socioeconomic status than nonvoters, the magnitude of the difference and, more importantly, its stability over time are disputed. Burnham (1982, 1987a), Bennett (1991), and Reiter (1979) argue that turnout decline since the 1960s has been significantly greater among low-status groups than high-status groups, while both Cavanagh (1981/82) and Teixeira (1987), using different measures and different time periods, claim otherwise. Any claim of disproportionate decline in turnout among one class of the potential electorate has troubling normative implications: if a predominantly upper-class actual electorate emerged from the low level of turnout, then we would expect policies chosen by elected officials to reflect such an elite bias; and representational ideals would suffer (Key 1949). Alternatively, had the decline in turnout since 1960 occurred equally across all social classes, then, at least in terms of representational equality, the character of the democratic process would not be altered.[1]

We challenge the conclusion that the post-1960s decline in voter turnout is marked by a large increase in socioeconomic class bias in the electorate. We examine the relative turnout rates of different demographic groups from 1964 through 1988 and demonstrate that there is actually remarkable stability in these relative rates over this period. Using multivariate analysis, we show that the effect of income on turnout has remained stable. In addition, we demonstrate why other scholars have reached a different conclusion regarding the change in class bias in the electorate.

ANALYZING TURNOUT

There are several possible reasons for disagreement regarding changes in the effects of socioeconomic status on turnout. First, observed effects will depend upon the choice of election years. Examining different years may generate conflicting findings for either of two different reasons: the sample estimates may be unstable from year to year, or the true population parameters may change from year to year. Attempts to solve the first problem by pooling the data across elections make the strong assumption that the effects of demographic characteristics on turnout do not change from year to year (see Teixeira 1987). If this assumption is incorrect, then, pooling the data sets may solve the problem of unstable coefficients but introduce yet another: the pooled model will be badly misspecified; hence, the resulting estimates will be biased and inconsistent (Johnston 1984).

A second possible reason for differing findings is that analyses of turnout often use reported, rather than the validated, vote. To the extent that misreporting is associated with other hypothesized correlates of turnout, findings based on the reported vote alone may simply be wrong (Hill and Hurley 1984). Katosh and Traugott (1981) and Sigelman (1982) assert that most inferences based on reported vote will remain true when the validated vote is examined. However, Abramson and a number of colleagues have shown quite persuasively that blacks are more likely than whites to overreport (Abramson and Claggett 1984, 1986; Silver, Anderson and Abramson 1986; Anderson and Silver 1986). Since race and income are correlated, inferences about the effect of income on turnout based on the reported vote may be biased, as well.

Third, disparate findings may arise from the choice and measurement of variables included in multivariate models. Since many of the demographic factors commonly included in studies of turnout are highly correlated (e.g., race, income, and education), the estimated effects of each factor will be extremely sensitive to the inclusion or omission of other factors (Johnston 1984). For instance, including occupation as a variable will alter estimates of the effects of income, education, and sex on turnout. Thus, comparison of findings regarding the latter three items across studies that are not consistent with regard to the inclusion of occupation becomes impossible.

Finally, conclusions regarding the representation of the socioeconomic groups in the electorate will necessarily be affected by the validity of the measurement of socioeconomic status. As shown by Wolfinger and Rosenstone (1980), the three standard indicators of socioeconomic status are related to turnout in different ways. This suggests that conclusions regarding socioeconomic class bias may be sensitive to which measure of socioeconomic status is chosen. Much of our analysis is devoted to demonstrating this point.

THE TURNOUT DATA

We analyze voting turnout in the presidential elections of 1964 through 1988 using the Current Population Surveys (CPSs) from the Bureau of the Census, as well as the American National Election Studies (NES) of the same years. We begin in 1964 because it marks the beginning of the long-term post-1960 decline in presidential turnout. Thus, we are able to examine whether that aggregate turnout decline has been distributed unevenly among different socioeconomic groups. Since 1964 is also the base year used in Burnham's (1987a) calculations, we can compare our findings to his. The CPS is a monthly survey of individuals conducted by the Bureau of the Census. Each November of even-numbered years the survey includes a set of questions about individual voting behavior, as well as the standard battery of monthly questions about respondents' income, education, occupation, and other demographic characteristics. Because the original data from the 1964 and 1968 CPS surveys are no longer available, our analysis for those years is limited to information available in Census Bureau reports. For the 1972–88 elections, we are able to provide a significantly richer analysis of changes in the electorate.

The CPS data offer several advantages in analyzing turnout in presidential elections due to sample sizes. In each election year there are from 89,000 to 115,000 valid respondents, approximately 50 times the number of respondents available in comparable NES data sets. This means that estimates of population parameters are much more precise. We are able to determine whether year-to-year variations in parameter estimates are the result of actual changes in the true parameters (i.e., changes in the real world), rather than simply being artifacts of the limited precision of sample estimates. While the NES data allow for estimating the effects of highly correlated measures, the limited sample size precludes firm conclusions regarding the *stability* of the population parameters from year to year.[2]

We compute turnout from the CPS as the percentage of respondents who report that they voted in the recent presidential election relative to respondents who provide valid responses to the question. This is slightly different from the Census Bureau's procedure.[3] The Census Bureau treats individuals with no response to the vote question as nonvoters for the purposes of their turnout calculation. Hence, our estimates of reported turnout are consistently higher than the Census Bureau figures.[4]

Since the NES is the standard source for studies of voter behavior, we compare our central findings to similar analyses of the NES data. In addition, we compare our findings based on the reported census vote to an analysis based on the NES validated vote for each election from 1964 through 1988, excluding 1968 and 1972.[5]

In the analyses that follow, we analyze class bias in six ways: (1) we report turnout rates for different socioeconomic groups; (2) we plot the relative turnout rates for different income groups over time; (3) we compute modified Gini coefficients based on income quintiles to obtain income-based measures of class bias that are based on the entire population, rather than the extremes of the income distribution; (4) we compare the turnout gap across all three types of measures (income, occupation, and education) to assess the sensitivity of findings to the choice of measure; (5) we analyze misreporting rates across class groups to test the robustness of our findings based on the reported vote; (6) we estimate a multivariate model using both the reported vote and the validated vote, to test for stability in the marginal effect of each measure of class.

TURNOUT AND SOCIOECONOMIC STATUS

Exactly how the socioeconomic composition of the electorate might have changed between 1964 and 1988 is not obvious. Examination of Census Bureau data shows that the percentage of high school graduates in the bottom income group rose 29.2% from 1964 to 1988, compared to only 16.5% for the top income group. Similarly, the percentage of high school graduates among blue-collar workers and white-collar workers increased by 35.4% and 14.3%, respectively. Since increases in levels of education have occurred more among the lower socioeconomic groups, we would expect the participation gap between the lower and upper socioeconomic groups to *decrease*. Alternatively, the poor were more likely to be young and single and to reside in female-headed households in 1988 than they were in 1964. We would

expect the first two of these changes to lead to lower voting rates among the lower-income group, that is, ceteris paribus, a *larger* participation gap in 1988 than in 1964.

The last, in fact, is the claim that Burnham makes: "The post-1960 turnout decline has been concentrated among those who had already participated least in the 1940–60 period" and is "strikingly selective" (1987a, 124–5). Burnham argues that after 1968, the low-cost information supplied by partisanship for voters became irrelevant in the new image-based politics. According to Burnham, the electoral consequences of these changes have not been equal across social classes because the participation of low-status individuals is more heavily dependent upon political institutions (e.g., party mobilization) than on personal resources.

Burnham (1987a) provides evidence for this thesis using data on working- and middle-class turnout in presidential elections in Boston from 1964 through 1984 and census data on the turnout of various occupational groups at two points in time. Census data for 1964 and 1980 show that the turnout rate of men classified as manual labor (blue-collar) dropped from 66.1% in 1964 to 48% in 1980. During this same period the rate for white-collar men dropped from 83.2% to 73.0%. Thus, while blue-collar male turnout dropped 18.1%, white-collar male turnout dropped only 10.2%. This differential decline is what Burnham refers to as "selective demobilization."

Reiter (1979) also claims that the class bias in turnout has increased. Rather than using occupation as a measure of class, he compares income quartiles for white NES respondents from 1960 through 1976. According to these figures, the gap between the voting rate of the top and bottom income quartiles has gone from 18.2% in 1960 to 28.7% in 1976. However, these findings are restricted to whites and hence may not provide an accurate picture of the entire electorate. This is particularly important because the time span Reiter focused on encompasses the large change in black turnout following the enactment of the 1965 Civil Rights Act. Basing conclusions on only the top and bottom quartiles of the income distribution also ignores possible changes in the turnout pattern of the middle two quartiles.

Bennett (1991) measures class bias in voting by education level and draws the same conclusion as Reiter for *whites under the age of 35*: class bias has increased. He reports that from 1964 to 1988, turnout among college graduates in this group went from 71% to 59%, while among whites without any college years, turnout dropped from 63% to 31%.[6] Bennett's findings bear less directly on the question of socioeconomic class bias in the electorate because the distribution of education in the population has changed so much from 1964 to 1988. According to the NES data, in 1964 only 30% of whites under 35 had some college experience. In 1988 the size of this group increased to 45% of whites under age 35.[7] Hence, Bennett is comparing a relatively high-status group in 1964 to a relatively lower-status group in 1988; persons who had attended college were rare in 1964 compared to 1988. Thus, the temporal nature of education as a measure of socioeconomic status can thwart attempts to measure change in the socioeconomic voting gap.

Finally, Cavanagh (1981/82), who reports no net change in class representation since the 1950s, provides evidence contradicting these conclusions. Dividing the NES data into thirds rather than quartiles, he computes a class bias ratio defined as the ratio of the turnout rate of the top third income group to the turnout rate of the bottom third income group. He points out that the years 1960 and 1964 were relative lows in class bias for the postwar period and that in fact the class bias scores for 1972 and 1976 are approximately the same as those for 1952 and 1956. This evidence highlights how critical the choice of years is in drawing inferences regarding changes in socioeconomic class bias. It is also interesting to note that the time period that Cavanagh describes as being marked by unusually low socioeconomic class bias includes the election year (1964) that Burnham uses as a base for his calculations.

That Cavanagh's claim of no change in class bias is based on an income measure suggests that the choice of socioeconomic status measures may be critical for the conclusions drawn regarding socioeconomic class bias. Burnham (1987a) based his conclusion regarding the 1964–80 period on only one measure of socioeconomic status, occupation.[8] There are three reasons to prefer income to occupation as the relevant measure of socioeconomic status. The first reason is fundamental to the entire exercise; income is the more relevant measure with regard to government policy. Few government programs convey benefits based solely on occupation. Instead, government policies are debated in terms of their effect on the rich versus the poor; and many government policies explicitly distinguish between individuals based on income: the tax code, Medicaid, Aid for Families with Dependent Children, and so on. The second and third reasons are based on the ambiguity in measuring occupational status. Some occupations may be difficult to classify as either white-collar or blue-collar in a given year. Finally, the socioeconomic class rankings of occupations may not be stable over time.

Table 1 shows the overall turnout rate for presidential elections from 1964 through 1988, as well as the turnout rate by different measures of socioeconomic status: income, occupation, and education. Individuals' family income is coded into quintiles, using the overall family income distribution among the potential electorate (i.e., among individuals over the age of 18) for 1964–88. Quintiles of income are used, rather than reported family income for each election year, so that the indicator reflects socioeconomic status instead of absolute wealth. This is especially appropriate for comparisons across time, since an individual's ranking in the income distribution is more comparable over time than is the individual's absolute income level. (See Table A-1 for the exact size of each income quintile.)

TABLE 1

Turnout by Demographic Characteristics (1964–88, Current Population Surveys)

DEMOGRAPHIC GROUP	1964	1968	1972	1976	1980	1984	1988

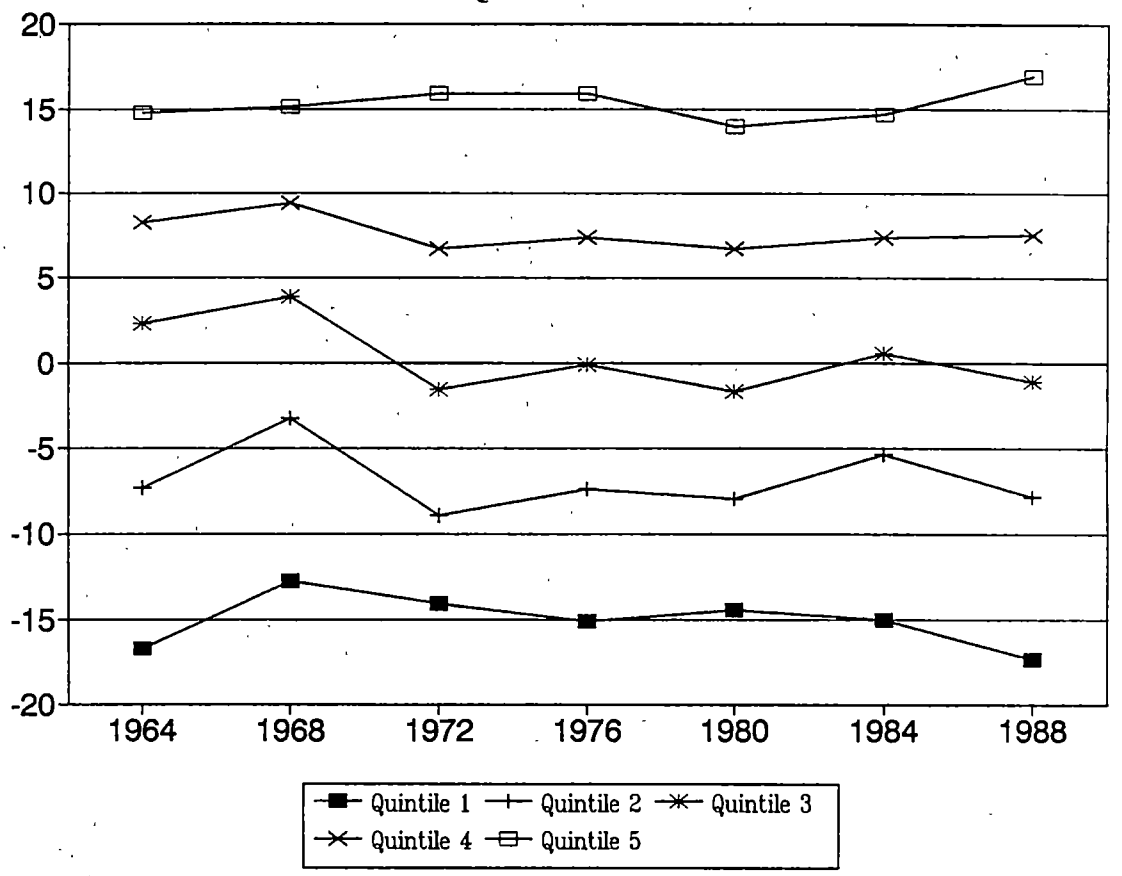
Post-college	88.2	86.9	87.4	85.2	84.9	84.4	83.9

Note: Table entries are the reported turnout rates for each demographic category.
[a]For 1964 *college grad* and *post-college* are only available in combined form.

In any given year, the socioeconomic class bias in turnout is clear, with the highest-income group typically voting at over 70%, and the lowest-income group typically voting close to 50%. However, the wide range in turnout across income groups does not imply a significant change in *relative* turnout rates over time. From 1964 to 1988, turnout of the lowest-income group dropped 11%, while turnout for the highest-income group dropped 8.3%, suggesting only a slight increase in socioeconomic class bias.

If we consider the time period 1964–80 (used by Burnham 1987a), we find that turnout dropped 6% for the lowest-income group and 9.1% for the highest-income group. This suggests that based on income, class bias actually *decreased*. These findings highlight how critical the choices of time period and measures of socioeconomic status are to conclusions regarding class bias (points to which we shall return shortly). Moreover, they provide preliminary evidence that Burnham's conclusions regarding class bias across the 1964–80 period are largely a function of his choosing occupation as a measure of socioeconomic status.

Figure 1 graphs the difference between the turnout rate of each income group and the overall turnout rate for 1964–88. This provides a measure of the changes in each income group's turnout relative to changes in the overall level of turnout for each year. Disproportionate decline in the turnout of one class would be reflected in the difference between that class's turnout and overall turnout becoming increasingly negative over time. The larger the negative turnout difference, the greater the underrepresentation of that class. Thus, if a group's representation among voters is declining, as Burnham (1987a) claims, we should see a negative slope to its line in Figure 1.



This is not the case for lower-income groups. Between 1964 and 1988, there is only a marginal change in the difference between turnout rates for the two lowest-income groups and the overall turnout rate—from 16.8% and 7.4%, respectively, in 1964, to 17.4% and 7.9%, respectively, in 1988. The greatest decline in turnout relative to the overall rate between 1964 and 1988 actually occurs for the middle-income quintile, with a change from +2.3% to −1.2%, while the only increase in turnout occurs in the highest income group (from 14.7% to 16.8%).

Each of these differences, however, is exaggerated by relatively large changes between 1984 and 1988. If the turnout differences were compared for 1964 and 1984, we could report that relative turnout of the two lowest-income groups had increased, the middle-income group had declined slightly, and the relative turnout of the upper-income groups had basically remained stable.

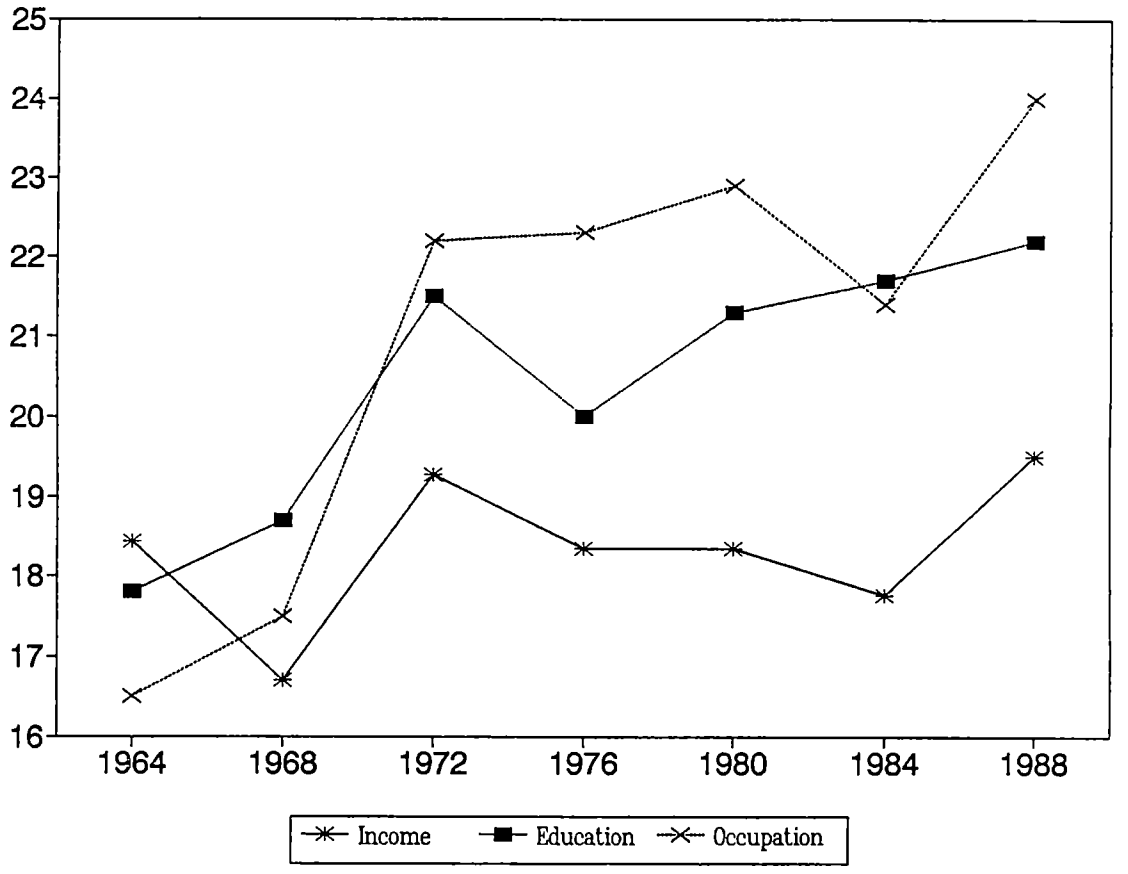
If we restrict the analysis further to the 1964–80 period used by Burnham (1987a), we would, again, reject the selective demobilization claim. Between 1964 and 1980, the relative turnout of the lowest-income group actually increased slightly—the only group to do so. Slight declines in the turnout difference for the upper two income groups, as well as the next-to-lowest-income groups, occur, while the middle-income group experiences the largest relative decline in turnout across the 1964–80 period. Thus,

FIGURE 1

Difference between Turnout for Each Income Quintile and the Overall Turnout Rate

Source: Computed from the Current Population Surveys, 1964–88.

restricting the time period to that used by Burnham does not change our initial conclusion that socioeconomic class bias in the electorate has not increased since 1964.



A more precise measure of the relative representation of low-income versus high-income individuals in the electorate is derived from the CPS data using a modification of the Gini coefficient. Gini coefficients are usually used as measures of income inequality of societies (e.g., the amount of wealth held by the richer, compared to the amount held by the poorer, members of society). We have modified the calculation of it slightly to make it a measure of electoral representation for different income groups. Though the Gini coefficient is not typically used in analyses of turnout, it offers two advantages. First, it is a calculation that makes use of all the voters, rather than merely the extremes of the income range used when turnout difference scores are calculated based on the turnout of the highest- versus lowest-income groups. Second, it gives a bounded measure that can be compared across years. These advantages are especially valuable to resolve the class bias dispute, given that findings based on simple comparisons of the lowest- to the highest-status groups may depend upon the size of the groups chosen.

Each year, the CPS categorizes respondents in one of 14 income groups. We computed 14 pairs of points for each year—the percentage of persons at or below each income level paired with the percentage of voters at or below that income level. The pairs were ordered by ascending income level, then plotted on the x- and y-axes. The Gini coefficient is defined as twice the area between this curve and a 45-degree line. If equal percentages of persons voted regardless of their income level, then the pairs should trace a 45-degree line; and the Gini coefficient would be zero. Alternatively, if the only persons who voted were those persons in the highest-income group, then all points except the final one would lie on the x-axis, and the Gini coefficient would be one. Thus, the Gini coefficient is bounded by zero and one, with zero representing perfect equality of representation by income groups and one representing a situation where all of the votes are concentrated in the hands of the top-income group: the higher the Gini coefficient, the more unrepresentative the voting population is.[9]

The Gini coefficients, reported in Table 1, follow a pattern that is the inverse of overall levels of turnout; that is, when turnout decreases, the Gini coefficient increases, and vice versa. During the 1964–88 period,

FIGURE 2

Trends in Class Bias, Using Various Measures of Socioeconomic Status

Note: Income bias is the difference in turnout rates between the top and bottom halves of the income distribution. Education bias is the difference in turnout rates between high school graduates and non–high school graduates. Occupation bias is the difference in turnout rates between white-collar and blue-collar workers.
Source: Computed from the Current Population Surveys, 1964–88.

there is again no secular trend of increasing unrepresentativeness of the electorate based on income. Were the lower-income groups voting less or the higher income groups voting more, we would see a consistent increase in the Gini coefficients over time. Instead, the Gini coefficient is almost unchanged from 1976 to 1980 and drops from 1980 to 1984. It is only in the 1988 election that the Gini coefficient shows a sizable increase.[10]

SELECTIVE DEMOBILIZATION AND ALTERNATIVE MEASURES OF SOCIOECONOMIC CLASS

So far, we have determined that with income as a measure of socioeconomic class, there has been virtually no increase in class bias between 1964 and 1984 and that 1988 stands out in contrast to that stability. To the extent that this finding is solely a function of using income, rather than occupation, as a measure of socioeconomic status, we have not resolved the class bias controversy but, instead, merely added to it. We now explicitly consider Burnham's (1987a) claim regarding selective demobilization by comparing estimates of class bias using occupation groups, education, and income as alternative measures of socioeconomic status. For ease of comparison, we have plotted turnout differences between upper- and lower-status groups using each of the three measures. Figure 2 plots these differences for (1) the top 50%, versus the bottom 50%, of the income distribution; (2) white-collar workers versus blue-collar workers; and (3) high school graduates versus individuals with fewer than 12 years of school.[11]

So far as education, income, and occupation reliably measure the same underlying trait (socioeconomic status), each indicator of socioeconomic class should generally follow the others across time. According to Figure 2, the level of socioeconomic bias associated with occupation increased significantly between 1964 and 1988. The lower occupation group (manual labor) has a sharply reduced voting rate vis-à-vis the higher occupation group (white-collar workers) in 1988 compared to 1964; the gap is 24% in 1988 compared to 16.5% in 1964. Consistent with

TABLE 2

Turnout by Demographic Characteristics (1960–88, National Election Studies)

Post-college	96.3	87.7	89.4	89.9	87.1	90.7	90.6	92.4

Note: Table entries are the reported turnout rates for each demographic category.

Burnham (1987a), this gap is also evidenced when comparing 1980 to 1964.

Figure 2 also shows that the socioeconomic bias associated with income—the difference in turnout between the top 50% and bottom 50% of the income distribution—rose from 1968 to 1972. However, the increase is less than half the increase shown by the occupation gap. Furthermore, the income gap in 1968 was exceptionally low; the 1972 income gap is actually less than 1% above the 1964 income gap. The socioeconomic bias associated with education—the gap between turnout rates of high school graduates and nongraduates—also increased significantly less from 1968 to 1972 than did the occupation gap, according to Figure 2. Thus, the substantive conclusions drawn regarding selective demobilization are indeed sensitive to the choice of measure used. Claims regarding selective demobilization cannot be sustained when using income as a measure of socioeconomic status.

Several points cause us to question the validity of occupation as a measure of socioeconomic status. First, the majority of the drop in relative voting rates among the occupation groups occurred in one time period: from 1968 to 1972 the voting gap between the two groups increased from 17.2% to 22.2%. This suggests that rather than being a secular trend over the time period identified by Burnham (1987a), the turnout decline for manual labor actually occurred between the 1968 and 1972 elections.[12]

Second, the education gap, as well as the income gap, decreased in 1976, while the occupation gap continued to rise. If the variables plotted in Figure 2 measure the same phenomena—turnout differences as a function of socioeconomic status—then they should move in the same direction (and, ideally, with the same magnitude) from year to year.

Third, were occupation a reliable measure of socioeconomic class during this period, then we should see similar patterns of turnout for occupational groups using the NES. Instead of replicating the CPS findings, the NES shows quite different patterns of turnout for blue- and white-collar workers over time (see Table 2). For instance, between 1968 and 1972, when Burnham (1987a) reports a significant change in relative turnout levels, the NES data show that turnout for blue-collar workers is fairly stable (59.1% in 1968, 68.3% in 1972), while turnout for white-collar workers drops from 86.4% in 1968 to 82.1% in 1972. Thus, the turnout differences between white-collar and blue-collar workers for 1968 and 1972 are 17.4% and 13.8%, respectively. This suggests that across these two elections, with occupation measures from the NES, socioeconomic class bias actually *decreases*.

Having presented evidence suggesting that occupation is less reliable an indicator than education or income, we now offer an alternative explanation for the drop in relative turnout between 1968 and 1972 among the lowest occupation categories observed by Burnham (1987a). Since these two elections spanned a decennial census, the changes the Census Bureau made in their occupation codes could account for the discrepancy between the pre- and post-1970 turnout rates. In the absence of supporting evidence for the sudden drop among the low occupation category and in the face of conflicting turnout patterns using the NES data, the coding change hypothesis must be considered a plausible explanation for the figures.

TABLE 3

Misreporting by Occupation and by Income (1964, 1976–88, National Election Studies)

DEMOGRAPHIC GROUP	1964	1968	1972	1976	1980	1984	1988
Occupation							
Blue-collar	40.3	—	—	31.8	21.2	23.7	16.1
White-collar	53.0	—	—	44.5	45.0	37.5	38.6
Income							
Low	37.4	—	—	31.3	26.1	21.6	16.8
High	45.2	—	—	34.7	33.7	33.6	33.2

Note: Table entries are the percentage of *nonvoting* respondents in each category who claim to have voted.

This reflects the basic problem with the use of the occupation variable: it is fundamentally a categorical, rather than ordinal, measure.

REPORTED VERSUS VALIDATED TURNOUT

To verify that these findings do not result from changes in the tendency of high- or low-income—or blue- or white-collar—individuals to misreport voting, we also examined turnout using the NES validated vote. If low-income individuals or blue-collar workers are now voting in lower numbers but misreporting their behavior more frequently, then we would fail to find an increase in socioeconomic class bias using the reported CPS vote. If the high relative misreporting rate for blacks observed by Abramson and his coauthors is a recent phenomena and extends more broadly to lower socioeconomic groups, then our finding of no increase in class bias could be erroneous. To test our earlier results we calculated the probability of individuals' misreporting for each income and occupation group conditioned on their not having voted. (Almost no one votes and reports that they did not.)

These results are reported in Table 3, which shows that in fact, over time, there have been rather large changes in misreporting probabilities. While both occupational groups show less of a tendency to misreport in 1988 than in 1964, the decline in misreporting is much larger for the blue-collar workers. Misreporting by white-collar individuals decreased from 53.0% in 1964 to 38.6% in 1988; among blue-collar individuals the decrease was even larger: 40.3% in 1964 compared to 16.1% in 1988. Thus, the difference in misreporting *increases* from 12.8% in 1964 to 22.5% in 1988, with higher-status individuals being relatively more likely than lower-status individuals to misreport in 1988 than in 1964. Using the reported vote, differences in turnout between classes would be more exaggerated in 1988 than in 1964.

We find a similar result when comparing misreporting by income. Misreporting for the bottom half of the income distribution decreases from 37.4% in 1964 to 16.8% in 1988, while for the top half of the income distribution it decreases from 45.2% in 1964 to 33.2% in 1988. Hence, the difference in misreporting rates again *increases* from 7.8% in 1964 to 16.4% in 1988. Analyzing reported vote over time would tend to exaggerate increases in socioeconomic class bias since the higher-class groups' turnout would be falsely overreported. Hence, using the reported vote to claim stability in the socioeconomic voting gap is a conservative test and does not call into question the validity of our finding that socioeconomic status bias has remained stable.[13]

MULTIVARIATE MODEL

We now adopt a multivariate model that allows us to assess the marginal impact of each demographic characteristic on voter turnout. As a further test of our claim that there has been little or no change in socioeconomic class bias, we use this model to test the stability of the marginal effect of income (other demographic traits held constant) across elections. In this model, we include the basic individual demographic characteristics found to be correlates of voting: education, income, age, sex, marital status, and race. We also include a dummy variable to denote the South. Since the effect of age on turnout appears to decrease at some point in the individual's life cycle, we also include an age-squared term in the model, with the expectation that its estimated coefficient would be negative.

The probit estimates of this model for the reported vote are presented in Table 4. The stability of the coefficients of income and education (they are bounded between .115 and .139 and between .266 and .283, respectively, for each year) is further evidence that there has not been a major shift in the impact of socioeconomic status on voting. In other words, had high-status individuals become more likely—and low-status individuals less likely—to vote, then the effect of education and income as independent predictors of turnout should have increased over time. That the estimate for income decreases slightly (.126 vs. .115), and the coefficient

Note: All coefficients are significant at $p < .01$. The dependent variable is the respondent's reported turnout for each presidential election. Table entries are probit coefficients, with standard errors in parentheses.

for education remains essentially unchanged (.266 vs. .281) from 1972 to 1980—the endpoint for Burnham's (1987a) calculation—suggests that class bias remained essentially the same over that period.

To interpret the probit coefficients, predicted probabilities based on changes in the independent variables should be examined. The predicted probability of voting is equal to $\Phi(X_i\hat{B})$, where $\Phi(X_i\hat{B})$ is the cumulative normal evaluated at the sum $X_i\hat{B}$ (Johnston 1984). Therefore, the predicted probability will depend upon the value of $X_i\hat{B}$, or of the values of all the independent variables. The effect of a change in an independent variable can be calculated by computing two predicted probabilities: an initial probability based on specific values of the independent variables, and an adjusted probability based on a change in the independent variable of interest. For instance, the effect of moving from the middle-income quintile to the next highest quintile for a 30-year-old, single, white northern male with high school education in 1972 would have been to increase the likelihood of voting by 4.8% (from 59.9% to 64.7%).[14] In 1988, the effect would have been to increase the likelihood of voting by 5.5% (from 42.6% to 48.1%), meaning that the effect of income has increased for such an individual by only .7% over the five elections. Thus, even when considering 1988, there is not evidence of a large increase in class bias.

Additional evidence that class bias has not increased significantly is provided by estimating the same multivariate model using the NES validated vote. As reported in Table 5, the coefficient of the income variable is quite unstable over time. In particular, the increasingly large estimates of the impact of income on turnout between 1980 and 1988 derived from the census data are not replicated using the validated vote. Instead, the income coefficient is at its lowest in 1980 (.056), increases to .190 in 1984, and then drops to .104 in 1988. Thus, even were we to extend the time period under consideration to assess Burnham's argument, we find no support for dramatic increases in class bias.

Tables 4 and 5 indicate that the effects of two socioeconomic characteristics other than income, occupation, and education *have* changed as predictors of turnout between 1964 and 1988. The estimates for sex show a noticeable trend toward increased voting by women relative to men. The coefficient of race is much less stable than the other estimated demographic coefficients. According to the CPS data, the effect of being black on turnout is positive, though it decreases in magnitude throughout the 1970s, then increases in the 1980s. The validated NES data suggest that the effect of being black decreases the likelihood of voting, with the magnitude of the impact increasing throughout the 1980s. Thus, while there may be changes in the composition of the electorate over time, they are associated with less class-based measures than income, occupation, or education.

CONCLUSION

The question whether class bias in the electorate has changed over time seems straightforward. However, the debate it has engendered suggests otherwise. We have attacked this question in as direct a way as possible. By tracing the demographic characteristics of all voters (as opposed to particular subsets of voters) over seven consecutive presidential elections and using samples large enough to reduce random error, we found that class bias has not increased since 1964. This conclusion is buttressed by a comparison of different distributions of income over time using Gini coefficients, as well as by multivariate analyses.

Any conclusion regarding class bias in the electorate is dependent upon the choice of measure of socioeconomic status. We argue that from a theoretical perspective, income is the appropriate measure to use, since government policy is more likely to distinguish among individuals based on income, rather than any other single measure of socioeconomic status. And we point out that there are measurement problems with alternative indicators, such as occupation.

We have painted a picture of turnout that is remarkably stable over seven different elections spanning 24 years. Despite different social and political contexts and different candidate choices, the class differences between voters and nonvoters in presidential elections remain the same. These elections include races between incumbents and challengers, as well as two open seat races. During these elections, the electorate faced a broad array of issues, ranging from Vietnam to double-digit inflation to $200 billion budget deficits. The one deviant election we observed was 1988, where socioeconomic class bias in turnout did seem to increase. The class consequences of Reagan administration policies beginning in 1981 may have influenced the composition of the electorate in 1988 (see Phillips 1990). Alternatively, campaign-specific effects such as the content of television advertising or the targeting strategy of either campaign could account for the distinctiveness of the 1988 electorate. Whether these differences persist in the 1992 election is obviously an unanswered question.

One can interpret these findings either optimistically or pessimistically. From a normative perspective, the lack of an increase in class bias in the electorate is good news. However, from the representational perspective of desiring an electorate able to adapt to changing circumstances and choices, the stability is not necessarily good news.

APPENDIX

The exact size of each income quintile is shown in Table A-1.

Notes

This is one of several joint papers on turnout in American national elections; the ordering of the authors' names reflects alphabetic convention. We appreciate constructive comments on earlier versions of this paper from Frank Baumgartner, Wendy Hansen, Kim Hill, Patricia Hurley, Rod Kiewiet, Rebecca Morton, Doug Rivers, and Larry Rothenberg. We would like to acknowledge the research assistance of Sam Hudson and typesetting assistance of Marcia Bastian. Research support from the Texas A&M University College of Liberal Arts and Supercomputer Center is also appreciated. The data utilized in this publication were made available in part by the Inter-University Consortium for Political and Social Research. The data for the American National Election Studies, 1964–88, were originally collected by Warren E. Miller and the National Election Studies.

1. See Burnham 1982 and Kleppner 1982 for discussions of historical trends in turnout and representation.

2. For instance, to conclude that coefficients from consecutive elections are even significantly different from each other using an NES data set that typically generates income coefficients with t-statistics of about 4—much less to estimate the magnitude of the difference—would require that one estimated coefficient be over twice the size of the other.

3. We have corrected Census Bureau–reported figures for 1964 and 1968 to be consistent with our method of computing turnout.

4. For a discussion of the properties of the Census Bureau estimates, see Jennings 1990.

5. No validation study was conducted in 1968; and though a validation variable is available for 1972, the CPS discourages its use because the validation procedure for the 1972 vote was conducted in 1976 and produced poor estimates of validated turnout (Traugott 1989).

6. Bennett 1991 finds an increase in class bias among older whites, as well, but notes that it is not nearly as large: the gap in turnout between the two groups increases only 4%.

7. Directly comparable census figures are not available. However, according to the census data, 30% of individuals over age 20 had some college experience in 1964, and 38.8% of individuals over age 20 had such experience in 1988.

8. In Burnham's many writings on the subject of social class and American political behavior, he has used a variety of measures of social class, including income, education, housing values, and homeownership (1978, 1987b). But on the narrow question of changes in class bias after 1960, he consistently uses Census Bureau occupation data as a measure of social class.

9. The Gini coefficients essentially incorporate the same information that would be contained in a regression of voting rates against income: the coefficient of such a regression would represent the best way to fit all the voters to the data. Computing regression coefficients for the five years using the voting rate of each income quintile as the independent variable yielded coefficients consistent with the estimated Gini coefficients: the smallest coefficient was for 1984, the largest for 1988.

10. Since the raw data was unavailable for 1964 and 1968, we could only compute Gini coefficients for those years using the six income categories contained in the Census reports. These coefficients (.0856 and .0770) were lower than the Gini coefficients we computed for subsequent years. However, their reliability is extremely suspect, because Gini coefficients calculated with fewer income groups would necessarily be smaller than those calculated with income groups representing a finer breakdown of the income distribution.

11. These income gaps are not exactly the top 50%, versus the bottom 50%, of the distribution, because income is a categorical, rather than continuous, variable in the survey. However, in each year, the difference between the size of the top and bottom group is no more than 8%. The size of the blue-collar group ranges from 37.1% to 30% of the workforce, the size of the white-collar group ranges from 45.4% to 56.7%. In 1964, only 52.4% of respondents were high school graduates; by 1988 they had reached 77.4%.

12. We also examined the sensitivity of the occupation variable to disaggregation by sex, since Burnham only considered the turnout of men. The 1968–72 jump was identical for men and women. After 1972, the gap for women decreased; but the overall trend remained the same as the trend for men only.

13. See Filer, Kenny, and Morton 1991 for estimates of demographic voting based on county turnout figures (hence uncontaminated by misreporting problems).

14. In the CPS data, income quintiles are coded from 0 to 4 (4 being the highest), education is coded from 1 to 8 (8 being highest).

TOWARD A THEORY OF THE POLITICAL ENTREPRENEUR: EVIDENCE FROM LOCAL GOVERNMENT

MARK SCHNEIDER and PAUL TESKE *State University of New York, Stony Brook*

Political scientists have been increasingly interested in entrepreneurs—individuals who change the direction and flow of politics. In this research note, we synthesize aspects of an economic approach to entrepreneurship with concepts used in political science. We then tie these theoretical observations to the emergence of entrepreneurs in local governments and test components of our theory using observations from a large set of suburban municipal governments. Empirically, we identify several conditions that affect the probability that an entrepreneur will emerge in a local government, especially slack budgetary resources that the political entrepreneur can reallocate. We also find that the probability with which an entrepreneur is found in local government is a function of the difficulty of overcoming collective action problems in a community.

Political scientists have been increasingly interested in entrepreneurs—individuals who change the direction and flow of politics. Existing studies of political entrepreneurship rely heavily on case study material. Most common are biographical studies of entrepreneurial leaders, which focus on individuals whose actions produced policy changes that were innovative or unexpected (see, e.g., Doig and Hargrove 1987; Kirchheimer 1989; Lewis 1980; Riker 1986; Weissart 1991). Such studies tend to focus on high-level bureaucrats in governmental or quasi-governmental agencies (Robert Moses, David Lilienthal, Admiral Hyman Rickover) or on dynamic politicians (Abraham Lincoln, Lyndon Johnson). Another case study approach to entrepreneurship is through the use of issue histories, which analyze the role of policy entrepreneurs in the development and implementation of new public programs (Beam 1989; Kingdon 1984; Milward and Laird 1990).

More recently, formal models of leadership have been presented (e.g., Bianco and Bates 1990; Calvert 1987). These formal theories focus on agenda setting, strategic manipulation, and the incentives of leadership. Riker's (1986) notion of "heresthetics" has been particularly important in stimulating this more systematic approach to the study of leadership by political scientists. More theoretic than most biographies or issue histories, yet not fully "formal," Riker's work shows how a political entrepreneur can advantageously transform existing political coalitions, especially by adding a new dimension to political debates. Importantly, this line of research transforms the notion of entrepreneurs from the study of heroic figures to the study of a larger class of individuals who help propel political and policy changes.

Most case studies lack generalizability, and formal models are necessarily abstract and fairly simple compared to real political situations. To understand political entrepreneurship we need to further develop elements of a theory of entrepreneurship and empirically test these theoretical expectations. We shall synthesize aspects of an economic approach to entrepreneurship with concepts used in political science and apply the results to local government.

We argue that there is a population of potential political entrepreneurs distributed across local governments. The size of the local population with entrepreneurial skills and ambitions is a function of the characteristics of the community, such as its income and education level (Ricketts 1987; Ronen 1983, intro.).[1] While we cannot observe the distribution of potential entrepreneurs, our research does identify communities in which entrepreneurs are found. Our empirical research goal is to identify the conditions that affect the probability with which an entrepreneur emerges in any given community.

Potential entrepreneurs have energies and talents that they could invest in alternate spheres of activity. The rate at which they are attracted to the local *political* environment (as compared to some other domain) is a function of the costs they face in entering the political arena and the benefits they garner if they succeed as political entrepreneurs (Ricketts 1987). The level of these costs and benefits are embodied in measurable facets of local government. For example, we shall argue that costs are a function of the collective action problem entrepreneurs face and the ease with which these problems can be solved. Similarly, the benefits (or "profits") entrepreneurs reap are a function, among other things, of the budgetary slack of their local community, which affects the entrepreneur's ability to reallocate resources to achieve the policy goals held by the entrepreneur.

These factors enter the decision calculus of the *individual* entrepreneur. But the decisions of these individuals have wider impacts. On a more *systemic* level, entrepreneurs can affect the political equilibrium in metropolitan areas. For example, within a community an entrepreneur can transform the nature of political debates (Riker 1986; see also Schneider and Teske n.d.). Across communities, the entrepreneur can change the service/tax mix found in communities facing each other in the local market for public goods (see Tiebout 1956; Schneider 1989).

We shall turn first to the conceptually more difficult issue of entrepreneurs and equilibrium, then to an investigation of entrepreneurial profits and the difficulties entrepreneurs face in organizing a collective base to launch entrepreneurial policies. Finally, using observations from a large set of suburban municipal governments, we shall empirically address the question, Under what local conditions are political entrepreneurs more or less likely to be found?

HOW ENTREPRENEURS AFFECT MARKETS

To understand how entrepreneurs affect markets and politics, we begin by considering private sector entrepreneurs, comparing the role of the entrepreneur in the private market to the role of political entrepreneurs. We are directly concerned with entrepreneurs in what we call the local market for public goods, in which local services are delivered by multiple municipal governments in packages that are paid for using a revenue system in which local property taxes are central.[2]

While we develop a variety of theoretical issues that underlie the study of political entrepreneurship, two are central to the empirical analysis we present later. First, we are concerned with the concept of "opportunity": What conditions lead a potential entrepreneur to become active in the local political arena? Most economic theories of the entrepreneur argue that the pursuit of profits drives the entrepreneurial process. Hence, we are interested in identifying the conditions that affect potential profits in the local political arena and thus affect the likelihood that a political entrepreneur will be found. A second issue centers on the organizational milieu of communities that makes entrepreneurship more or less likely. We tie these conditions to the ability of the entrepreneur to solve problems of collective action, problems that are far more critical to the political entrepreneur than to most economic entrepreneurs.

Entrepreneurial Profits and Market Equilibrium

Perhaps the most common focal point in the recent economic literature on entrepreneurship is the emphasis on the "discovery" of market opportunities by "alert" individuals (see Kirzner 1985). From this perspective, entrepreneurs engage in the act of "creative discovery"—they try to take advantage of newly *discovered* or newly *created* possibilities in order to earn entrepreneurial profits (Casson 1982; Ricketts 1987).

In their drive for profits, private entrepreneurs discover and exploit new opportunities through arbitrage, speculation, or innovation. Entrepreneurs are driven by personal motives and the maximization of profits, but their activities affect the overall market in which they operate. Disagreement over the degree of independence of entrepreneurs distinguishes the Austrian school's approach to the study of entrepreneurs from that of the neoclassical "establishment." Moreover, economists do not agree on how entrepreneurs affect market equilibrium.

To summarize a large, sometimes difficult, and often contentious literature, entrepreneurs are not central to much of neoclassical economic analysis. Hayek believed that neoclassical economics neglected entrepreneurs because its core concept of market equilibrium assumes full information, leaving the entrepreneur little scope for innovative activity (Hayek 1949; Kirzner 1985). According to Kirzner, the "neoclassical approach has . . . squeezed the real-world entrepreneur back into the neoclassical full-equilibrium box" (1985, 8–9). In the neoclassical approach, entrepreneurs are "called forth" by conditions in the market in a systematic, if not necessarily predictable, process. In contrast, in the Austrian tradition, entrepreneurs have greater independence of action, and market outcomes are less predetermined. However, in both schools of thought, the relationship between entrepreneurs and equilibrium is central.

On one hand, entrepreneurs can be viewed as seizing opportunities in the market to move it toward equilibrium. While Kirzner's entrepreneur is defined by an "alertness to disequilibrium" and independently injects new elements into markets, ultimately, for Kirzner,"—the changes the entrepreneur initiates are always toward the hypothetical state of equilibrium" (1973, 73). In contrast stands Schumpeter's idea of creative destruction (1942; see also Shackle 1972). For Schumpeter, entrepreneurial activity is most likely to emerge when a market is approaching equilibrium. In this evolving situation, the successful entrepreneur engages in a series of innovations that move the market first toward disequilibrium and then, ultimately, to a new market arrangement that is more profitable for the entrepreneur.

Political scientists studying entrepreneurs are struggling with similar issues. We have very little information about variation in the supply of political entrepreneurs, that is, how and why political entrepreneurs are called forth. Kingdon's work (1984) may be the best current description of how entrepreneurs market their policy ideas to national decision makers. Kingdon describes policy entrepreneurs as constantly shopping around for windows of opportunities through which to shove their preferred policy ideas (also see Walker 1981). In a similar vein, Elder and Cobb (1983) focus on the importance of policy entrepreneurs in agenda setting.[3] In an extension of this approach, Baumgartner and Jones (1991) argue that the outcome of political debates can vary with the arena or "venue" in which debates occur. Because the federal system of the United States presents so many alternate venues, policy entrepreneurs can maximize their likelihood of success by carefully shopping around for the most favorable available venue. While these works focus on the role of entrepreneurs, they do not systematically identify the conditions under which entrepreneurs emerge.

Political scientists also need to explore further the relationship between entrepreneurs, innovation, and equilibrium. Since the concept of equilibrium is at the core of so much economic analysis, the extent to which entrepreneurs move private markets toward equilibrium or disequilibrium is theoretically critical for their enterprise. But the concept of equilibrium is also important in the study of entrepreneurs in *political* marketplaces.

Again, Riker's position is critical. Riker (1982) argues that political situations are normally characterized by an underlying disequilibrium of tastes. His contention is supported by a number of experimental and formal analyses that have severely restricted the conditions under which equilibrium can be expected. The fact that stable "equilibrium" outcomes are empirically evident despite the underlying dynamics of instability presents a conundrum for political scientists. Shepsle (1979) was among the first to show how institutions can induce stable outcomes despite the forces pushing toward disequilibrium. More recently, using field studies exploring the use of common property resources, Ostrom (1990) has shown how a wide variety of societal arrangements can overcome strong inherent tendencies toward disequilibrium driven by conflicts in tastes and strategies.

Thus, the idea of institutionally induced equilibrium provides a line of argument that addresses one part of the equilibrium/disequilibrium conundrum. But this makes Riker's argument linking politicians and equilibrium an even more central issue that must be addressed in any theory of entrepreneurship. For Riker, while equilibrium may appear in political arrangements at any given point in time, such an equilibrium is inherently unstable. This presents openings for Riker's "heresthetician"—an entrepreneurial political leader who "probes until he finds some new alternative, some new dimension that strikes a spark in the preferences of others" (Riker 1986, 64). Riker argues that through agenda control, strategic behavior, and (most importantly) the introduction of new policy dimensions to political debate, the heresthetician can break up institutionally induced and maintained equilibria to create new and more profitable political outcomes. Riker's heresthetician thus resembles Schumpeter's entrepreneur: both engage in creative destruction, tearing apart existing political–economic arrangements in order to create new ones.

Like Schumpeter's entrepreneur, Riker's heresthetician stands to profit from the successful introduction of new ideas or policies into a market that appears stable to others. After the disruption caused by the innovation, a new stability may emerge. But Riker believes that lurking behind this new stability is still the fundamental disequilibrium of taste that can then be exploited by the next generation of entrepreneurial politicians. Similarly, for Schumpeter, as the market absorbs the last round of innovations to approach equilibrium, the potential for entrepreneurial profits increases, giving rise to yet a new generation of entrepreneurs. Empirically, the outcome of innovations pushed by Schumpeter's entrepreneur or by Riker's heresthetician may thus resemble a *punctuated equilibrium*—a process in which institutions are characterized by long periods of stability punctuated by short bursts of rapid change (Krasner 1984). In the realm of politics it is important to remember that during these periodic disruptions, not only are the present politically determined allocations of resources questioned, but the fundamental rules of the game may also be challenged.

In the arena of local governments with which we are ultimately concerned, governments are in competition with one another and use their taxes and services to lure desirable households and business firms (Peterson 1981; see Schneider 1989). In the resulting competitive market, some forms of local political entrepreneurship may temporarily create disequilibrium, upsetting existing local public service and tax arrangements and altering the relationship between communities in a region. These innovations are often then absorbed and institutionalized into new political arrangements and a new balance between communities emerges. As we shall argue, the tax/expenditure limitations movement of the 1970s (e.g., Clark and Ferguson 1983), the concern for economic development policies of the 1970s and 1980s (Eisinger 1988), and the recent no-growth movement (see Logan and Rabrenovic 1990; Schneider 1992) may all be examples of entrepreneurship in local government that display some of the dynamics of punctuated equilibria.

ELEMENTS OF ENTREPRENEURSHIP: PROFITS AND COLLECTIVE ACTION

Before turning specifically to entrepreneurship in local government, we consider in more detail the concept of entrepreneurial profits. In particular, we explore two specific aspects of entrepreneurship that affect profits: private information and entry barriers.

Entrepreneurial Profits

Virtually every theory of the entrepreneur in the private sector emphasizes the importance of the profit motive. In such theories, the entrepreneur enters into market-making activities with a belief that the existing allocation of resources is somehow wrong and that profits can be made by reallocating them in a correct manner. However, a theory of political entrepreneurship based on the concept of monetary profit will not work. Most political entrepreneurs cannot be residual claimants to profits generated by their ideas (but see Niskanen 1975). This means that one of the most important motivating concepts in economic theories of the entrepreneur cannot be easily employed in the study of political entrepreneurs. Instead, a much more complicated utility function for the political entrepreneur must be

developed, including terms related to policy success and status. Formal models of political entrepreneurs pay more explicit attention to this issue than do case-study-oriented analyses. However, these formally derived utility functions are often so complex as to be beyond empirical confirmation. We shall develop two empirical indicators of potential profits for local entrepreneurs; but ultimately, political scientists interested in entrepreneurship must more fully develop the concept of political profits and its indicators.

Private Information. Understanding entrepreneurial profits requires analysis of the ability of the entrepreneur to restrict competition. One way to restrict competition is by maintaining control over information, excluding others from the data necessary to profit in a market.

Thus, one key to entrepreneurial success in the private sector is the protection of private information. Entrepreneurs glean some new piece of information from the environment and then bet on the future based on their insight. However, once this information becomes public, the entrepreneur loses the competitive edge and entrepreneurial profits are bid away. For example, in the process of arbitrage, the entrepreneur sees a discontinuity in the market. Acting on this insight, the entrepreneur enters into a series of profitable transactions. But as the entrepreneur succeeds, the insight becomes more widely known and competitors enter the field, ultimately driving down the entrepreneur's profits. Over time, the entrepreneur's innovation becomes a more or less standardized product, yielding only market rates of return.

Casson argues that to maintain the information advantage, the entrepreneur must be in close contact with *primary* sources of information (1982, 147). The more removed the entrepreneur from such sources, the more distortions enter into the flow of information and the more quickly the entrepreneur's advantage is dissipated. While this observation may have particular relevance for a study of local political entrepreneurs, Lewis's (1980) discussion of Admiral Hyman Rickover presents a clear example from the public sector (also see Bendor, Taylor, and Van Galen 1987 on bureaucratic models of information flow).

Still, there are serious theoretical problems when the concept of private information is carried over to the public sector. What, if any, private information can public sector entrepreneurs monopolize? The very nature of public entrepreneurship often requires that at critical times (especially during elections) the entrepreneur must share information with the public, without being able to protect the rate at which it disseminates to other competing politicians. In order to raise capital, the private sector entrepreneur may have to share his insights with others. But this process of revelation is protected by patent laws, franchising agreements, and so on. In the public sector, there is no similar legal protection on sharing information. And while policy entrepreneurs may emphasize the benefits of their proposals and try to hide the negative aspects (Arnold 1990), the public sector entrepreneur still must disclose more information than the private entrepreneur. In large part, this is because the private sector entrepreneur usually needs to raise capital to operate in the private market—and capital is controlled by a small number of individuals. Most public sector entrepreneurs need votes or support in public opinion to succeed. As Doig and Hargrove (1987) and others note, building and maintaining a political coalition is critical to the success of a political entrepreneur, and revealing information and ideas is central to this coalition process.[4] Indeed, ambitious local entrepreneurs may seek to have their innovations imitated elsewhere, to develop a broader reputation and to increase the rewards of their entrepreneurial activities.

Barriers to Entry. Entrepreneurs will inevitably face barriers embedded in the status quo as they push their innovations. If they are successful, entrepreneurs will themselves seek to establish entry barriers to protect their profits from new entrepreneurs. In the private market, such entry barriers may include maintaining secrecy over technologies and protecting ideas through patents, acquiring monopoly control over critical resources, and creating and maintaining goodwill with customers.

Political science has developed a literature on entry barriers that may be applicable to the study of the entrepreneurial process. While not phrased in terms of entrepreneurship, we know that incumbent politicians use many strategies that restrict competition, limiting the ability of challengers to enter political contests. Most of the tools that incumbents use seek to diminish the number and quality of candidates that might otherwise emerge to challenge the incumbent (e.g., Parker 1991; Tullock 1965). Of particular importance may be the ability of incumbents to advance the interests of their constituents by manipulating bureaucratic services and by controlling the flow of legislation that constituents and contributors need (Fiorina 1977; Parker 1991). The increasing use of personal contact as a form of political advertising also increases the entry barriers challengers face, especially since much of this contacting is subsidized by the government (Fenno 1978; Parker 1986). While the use of the congressional franking privilege is the most-often-cited advantage of political office holders, local government leaders also use the more limited perks of their office to send newsletters to constituents and to dominate local news coverage.

In the arena of local government, entry barriers may also be embedded in the "constitutional rules" that structure local political economies (Oakerson and Parks 1988). Rules governing the incorporation of new communities, the annexation of existing ones, and the types of services local government must supply—all affect the range of competition local government officials face and the opportunities for entrepreneurial activity (Burns 1991). The degree of frag-

mentation and diversity in service offerings in the local area can also affect the incentives and actions of incumbent politicians and the potential for entrepreneurial activity (see Schneider 1989).

The manipulation of entry barriers to limit challenges to incumbents has been most widely studied in terms of Congress, but the effort to protect political incumbency occurs at all levels of government. How local political entrepreneurs overcome existing entry barriers and the extent to which they then try to erect new ones is a critical dimension of a theory of entrepreneurship in local government.

Entrepreneurs and the Collective Action Problem

Organizing collective action in any domain requires that the well-known problems of creating and maintaining organizations be overcome (Frohlich and Oppenheimer 1978; Moe 1980; Olson 1965; Taylor 1982). The stereotypical private sector entrepreneur works alone or in a small organization, thus solving collective action problems by avoiding collectivities. However, a public sector entrepreneur is much more likely to need a collective *group* foundation to survive and prosper in the political marketplace.

Those political entrepreneurs acting in the realm of electoral politics must use rhetoric, the manipulation of public policy goals and the distribution of selective incentives to identify and mobilize a winning electoral coalition. In this electoral domain, in addition to the problems of group formation and maintenance, the entrepreneur faces biases in the distribution of resources and the generation of selective incentives necessary to create new alliances in local politics (see, esp., Stone 1989).

Second, compared to the private sector entrepreneur, public entrepreneurs may be forced to deal with large-scale formal organizations. Lewis argues that public entrepreneurship *begins* in an organizational setting and that the public entrepreneur develops a career both using, then ultimately transforming, the practices of large-scale public organizations: "The public entrepreneur, somewhere during his career, comes to understand that the *large complex public organization is the most powerful instrument for social, political and economic change in the political universe*" (1980, 238; emphasis original). Recent work on "intrapreneurship" (e.g., Pinchot 1985) shows how private sector corporations try to meld entrepreneurs into a complex organizational environment. Similar developments may be occurring in public bureaucracies. While, more generally, we believe that the possible avenues for public entrepreneurship are more diverse than the managerial–bureaucratic route with which Lewis is concerned, a fundamental difference may still exist between the public and private sectors in the size of the organizations that entrepreneurs face as they push their innovations and policies.

ENTREPRENEURS IN LOCAL GOVERNMENT

In local governments, political entrepreneurs can be high-level unelected leaders, such as city managers; elected politicians, such as mayors or members of city councils; leaders of established interest groups; or creators of new groups. These political entrepreneurs develop new and innovative policies and galvanize otherwise difficult-to-organize, dispersed citizens to support their policies.[5]

Others have discussed the role of bureaucrats and managers as entrepreneurs in government, most often at the national level of government. At the local level, Oakerson and Parks (1988) argue that public entrepreneurship often occurs in the context of professional associations that link managers across different local governments. Clearly, much entrepreneurial activity concerning local service efficiency is managerial—especially with regard to the introduction of new technologies within a given service domain.

In addition to this type of managerial entrepreneurship, elected politicians can also play critical entrepreneurial roles. One type of local political entrepreneur active in recent years focuses on the politics of growth. These growth entrepreneurs can be divided into several subclasses. First there is the progrowth politician who advocates using the vast array of traditional tools of local government (such as tax abatements and debt financing) to lure business firms. These politicians had their greatest successes in the 1970s and early 1980s. But eventually, what has been called the "market for jobs" became so fully developed that most opportunities for political entrepreneurs advocating these traditional tools were identified, and entrepreneurial profits bid away, in the intense interlocal competition for economic development (Milward and Newman 1989; see Schneider 1992). Indeed, the use of many of the traditional progrowth tools of local government has been so routinized that they are now handled by a cadre of bureaucratic managers (e.g., Blair, Fichtenbaum, and Swaney 1984; Eisinger 1988). This process replicates that of innovation in private markets: competition leads to the dissipation of initial high entrepreneurial profits, and entrepreneurial leadership is replaced by routine bureaucratic processes handled by managers.

In contrast to the progrowth politician advocating the traditional tools of economic development, a new class of growth entrepreneurs is now emerging. Politicians in subnational governments are now advocating a whole new range of what Eisinger (1988) calls demand-side policies to promote economic development. This evolution in policy tools is congruent with a theory of entrepreneurship in local government. As the last set of innovative tools became routine, the payoffs for these now traditional policies dwindled. In turn, a new generation of political entrepreneurs create and experiment with policies with potentially higher rewards. But to the extent that these policies

are successful, political entrepreneurs will continue entering the local market advocating similar policies. Ultimately, the political profits attached to these innovative policy tools will decline; and they, too, will become standardized bureaucratic products. While this new generation of entrepreneurs advocating innovative approaches to economic development are pushing the boundaries of existing policies, they still support local growth. Even more radical challenges are emerging from antigrowth entrepreneurs—entrepreneurs whose political careers are built on questioning the very value of growth itself (Logan and Molotch 1987; Logan and Zhou 1980; see Schneider and Teske n.d.).

Yet another type of local political entrepreneur focuses more directly on services and taxes, emphasizing efficiency-enhancing reforms. Borrowing from Clark and Ferguson (1983), many of these "new fiscal populists" fit the profile of an entrepreneur; that is, they are politicians who challenge the existing service/tax arrangements in local governments by advocating policy reforms to reduce local taxes and improve the efficiency of local government services. Certainly, there were many such entrepreneurs in local government in the mid-to-late 1970s, but it is empirically unclear how open this field is at present for new entrepreneurs of this type.

In each case, the successful entrepreneur needs to create a political coalition by which to challenge the status quo. The new fiscal populist seized on dissatisfaction with rising local taxes and the middle-class predisposition for the norm of efficiency to challenge existing political/bureaucratic alignments. Often, these new fiscal populists not only challenged the political leadership in their communities but actually changed the rules of the game. For example, through initiatives and referenda these entrepreneurs created the need for extraordinary legislative or voting processes to allow higher taxes. In short, these entrepreneurs created and maintained a political coalition that challenged existing local tax policies and transformed the institutional rules of the politics of local taxes.

Similarly, to be successful, the antigrowth entrepreneur must fracture the existing progrowth political alliance found in many communities and create a new political orientation toward growth. Neighborhood and community organizations that are faced with rapidly accumulating costs of growth usually provide the organizational basis for the antigrowth entrepreneur. These increasing costs provide opportunities for alert antigrowth entrepreneurs to challenge the position of the progrowth politicians who have long dominated local politics (e.g., Elkin 1985; Logan and Rabrenovic 1990; Mollenkopf 1983). This alternate organizational base is often mobilized as the antigrowth entrepreneur introduces a new dimension in local debates over growth, a dimension that emphasizes the use value of land (Logan and Molotch 1987), replacing the traditional concern for its exchange value (see Schneider and Teske n.d.).

STALKING THE LOCAL POLITICAL ENTREPRENEUR

No simple theory exists to explain entrepreneurship in the private market. It follows that a theory of *political* entrepreneurship will necessarily be complex, drawing on work from a variety of perspectives and disciplines. We have developed a core set of ideas that must inform any theory of public entrepreneurship. These concepts include political profits (affected by the extent of entry barriers and the strategic use of information), challenges to entrepreneurs rooted in collective action problems, and the dynamic effect of entrepreneurs on political equilibria.

We believe that most components of our theory are empirically testable. For example, local governments in metropolitan areas can be modeled as interacting in a dynamic Tiebout-like game, in which they must fashion their services and taxes in a manner that makes them competitive with other cities (Peterson 1981; see Schneider 1989). A successful local entrepreneur can change the results of this competition, for example, by introducing more efficient services that affect the competitive position of a city relative to its neighbors. Over time, neighboring cities must respond, changing their own mix of services and taxes to reflect the lower taxes or better services a successful entrepreneur introduces. The extent to which these dynamic (and measurable) changes occur can serve as a test of the effects of local entrepreneurs in the local market for public goods. Similarly, the effects of entrepreneurs on intracommunity equilibria can be explored. For example, by integrating game-theoretic models of the interplay between incumbents and challengers (e.g., Harsanyi 1967–68; Milgrom and Roberts 1982) with Riker's insights and with the literature on the effects of the structure of local government on policy responsiveness (e.g., Grofman and Lijphart 1986; Morgan and Pelissero 1981), specific and testable predictions about the development of policy positions adopted by entrepreneurs and incumbents can be derived.

While we are moving ahead on these fundamental research questions, our present goal is more modest: we limit our empirical analysis to identifying the conditions that affect the emergence of entrepreneurs, concentrating on the first two elements of our theory. We thus address the emergence of entrepreneurs before studying in detail their specific strategies and their policy impact. Specifically, we argue that entrepreneurs are more likely to emerge when there are factors that make entrepreneurial profits more likely and where local conditions facilitate a solution to collective action problems.

To test these relationships, we surveyed municipal clerks in more than fourteen hundred suburban communities across the nation to identify the distribution of political entrepreneurs.[6] Municipal clerks are knowledgeable about the politics and political history of their communities, and we believe this makes them more-than-credible respondents.

Since asking city clerks to identify local leaders who are "alert to disequilibrium" or who engage in "creative discovery" stretches the norms of language (even if the phrasing would be more theoretically pure), we asked clerks whether, during the past several years there had been any individual in their community whose "policy proposals and political positions represented a dynamic change from existing procedures."[7] We received 963 responses, of which 257 (26.7%) nominated someone as a political entrepreneur.[8] Of these entrepreneurs, 43% were mayors, 26% were members of the city council, 23% were city managers or bureau chiefs, and the remainder were from business or from other private activities.[9] We found no significant regional pattern in the distribution of entrepreneurs.

We analyze the emergence of a local entrepreneur as a dichotomous (0, 1) variable (1 = entrepreneur reported in the community) and use probit analysis. In the analysis that follows, we thus identify objective local conditions that affect the probability of an entrepreneur's being found in a given community. Because our questionnaire asked clerks to name entrepreneurs who had emerged over the last several years, we use specific conditions of communities in the early 1980s to predict the emergence of an entrepreneur.

To correct for regional differences in the distribution of community conditions, all the independent variables have been adjusted by metropolitan means and standard deviations (that is, they have been turned into z-scores by Metropolitan Statistical Areas). Through this transformation, the independent variables reflect the standing of a community relative to its neighbors (Collver and Semyonov 1979).

The Effects of Local Conditions on the Probable Emergence of an Entrepreneur

We model the probability that an entrepreneur emerged as a function of local fiscal conditions, local budgetary patterns, and local demographic conditions. The fiscal wealth (tax base) of a community is a fundamental resource that should motivate potential political entrepreneurs. A strong tax base gives communities a wide range of policy options for the entrepreneur to pursue. Since communities with a strong tax base can provide good services at a moderate tax rate or moderate services at a low one (see Schneider and Logan 1982), a strong tax base represents a public resource entrepreneurs can use in pursuing their vision of the future.[10]

A second fiscal variable, the comparative local tax rate, is more likely to reflect the community's potential support for an entrepreneur. When local taxes are high relative to the taxes of other communities, an opportunity may exist for an entrepreneur to advocate innovations that increase the efficiency of local services, limit expenditures, or redirect patterns of growth that residents might associate with higher taxes. Thus, we hypothesize that both a higher comparative tax base and a higher tax rate will increase the probability that an entrepreneur will emerge in a given community.

Entrepreneurs will also be attracted by the possibility of redeploying local budgets to achieve the policy goals they prefer. Following Peterson (1981), we divide local expenditures into three categories: developmental, allocational, and redistributive.[11] According to Peterson, within the types of expenditures that constitute local budgets, allocational expenditures are the most free of political limits. In Peterson's analysis, cities have little leeway in their expenditure decisions over redistributive services (which they must avoid) and over developmental expenditures (which they must pursue in a nonpolitical professional manner). This leaves allocational expenditures as the domain over which local politicians have the most influence. From our perspective, high allocational expenditures create slack resources that increase public sector opportunities for entrepreneurial profits. These slack resources can be most easily reallocated by the entrepreneur to pursue preferred policies.

The probability of an entrepreneur's emerging should also be related to the demographic makeup of the community, because such conditions reflect the relative ease with which entrepreneurs can organize the citizenry into collective political action. One important variable affecting the ease of organizing for collective action is the stake that individual citizens have in local tax and service issues. We hypothesize that communities with a greater concentration of renters (individuals without a location-specific investment in property) will be harder to organize than communities with a larger concentration of more firmly anchored homeowners (Cox 1982).[12]

As we have noted, progrowth and antigrowth politics are increasingly important conflicts in local communities. Rapid growth can strain existing services, increase pressure on taxes, and mobilize local citizens who see the quality of life in the community changing. We thus hypothesize that rapid growth in a community will increase the likely emergence of a political entrepreneur.

We also believe that the growing racial heterogeneity of suburban communities may create the conditions for political entrepreneurship by providing a base for new political demands or by countermobilizing existing residents to the demands of a growing racial minority population. Specifically, we hypothesize that a larger black population can add a new racial dimension to local politics that can increase the probability of local entrepreneurial political behavior. We also include a suburb's distance from the central city as a control variable, since this condition is often directly correlated with a variety of economic and social conditions of suburban communities (Dye and Garcia 1978).

Table 1 shows the results of a probit estimation of the effects of these conditions on the emergence of a local entrepreneur.[13] In the probit estimation, the most important variable affecting the emergence of an

TABLE 1

Probit Estimates: The Effects of Local Conditions on the Emergence of a Local Political Entrepreneur

VARIABLE	COEFFICIENT	SE	PROB > |T|
Fiscal conditions			
Tax rate	.102	.059	.086
True value	.064	.063	.311
Expenditures			
Allocational	.151	.063	.017
Redistributive	−.092	.061	.134
Developmental	−.046	.061	.454
Demographic conditions			
Percentage renting	−.127	.061	.037
Growth	.104	.058	.072
Percentage black	.105	.058	.098
Distance	−.058	.060	.335
Constant	−.619	.054	.000

Note: N = 635; chi squared = 23.43 with nine degrees of freedom (p = .005). Percentage of communities with entrepreneur = 27.5%. All independent variables are z-scores, i.e., they are standardized by regional means and standard deviations. *Tax rate* is the effective local tax rate; the tax base is the equalized value of local property per capita. *Allocational* expenditures are the standardized per capita expenditures on allocational functions, 1982; *redistributive* expenditures are the standardized per capita expenditures on redistributive functions; *developmental* expenditures are the standardized per capita expenditures on developmental activities. See n. 11 for full description.

entrepreneur is the size of slack budgetary resources measured by allocational expenditures. The importance of this budgetary variable is followed by the size of the rental population, which, we argue, makes the collective action problem more difficult for the political entrepreneur. Using the appropriate one-tailed significance test, we find that the disruptions of population growth and increasing racial diversity also increase the probability of finding an entrepreneur. Finally, note that a higher tax rate does increase the probability with which an entrepreneur will be found—high costs being associated with opportunities for entrepreneurs. However, the tax base variable is not related to the emergence of an entrepreneur at any acceptable level of statistical significance.[14]

Table 2 reports the effects of each individual variable on the probability of finding an entrepreneur. Keeping all other variables at their mean (since they are z-scores, the mean is 0) and looking at the effects of a variable set at one standard deviation below, and then one standard deviation above, the mean, we can get a further idea of the importance of each variable. The range for each variable alone is relatively narrow. Allocational expenditures has the largest effect in changing the probability with which an entrepreneur is found, with a change in the probability of finding an entrepreneur increasing from .22 to .32. This is followed by percentage renting, growth, and percentage black. While the range for each variable individually is narrow, the cumulative effect of all the variables we measure is considerable. If all the conditions in our model are set at one standard deviation from the mean to reduce the probability of finding an entrepreneur, the likelihood of finding an entrepreneur is only .07.[15] When we reverse the signs on the variables to increase the likelihood of finding an entrepreneur as a function of the conditions we measure, the probability increases substantially, to almost .59.

ENTREPRENEURS IN THE LOCAL MARKET FOR PUBLIC GOODS

Entrepreneurs play an important role in the American policy process. While the effect of entrepreneurs has been most widely studied at the national level, we believe that many opportunities for entrepreneurial behavior exist in the thousands of subnational governments in the United States. We further believe

TABLE 2

the concept of entrepreneurship should not be limited to a few figures with national reputations. In addition, most studies of political entrepreneurs have focused on the actions of a single entrepreneur facing a specific policy situation. Neither the motivations of entrepreneurs nor why entrepreneurs emerge has been investigated in a systematic manner. As a result, most existing studies of political entrepreneurship are not cumulative. An overarching theoretical perspective on the political entrepreneur is needed, a perspective that will allow individual studies of entrepreneurs to be tied more closely to each other and that will increase our understanding of how entrepreneurship is embedded in the systemic process of political change. We present the beginnings of a theory that synthesizes elements of an economic approach to entrepreneurship with existing work on political entrepreneurs.

It is important to emphasize that we believe a *synthesis* of political and economic theory is required. The study of political entrepreneurs will be ill served by the wholesale importation of economic theories of the private sector entrepreneur. The study of public entrepreneurship requires different emphases and focal points from the study of private sector entrepreneurs. For example, a fully developed theory of political entrepreneurship will require the definition of an expanded utility function for the entrepreneur. In particular, compared to the analysis of private sector economic entrepreneurs, the study of political entrepreneurs will require a more complex approach to profits, with an explicit concern for the role of private information and entry barriers. The study of political entrepreneurs will also require a much fuller investigation of the relationship between the strategies of the entrepreneur and problems of collective action than is the norm in economics.

While most studies of political entrepreneurs begin with an entrepreneurial politician, a more complete theory of political entrepreneurship must begin one step back: What motivates the entrepreneur? What conditions systematically affect the probability that an entrepreneur will be found? While our indicators are not as neat as the monetized concept of entrepreneurial profits of economic theory, our data show that slack public sector resources attract entrepreneurial politicians. These resources provide opportunities for the entrepreneur to garner the local public sector's equivalent of profit. Similarly, given their concern for individual behavior, economic theories of the entrepreneur are not usually concerned with collective action. But our evidence shows that problems of collective action strongly affect the emergence of local political entrepreneurs.

In short, our theoretical concern for an integrated theory of political entrepreneurship provides conceptually richer insights into the role of entrepreneurs in the policy process than do the separate theoretical traditions in economics and political science upon which we draw.

Notes

The research reported in this paper was supported by National Science Foundation grants SES-8508473 and SES-9024116. The authors wish to thank Bryan Jones, Roger Parks, Vincent Ostrom, Elinor Ostrom, Jerry Wright, and Robert Huckfeldt for their insights. Michael Mintrom and Sam Best also provided valuable feedback.

1. We do not know the actual size of the local population of potential entrepreneurs. Following the most recent literature on leadership, we believe the population to be much larger than implied by the biographical case studies on entrepreneurs, which tend to glorify their subjects as heroic, and which almost by definition makes them uncommon.

2. For a fuller description of the local market for public goods, see Schneider 1989.

3. For a recent summary of work building on Elder and Cobb, see Milward and Laird 1990.

4. Information asymmetries and the strategic revelation of information has become a topic of interest in the study of legislatures (see, e.g., Austen-Smith and Riker 1987; Gilligan and Krehbiel 1990). The insights contained in such studies of committees and legislatures, set in a particular institutional arena, do not easily carry over to the study of the entrepreneurial process with which we are concerned.

5. We are specifically interested in the role of individual political entrepreneurs in the development of local policies. However, these individuals are just one class of entrepreneurs found in the local market for public goods. For example, building on the work of Charles Tiebout, we are exploring how mobile households and business firms can also play entrepreneurial roles in the development of local policies. Moreover, political entrepreneurs can have radically different goals. As we argue later, some are concerned with fast growth, others with slow growth, and yet others with taxes. In other work, we are exploring differences between types of entrepreneurs; here we deal with the entire set of individual entrepreneurs.

6. We began our sample construction with all incorporated suburbs with populations greater than 2,500 in 1970 located in the 100 largest metropolitan regions of the United States (but no more than three metropolitan areas per state). This produced a set of over 1,400 suburbs in 55 metropolitan regions, of which clerks in 963 communities responded to our survey. However, limits on data availability further reduced the number of cases for analysis.

7. We recognize that this operational definition is fairly broad, encompassing entrepreneurs who change local politics, alter equilibria, develop and implement new ideas or policies, and so on. However, our operational definition is virtually identical to that developed by Roberts (1991), who has presented perhaps the most recent comprehensive review of the literature on entrepreneurship from a political science perspective. In our on-going research, using a combination of follow-up surveys, objective data from various census reports, and selected case studies, we are exploring in more detail what these entrepreneurs have done (with particular concern for the theoretically central issues of the role of entry barriers and the dissemination of information), how their actions and positions actually differed from previous policies, and what effects the entrepreneurs have had on local services and taxes.

8. Since this is the first large-scale survey of suburban municipalities, it is impossible to say whether the 27% rate of entrepreneurship is high or low. However, in a comparative study of economic development strategies in close to two hundred cities, Clarke (1990) finds "innovative" programs in 5%–21% of the cities surveyed. Since her numbers are for individual programs, it is not unreasonable to assume that a joint set of programs that might define an entrepreneur will be found in the proportion of cities we report.

9. Clerks were informed that the survey was part of a large nationwide study of political entrepreneurs. The questionnaire began with a series of questions about the local

government structure and local politics. Clerks were then asked to name someone who met our definition of an entrepreneur. The clerks who "nominated" an entrepreneur were then asked a series of open- and closed-ended questions about the entrepreneur's activities. Clerks could nominate one or more entrepreneurs in the 1980s. They were also given the opportunity to name any entrepreneurs from the 1970s.

10. The tax base is measured as the per capita true value of property in the community. The tax rate is the effective tax rate. These measures are adjusted for differences in assessment practices, using state and county reports.

11. Expenditures on business-related "developmental" services are measured by combining local per capita expenditures on streets and highways, sewers, sanitation, water transport, water supply, gas, electricity, and transit. Redistributive services are defined as health, hospitals, urban renewal, and welfare. Allocational expenditures are for "housekeeping" functions (general administration, general government, financial administration, and buildings) plus public safety (police and fire).

12. Of the variables we use in the following analysis, percentage renting and percentage black are from the 1980 census of population. Population growth is the 1970–80 rate of growth. Since 1990 census data are not yet available for individual communities, these are the only data available. Moreover, Donovan and Neiman (n.d.) show that the lagged rate of growth is more important than the current rate of growth in determining local growth politics. Distance is measured as the straight line linear distance between the outer boundary of the central city and the inner boundary of the suburb.

13. The number of cases in the probit estimate is less than the full number of cases for which we have information on the emergence of a local entrepreneur. Only the cases for which we have information on every independent variable is included in the estimation. Missing data on the fiscal variables (which are gathered not centrally, but from state and county reports) account for the elimination of most cases.

14. There is a high correlation (.41) between relative allocational expenditures and relative tax base. This is not surprising—a higher tax base leads to more resources available for expenditures on the relatively more discretionary local services encapsulated in the allocational category.

15. In other words, for variables with a positive coefficient, we estimate the probability of finding an entrepreneur while setting the variable at one standard deviation below the mean. For variables with a negative coefficient, we set the variable at one standard deviation above the mean. To increase the probability of finding an entrepreneur as a function of these variables, we reverse the signs. Note that since all the variables are z-scores, the value of the variable at one standard deviation from the mean is plus or minus one.

SIZING UP THE PEACE DIVIDEND: ECONOMIC GROWTH AND MILITARY SPENDING IN THE UNITED STATES, 1948–1996

MICHAEL D. WARD *University of Colorado*
DAVID R. DAVIS *Emory University*

We examine the relationship between military expenditures and economic growth in the United States from 1948 to 1990, in order to gauge the potential peace dividend. Our main results suggest that military spending is a significant drain on the economy. We then examine the implications of a restructured international system for U.S. military expenditures and their resultant impact on economic growth in the 1990s. Simulations of Democratic and Republican proposals for cuts in defense spending suggest increases in economic output of between 2.5% and 4.5% over the period 1993–96.

> With cold-war expenditure no longer needed, our gigantic government expenditures abroad could be reduced and our international deficit would probably disappear almost overnight. With the dollar no longer overvalued, militant expansion of monetary and credit policy could stimulate capital formation, [or investment,] to utilize the resources released from armament production. . . . America's potential and actual growth rate, far from depending upon war preparations, would be markedly increased by an end to the cold war.
>
> Paul Samuelson, *Economics: An Introductory Analysis*

The recent collapse of the Soviet Union has opened the door for a reconsideration of the role and obligation of the United States in a post–cold war international system. As Paul Kennedy argued, the United States has been on the horns of a dilemma (1987, 532–35). It has extensive political commitments that "require" large resource commitments to the military. At the same time, (relative) industrial decline, coupled with the twin problems of massive external and internal debt have all suggested the economic "fall" of the United States, particularly in terms of declining competitiveness and stagnating economic growth. Furthermore, the increased levels of economic activity and economic productivity of Europe, as well as Asia, have made the commercial world increasingly competitive. The dilemma has the potential of being resolved, however, as diminished military threat poses an opportunity for restructuring U.S. military commitments.

Concurrent with the relative decline of U.S. economic health has been the elimination of the major military threat to the United States. This has brought about significant restructuring of U.S. military policy away from stability based on nuclear deterrence. What will replace the bipolar balance of terror is at present unclear, but it is clear that the total threat to the United States has diminished in remarkable ways over the last few years. This dramatically reduced threat has led to widespread agreement that a rethinking of U.S. defense policy is required. Many have called for a significant downsizing of the U.S. military. President Bush noted in the 1992 State of the Union Address: "Two years ago, I began planning cuts in military spending that reflected the changes of the new era. But now, this year, with imperial communism gone, that process can be accelerated." Paul Tsongas has summarized much current opinion in declaring, "The basic economic reality we face in this country is very simple: the Cold War is over. . . . We can make deeper defense cuts and still maintain the world's strongest military" ("The Democrats on Defense," *Boulder Daily Camera*, 3 March 1992). Everyone seems to agree that the cold war is over; just how much of a dividend a restructuring of U.S. defense posture can produce is still in question.

Defense Secretary Cheney has asserted that the only real peace dividend is peace. On the other hand, many others have put forward the notion that a peace dividend may well provide a needed stimulus to the economy and overall U.S. global economic competitiveness. In one form, this argument targets other social programs as the beneficiary from the windfall, while others suggest that economic output itself will be enhanced. Deficit reduction and the stimulation of private investment also are targets of those wishing to spend the putative peace dividend.

Joshua Goldstein (1988) maintains that every 1% of gross national product (GNP) devoted to military spending "robs" the United States of about ½% of economic growth.[1] A recent International Monetary Fund study of 125 countries from 1972–88 concluded, "While some have argued that military expenditures enhance economic growth, there is no question that more efficient alternative means of using the resources exist that would provide greater benefits to the economy" (Hewitt 1991b, 20; see also Hewitt 1991a).

Results of contemporary research on the United States, however, are not so clear concerning the relationship between military spending (and the like) and economic activity. A number of important studies have addressed the trade-off issue and found evidence supporting the contention that the United States has paid an economic price for its military spending. Russett (1969, 1970) found evidence indi-

cating that defense expenditures displace investment, personal consumption, and state and local government expenditures; Russett's conclusions were based on the results of analysis between defense spending as a proportion of GNP and nongovernment spending proportions, rather than within the context of a macroeconomic model. Russett's later (1970) study found additional evidence supporting the argument that there was a strong bivariate trade-off between defense and welfare spending ratios within the United States; subsequently, he reexamined the trade-off hypothesis using a more sophisticated research technique and data from a longer time period and found no evidence of systematic trade-offs between defense spending and health and education expenditures (1982).

Mintz and Huang (1990, 1991) have studied the relationship between economic growth and defense expenditures over the period 1953–87. Recently, testing for externality effects, they found no statistically significant impact of defense spending on economic growth in the United States (Huang and Mintz, 1991). In their earlier studies, using a two-equation model of growth and investment, they found no direct relationship between military spending and economic growth; but they uncovered an "indirect" relationship between military spending and investment five periods subsequent (at the .10 significance level). Military spending in 1990, for example, would drive down investment levels in 1995. They concluded: "The findings reported in this study reveal the existence of an indirect, delayed effect of military spending on growth. To be more specific, we found that in the long run, lower military spending encourages investment, which in turn promotes economic growth. This effect is not immediate, however. Our analysis shows that it takes about five years for such an indirect tradeoff to begin to become manifest" (Mintz and Huang 1991, 1291).

In another study of defense spending and economic growth in the United States, Atesoglu and Mueller (1990) employed a similar neoclassical growth equation, focusing on elasticities. In this study, the economy is divided into a military and a civilian section, the latter including nonmilitary, governmental spending programs. Atesoglu and Mueller found that the elasticity of GNP vis-à-vis defense spending is inelastic and positive. This implied that growth in defense spending leads *directly* to increases in output.

We reexamine the question of the trade-off in the United States, using data from 1948 through 1990. Like others, we look at the defense–growth issue within a neoclassical economic growth model. However, we focus on the separate size and externality effects of military and nonmilitary expenditures. In so doing, we examine the multiplier effects of military and nonmilitary components of governmental spending to discern their separate impacts on the macroeconomic environment. In this way, we hope to provide a more accurate gauge of the economic impacts of defense reductions in the coming years.

A MODEL OF DEFENSE–ECONOMY TRADE-OFFS

Ram (1986) and many others since have used Feder's (1982) initial model to study the role of government spending in the economy. This is done by assuming that instead of an export and a nonexport sector developed by Feder, the macroeconomy is divided into a governmental and nongovernmental (or private) sector. Following this idea, we assume that there are two sectors contributing to national economic output, P and S, representing the *private* and *state* sectors, respectively. Capital, K, and labor, L, are the main inputs to each sector, although output of the state sector S, is also an input to the private sector.

$$P = F(K_p, L_p, S)$$

$$S = G(K_s, L_s)$$

where F and G are real valued functions; subscripts refer to sectors.

Biswas and Ram (1986) were the first to use this set of assumptions to study the impact of military spending on economic growth by substituting a military and a nonmilitary sector for Feder's original export and import sectors. Ram (1986) was the first to apply these ideas to a state and a private sector. Building on Ram's application, Mintz and Huang decomposed state activity into military spending M and nonmilitary state spending N (1990, 1991; Huang and Mintz 1990). (For a full derivation of the model, see Ward et al. 1991.) The neoclassical growth equation to be empirically estimated is

$$\frac{\Delta Y}{Y_{-1}} = \alpha_0 + \alpha \frac{I}{Y_{-1}} + \beta \frac{\Delta L}{L_{-1}} + \left(\frac{\delta_M}{1+\delta_M} - \theta_M\right)\frac{\Delta M}{Y_{-1}} + \left(\frac{\delta_N}{1+\delta_N} - \theta_N\right)\frac{\Delta N}{Y_{-1}} + \theta_M \frac{\Delta M}{S_{-1}} + \theta_N \frac{\Delta N}{S_{-1}} + \epsilon. \quad (1)$$

National income is represented by Y, investment by I, and labor by L. This equation assumes that the contribution of M and N to growth via the externality (θ) and the factor productivity differential (δ) are not necessarily equivalent and associates unique δs and θs with respective components of M and N, an assumption that can be tested empirically.

The basic idea of the model is that changes in factor inputs (i.e., investment, labor and the various types of government spending) contribute directly to the growth rate of economic output, or national product. This neoclassical assumption is further modified by separating out the size effects of spending patterns from their externality effects. *Size effects* represent the contribution to national product of the overall spending levels. Government purchases, in effect, contribute to national productivity. *Externality effects* refer to the spillover contributions. Government spending on roads, for example, contributes indirectly to the efficiency and productivity of nongovernmental sectors. In general, if government activities developed out-

side of the market economy contribute to productive capacity they are said to represent an externality effect. (A broader discussion of these effects may be found in Cornes and Sandler 1986; Huang and Mintz 1991 explores the externality effects of defense spending on the U.S. economy using a three-sector production function approach.

We apply this model to the United States because we believe that externalities of defense spending are important in understanding the defense–economy trade-off and that the linkage between the military and the aggregate economy is sufficiently strong to be evident directly. This model also permits us to discern the separate effects of military and nonmilitary spending on economic growth.

A number of theoretical expectations flow from this model. The United States benefited from contributions to industrial infrastructure over the past decades. Accordingly, we expect that the impact of investment on changes in aggregate output should be significantly positive: $\mathcal{H}_1: \alpha > 0$. Furthermore, we posit that gains in labor inputs will be translated into output gains, that is $\mathcal{H}_2: \beta \geq 0$.

Ram (1986) found that the size effects of government spending are generally positive. However, military spending is often thought to be inherently nonproductive and a drain on productive resources in mature economies. Accordingly, we posit that military spending will have negative size effects on output while nonmilitary spending programs will generally have positive size effects. Thus (for m, n = military/nonmilitary governmental spending),

$$\mathcal{H}_3: \frac{\delta_m}{1+\delta_m} - \theta_m < 0$$

and

$$\mathcal{H}_4: \frac{\delta_n}{1+\delta_n} - \theta_n > 0.$$

Military spending programs are also frequently thought to bring spinoff effects as technologies and production processes initially developed for defense applications are brought easily and without separate research and development costs into the private sector. On the basis of this argument, we posit that the military spending of the United States will have positive externalities. Nonmilitary state spending programs are also thought to have positive externalities in some regards, since much state spending is aimed at providing infrastructure (e.g., roads, schools, national defense, and other public goods) that benefit commerce. For i = military/nonmilitary state spending, we hypothesize that $\mathcal{H}_5: \theta_i > 0$.

Before turning to a description of the data employed and our empirical results, it is important to catalogue, however briefly, some weaknesses of this approach. In adopting a production function approach that assumes an equilibrium between supply and demand, one necessarily glosses over the ability of the economy to function in disequilibrium. We ignore the major mechanisms through which the macroeconomy attempts to deal with disequilibrium: prices, the labor market, the responsiveness of investment to changes in output, and financial markets. A more complete model would provide a description of demand, as well as supply. Additionally, by adopting an economywide description of the United States, we ignore the existence of linkages that may be present in one sector (such as high technology) and absent in another (such as textiles). We also ignore regional differences, differences that may be stronger in some parts of the country and absent, weak, or opposite in the other locales. Available models of open economies are considerably more fine-grained, sophisticated, and advanced than the model presented here. However, the model employed herein is a simple and straightforward tool for evaluating the impact of military expenditures on economic growth, while permitting us to tease out the economic implications of various policy options for reducing defense expenditures under consideration.

DATA

Data measuring GNP, military outlays, government spending, and investment were all taken from the 1986 U.S. Department of Commerce publication, *The National Income and Product Account of the United States; 1929–1982*.[2] These measures were updated through 1990 from the *Survey of Current Business* (Dec. 1989 and 1990, July 1991, and Jan. 1992). Data measuring employed civilian labor force were taken from the U.S. Department of Labor (1989, 1991). All fiscal data were deflated into constant 1982 U.S. dollars using the GNP deflator and are given in calendar years.

EMPIRICAL RESULTS

Table 1 presents the results of the ordinary least squares estimates of equation 1. Studies by Mintz and Huang (1990, 1991; Huang and Mintz 1990) and Atesoglu and Mueller (1990) have argued that multicollinearity is a severe problem in formulations of the sources of growth equation. Accordingly, Atesoglu and Mueller drop consideration of the externality effects from their analysis. Mintz and Huang employ a *k-class* ridge estimator to circumvent collinearity problems and report results for ridge as well as for ordinary least squares estimators. The value of the ridge approach to avoiding problems associated with multicollinearity is, however, widely contested. (See Kennedy 1986 for a discussion of the salient points.) We do not adopt the ridge approach in this study because all of the ordinary least squares parameter estimates are unbiased and highly significant. Increasing their significance by introducing bias would provide no leverage in this instance.

Turning first to the diagnostic statistics, it is clear that the model demonstrates a high degree of fit.

TABLE 1

Military Spending and the Sources of Growth in the United States, 1948–90

COEFFICIENTS	ESTIMATOR: ORDINARY LEAST SQUARES			
	VALUE	ST.E.	T-STATISTIC	PROBABILITY
Constant	−.1053	.0479	−2.1981	.0344
Investment	.6940	.3148	2.2045	.0340
Labor	.6387	.3104	2.0575	.0469
Size effects of				
Military spending	−2.9773	1.2390	−2.4029	.0215
Nonmilitary spending	6.9957	1.4895	4.6966	.0000
Externality effects of				
Military spending	.7369	.2462	2.9934	.0050
Nonmilitary spending	−1.2712	.2888	−4.4017	.0001

Note: Lagrange multiplier tests are serial correlation, $\chi^2 = .464$, $p = .496$; functional form, $\chi^2 = .258$, $p = .612$; normality, $\chi^2 = 1.133$, $p = .568$; heteroscedasticity, $\chi^2 = .508$, $p = .476$; stability, $F(7, 9) = 2.723$, $p = .027$. Diagnostic statistics are $\bar{R}^2 = .7529$; $F(6, 36) = 22.3308$; log likelihood = 128.6642.

Over three-quarters of the variance in the rates of economic growth are explained by the model as derived. Moreover, tests of the structural specification of the model support the specification of the model, which shows no evidence of serial correlation, functional misspecification, nonnormality of residuals, or heteroscedasticity. These statistics increase our confidence in the model. Graphic presentation of the fit in Figure 1 also shows that the ups and downs in U.S. economic growth are well captured by this simple neoclassical model.

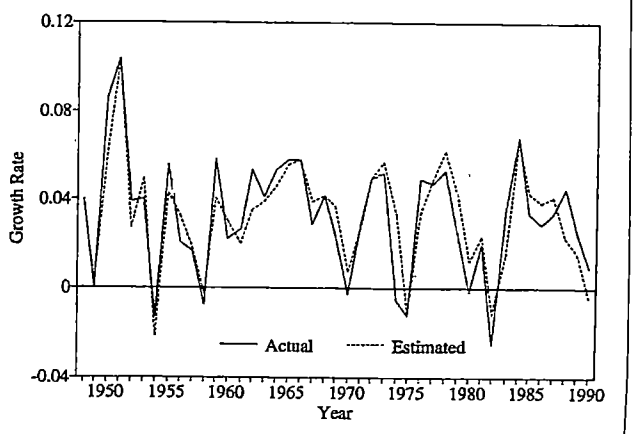
Turning to the specific coefficients, each estimated coefficient is statistically significant at the .05 level or better. (Robust standard errors are reported.) Most of the coefficients have the predicted sign. We hypothesized that the impact of investment on changes in output would be significantly positive. The estimated coefficient ($\alpha = .694$) suggests that investment has a positive short-term impact on increasing gross national product. Labor inputs also have a positive coefficient, $\beta = .64$.

We posited that military spending has negative size effects on GNP, while nomilitary spending has positive size effects. These speculations are upheld by the empirical analysis:

$$\frac{\delta_m}{1+\delta_m} - \theta_m = -2.98$$

and

$$\frac{\delta_n}{1+\delta_n} - \theta_n = 7.00.$$



As military spending goes up, economic output will decline; as nonmilitary spending programs are augmented, one may expect positive effects on gross national product. Since military spending is generally smaller than nonmilitary spending, the overall size effect of government spending will be positive; but this hides the fact that military spending not only apparently reduces economic growth rates but may drain resources from nonmilitary spending programs that are likely to have positive size effects on the civilian economy.

Rather than observing positive externalities for both military and nonmilitary governmental spending, we find that the military has a positive externality as predicted ($\theta_M = .74$), while the externality for nonmilitary spending programs is negative ($\theta_N = -1.27$). Thus, it appears that military spending does generate positive spin-offs or externalities for the civilian economy.

Factor productivity of sector i is greater than that of the private sector whenever δ_i is positive. Using estimated values from Table 1 to solve for these parameters, we find that $\delta_N = -1.21$ for nonmilitary government spending and $\delta_M = -.69$ for military spending. Taken together, these coefficients suggest that on average, over the entire time span, *government* sectors have lower factor productivity in the United States than civilian sectors.

FIGURE 1

Actual and Fitted Values of Growth Rates in U.S. Gross National Product, 1948–90

SIZING UP THE PEACE DIVIDEND

Having developed and tested a model of the impact of both military and nonmilitary spending on the economy, we are in a position to forecast the impact that changes in U.S. government spending may have on the economy. During 1991 and 1992 there has been intense debate in the defense policymaking community about the appropriate future trajectory of U.S. defense spending.

One major proposal is that of the Bush administration, seen in terms of the revised Five Year Defense Plan (FYDP) put forward by Secretary Cheney in late 1991 and early 1992. This plan calls for defense spending to be reduced by a total of about fifty billion (current) dollars over the period 1992–96, although the level of defense spending in 1996 would be approximately ten billion dollars lower than current levels. This is widely referred to in the press as the "fifty billion" plan, and represents the view of the Bush administration as exemplified in the 1992 administration budget proposals that while some cuts in defense spending may be undertaken, the international environment remains threatening and uncertain, so that widespread cuts would be imprudent.

William W. Kaufmann and John D. Steinbruner have offered a timely criticism of this point of view in *Decisions for Defense: Prospects for a New Order* (1991). This volume offers a detailed analysis of the force structure and financial requirements of various strategic and operational postures that might guide U.S. defense policy in the years ahead. Kaufmann and Steinbruner offer an alternative conception, called *cooperative security,* that served as the basis for a different set of projections of defense spending, projections considerably lower than those put forward by the Secretary of Defense. The basic idea behind the Kaufmann and Steinbruner plan is to rethink and restructure U.S. defense planning on the basis of a collective arrangement among many national governments around the globe, rather than trying to use the defense budget to perpetuate U.S. military preponderance unilaterally. In much the same way that European Ministries of Defense are beginning to discuss a European Defense Union (Fontanel and Smith 1990), this plan would imply a subordination of U.S. traditional objectives of containment and deterrence to a cooperative strategy of engagement that would necessarily involve other important global powers.

According to Kaufmann and Steinbruner (in subsequent testimony to the U.S. Senate Appropriations Committee, 19 February 1992), the basic plan is premised on the notion that "participating military organizations are all on the same side, are all defensively configured, and are all primarily committed to providing mutual reassurance. This requires them to systematically limit offensive capabilities that might support ground invasions or might undertake long-range bombardment to achieve some political objective" (Kaufmann and Steinbruner 1991, 70–71). This type of arrangement would include the notion of an inhibition of firepower concentrations—that is, conventional arms limitations; a geographical restriction of the location of force concentrations; tactical air restrictions; full disclosure of research activities affecting weapons technologies; maintainence of small "residual" nuclear forces; and widespread and consolidated weapons export controls. Such an arrangement would require the participation of the United States, the Commonwealth of Independent States (especially Russia), the United Kingdom, France, Germany, Japan, and China at a minimum. Cooperative security permits Kaufmann and Steinbruner to tease out the force implications of such a strategy and from there to derive the budgetary implications of such a strategic restructuring over the next five to ten years.

These two different visions of the strategic future have been in considerable conflict among the Washington decision makers. The Pentagon's 18 February draft of the *Defense Planning Guidance for the Fiscal Years 1994–1999* criticizes the cooperative security approach and offers the strategic vision behind the administration's then-current FYDP. The guiding principal is "to maintain the U.S. position as the only military superpower in the world."[3] In addition to preventing the emergence of a major power dominating Western Europe, the territory of the former Soviet Union, East Asia, or Southwest Asia, this new plan promotes a military balance that will convince "potential competitors that they need not aspire to a greater role or pursue a more aggressive posture to protect their legitimate interests"; this will putatively assure that no rival superpower emerges in the military realm: "We will retain the pre-eminent responsibility for addressing selectively those wrongs which threaten not only our interests, but those of our allies or friends, or which could seriously unsettle international relations."[4] In short, this policy would reject the ideas of Kaufmann and Steinbruner and pose a distinct alternative not based on a collective or cooperative internationalism as the foundation for U.S. defense policy. In so doing, the required force structure would continue to be substantial and the potential for reduced military spending would be modest.

In these two basic plans, we see not only different strategic postures, but also budgetary implications that are quite distinct. In large measure, the administration plan has been backed by Republicans, and the Kaufmann–Steinbruner plan (or a version of it) has been backed by Democrats. Table 2 presents the specific top-line proposals in each of these two plans for annual defense spending 1992–96. It seems useful to tease out potential economic implications of these two different scenarios. To do so, we used estimated coefficients for equation 1 to structure the simulation. Since the formulation is dynamic, it produces growth rates and GNP for future periods, given exogenous data on investment, government spending, and labor. We used recent historical growth rates for these variables (the decade from 1980–89) but supplemented these by actual data for 1991 where available.

TABLE 2

Comparison of Five Year Defense Plan with Cooperative Security, 1992–96

YEAR	FYDP	COOPERATIVE SECURITY III
1992	295.2	295.2
1993	285.9	275.5
1994	282.0	256.8
1995	285.8	239.0
1996	289.1	222.4

Note: These data are for outlays, given in billions of current dollars. The Bush FYDP figures are from the Office of Management and Budget estimates of Total 050 expenditures. The Cooperative Security III scenario data appear in Steinbruner 1992. These data are a slightly accelerated version of the cooperative security option described in Kaufmann and Steinbruner 1991, 74ff).

(Complete details on the data and the simulations are available on request.) We used actual data on investment for 1991, from the *Economic Report of the President* Bush (1992), as well as official projections of government spending for the period 1991–93 in the same source. During this period, investment grew by 1.4% per annum, while the labor force grew by 1.7% per annum. During the same period, the growth rate of government spending was 2.9%.

Our simulation compares three defense spending scenarios. The first of these is a benchmark using the 1991 spending levels for each year until 1996. Our second defense spending scenario is that presented in the Bush–Cheney FYDP as of February 1992 as discussed in congressional hearings and summarized by the Office of Management and Budget. Our third military spending scenario is the plan known as Accelerated Cooperative Security III, a plan proposed by Kaufmann and Steinbruner in February 1992.

We also examine three basic options of what to do with the putative "peace dividend." First, we explore what would happen to the economy if savings from the defense reductions could be spent by other government programs. Second, we explore the implications of the so-called "Firewalls Bill" to prohibit savings in military spending from being used by other government programs; rather, the savings would simply disappear from the government budget and go toward deficit reduction. Our third scenario would take the savings from defense down-sizing and put them directly into private investment. This last option is based on the widely held notion that defense spending "crowds out" private investment. (Mintz and Huang 1990 offer a summary of this argument; see also Paul Samuelson 1964, 785). Private investment has been dropping in constant terms over the period from 1989 to the present. This scenario attempts to gauge the impact of a stimulation of investment as a result of defense downsizing. We note that the 1992 budget is the same in each scenario; it is only in 1993 that the implications of any of the proposed budgets will be felt upon the U.S. economy.

Table 3 presents the projected level of annual output (GNP) based on each of the three defense budgets in each of the three savings options over the period 1993–96. These projects are given in constant billions of 1982 dollars. Several things are striking about these results. First, it should be apparent that without a reduction of U.S. defense spending, real economic growth will be miniscule in the next few years, even assuming a recovery of investment to historical growth levels and an expanding job market. Projected 1996 GNP (in 1982 dollars) is only 1.5% higher than projected 1993 gross national product, under the benchmark scenario of no change in defense spending over the 1991 program targets. We note that actual national income has grown by an average of less than 1% per annum every year since 1989 (Bush 1992). Second, by using savings in defense spending to reduce the deficit, one can begin to see substantial effects on economic output, even in the short run, with either reduction plan, bringing about greater levels of economic growth. Thus,

TABLE 3

Growth Implications of a Peace Dividend, 1993–96: Projected Gross National Product in Billions of 1982 Dollars

USE OF PEACE DIVIDEND	1993	1994	1995	1996
Civilian government programs				
No change over 1991	4210.04	4198.14	4234.10	4275.54
FYDP	4218.87	4228.11	4274.39	4319.54
Cooperative Security III	4223.16	4245.02	4305.54	4357.62
Deficit reduction				
No change over 1991	4210.04	4198.14	4234.10	4275.54
FYDP	4218.87	4224.23	4264.06	4303.94
Cooperative Security III	4223.16	4242.66	4293.15	4341.99
Investment				
No change over 1991	4210.04	4198.14	4234.10	4275.54
FYDP	4222.50	4241.94	4299.63	4358.42
Cooperative Security III	4223.16	4248.81	4320.49	4400.81

whether a Democrat–sponsored cooperative security strategy is adopted or whether a down-sized military sculpted after Pentagon plans for the maintainence of U.S. military preponderance is adopted, the U.S. economy stands to benefit in the short run, with short-term growth rates higher for each reduction scenario. If defense savings can be used to increase investment (following the crowding-out thesis), substantial increases over current trends in output can be expected. However, even these drastic changes in the trajectories of defense spending and investment only suggest that real growth in GNP is going to be less than 2% a year over the foreseeable future. Finally, it is clear that the accelerated cooperative security option consistently has a greater stimulative effect on the U.S. economy regardless of what, if anything, is done with the savings. By 1996, U.S. economic growth under the cooperative security option will be close to 2% per annum, while the 1995–96 growth rate for the Bush–Cheney FYDP is projected to be 1.4% and under the no-change scenario, it would be about 1%.

SUMMARY

This research provides a number of interesting implications for the literature on the defense–growth trade-offs in the United States and for the current debate about the peace dividend.

First and foremost, consonant with theory and speculation suggesting the nonproductive nature of military spending in industrial societies, we find strong evidence that military spending detracts from economic growth. Recent studies have pointed away from a negative link between military spending and economic growth in the United States (Atesoglu and Mueller 1990; Congressional Budget Office 1990; Huang and Mintz 1990; and Mintz and Huang 1990 and 1991). Our results suggest that such a linkage not only exists but is composed of two distinct parts. On the one hand, we find that the size effect of military spending on the economy is negative. On the other, it seems clear that the military spending programs are able to generate spin-off benefits for private sectors of the economy (i.e., have positive externalities) independently of the size of military spending vis-à-vis total output. Furthermore, we have demonstrated that both military and nonmilitary governmental spending have lower factor productivities than the private sector of the economy, indicating that both aspects of government spending are less efficient than the private sector. Finally, we demonstrate that under each of the policy scenarios of reduced military spending, it is reasonable to expect a small but nontrivial boost to the level of gross national economic product by 1996 compared to a scenario of no reduction. This is consistent with the finding by Mintz and Huang (1990 and 1991) that the linkage between investment and growth may be a powerful conduit of the relationship between military spending and growth; our simulations suggest that by stimulating investment with the peace dividend one gains the largest macroeconomic benefit.

With respect to the current political debate over appropriate levels of military expenditures in the near-term future and the "peace dividend," these scenarios indicate that the consequences of the resolution of this debate have important implications for economic growth, especially for how it is allocated. For instance, the Democratic proposal would result in a GNP 1.6% higher by 1996 if the peace dividend is spent on deficit reduction, 2.1% higher if it is channeled to other aspects of government expenditures, and 2.9% if it is directed into investment. Corresponding numbers for the Bush–Cheney proposal are .6%, 1.0%, and 1.9%, indicating that the overall magnitude of the cut is also critical, supporting the assertions of Kennedy (1987) that maintaining a hegemonic military position carries with it economic consequences.

It turns out that cutting the defense budget is a question that is political *in the extreme.* Not only does the current discussion come in the throes of a presidential campaign, but also the current downsizing has local, as well as national and international, implications. Gordon Adams notes that "Congress is caught between a rock and a hard place. The rock is the desire for a peace dividend. The hard place is jobs in your district."[5] It is clear that local dislocations will attend to specific defense cuts. For example, the local economy around Monterey, California, will not be the same after Fort Ord is shut down. However, the results of our analyses suggest that on balance the U.S. economy will be stronger with defense cuts than without them. Larger cuts appear to help more, whether employed to offset the deficit, provide resources for civilian governmental programs, or stimulate capital formation. While it is politically challenging to support cuts that will affect local jobs, it does seem clear to all concerned that the military threat faced by the United States is significantly diminished. According to widespread accounts, the economic challenges faced by the United States continue to multiply both in number and complexity; these are made clear in the most recent *Economic Report of the President* (Bush 1992). Given this conjuncture of decreased military threat and increased economic threat, the downsizing of the military that seems to make strategic sense may well carry with it economic benefits that are substantial. However, a strong political will also seems necessary to obtain the peace dividend.

EXPLAINING SELF-DEFEATING FOREIGN POLICY DECISIONS: INTERPRETING SOVIET ARMS FOR EGYPT IN 1973 THROUGH PROCESS OR DOMESTIC BARGAINING MODELS?

How should we explain why a state sometimes adopts a foreign policy in one region that interferes with its concurrent policies elsewhere? In their article in the March 1989 issue of this Review, *Stewart, Hermann and Hermann proposed a three-level process model of foreign policy to explain such Soviet behavior towards Egypt in 1973. The analysis has continuing interest because it interprets the puzzling behavior as a manifestation of general problems of information processing in making foreign policy choices. Richard Anderson suggests that a two-level model of domestic bargaining better accounts for the causal sequence in Soviet-Egyptian relations and is in general more parsimonious. Margaret and Charles Hermann defend their substantive analysis and argue in any case for the complementarity of process and bargaining approaches.*

COMMENT

Why does a state sometimes adopt a foreign policy toward one country or world region that impairs the prospects for success of policies concurrently followed by the same state toward other countries or world regions? Stewart, Hermann, and Hermann (1989) offer a process model of foreign policy to explain one case of this puzzling behavior—the Soviet decision in January 1973 finally to grant Egypt's requests for offensive arms to launch the October War against Israel. This decision remains puzzling because Egyptian use of Soviet arms to attack an ally of the United States could be expected to, and ultimately did, jeopardize the détente that the Politburo was concurrently pursuing.

Even though the Soviet Union is now defunct, both the question raised by the authors and their proposed answer remain worthwhile. Many states adopt self-defeating foreign policies (Snyder 1991). The general model proposed by the authors conditions the observed Soviet behavior not on any peculiar institutional or ideological characteristics of the Soviet Union but on general problems of information processing that might distort foreign policy choices by any national leadership. The authors' model has the particular merit of linking levels of analysis by treating foreign policy as contingent on international events, not determined by them. They explain the Soviet decision by an empirical investigation of two processes: (1) the individual-level process by which each of six Soviet policymakers adjusts his attitude toward the issue in response to new information (in this case, Egyptian president Anwar Sadat's July 1972 decision to expel Soviet military personnel from Egypt) and (2) the group-level process by which policy responds to change in individual attitudes toward Sadat's request for arms. In the authors' model, the Politburo approves delivery of arms to Egypt, despite this decision's incompatibility with détente, because Sadat's expulsion order triggers reconsideration of Soviet Mideast policy without simultaneously motivating a reevaluation of East–West policy.

While flaws in information processing have often drawn attention as candidates to explain self-defeating organizational behaviors, another possibility is domestic bargaining. Belonging to the family of "two-level" or "nested" games (Putnam 1988, Tsebelis 1990), a model of domestic bargaining explains self-frustrating behavior in the international arena as a consequence of interactions among the decision makers in the domestic arena. A domestic bargaining model differs from a process model in analytic focus. While the process model draws attention to the processing of salient international events, the bargaining model draws attention to national leaders' purposive behavior.

One way to evaluate the relative merits of process models and domestic bargaining models is to compare their handling of the evidence in particular cases. In the case of Soviet arms for Egypt, the process model, drawing the authors' attention to Sadat's July expulsion order, induces them inadvertently to commit a causal inversion by attributing an event to an observably posterior cause. I begin with a discussion of the causal inversion. Then I present the alternative domestic bargaining model and lay out its historical reconstruction of the case. I conclude with a discussion of the relative merits of the two models.

THE CAUSAL INVERSION

To explain the Soviet policy reversal in granting Egyptian requests for offensive arms, the authors build a causal chain. They examine change over time in the attitudes expressed toward the Egyptian requests by four Politburo "oligarchs" (Brezhnev, Kosygin, Podgorny, Suslov) and two key advisers (Defense Minister Grechko and party foreign affairs specialist Ponomarev). Sadat's expulsion of Soviet military personnel in early July 1972 causes a shift in the declaratory stand taken by Kosygin in the third

quarter of 1972. The resulting disagreement over policy toward the Mideast causes Suslov to realign his public stance with Kosygin's. Realignment among the oligarchs produces approval of the arms deliveries in January 1973.

To detect changes in the oligarchs' and their advisers' expressed attitudes toward the Egyptian demands for arms, the authors rely on a quantitative content analysis of all "speeches and writings" by the six Soviet officials during 1970–72. They measure the ratio of "references" deemed "supportive" or "resistive" to Sadat's demand for weapons deliveries. A reference to advances in the Third World is considered supportive, while a reference to East–West détente is considered resistive.

One may question whether the ratio of references carries any significance. Any speech or article is not a concatenation of isolated references but a coherent text. A feature especially pronounced in Soviet political discourse was the tendency for speakers to communicate differing policy preferences not only by varying the number of references to agreed policies but also by varying the manner in which these references were combined (Ploss 1971, 120). For example, in each of two speeches given by the oligarchs Kosygin and Podgorny two days apart in October 1971, references to advances in the Third World considerably outnumber references to East–West détente. But Podgorny says that advances in the Third World will make détente feasible, while Kosygin says that détente is necessary for advances in the Third World. Because meaning can depend on overall organization of a speech, the ratio of references to one policy or another might vary without any change in the attitude expressed by the speaker.

Rather than relying on quantitative content analysis, the authors might examine Politburo members' explicit comments on the Arab–Israeli conflict. They would discover that the Politburo's specialist on Mideast issues during 1970–72 was Podgorny, whose role they (following Spechler 1986) overlook entirely. Although the authors score him as paying zero attention to the Mideast, in fact, 10 of his 70 speeches concern the Mideast almost exclusively; and he addressed it in other speeches. He commented on the Mideast much more than any other Soviet leader. In opposition to Sadat's demands for arms, Podgorny advocated a "political settlement" to be achieved not by direct U.S.–Soviet or Israeli–Arab negotiations but by building a diplomatic coalition that would isolate Israel and the United States and compel unilateral concessions.[1]

Until 9 December 1971, Brezhnev and Kosygin echoed Podgorny's calls for a political settlement. But at summits with Sadat in *February and April 1972*, from which Podgorny was excluded, Brezhnev and Kosygin agreed to communiqués that shifted Soviet declaratory policy in favor of Sadat's view that offensive war was a justifiable solution to the Arab–Israeli conflict (Glassman 1975, 94; Rubinstein 1977, 179; Porter 1984, 122, n. 19). Their speeches began to call for "liberation" of occupied Arab territories without repeating Podgorny's strictures against military means.[2] Podgorny, meanwhile, continued to advocate a political settlement in the Mideast; but he also lost his 1971 predominance in the public exposition of Middle East policy.[3]

Thus, the shift in Kosygin's declaratory stand on the Mideast conflict—the first link in the authors' causal chain—occurs at least five months before the event, Sadat's expulsion order, which the authors say causes his attitude to shift.[4]

A DOMESTIC BARGAINING MODEL

To explain the Soviet decision to arm Egypt, one might turn to a simple domestic bargaining model of foreign policy. The bargaining model posits that each national leader seeks to control policy on as many issues as possible. (It lets stand the question *why* leaders want control of policy—perhaps because they are ambitious, perhaps because they think their policy preferences are optimal for their state.) Each national leader is assumed to have two choices of action: (1) to insist on his or her own policy proposal and (2) accept some other policy proposal. If some leaders accept some other policy proposal than their own when one leader insists on his or her own, the "other" policy is assumed to be the insistent leader's own proposal; if all leaders accept some proposal other than their own, the policy is assumed to be some intermediate compromise. This set of assumptions produces a game matrix, shown in Figure 1 for the two-leader case.

If the assumption that leaders want to control policy is interpreted to mean that they would rather disagree than surrender policy to another leader's control but prefer a mutually acceptable policy to disagreement, this game is the familiar prisoner's dilemma. It is iterated over indefinitely many policy decisions over time. This particular prisoner's dilemma has the interesting feature of uncertainty about who plays last. For example, under the rules in 1972, Politburo members could die in office or fall ill and retire or the Central Committee could remove them from office. Consequently, this indefinitely iterated prisoner's dilemma is not subject to the usual logic of backward induction, and there are many possible equilibria (Tsebelis 1990). Among these equilibria is an "alternating sucker" pattern in which each leader accepts an insistent leader's proposal on one issue in return for obtaining acceptance of his or her insistence on some other issue (Hardin 1982; for a spatial formalization, see Austen-Smith and Banks 1990).

In order for policy to change in response to world events, the model further assumes the existence of an informal norm among national leaders. Any leader who proposes a policy must justify it by setting forth a public agenda of goals that the leader promises the policy will accomplish. According to the posited norm, information that the policy is not accomplish-

FIGURE 1

A Foreign Policy Bargaining Game

		Leader 2	
		Accept other proposal	Insist on own proposal
Leader 1	Accept other proposal	Mutually acceptable policy	Leader 2's policy
	Insist on own proposal	Leader 1's policy	Disagreement: no policy

ing this agenda eventually requires the proponent leader to stop insisting on the proposal.

HISTORICAL RECONSTRUCTION

This model can explain the Soviet reversal of policy toward Egypt. Podgorny disagreed with Brezhnev and Kosygin about both Mideast policy and East–West détente. They wanted to negotiate with the United States on both issues. He wanted to negotiate only with friendly regional states: the Arabs in the Mideast, and France, Italy, and the small states in Europe. During 1970, these policy preferences imposed no particular choice on this subset of Soviet leaders, since Podgorny's desire for separate negotiations with West European countries could be accommodated in a general program of exploring détente through bilateral diplomacy with a variety of Western countries. Beginning in early 1971, Israeli recalcitrance and Henry Kissinger's duplicity combined to frustrate Brezhnev and Kosygin's efforts for superpower cooperation in sponsoring a negotiated settlement in the Mideast (Breslauer 1983), while the European NATO members' unwillingness to negotiate security issues separately from the United States frustrated Podgorny's program in Europe. Consequently, both Podgorny and the Brezhnev–Kosygin pair could invoke the informal norm; a compromise would combine Podgorny's policy in the Mideast with Brezhnev and Kosygin's policy on East–West issues. (The other three officials examined by the authors—Grechko, Suslov, and Ponomarev—were inactive on the Mideast; and Brezhnev and Kosygin used concessions on other issues to buy off their opposition to détente.)[5]

During 1971, Podgorny's speeches advocated his political solution to the Israeli–Egyptian dispute. Sadat, having declared 1971 the "year of decision," immediately complained about the gradualist aspects of Soviet policy but was willing in the short run to accept proposals for efforts through the United Nations to achieve an Israeli withdrawal from Sinai. However, as 1971 wore on without results, Sadat began to argue that Israeli rejection of the UN initiatives justified his demands that the Soviets provide offensive arms for his preferred military solution. He also sought a settlement through direct bilateral contacts with Washington (Golan 1990, 76–79). His spokesman Mohammed Haykal (1975, 1978) accused the Soviets of perpetuating a condition of "no war, no peace" for their own benefit.

By the end of 1971, Sadat's arguments, his contacts with Washington, and Haykal's accusations constituted information that Podgorny's coalition for a gradualist policy was falling apart. In fact, in a speech for the visiting Sadat in October 1971, Podgorny tried to rebut such concerns. Consequently, at this stage Brezhnev and Kosygin could invoke the informal norm again. They would prefer to return to a policy of negotiating a Middle East settlement in tandem with the United States. However, Kissinger's unwillingness to enter serious negotiations on the Mideast, combined with his efforts to lure Sadat away from the Soviet alliance, made their preferred policy impractical. As Kissinger himself writes, "[Foreign Minister] Gromyko was experienced enough to know what I was doing" (quoted in George 1993). Consequently, Kosygin and Brezhnev proposed a policy of maintaining the Egyptian alliance (and frustrating Kissinger's plans in the Mideast) by conceding to Sadat that Egypt had the legitimate right to undertake war against Israel.

At the same time, Brezhnev and Kosygin recognized that an Egyptian attack on the Sinai would seriously interfere with their policy of U.S.–Soviet détente. To manage this tension within their policy, they took advantage of Egypt's known lack of hard currency by insisting that Egypt pay cash for any new arms deliveries (Central Asian Research Centre vol. 1, p. 208 and vol. 2, pp. 93, 246). This demand prevented arms deliveries during 1972. Resorting to

the only leverage he could imagine, Sadat ordered the expulsion of the Soviet military personnel in July 1972 (Sadat 1977). His move did not affect the Politburo bargaining; for he did not withdraw from the Soviet alliance, and keeping troops in Egypt was not part of Brezhnev and Kosygin's stated agenda. They willingly "overcomplied" with the expulsion order, withdrawing more troops and weapons than Sadat had asked (Golan 1990, 79; Roi 1975).

In January 1973, however, Saudi Arabia suddenly granted Egypt five hundred million dollars for the purchase of Soviet arms (Golan 1990, 84; Rubinstein 1977, 242). Brezhnev and Kosygin did not foresee this development; for their image of Arab countries distinguished "progressives" like Egypt from "reactionaries" like Saudi Arabia, said to be tacitly allied with Israel. Within days an Egyptian delegation left for Moscow to buy arms. If, as per my assumption, Brezhnev and Kosygin's purpose was to control policy on as many issues as possible, they would have acceded to the Egyptian demand for arms deliveries because this move would have enabled their policy proposal to retain control of the Mideast issue. Otherwise, they would have to admit that their policy had failed to maintain the Egyptian alliance and agree to some policy sponsored by someone else. Podgorny held them to their bargain with Sadat because he expected the arms deliveries to interfere with the détente that he opposed.

In short, the Soviet leaders chose a policy of delivering arms to Egypt that later interfered with U.S.–Soviet détente because this suboptimal policy in the international game was optimal in a domestic bargaining game.

CONCLUSION

Both process models and domestic bargaining models offer general explanations why states often adopt self-frustrating foreign policies. Process models attribute these policies to deficiencies in processing information about new events. In domestic bargaining models, leaders may be uninformed about circumstances and surprised by events; but they adjust their strategies reliably to new information. According to the domestic bargaining model, states adopt self-frustrating policies whenever these policies win in the domestic game, because a win in the domestic game is prerequisite for any policy to advance to the international game. In the case of Soviet arms for Egypt, the process model's focus on the impact of salient international events leads the authors to attribute the change in the Soviet leaders' attitude toward Mideast policy to an event, Sadat's expulsion order, that *followed* the observed change by five months. A domestic bargaining model avoids this causal inversion.

Bargaining models and process models are alternatives, not complements, because their explanatory logics make incommensurable assumptions about decision makers' use of information. The domestic bargaining model has the advantage of being much more compact than the authors' very elaborate process model. At the same time, the bargaining model preserves all the desirable features of the process model. Individual-level variables (preferences, perceptions of the international situation, information) combine with group-level variables (bargaining, norms) and state-level variables (rules affecting choice of equilibrium, number and identities of bargainers) to produce policy choices that react to international events but are contingent in the sense that national leaders can choose any of a wide variety of possible equilibria to the game. While the explanation of Soviet policy is consistent with evidence of oligarchic decision making by the Politburo, the model is well known to be general to policy choice, domestic and foreign, in other states.

This last point deserves emphasis. The propensity for strategic interaction within collectivities to produce behaviors suboptimal for the collectivity in larger social and natural environments is familiar from virtually every subfield of political science. Failures of information processing are inherently plausible as explanations for suboptimal behaviors, but they are inordinately difficult to detect against the background of the general disarray introduced into policy by collective choice.

RICHARD D. ANDERSON, JR.

University of California, Los Angeles

RESPONSE

Anderson, in critiquing the process model we employ to understand one puzzling case of a self-defeating foreign policy, claims (1) that the indicators we use do not adequately assess aspects of the process model, (2) that we have engaged in a causal inversion, and (3) that the domestic bargaining model is more parsimonious and better fitted to explaining the Soviet shift in early 1973 to granting Egypt's request for offensive arms. We would like to rephrase Anderson's criticisms into a set of questions and compare and contrast the process and domestic bargaining models in light of these queries: (1) Do self-defeating foreign policies reflect compartmentalized or competing attitudes among the leadership? (2) How do we know when attitudes change? and (3) Is the domestic bargaining model *too* parsimonious?

COMPARTMENTALIZED OR CONFLICTING ATTITUDES?

The differences between Anderson's and our approaches to assessing leaders' commitment to their preferences are at the heart of a debate among scholars studying the Brezhnev regime and lie at the heart of the questions that arise around self-defeating foreign policies. Two schools of thought have developed

to account for the Soviet government's simultaneous pursuit of essentially contradictory policy lines during the 1970s. One—like Anderson—sees a consensus among the Soviet leaders about their image of the Soviet Union as a global and imperial power that included within it the complementary elements of military growth, Third World activism, and détente (e.g., Glassman 1975; Head 1982; Rigby 1970). As Head has noted, the leadership practiced "separatism"—the Soviet Union had "the right to seek cooperation with the West in some matters, while challenging it in others" (1982, 41). Differences among Politburo members focused on how these various elements should be combined—how each might condition, or be conditioned by, the others—rather than on which should be the center of attention.

The other school—the one we have followed—proposes that the sharp differences in Soviet policy reflected similar differences among the leaders about the nature of Soviet objectives and appropriate methods of achieving them. Which objective should be the number one priority was at issue. Politburo members held different images of the Soviet role in international relations. Consequently, Soviet foreign policy could shift dramatically as the coalitions supporting different objectives aligned themselves in different ways. The data from studies by Spechler (1986) and Stewart, Warhola, and Blough (1984) persuaded us of the appropriateness of following the conflict theory approach and developing a ratio measure of commitment to preference (see also Dawisha 1979 and Kass 1978).

Spechler (1986) identifies two dominant images toward the United States among Politburo members during the years 1967–73. These images, she argues, had implications for the Arab–Israeli conflict and the decision to provide Egypt with offensive, strategic weapons in 1973. She labels the two the "cooperative" and "antagonistic" images. Members with the cooperative image "were impressed by the fragility of détente. . . . They did not want events in the Middle East (or in any other region) to cause or deepen mistrust and hostility between the U.S. and the U.S.S.R." (Spechler, 1986, 448). Those with the antagonistic view argued, "The U.S. must be actively countered and restrained, both militarily and politically. Highest priority must therefore be given to expansion of Soviet military power and political influence on a global scale. The Soviet Union must acquire friends and military facilities and maintain loyal allies wherever these would help to combat, contain, or undermine American power" (p. 450). In Spechler's study of the Soviet decision to give arms to Egypt, Politburo members held one or the other of these images, *not* both. In effect, the images were inverse, not conditional.

In support of Spechler's argument for the conflict between these two images in Soviet foreign policy during this time period, we note the content analysis of themes surrounding East–West relations done by Stewart, Warhola, and Blough (1984). References to détente and Soviet military power were the most prevalent in the 1970s when compared to all other themes (43% and 28% respectively), reflecting the importance of these two issues in Soviet foreign policy discourse. An R-factor analysis of all the themes across Politburo members indicated that these two foci were in competition with one another. Factor scores for individual Politburo members showed that the spokesmen for détente were not the spokesmen for increased military power, and vice versa.

The emphasis on either compartmentalized or conflicting attitudes has led Anderson and us to employ different techniques to measure commitment to preference. Anderson has used a more qualitative content analysis procedure in developing leaders' positions. He is as interested in noting when phrases describing policies and approaches change as in keeping track of how often a particular theme is repeated. He focuses on how the Politburo members link the various streams of Soviet foreign policy to deal with what appear on the surface as contradictory ideas. One result of this focus is his interest in conditional policies. We, on the other hand, have used a more quantitative content-analytic approach that looks for how much Politburo members emphasized certain themes relative to other themes. We have paid particular attention to which leaders have focused on which issues to facilitate our understanding of the positions each is likely to advocate in a decision-making process where there are basic disagreements over objectives.

HOW DO WE KNOW WHEN ATTITUDES CHANGE?

One of the important concerns of both Anderson and us is to determine when Brezhnev and Kosygin began to be influenced by the environment to change their attitudes regarding supplying Egypt with offensive, strategic weapons. Because these two leaders are classified as caretakers by our process model, we are interested in how contextual information shaped their positions. What environmental cues triggered a change has implications not only for the positions of these two leaders but for what happened in the group process as the Politburo worked to solve the problem. Ascertaining such environmental impacts is important for Anderson, as well, in determining when Brezhnev and Kosygin's views began to diverge from Podgorny's and, thus, when the bargaining equilibrium started to shift from Podgorny. Anderson argues that Brezhnev and Kosygin changed their positions in December 1971, or at least by February 1972, when they stopped advocating a political settlement. We focus on Sadat's two dramatic steps in the summer and fall of 1972 (expelling Soviet military personnel and returning "hat in hand" to seek Soviet support when overtures to the West were rebuffed) as catalytic agents for shaping Brezhnev and Kosygin's positions. In effect, Anderson believes that the change occurred from five to seven months earlier.

For Anderson, it is a change in the expressed attitude that took place by February 1972. Brezhnev and Kosygin stopped advocating a political settlement of the Arab–Israeli dispute and began shifting toward Sadat's position, indicating that means other than diplomacy could be used in dealing with Israel. Anderson refers to a shift in "Soviet declaratory policy." He argues that Brezhnev and Kosygin could shift their rhetoric and not interfere with their policy of détente with the West because they added the caveat that Egypt would have to pay hard currency for any new arms deliveries. They knew Egypt did not have sufficient hard currency to buy the weapons. Their bluff was called in January 1973 when Saudi Arabia provided Egypt with the hard currency for Soviet weapons; and the Soviets sold offensive, strategic arms to Egypt.

As Anderson describes the scenario, his choice of words for Brezhnev and Kosygin's positions seems quite appropriate—a change in Soviet "declaratory policy." The two Soviet leaders changed their public posture, but did they change their attitude before their bluff is called? Indeed, this change in public posture without a coterminous change in Soviet foreign policy behavior led to Sadat's frustration and his expulsion of Soviet military personnel in July 1972. The Soviet leadership appeared hypocritical—saying one thing and doing another. In a description of the communiqués issued from the series of meetings between Soviet and Egyptian leaders between February 1972 and July 1972, Rubinstein notes the increased tension and disagreement occurring as Sadat heard Brezhnev and Kosygin's words encouraging him to use other means than a political settlement to deal with the Israelis but saw no action in providing him with the military support he needed (1977, app. 4). As Rubinstein notes for the meeting on 27–29 April 1972, "Moscow expresses 'full support' for Arab efforts, though, 'the sides found it necessary to study again in a spirit of fraternal cooperation measures' for increasing the military potential of Egypt" (p. 362). At the meeting on 13–14 July 1972—just three days before Sadat's expulsion of Soviet military personnel, Rubinstein observes, "the brevity of Sidqi's visit suggested tension and disagreement" and "the mention of economic cooperation serves to highlight the absence of any mention of military cooperation or of Soviet efforts to increase Egypt's defense capability" (p. 363). In effect, as Anderson has recorded the events, the Soviet leaders' attitudes may never have changed. By providing hard currency to Egypt, the Saudis helped Sadat to call the Soviet bluff. As a result, Brezhnev and Kosygin were forced by the strategies they had used to maintain their position to act contrary to their preferences.

In our application of the process model to this case, we present a table with commitment-to-preference ratios for the Soviet leaders whose positions counted in this decision for each of five quarters beginning with the first quarter of 1972 (Stewart, Hermann, and Hermann 1989, Table 3). *Only* in the first quarter of 1973 are the commitment-to-preference ratios for three of the leaders more than one standard deviation above the mean for the Politburo and in the direction of supporting sending offensive weapons to Egypt (over .50). Two of them (Kosygin and Suslov) are leaders in the oligarchy at this point in time; that is, by the first quarter of 1973—*after* Sadat's two dramatic moves—half of the oligarchs whose positions counted have become advocates for supplying Egypt with such weapons. Throughout the period, Grechko, the defense minister, has scores one standard deviation above the mean—the lone advocate for supporting Egypt militarily. Interestingly, Kosygin's commitment-to-preference ratio increases dramatically in the third quarter of 1972 during the period when Sadat expelled Soviet military personnel (going over .50) and again when the decision to provide weapons is made. He appears to have been affected by what was happening to Soviet influence in the Middle East as a result of Sadat's behavior.

Brezhnev's scores remain an anomaly, staying close to the mean of the Politburo across the five quarters. We hypothesize that as a cuetaker Brezhnev may have been more interested in what was going on in the Politburo than what was happening in the international environment. He retained his position based on support among his colleagues in this body. Thus, when there was disagreement among members of the Politburo, we would argue, Brezhnev made a conscious effort to determine where everyone stood, wanting to reflect the consensus among the members and not be too different until the position of the group was fairly well defined. There is some support for this proposition in Valenta's (1979) study of the Politburo's decision to intervene in Czechoslovakia in 1968. Brezhnev sat on the fence between the arguing factions until a definite consensus began to emerge.

Thus, our data suggests that the change in Politburo members' attitudes, particularly Kosygin's and Suslov's, occurred in the early part of 1973 after Sadat's moves away from, and then back toward, the Soviet Union. The data also indicate that Kosygin's reaction to the expulsion of Soviet military personnel may have helped to begin a reevaluation of the situation among Politburo members. In any case, there appears to have been a growing consensus in the first quarter of 1973 to supply Egypt with offensive, strategic weapons. The knowledge of a change in the consensus among Politburo members probably led Brezhnev to acquiesce and agree to providing Egypt with the weapons Sadat wanted.

IS THE DOMESTIC BARGAINING MODEL TOO PARSIMONIOUS?

The process model asks three questions: (1) Whose positions count in making a decision on a particular issue ? (2) What are their positions on the issue under consideration? and (3) How are disagreements handled? As a consequence of these three questions, the process model examines decision making using three

levels of analysis: the individual, the group, and the state. In some interesting ways, the process model is a more inclusive model that provides the input information required by the domestic bargaining model. For example, Anderson does not question the part of the process model that indicates whose positions count—which Politburo members had influence and had to be included or consulted before a decision was made. He assumes this part of our model, as he concludes that the Brezhnev regime during the period 1970–72 was an oligarchy. The domestic bargaining model does not provide a mechanism for deciding whom to focus on as the bargainers in a decision-making body. They must be stipulated by the researcher. The process model includes a way to determine whose positions count.

Data from the process model are also useful in assessing which of the two positions the bargainers are likely to take in the domestic bargaining model (accept another proposal or insist on one's own proposal; see Figure 1). The advocate in the process model is equivalent to the bargainer who insists on his own proposal; the cuetaker is equivalent to the bargainer who is willing to accept another proposal. In the process model, using personality and organizational information, we are able to identify different types of advocates and what cues are likely to be valued by the cuetakers. Thus, there are advocates who push their positions *only* when the timing is right or their position is congruent with that of their organization, as well as advocates who persistently push their positions or their organization's agenda *regardless* of the situation. Cuetakers likewise differ on where they look for cues on appropriate behavior. Some focus on the particular situation, others on their patrons or clients, and still others on their organizations. Again, the process model provides the means for determining the positions needed—but not established—by the bargaining model.

Assuming Anderson's description of Podgorny to be correct, we probably have in this leader an advocate who was interested in pushing his position, perceiving only the information from the environment that supports what he believed was right. There was little flexibility when he was strongly committed to something. As we have already noted, the data in our study indicate that both Brezhnev and Kosygin were cuetakers who, though focusing on different kinds of cues, used situation-specific data in making up their minds, ever taking stock of context factors before assuming a position and cautious in jumping to conclusions without knowing what was going on around them at a particular point in time. In terms of the domestic bargaining model, then, using information from the process model, we would expect Podgorny to have insisted on his proposal in a competitive and aggressive manner and Brezhnev and Kosygin to have been willing to accept another's proposal and, most likely, seek a mutually acceptable policy. The data Brezhnev and Kosygin would use in seeking a mutually acceptable policy, however, would be different. Brezhnev would want to know what his colleagues were thinking; Kosygin would be interested in what was happening in the international environment regarding the particular issue under debate.

An examination of Anderson's historical reconstruction suggests the accuracy of these profiles. Throughout his description of what happened in the bargaining process during 1971–73, Anderson notes how events were driving Brezhnev and Kosygin while Podgorny continued to hold the position he began with.[6] Podgorny held to his original point of view, while Brezhnev and Kosygin responded to what was going on in the Politburo, as well as to Israeli recalcitrance, Sadat's growing frustration, and Saudi grants of hard currency to Egypt, in fashioning a policy that tried to respond to the situation that they perceived was facing them at the time.

The domestic bargaining model and our process model are most similar in stipulating rules for how Politburo members resolve differences and disagreements among themselves. In both, the models are focused on the dynamics in the group as members try to reach a decision. When those who count in the decision-making process disagree and come into conflict, how they go about resolving this conflict is at issue. Interestingly, the outcomes of the two models mirror one another. In the process model, "adopt oligarch's position" is similar to the case in the domestic bargaining model where Leader 1's or Leader 2's policies are selected. In the process model, deadlock can occur just as in the domestic bargaining model. And compromise is possible in the process model, matching "mutually acceptable policy" in the domestic bargaining model.

In actuality, the process model helps to spell out some of the activities in the group that underlie the domestic bargaining model. Whereas the domestic bargaining model searches for equilibria and builds on the rules of nested games, the process model arises out of the group dynamics and organization literatures where the emphases are, among others, on understanding majority–minority influences, building cohesion, achieving compromise and consensus, preventing deadlock, and developing decision norms. The process model offers ways to explain why certain equilibria are possible, given the configuration of roles and positions in a decision unit.

CONCLUSION

If our aim is to understand and explain how foreign policy decisions are made, it seems important to use a variety of models and methods to study self-defeating policies such as this Soviet decision. Only if we engage in these endeavors, can we begin to see how the models might interrelate, might explain different aspects of the decision process, might be relevant under different conditions, or might hold in different contexts. Moreover, only by taking different perspectives on the problem and making different assumptions can we gain a multifaceted view of

leaders' preferences, positions, and roles. The tendency to see models and methods as always in competition with one another with only one supposed to win and supersede the others does not facilitate such an exploration. We may learn more by comparing and contrasting the models, as we have done in this point–counterpoint analysis, than by focusing on one model to the exclusion of all others.

Notes

Anderson wishes to thank Miriam Golden, Thomas Schwartz and George Tsebelis for comments and the Social Science Research Council/American Council of Learned Societies, MacArthur Foundation, and the University of California Institute for Global Conflict and Cooperation for funding the larger project from which his piece is drawn.

1. Factual assertions concerning the contents of Soviet leaders' speeches during 1970–72 are taken from my dissertation (Anderson 1989).

2. For Kosygin, see *Pravda*, 12 February, 10 April, 4 July, and 3 and 17 October 1972. For Brezhnev, see *Pravda*, 9 December 1971 and 19 March, 6 and 28 June, and 14 November 1972. Kosygin's speech published on 17 October 1972 coupled the call for liberation with a call for a political settlement as an alternative if possible; his speech on 25 October defined a political settlement as equal to an Israeli withdrawal from all Arab territory. Brezhnev's speech on 22 December adopted this same position.

3. For Podgorny's continuing advocacy of a political settlement, see *Pravda*, 13 October and 8, 9, and 14 December 1971 and 13 April, 7 July, and 15 September 1972. Note that Podgorny's three references to a political settlement during December 1971 coincide with Brezhnev's abandonment of this phrase.

4. The literature disagrees on the importance of the expulsion to the Soviet decision. Spechler 1986 and Porter 1984 concur with the authors; Dawisha 1981, Freedman 1978, Glassman 1975, Golan 1977 and 1990, and Roi 1974 and 1975 all attach much less importance to Sadat's action.

5. Grechko possibly preferred to grant Sadat's requests for arms, but the Politburo had an arrangement with the high command that the generals could have autonomy in military policy if they accepted the Politburo's right to decide larger foreign policy issues (Colton 1979; Colton and Gustafson 1990; Rice 1987). Suslov and Ponomarev concentrated on relations with world communist parties. Because communist parties were inactive in Egypt and Syria, the Mideast issue played little role in world communist politics.

POLITICAL THEORY

We the People: Foundations. By Bruce Ackerman. Cambridge: Harvard University Press, 1991. 369p. $24.95.

This book of essays is an outline of, and introduction to, a larger work that will eventually include two more volumes. The guiding and very persuasively argued thesis set out here is that the United States is a "dual democracy" in which "We the People" assert ourselves occasionally in acts of revolutionary constitutional politics, while mostly it is governed by the normal politics of its elected representatives. The Supreme Court acts as the agent of "the People" during the long calm periods by preserving the Constitution against the "erosion" of normal politics (p. 87). As such, it is an eminently democratic institution. This argument is not entirely new. I first heard a version of it in the early 1950s in the lectures of Robert McCloskey, who used to say that the American people wanted both change and continuity and that judicial review guaranteed the latter. It was even suggested that this was a realization of Rousseauian democracy in which the will of all, or at least of the majority, prevailed most of the time, to be checked when necessary by the higher general will of the people.

Ackerman would probably reject any such introduction of European philosophy into the interpretation of American constitutional history. He, in fact, begins with an outburst of truly Jacksonian populism, denouncing just such theoretical European distortions of the native experience, and especially of the majesty of "We the People." In truth, his own version owes more than a little to Hegel. In what he calls his "story," institutions have a historical logic and dialectic of their own, quite apart from the preferences and beliefs of the individual agents who at any moment administer them. This is, moreover, especially true of the courts, because Ackerman is wholly convinced that theirs is an autonomous history within America's culture and that bench and bar form a discrete community that has historically followed its own path (p. 39). Unfortunately, he merely asserts this conventional common lawyer's ideology without offering any arguments in its favor—a great pity, because it simply imposes an excessively narrow framework upon his otherwise ambitious project. As it is, Ackerman is only "gesturing" toward the social sciences and history (p. 60). He is certainly not writing for political scientists, since in the second half of the book he openly addresses readers who have never read, much less thought about, *The Federalist Papers* (p. 200).

In spite of these oddities and of far too many rhetorical flourishes, the first part of this book is extraordinarily interesting, intelligent, and lucid; and it is sure to raise the intellectual level of the whole field of constitutional theory. In Ackerman's new "story," American constitutional history is neither a seamless web nor a succession of ups and downs. Instead, it has been run on two tracks, one revolutionary and the other adaptive. There have, he argues, been three acts of radical adjustments between generations: the ratification of the great document in 1787, the three Reconstruction Amendments, and the New Deal. The latter differs from the first two in that it was not preceded by violent warfare and that it amended the Constitution not by following the procedures of Article 5, but wholly by judicial interpretation, after the "switch in time." It was a genuine revolution, nevertheless, because it created a new activist state and, with its acceptance, a renewed and aggressive judicial emphasis on the Bill of Rights. Jacksonian democracy, on the other hand, does not qualify as a revolution, because it was "not sweeping enough", failed to promote the nationalization of politics, and its tribunal presidency did not last (pp. 77–80). Judicial doctrines did not really shift, either. One might, of course, consider that the adoption of universal white manhood suffrage was a major democratic achievement, as was the recasting of democratic ideology, both of which set America forever apart from Europe. This was, however, played out in the states, where most of the political action was, in any case—which is why it can have no part in Ackerman's exclusively national "story."

Beginning, as one must, with the Marshall Court, Ackerman shows how it preserved the essence of the new Constitution against the localizing tendencies of normal politics. It sustained the centralizing political thrust of the Constitution, as well as its guarantees of rights, in the memorable *McCulloch* and *Dartmouth* decisions respectively. Above all, Marshall set the Court its permanent task—the protection of the revolutionary new governmental order against the demands of regular politics. This was to be the function of the Court when it was confronted by the three Reconstruction Amendments, as well. While, at first, it treated the new Constitution as applying only to African-American exslaves, it soon extended "the equal protection of the laws" to cover the contractual and property rights of white citizens, as well. The market was its paradigm, and for that time and place it was a genuine work of integration as the new rights were absorbed into the Federalist doctrines of the first era of interpretation. For the Court understood that the people had acted to create national citizenship and an energized laissez-faire economy, free of the impediments that slavery, sectionalism, and their attendant political inhibitions had imposed on the pre-Civil War order. In that view, *Lochner* was quite appropriate in 1905, though it was no longer acceptable in 1932. With the New Deal, the Court learned to accept the regulatory state and the finally institutionalized "energetic" presidency that Hamilton and Jackson had promoted in vain. Above all, beginning with Chief Justice Stone's celebrated footnote in *Carolene Products*, the Court restored the Bill of Rights to primacy in order to protect personal and minority rights within the now enormously expanded powers of the state. The break with its immediate past was thus not really complete, since the Court saw to it that the new state was still limited in its powers. Moreover, the Warren Court was no more "prophetic" than its predecessors (pp. 140–42). Even *Brown* was only a part of the New Deal's comprehensive state activity, extended to public education with due regard to the tradition of "the equal protection of the laws." It was not a return to the Marshall Court, as some claimed, but an adaptation of its doctrines to wholly new circumstances and a measured response to the more immediate past. This story has at least two important implications. First, it reveals the Court as the

guardian of those few truly revolutionary amendments when "the People" act directly and not through their "stand-ins." Its does so ultimately by integrating these radical changes into accumulated interpretive practices. Second, Ackerman also neatly overcomes the old question so often put to liberals, "Why are personal rights more important than property rights?" If one accepts, as he does, that our rights are to be found only in the Constitution that "the People" have made and remade, then one simply recognizes three successive episodes in which rights were given new meanings and applied to new claimants. In this scenario, all rights have the same standing and source—and all undergo the same fate—as history imposes its limits on every successful revolution.

"We the People" are only the politically active citizenry in Ackerman's story. Americans are normally "private citizens" who become politically engaged only sporadically. He does not particularly regret their preference for civil society. The Constitution was made for such people, and it does not require Jacobin, virtuous, full-time citizens. An occasional Ralph Nader is quite enough (pp. 232–33). Nevertheless, Ackerman does think that the amending process should be made more like a referendum and offer a greater opportunity for presidential initiative. This would evidently make the mobilization of "the People" for revolutionary change easier and more frequent. Actually, Jefferson proposed something of the sort only to be soundly refuted by Madison in *Federalist* 49. Ackerman does not mention this, perhaps because he seems so eager to deny his own perfectly obvious Jeffersonian roots. He is none the worse for them; for though he is not as insouciant about bloodshed as Jefferson was (Who in our century could be?), he, too, advocates transforming popular action, in a modified version of Hannah Arendt's idea of a political revolution with some social issues added. Her definition, moreover, justifies Ackerman's applying the term *revolution* to his three transforming moments of constitutional history. It is an encouraging thought, as well, meant to inspire "the People" to assert their sovereignty again. The Supreme Court could presumably use a new amendment to divert it in time from its current course. In the meantime, we can look forward to the continuation of Bruce Ackerman's interpretation of our constitutional history and hope that he will expand his story to include people and events that lie beyond the confines of a hermetically sealed legal history.

Harvard University JUDITH N. SHKLAR

The Prevalence of Deceit. By F. G. Bailey. Ithaca: Cornell University Press, 1991. 143p. $24.95 cloth, $7.95 paper.

Positivism has been displaced, or so we assume. The program of making everything knowable through the supposedly impersonal norms and procedures of "science" has been radically questioned. The hope of constructing a "grand narrative," either intellectual or political, that will give us the ultimate truth and will lead us to freedom has been shattered in many ways. Reality, it seems, is a text subject to multiple interpretations and multiple uses. The implications of this for research and politics in our supposedly "postmodern" age are more than a little interesting.

There are few words more often used—and abused—in discussions of contemporary culture and politics than postmodernism. It is hard, in fact, to find an area of study where it has *not* had an impact. In general terms, the form postmodernism takes is that of the self-conscious, self-contradictory, self-undermining statement. It wants to provide a thoroughgoing "denaturalizing" critique, to "dedoxify" our cultural representations. All of our discourses are politically "uninnocent." They occur within a dynamic social context in which the existence of multiple sets of power relations are inevitable. Hence, discourse and politics, knowledge and power, seem to be part of an indissoluble couplet.

All of this is provocative. Yet while much of the postmodern project is insightful and serves as an important corrective to what even progressive scholars take for granted, there are still parts of postmodernism that should and do make one pause. Its capacity for overstatement, its own rhetorical flourishes, its use by all too many people to make often simple points that we sometimes already knew from other traditions—all of this detracts from some of its strengths.

Bailey avows parts of the deconstructionist program while offering substantive (and occasionally simply rhetorical) criticisms of it. Even when I was not always in full agreement with his reproofs, constructing responses to them was quite an enlightening enterprise.

Bailey himself is a reconstructed positivist, one who wants to inquire into the conditions in which we test "truth" in a world of contested values. Because of this, *The Prevalence of Deceit* is true to its title. Social life is organized around "basic lies" and smaller lies. Truth is a contest, it is not simply there. The language of truth and deceit has multiple uses. It provides the cement of social interaction and is malleable depending on its historical and cultural context. Truth and untruth are the very instruments of politics. Bailey's discussion of this is based on multiple examples, often taken from his own earlier anthropological fieldwork in India.

In the process, he offers comments on how the issue of truth and lying has been dealt with in previous theories, how we are to understand the process through which dominant groups gain hegemony, how negotiations over "the truth" involving differential power relations go on, the place of deceit in ethnographic research, and the status of truth claims in such research. The volume is really a wide, varying essay, more a "reflections on" than a detailed treatment of its subject. To prove his case that in political and cultural life, truth is "mostly illusory" and that the "life we share with others must include untruth" in a variety of forms (p. xxi), Bailey would have had to expand his examples and arguments considerably. While this gives some of its content a rather stipulative feeling, what he does present is nicely complemented by an engaging and often bitingly humorous style.

The volume is not without its conceptual and stylistic problems, however. There are times when, even given Bailey's elegance and wit, the reader is not at all certain where the book is going. Further, I was surprised that Bailey did not draw upon Murray Edelman's work on political language or James Scott's discussions of public "performances" that hide acts of resistance. This might have lent even more strength to some of his claims about relations between dominant and dominated groups.

Finally, Bailey at times does not always fully represent the more sophisticated arguments already made either defending or criticizing interpretive/hermeneutic an-

thropological theories and postmodern approaches. Although I, too, have strong reservations about aspects of interpretive and postmodern theories, especially their tacitly apolitical tendencies behind their rhetoric, these theories are not composed of simple arguments. They require detailed exposition of their *best* case; then one can set about doing a more powerful critique.

All this said, I do recommend *The Practice of Deceit*. Few books actually force us, by both their style and their content, to engage in a good debate. Bailey has offered one such book.

University of Wisconsin, Madison MICHAEL W. APPLE

Identity\Difference: Democratic Negotiations of Political Paradox. By William E. Connolly. Ithaca: Cornell University Press, 1991. 244p. $27.50.

In a letter to his brother Theo, Vincent Van Gogh cautioned, "We must not judge God from this world, it's just a study that didn't come off. It's only a master who can make such a blunder." The statement expresses awe at worldly existence without expressing resentment of its shortcomings. Yet both here and in his art Van Gogh conveys that for all its wonders, there is much pain in life and that we decidedly do not live in the best of all possible worlds. One might say that William Connolly's *Identity\Difference* offers a secular and political translation of these sentiments.

For inspiration, Connolly primarily looks to Friedrich Nietzsche, who did with prose what Van Gogh did with paint. The purpose of Connolly's book is to investigate the psychology of resentment, so trenchantly described by Nietzsche, that stems from our unwillingness to accept the contingent and ungrounded aspect of the human condition. Connolly also looks to Michel Foucault, who offers historical analyses that illustrate the means by which resentment finds its social and political expression in disciplinary regimes, normalizing procedures, and processes of exclusion. Following Nietzsche, Foucault has called these investigations "genealogies" because they illustrate the pedigree of the identities we take for granted. As an academic strategy, Connolly strongly advocates for them. Departing from Nietzsche, Foucault promotes an agonistic and *democratic* politics that seeks to avoid, or at least severely limit, the imposition of identity and the penalizing or pathologizing of difference. As a political program, Connolly strongly advocates for this. Such democratic practice, Connolly admits, will not eliminate but will at least "expose and redress the politics of resentment" (p. 192).

Identity\Difference is, to my mind, the best-written of Connolly's books. It is stylistically original and captivating. Formally, its major problem is its repetitiveness. The reader is frequently reintroduced to the book's central theses, which get dressed up in different attire for different events but generally fail to make new impressions. The gist of his 34-page "Letter to Augustine," for instance, already elaborated in earlier chapters, could have been nicely conveyed by Nietzsche in a few aphorisms. Notwithstanding such formal criticism, I consider *Identity\Difference* to be the best work to date that theorizes politically about the effects of existential resentment. In the spirit of Connolly's desire agonistically to "negotiate" with his readers about the political paradoxes this theorizing begets, I shall illustrate Connolly's impressive achievement by questioning a few of his tactics.

Connolly highlights the effects of resentment by focusing on the "problem of evil." He examines Saint Augustine and the "discoverers" of America as examples of those who persecute or conquer others because they are incapable of celebrating difference. Evil appears to exist, for the world is imperfect. Unwilling to ascribe the root of evil to their God or to themselves, these powerful men indignantly thrust its burden on those different from them. The Manicheans, Pelagians, and Donatists suffered for their otherness at the hands of Augustine. Similarly, the native dwellers of America suffered at the hands of Columbus and Cortez, who attempted to conquer them, and the priest Sepulveda, intent on their conversion to Christianity. Connolly extends this analysis to modern "territorial democracy," wherein national solidarity is bolstered through the creation of external threats. As the old quip goes, a nation is a group of people with nothing in common except an enemy. A democratic politics that questions national boundaries, celebrates difference, and struggles against existential resentment, Connolly suggests, would offer us an alternative to the age-old alleviation of our existential insecurities by the facile imposition of evil identities on other individuals and nations. The goal is certainly admirable. Connolly's means of promoting it, I would suggest, require rethinking on at least two counts. First, despite Connolly's globalist aspirations, his own analyses, resources, and discussion remain fundamentally Western (not to say, American) in orientation and scope. Despite his call for us to escape the territorial state, Connolly's own work seldom leaves its own shores to encounter the other. Second, Connolly challenges us to eschew the attempt to secure the purity of our own identities by the simplistic and dangerous imposition of evil identities on others. Yet his own attack on the critics of postmodernism and other assorted opponents often fails to escape this type of behavior. In Connolly's hands, "[Kenneth] Waltz becomes the Sepulveda of his time" (p. 51); "[Robert] Keohane is the Columbus of modernity discovering the postmodern" (p. 55); and we find "[Charles] Taylor and [Jean-Paul] Sartre . . . embodying modernizations, respectively, of Augustinianism and of a heresy (Pelagianism) it spawned" (p. 113). These characterizations are stimulating. But they do not exemplify the ambiguous nature of identity advocated by Connolly.

Identity\Difference "reverses the emphasis" of his previous works, Connolly claims, by focusing more on the effects of resentment than the "social injustices" that may foster it (p. 34). But, and this is my third substantive criticism, the reader of *Identity\Difference* is given *no* reason, theoretical or empirical, to believe that social injustices, however defined, foster existential resentment. We are offered only the weak claim that "general access to economic, educational, and cultural opportunities *seems* to be one of the preconditions of more widespread engagement with the contingency of identity" (pp. 211–12; emphasis mine). In his magisterial investigation of the political effects of existential resentment, Connolly neglects to examine its social causes and therefore leaves us with no basis for understanding the social preconditions required for agonal democracy.

We are introduced to Connolly's text by an epigraph of Foucault's that celebrates curiosity as "a lack of

respect for the traditional hierarchies of what is important and fundamental." It seems a fitting orientation for Connolly's postmodern project. Yet Connolly fails to notice that Heidegger (who, with Nietzsche and Foucault, forms the tripod supporting Connolly's endeavors) had a different view of curiosity. Heidegger often spoke of curiosity as an attempt to escape thinking about the fundamental ground of existence by way of a constant and eventually jaded search for novelty and the stimulus of innovation. As such, curiosity feeds the modern technological attempt to escape the limitations of our world and the burden of our being through the continuous fabrication of new things. My final criticism is that Connolly generally ignores the threat posed to sustainable democracy by technological ways of life and thought, as well as the potential charge that postmodernism often reflects just this attempt to flee the human condition and the hard choices of politics by means of literary fabrication coupled with a flippant iconoclasm and rootlessness.

Connolly is an unapologetic postmodernist. He has no pretensions that the world we inhabit and the lives we live are metaphysically grounded, ideally constructed, or even rationally coherent. For the most part life is a mystery whose tangles only further enmesh us the more we struggle to undo them. Nearly two-and-a-half millennia ago, Socrates seemed to say the same thing. He claimed to know only that he knew nothing. But then Plato, in Book III of the *Republic* and with political purpose in mind, has Socrates tell a lie; the truth of life's mystery does not allow for an orderly politics. So Socrates spins the myth of the metals, encouraging the belief that the gods have mixed gold, silver, iron, or bronze in people's veins at birth so that their endowments and destinies are predetermined. Unambiguous identities are established. Political order is achieved. Difference is tolerated only to the extent that it plays its prefigured role within the austere and restrictive structures of the city.

Identity\Difference is a courageous attempt to sketch a city in speech that rejects the need for noble lies. Like Plato, Connolly is necessarily ironic. That is, he is telling stories that make no claim to transcendent truth. Unlike Plato, Connolly makes no pretense that the stories he tells are noble ones. That is, he eschews that heroism investing Plato and Nietzsche (Foucault is explicitly invoked as an antidote to Nietzschean heroism on p. 10) that has one striving to raise one's program above all possible contenders. There is no attempt by Connolly to justify his theory as the means by which the polity at large, or even one's own soul, *must* be grounded. Thus, Connolly rejects any form of "command ethics" and opts for an "ethic of cultivation" that promotes, but does not ground, a caring for difference. He inserts his into the tumult of voices seeking our academic attention and political cooperation in the late modern world, not to "provide a single, exclusive interpretation but to place another candidate onto the field of discussion" (p. 171). Connolly's only firm conviction is of the partial (i.e., neither impartial nor totalistic) nature of the picture he paints. In short, Connolly's irony distinguishes him from the modernist, who "perpetually asserts . . . *as if* each time were at once the first and the last time it will be needed to refute the opponent" (p. 59). What separates Connolly from the ancients, and from Nietzsche, is his rejection of the need for nobility, which, as Nietzsche knew, is the oldest collective identity invoked by some that they might impose yet a different identity upon others.

University of Florida LESLIE PAUL THIELE

The Noble Savage: Jean-Jacques Rousseau, 1754–1762. By Maurice Cranston. Chicago: University of Chicago Press, 1991. 399p. $32.50.

The admiring readers of the previous volume of this biography (*Jean-Jacques Rousseau: The Early Life and Work, 1712–1754* (now available in paperback) have looked forward to this second volume; and, with confirmed enthusiasm, will be looking forward to the third. This volume begins with the *Discourse on Inequality* on the point of publication. It covers the years during which Rousseau was writing and getting into print *Julie*, the most successful novel of the eighteenth century; *Emile*, a hardly less considerable founding contribution to the philosophy of education; and *The Social Contract*, which would have sufficed by itself to make his name immortal. The volume ends with *The Social Contract* banned in France, and with Rousseau fleeing France, under indictment for provocation to recrudescent Catholicism offered in *Emile*, just banned, recalled, shredded, and burned.

He was leaving behind the best (and best-placed) friends that any original and versatile genius could have hoped for—the Marechal and Marechale de Luxembourg, whose patience, affection, magnanimity, and kindness for Rousseau resound through this book down the centuries. They were not the only kind friends that Rousseau had in these years nor the only ones who had to exercise patience to keep friendship up. Yet, touchy and often suspicious as he was, he was not at this time incapable of revising away his suspicions; and the touchiness reflected, in part, physical suffering and in part, a continual and, by Cranston's account, reasonably successful effort to maintain his exemplary independence. We find him again and again making difficulties about accepting gifts from any of his rich and noble friends and treating the Luxembourgs (grand and grandly helpful though they were) as friends, rather than patrons, all the while denouncing established society with undiminished vigor. Where affectionate relations did end, it was in one instance disappointment in love (for Sophie d'Houdetot, who fully returned his love for a time and long continued friendly and kind even after she had to break off) and in another a quarrel with Diderot after he had shabbily betrayed Rousseau to Sophie's established life companion.

Are these details of any importance to understanding Rousseau's thought? (The people just mentioned are only a few in the long procession that Cranston brings before us, keeping the whole cast of characters under such control that the information about them does not for a moment impede the forward motion of the narrative.) Cranston's synopses of Rousseau's works as they come up are excellent; but in them, the book gives us nothing new except grace in expression, polish, and economy. The story is engaging as the story of an interesting eighteenth-century life; but it might be engaging without having anything of importance to imply about the content of the hero's thought.

That is not the case here. There is something to learn about the depth of Rousseau's convictions from the aims

and character of his attempt to set an example for his age. There are points to gather, from his correspondence with friends (more often than not, pastors) in Geneva, about his complex and discriminating attitude toward that city, its government, and its culture. It is of considerable importance to students of his work to observe his growing intellectual distance from the circle of the Encyclopedists, where he first gained intellectual credit. Cranston quotes liberally from Rousseau's letters in all these connections and thus usefully supplements the body of Rousseau's writings standardly read.

Yet the most important implications of the story told here are to be found in the sympathy and respect for Rousseau that its details tend to elicit. He was painfully and incurably ill with a defective urethra and with stone, yet he not only kept at work but enjoyed many happy moments and gave happiness to many others. He continued to be mixed up about sex, but he hardly fell outside our own normal range of confusion. He was not wildly irrational, to be looked to more for preromantic effusions than for orderly thinking. On the contrary, we see him carrying on a pointed and penetrating correspondence with his publishers. We see him judiciously discarding works that did not meet the standards that he had set for greatness, namely, *Les Solitaires*, a sequel to *Emile* in which both Emile and Sophie belie their promise and succumb to the corrupt temptations of the metropolis, and a sequel to *Julie* in which Milord Edonard disports himself at some length with women in Italy. The persecutions of which he became a target were under way, but we see Rousseau for the time being making no more of them than was warranted. He had given Voltaire provocation, and one can see that their ideas were irreconcilable; but it is Voltaire, not Rousseau, who displays malice and vindictiveness. We see Rousseau, in the midst of writing his greatest works, sincere, balanced, and clear-headed; and we should bear in mind that many charming and civilized people found him lovable.

University of Texas, Austin DAVID BRAYBROOKE

Configurations of Masculinity: A Feminist Perspective on Modern Political Theory. By Christine Di Stefano. Ithaca: Cornell University Press, 1991. 256p. $29.95 cloth, $10.95 paper.

"Gentlemen: this book's for you." It is not new to suggest that, despite their explicit address to a generically human condition, the canonical texts of western political theory may implicitly carry rather more partial dedicatory inscriptions. At least since Wollstonecraft—which is to say, well before the term *feminist* entered the English lexicon—writers of the female persuasion have repeatedly taken exception to the masculine undertones of that tradition. Focusing on the work of Hobbes, Marx, and Mill, Christine Di Stefano reiterates this criticism even as she significantly shifts and complicates the position from which it is voiced. At once a feminist intervention in political theory and a political intervention in feminist theory, *Configurations of Masculinity* is a provocative contribution to both.

Di Stefano draws upon object relations and literary theory to consider "the plausibility of a demonstrable connection between modern masculine gender and the political theories of Hobbes, Marx, and Mill" (p. 11). The connection suggested, however, as well as the approach used to elaborate its features in each case, distinguish this work from what should by now be familiar criticisms of the sexism of social and political theory. At issue in *Configurations* is not particular authors' neglect or exclusion of women nor even how the internal coherence of a particular theory is structurally guaranteed by the subordination of conventionally "female" activities. Instead, Di Stefano argues, masculinity functions in the form of culturally and historically specific "cognitive proclivities" structuring perception "such that the social world is interpreted, and hence engaged, contested, and reproduced, within the horizon of those perceptual commitments" (p. 55). More specifically, as formulated by object relations theory, masculinity is a deep cognitive orientation generated by the processes of gender differentiation in the modern nuclear family—in particular, by the distinctive tensions and ambivalences experienced by boys during the pre-Oedipal stage of separation and individuation from the mother. Characterized by rigid ego boundaries and an exaggerated emphasis upon separation and autonomy, it is at once supported and threatened by its differentiation from a female maternal "other"—which Di Stefano refers to as the "(m)other."

Mothers, to be sure, receive scant notice in modern political theory, but this is not Di Stefano's focus. In the book's most theoretically innovative move, she shifts beyond the question of explicit representations of women or femininity. Embracing the hermeneutic principle that reading *generates*, rather than finds, meaning, she adapts Teresa de Lauretis' use of the *space-off* (*Technologies of Gender*, 1987)—a concept in film theory designating that which is implied by the cinematic apparatus yet not visible within a film's explicit frame of reference—to situate her own project of rereading. Locating the "(m)other" of object relations accounts in this space beyond overt representation, Di Stefano theorizes maternal origins as that which is at once necessary to, and elided by, each of her selected theorists' productions of a generic humanity.

Di Stefano thus limns the political face of modern masculinity as a more general construction of the political across otherwise disparate theoretical frames. It is not, however, offered as a seamless or unitary epochal characteristic. Separate chapters devoted to Hobbes, Marx, and Mill identify "heroic," "productive," and "disciplinary" masculinity (respectively) as distinct variations on a common frame of reference. Each configuration, Di Stefano argues, offers up substantive and thematic tensions between images of autonomous self-creation, longings for the solace of social unity, and fears of engulfment or annihilation—tensions that resonate strongly with the object relations account of masculine identity as a precarious achievement—hence Leviathan's taming of "heroic masculinity," communism's emancipation of "productive masculinity," and Mill's dual quest for individuality and social progress through civilized self-discipline. Each theory, on the account offered here, sustains the illusion of generically human self-production by effacing its own gendered specificity. Simultaneously forgetting maternal origins and appropriating maternal power, each thus falls short of its own claim to a comprehensive account of the human condition—not by its treatment of women but, more profoundly, by its obliviousness to the masculinity of its own perceptual frame. In Di Stefano's trenchant phrase,

"the 'forgotten self' of these political theories is the modern masculine self" (p. 16).

Configurations of Masculinity is a work of complex intelligence and subtle ambition, a work likely to challenge, rather than satisfy, its own multiple audiences of address. Three sorts of potential criticism bear mention. Those unconvinced that gender constitutes a distinctive politics may question the book's inattention to what are conventionally taken to be significant political stakes in the differences among Hobbes's sovereignty, Marx's class analysis, and Mill's liberalism. Similarly, feminists and fellow-travelers sympathetic to gender-based criticism of the canon may wonder whether such variations within modern masculinity may structure different prospects for reconfiguring gender relations. While Di Stefano's account does not foreclose either of these lines of questioning, neither does it address their respective concerns. Finally, readers invested in feminist debates over sexual difference may find themselves divided over the book's reliance upon the object relations account of gender differentiation. Arguably, this emphasis upon the pre-Oedipal roots of gender identity not only sustains the masculine–feminine opposition but does so at the expense of contemporary interrogations of sexuality. In effect, the identification of the (m)other as the off-screen presence of traditional theory may inscribe a different avoidance; for what occupies the "space-off," as it were, of Di Stefano's own account may be the sexual "other" elided by the constitutive heterosexuality of (re)producing mothers, an "other" now beginning to receive specific articulation in the emergent field of lesbian and gay theory.

Such criticisms, however, are beside Di Stefano's point—not in the sense of being irrelevant but, rather, in the sense of being parallel or proximate to the interpretations she advances. If she proffers the (m)other as a privileged site for feminist readings of canonical texts, she lays no claim to have discovered the truth of such texts' indebtedness to gender. Similarly, if important political differences among modern political theories appear to dissolve into diverse substrata of modern masculinity, the book is an invitation not to abandon such differentiations but to re-view them in light of their variegated imbrications with the problematic of gender. As emphatic in its insistence upon feminism's engagement with the canon as it is upon political theory's engagement with feminist perspectives, *Configurations of Masculinity* thus accomplishes the difficult task of addressing diverse constituencies with both clarity and grace. And this is no small achievement.

Johns Hopkins University K. M. McCLURE

Rights Talk: The Impoverishment of Political Discourse. By Mary Ann Glendon. New York: Free Press, 1991. 218p. $22.95.

The title and subtitle of this book nicely indicate its content. Mary Ann Glendon argues that Americans have become fluent in discussing and claiming rights but dangerously inarticulate in speaking of responsibilities, of limits on rights, and of the complex and fragile social setting in which rights have to be realized. Among the results is a tendency to formulate all social and political issues in terms of rights and to phrase rights claims in stark and uncompromising terms. Hence, political discourse tends to be reduced to confrontations about rights, with the nuances of the situations being debated left out of consideration and the interests of the competing parties formulated as absolutes. This makes it difficult either to understand political issues adequately or to negotiate their resolution.

Glendon is particularly concerned with how our preoccupation with rights leads us to neglect the social ecology on which our lives depend for their human substance. We envision the rights bearer as isolated and self-sufficient. Hence, in public deliberation, we neglect the network of families, neighborhoods, churches, and other groups below the level of government without which freedom is empty. Judges, like the rest of us, are habituated to thinking and speaking in terms of rights and are consequently inept when it comes to the threat that certain presumed rights, like that of a business corporation to shift one of its plants to another city, may pose to traditional ways of life that cannot readily be defended in terms of counterrights. Phenomena such as urbanization, bureaucracy, mobility, and mass culture tend to strip individuals to human atoms whose relations with one another are controlled wholly by the market and the state. In such circumstances, rights talk loses the social roots necessary to its moral authenticity. It comes to be less about human dignity than about "insistent, unending desires" (p. 171).

To appreciate Glendon's argument, it is essential to understand that she is not arguing anything as banal as the necessity of balancing rights with responsibilities. She is concerned with what happens to our understanding of rights when we forget about responsibilities. Ironically, if we can think only of rights, our ability to understand and defend those rights is threatened. We become preoccupied with our own rights and lose our capacity for respecting the rights of others and for understanding the social circumstances in which rights are realized. The purpose of the book, accordingly, is not that of curtailing rights talk but of refining and deepening it.

In a sense, *Rights Talk* is about law; and it contains informative discussions of court cases in this and other countries. But when the author is discussing law, she obviously has in mind also morals, politics, and language, and one of the major virtues of her book is the way it illuminates the role of law in the overall life of society. It shows, for example, how legal and moral norms interact and also how litigation shapes our language and thus affects the way we talk about, and act upon, our social environment. A particularly interesting example is her discussion of "silences" in the law. Given the heterogeneity of contemporary society, it is often hard to identify values that we all have in common. This gives law a particular moral weight; people tend to assume that an obligation not prescribed in statutes and upheld in the courts is not an obligation at all. Thus, the lack of a legal obligation, such as that of coming to the assistance of someone in peril (even the police in America being under no such obligation), encourages people to infer the lack of a moral obligation.

This is not an easy book to criticize. The author's argument is continuously interesting and is upheld with a wealth of information from this and other countries. The main themes advanced seem both true and important. And almost everything that is said is said felicitously and exactly. In the most comprehensive sense of the term, it is an intelligent book.

One might, however, take issue with Glendon's suggestion that there exists in the United States "a significant constituency . . . for candor, moderation, and complexity" and that what is in doubt is only "whether Americans in positions of leadership have the will, ability, courage, and imagination necessary to respond to and mobilize such a constituency" (p. 183). One can hardly deny that American leaders on the whole are both simplistic and timid in their public utterances. Nevertheless, they have gained office by being elected and one of the main reasons they do not speak more boldly is that they have learned better. For example, any candidate with even the modest respect for complexity necessary for saying that perhaps taxes need to be raised rather than lowered or that there may be legal ways of recognizing the evils of abortion without interfering intolerably in the private lives of women will, unless the audiences for such suggestions have been very carefully chosen, quickly be taught the perils of candor and moderation.

But this is perhaps only a quibble. What mainly needs saying is that this is a book that specialists in political theory and public law—and indeed all branches of political science—are certain to find provocative and instructive.

University of Massachusetts, Boston GLENN TINDER

Political Theory Today. Edited by David Held. Stanford: Stanford University Press, 1991. 360p. $39.50 cloth, $12.95 paper.

This well-edited volume offers 13 chapters of high quality essays ranging over numerous issues in contemporary political theory. Its most distinctive strength is a set of five essays on international politics: David Held's on democracy, the nation–state, and the global system; Charles Beitz's on sovereignty and morality in international affairs; Antonio Cassese's on violence, war, and the rule of law; Onora O'Neill's on transnational justice; and Samir Amin's on the state and development. To those acquainted with these authors' previous work, there will be little that is dramatically new; but each manages to restate key theses in a lucid and organized manner. Four essays represent sophisticated versions of conceptual analysis conducted with sensitivity to history and empirical political science: John Dunn's on political obligation; Steven Lukes's on equality and liberty; Andrew Reeve's on property; and Agnes Heller's on the concept of the political. Writing from a rational choice perspective, Iain McLean contributes an essay on forms of representation and systems of voting, while Jon Elster offers cogent if not exactly unfamiliar reflections on the limits of rational politics. Susan Moller Okin analyzes the public/private distinction from the perspective of gender, while Clauss Offe and Ulrich Preuss explore how democracy can be justified, limited, and extended.

Two other strengths of this volume should be noted. First, most of the chapters are written with admirable breadth and grasp of the relevant literature. Reeve's and O'Neill's contributions are exemplary in this regard, amounting to concise review essays that scholars will wish to consult early on. Second, taken as a whole, the chapters represent a welcome engagement of theory with the real world of politics, along the lines long recommended by Brian Barry, John Dunn and others. That the terms of this engagement are so manifestly uncertain and contested is only an argument for proceeding further.

The volume begins with a useful and balanced editor's introduction exploring the contemporary revival of political theory under the rubrics of its "object" and "nature." With regard to objects, Held argues persuasively that the traditional focus on the public institutions of the nation–state must be broadened both *internally*, to cover a wider range of economic, social, and familial activities, and *externally*, to address not only changing relations among nation–states but also new issues and institutions that cut across their boundaries and powers. With regard to the nature of contemporary political theory, Held delineates seven principal approaches: history of political thought, conceptual analysis, systematic theories of political value, concrete problem- or institution-oriented explorations, discussions concerning foundationalism and postmodernism, systematic model building, and theory directed toward empirical political inquiry.

It is of some interest to look at Held's volume through the prism of his own typology. The foundationalist/antifoundationalist, communitarian particularist/liberal universalist, and modern/postmodern debates go unrepresented. Also conspicuous by its near absence is systematic value theory. There are, for example, no sustained discussions of domestic distributive justice or of deontological liberal theory: John Rawls is far less central than in other easily imaginable volumes on contemporary theory and, to judge from this volume, utilitarianism is all but dead. There is also surprisingly little on the theory of the welfare state, about which (as David Miller argues) there has been remarkable ferment in Britain and rising concern in the United States as well. Nor is there much about the kinds of social issues—multiculturalism, difference, affirmative action, dependency, and others—that have so dominated recent public debate and (increasingly) political theorizing in the United States. Nor (with the partial though honorable exception of the Offe and Preuss chapter) is there sustained attention to the individual moral prerequisites of citizenship or, conversely, the moral consequences for individuals of participating in various kinds of institutions.

This enumeration, which could be lengthened, is not intended as a criticism of the volume under review, which represents a serious effort, stretching over 360 pages of dense type, to achieve breadth of coverage. It is to say, however, that a volume fully representing "political theory today" would have to be much longer and far more diverse. In the face of the proliferation of political theory over the past 20 years, perhaps no single volume can any longer aspire to such representativeness.

There is another reason why this may well be the case. In many respects, political theory is politics carried on by other means. One would expect, therefore, that political theory would tend to mirror the full range of contemporary public debate. *Political Theory Today* presents the portion of that range running (roughly speaking) from liberal egalitarianism to quasi Marxism. I had thought that over the past decade in the United States and Britain—indeed, in Europe from the Atlantic to the Urals—other political tendencies were finding public

voice and systematic expression. They, too, deserve to be considered part of "political theory today."

University of Maryland, College Park WILLIAM A. GALSTON

Politics/Sense/Experience: A Pragmatic Inquiry into the Promise of Democracy. By Timothy V. Kaufman-Osborn. Ithaca: Cornell University Press, 1991. 327p. $21.91.

John Dewey and American Democracy. By Robert B. Westbrook. Ithaca: Cornell University Press, 1991. 570p. $29.95.

Something of a "Dewey revival" is under way. These two books come on the heels of Richard Rorty's decade-long campaign to get American scholars to take Dewey as seriously as they have long taken Wittgenstein, Heidegger, and Nietzsche, while they coincide with Steven Rockefeller's study of Dewey's religious thought (*John Dewey: Religious Faith and Democratic Humanism*, 1991) and Robert Bellah and his colleagues' call for a revival of Deweyan "public philosophy" in *The Good Society* (1991).

Dewey occupies a slightly odd place in American intellectual life. When he died in 1952, he was an intellectual dinosaur. He had been a philosopher in the grand style, ready to write about art, religion, morals, politics, and the nature of science, and sometimes about all of them at once. He died when the analytical movement's reaction against all this was at its fiercest; and although he was honored as America's greatest philosopher, he exerted little influence on the subject for the next 30 years. The revival in his reputation even now owes less to the discovery of his merits by orthodox academic philosophy (though there is some of that) than to the sense that the analytical enterprise has lost its way.

John Dewey and American Democracy offers the reader very much what the title suggests. Westbrook takes us through Dewey's career step by step, tackling his views on democracy and education, industrial democracy, the religious sensibility of a democratic society, the role of art in a democracy, and more. The author writes with the enthusiasm of a convert. A note confesses that once he shared Christopher Lasch's view that the main function of pragmatism was to teach young Americans how to be well-adapted citizens of the corporate state; but now he sees Dewey as an inveterate radical, a critic of democratic practice in the light of democratic ideals, a social democrat, and an enthusiast for workers' control. His enthusiasm for his subject greatly enlivens this substantial book and ought to persuade any reader that there is much in Dewey still worth reading.

Politics/Sense/Experience is not so much "about" Dewey's views on democracy as a Deweyan meditation on the domination of our lives by a narrowly instrumental rationalism and the contrast between this and the politics of a truly democratic society. Because what Kaufman-Osborn values most highly in Dewey is the latter's ability to subvert or displace the conventional meanings of terms, it is not quite exact to say that *Politics/Sense/Experience* criticizes contemporary politics in the light of Deweyan ideals. Rather, the deficiencies of contemporary politics are seen as an outgrowth of a narrow conception of how rationally to manage our affairs. The defects of this conception are illuminated by an appeal to Dewey's own view of the way *experience*, with its connotations of doing and suffering, had been denigrated in favor of *reason*, understood in essentially spectatorial, detached, unengaged terms. "Political things" lose their meaning when detached from experience, and we are suffering from just that meaninglessness.

Westbrook's book is an admirable piece of work. Now that we have Dewey's *Collected Works* in 37 volumes, it is easier to appreciate the sheer hard digging that Westbrook engaged in before the Dewey Center at Southern Illinois University had finished its work. He seems to have read everything by and about Dewey and most things by and about Dewey's contemporaries. Particularly valuable is his way of moving in and out of Dewey's wider philosophical concerns, as well as his politics (though that is a slightly misleading way of putting it, since Dewey insisted that the kind of cultural criticism that philosophy had become in the twentieth century was a seamless web).

It is only by following Dewey through the whole enterprise that one can understand why he enjoyed the esteem he did. His claim that there need be no conflict between faith and science, high culture and democratic politics, art and democracy was just what his readers wished to be told. Westbrook usefully conducts us through Dewey's account of religion, with its startling conclusion that in the modern world, the task of the churches is to vanish, leaving behind a common faith in democracy and a conviction that its pursuit is overwhelmingly valuable. Again, it is not quite clear either how Dewey's relations with the eccentric Albert Barnes resulted in *Art and Experience* or how Dewey's belief that in a democracy all experience must have an aesthetic quality relates to Barnes's hatred of art experts and his enthusiasm for teaching art history to ordinary folk; but it is clear that Dewey thought a democracy could be more, rather than less, appreciative of high art.

Admirable as *John Dewey and American Democracy* is, its governing theme is not very persuasive. Westbrook writes of Dewey as a participatory democrat and an enemy of corporate liberalism, quite as if Dewey was the patron saint of Students for a Democratic Society. This must be multiply misguided, especially in its suggestion that Dewey was hostile to liberalism. Certainly, he thought capitalism doomed during the 1930s; certainly, he thought the rise of the large capitalist corporation had made the economy ungovernable. Certainly, he wanted some form of industrial democracy, vague though he was about just what it was. But he never renounced his own liberalism. Nor was his conception of the participatory society on all fours with the blend of Marx and Rousseau that we were fond of 20 years ago; quite what it was is hard to tell, but it certainly was not to be found in the Port Huron Manifesto.

Anyone with a certain amount of philosophical training will also wonder why Westbrook is so uncritical of his subject. Dewey's conviction that democracy and education are mutually reinforcing, for instance, is on the face of it a sleight of hand, achieved by emphasizing the "organic" quality of understanding and the "organic" quality of democratic life. Westbrook never stops to wonder whether Dewey's reconciliations rest on anything firmer than definitional fiat. Again, Westbrook uncritically accepts Dewey's attempts to preserve the "religious" attitude while turning his back on "religion"

but is much too quick to dismiss Reinhold Neibuhr's complaint that in throwing out institutional Christianity and the doctrine of original sin, Dewey ignored the radical imperfection of human nature and our need for constant moral discipline.

Dewey used to get particularly irritable whenever Bertrand Russell criticised his residual Hegelianism, and Westbrook is still irritable on Dewey's behalf. But Russell was quite right to ask why Dewey was so confident that "experience" revealed a world permeated by meaning and by the values to which Dewey subscribed. Dewey had been a Congregationalist, and then an Idealist, before adopting his own kind of naturalism. It was proper to ask what in naturalism substituted for God and the absolute, and *nothing* was hardly an answer. Still, Westbrook writes with such lucidity that readers will have no trouble seeing when Dewey is skating on thin ice.

Kaufman-Osborn is more elusive than Westbrook. Readers who share his horror of Weber's "iron cage" and believe that we are subject to the tyranny of instrumental rationality will find him persuasive; skeptics who think we are more alarmingly subject to the whims and follies of our rulers and in need of a lot more instrumental rationality will not. Those who share his view (held by the young Marx and many other distinguished thinkers) that "politics" has been stolen from the people will find him persuasive; skeptics who have always wanted to know what we would do with politics when we got it back and have found no answer in Marx, Arendt, Sheldon Wolin, or Jürgen Habermas may complain that they find no answer here. I find my heart with the sympathizers and my head with the skeptics. It was at least somewhat unwise of Kaufman-Osborn to couch his meditation on these difficult issues in a Deweyan voice. It adds needless complexity to what is already vertiginously difficult, and Kaufman-Osborn's own view of our situation is quite interesting enough for him to risk giving it to the reader straight.

Princeton University ALAN RYAN

Legal Theory, Political Theory, and Deconstruction: Against Rhadamanthus. By Matthew H. Kramer. Bloomington: Indiana University Press, 1991. 352p. $35.00.

Kramer's book proceeds on two levels. The larger and more successful part of the book is devoted to textual analysis of some of the key writings of G. A. Cohen, H. L. A. Hart, David Hume, and members of the Critical Legal Studies movement. A smaller and less fully realized portion of the book is concerned with negotiating the transition between theory and practice—how its textual strategies might enable us to achieve a bolder, and less frustrating, radical politics.

In his introduction, Kramer defines as the book's principal aim "to make clear the relevance and power of deconstruction for analytic philosophers" (p. 37). In this he succeeds superbly. One of the great virtues of the book is its systematization of the multifarious writings of Jacques Derrida and their distillation into a critical canon that is imaginatively and illuminatingly extended to some standard texts in legal and political theory. Central to this canon is a relentless working out of the implications of dilemmas surrounding self-referentialism: "If Epimenides avows that all Cretans never make truthful statements, and if he is himself a Cretan (and if all Cretans thitherto have indeed been chronic liars), then his pronouncement will be true only when false and false only when true" (p. 20). This perspective immediately exposes the vulnerability of extreme skepticism and relativism in philosophy. If extreme skepticism is true, then it is false. The same conundrum is applicable to extreme relativism as well.

The issue of self-referentialism also helps to structure a number of other antinomies relating both to our sense of the world and our use of language (p. 34). One of these has to do with how events can be individuated only in relation to a particular structure; and yet the structure as a whole can only be individuated in relation to the events that compose it. Analogously, the framing of events or texts through interpretive statements both constitutes an attempt at closure and attests to the impossibility of ever achieving closure. Every interpretive statement needs, in turn, to be interpreted and thus everlastingly forestalls what it presumes. Also, "because signifiers are always subject to recontextualization," the prospect of an assymetry—even a clash—between the "codes of intentionality" and the "codes of construability" always remains open and undermines the certitude of assigning consistent truth values even to tautologies (p. 29). Derrida extends the instabilities disclosed by paradoxes of self-referentialism into the citadel of language itself. With his famous notion of *différance*, Derrida calls attention to how the play of signifiers is grouped to yield significant meaning only in relation to receding contexts of what is other than itself, so that irresolvable problems of regress and circularity that were diagnosed in relation to the event/structure and text/interpretation dichotomies resurface with regard to the dualism of signifier/signified. There is an irremediable opacity in our very use of language: "All positions—be they metaphysical or political—will perforce dismantle themselves as the condition of their being elaborated" (p. 148). Kramer has a veritable field day transposing Derridean deconstructive moves to texts in legal and political theory. Thus, he shows how the distinction between *materiality* and *sociality*, pivotal in Cohen's interpretation of Marx, is undermined by the fact that *materiality* is "always already social" (p. 87). What is classified as the material domain is mediated through a set of linguistic and cultural categories that is socially ordained. In his analysis of Hart, Kramer shows how an infinite regress derails Hart's search for normativity. Hart's vaunted "rule of recognition," supposed to be internal to every legal system, can confer legitimacy on the rules that it pinpoints but cannot endow itself with binding force without erupting into an infinite regress (p. 143). Hume's philosophy unhinges itself in ways that resonate directly with Derrida's concept of *différance*, because the sensory particulars that are the building blocks of Hume's empiricism get their individuation endlessly deferred by the unceasing play of difference between what is and what is not themselves (p. 203).

Kramer fares less successfully with the second, more subordinate, part of his project, namely to evolve a more coherent radical politics from what is currently available, on the basis of Derridean deconstructive principles. He is very sensitive and sophisticated about the difficulties of effecting transitions between metaphysics and politics (pp. 246–47). Nevertheless, in his long, concluding chapter, he engages in an uphill battle to achieve a

fruitful political "clearing" in deconstructionist theorizing. Here, I feel, Kramer is less successful than in the rest of the book and is joined by the company of the vast majority of postmodernist theorists who are unable to coherently and fully articulate the connections between their metaphysical positions and their politics. Kramer is writing against Rhadamanthus—against objectivity. The deconstructionist approach he pursues, with its continual disclosure of *aporias* and paradoxes in both sides of traditional dichotomies such as skepticism/knowledge and inner/outer, ends up resurrecting a version of objectivity—a structure of dynamic "thereness" that remains unimpugned by the persisting recuperative turnings of deconstruction. The structure of the real is diagnosed as a field of dialectically countervailing forces, but it is still the "structure of the real." Deconstructionism discounts all discountings (including those of a Freudian and pragmatist sort), so that the remainder of its argument is what was there before—the brutely given, the sheerly and everlastingly unfolding other, the real. For all its sophistication, therefore, deconstructionism appears to reconcile us to what is. In the end, it is a philosophy of acquiescence—of dealienated resignation before the world (no matter how subjectively/objectively defined). Perhaps Kramer needs to take a cue from a critical comment he himself makes at the beginning of the book in talking about liberalism: "Those who hope for assurance that a tyranny cannot ever arise will have to plummet into an infinite regress, wherein each ground for encouragement has reproduced all the insecurities that evoked it. Each layer of supervision will provide assurance about everything but itself. Literal theories of politics hence turn out to be structured by incompleteness, since they enact the impossibility of achieving full and rigorous closure" (p. 22). Perhaps, then, the refusal of theory—unmoored from requirements of justification—becomes the most stalwart and clear-headed "theoretical" stance to take with regard to political matters.

Temple University ARYEH BOTWINICK

Equality and Partiality. By Thomas Nagel. New York: Oxford University Press, 1991. 186p. $17.95.

Very early in this difficult and illuminating book, Thomas Nagel remarks, "We really do not know how to live together." By this he does not mean only, or even primarily, that we live in a world of fractious disagreement. The deeper point is that we have not yet discovered social and political forms capable of ensuring the satisfaction of the claims we are justified in pressing upon each other without simultaneously imposing burdens on ourselves that we could reasonably resist. Nagel takes the reconciliation of this conflict between the perspectives of the collectivity and of the individual (the "equality" and "partiality" of the title) to be the main problem confronting political theory. It is also a main problem for political practice; and the very low probability of its being adequately resolved in practice anytime soon makes the theoretical enterprise a gloomy affair indeed.

The contrast of perspectives is a reflection in ethical thought of an inherent duality in human nature—the capacity to regard the world, in turns, from a particular position within it and from a position detached from it. Looking at things from the particular point of view of a determinate self, the success of one's own life will appear to be of very great importance. Looking at things from the detached point of view of one self among many, it will seem that the success of each life matters equally. Each point of view can give rise to reasons for action, and these reasons may conflict: impartiality may require more than people can give without risking the success of their own lives. When such a conflict exists, there may be no comfortable resolution, because it can be reasonable to be motivated by the requirements arising from both perspectives.

This complexity in practical reason will be familiar to readers of Nagel's earlier works, in which it is treated as a central problem of ethical theory. Here, it emerges as a problem for political theory, as well. In fact, it is part of several problems, of which I shall mention three that preoccupy him in most of this book.

First, and perhaps most fundamentally, it is a problem for the theory of legitimacy. The task of political theory is to discover the nature of legitimate institutions. Nagel's conception of legitimacy reflects the Kantian notion that morally acceptable institutions should be unanimously acceptable to those who live within them. To use the formulation Nagel borrows from T. M. Scanlon, institutions should conform to principles which no reasonable person could reject. The chief interest of Nagel's discussion of this difficult subject is his reinterpretation of the Kantian test in light of the two standpoints. His position is, perhaps, more controversial than he allows; but even those who disagree with this interpretation of legitimacy will find it a fruitful development in contractualist thought.

Second, the contrast of standpoints sets a problem for our conception of the role of political institutions in individual life. In recent years, political theorists influenced by John Rawls's *A Theory of Justice* have concentrated on matters of distributive justice in the broadest sense, that is, on how social institutions distribute the benefits and burdens of social cooperation. Although Nagel pays considerable attention to such questions here, his main contribution is to shift the focus to the interplay of legitimate institutions and the moral lives of individuals. Even in a world in which the requirements of distributive justice had been fully realized, the two standpoints could come into conflict. Institutions should help reconcile this conflict by satisfying the requirements of impartiality through collective action, so that individuals are left free to live their own lives in relative freedom from the direct demands of others. By doing their share in a moral division of labor, legitimate institutions become essential conditions of each individual's moral life.

The third problem involves moral motivation. Nagel believes that most of the inequalities of wealth and status characteristic of modern societies (to say nothing of those characteristic of the world at large) are unacceptable when these societies are regarded from an impartial point of view. Radical changes in institutions would be necessary to reduce social inequalities to acceptable proportions. As if the motivational obstacles confronting the transition were not enough, Nagel argues that maintaining egalitarian institutions once they were established would require large and perhaps inconceivable changes in human motivation, as much in the political sphere as in the economic. Largely for this reason, he claims that an ideally egalitarian society is

difficult to imagine and, in any case, practically out of reach. The best we can hope for is something like progressive social democracy. Nagel regards this alternative as distinctly second best; but even so, achieving and sustaining it will be a daunting challenge to the motivational capacities of people in most industrial societies.

There is much in this short and unsettling book to stimulate serious thought about a wide range of issues in contemporary political theory. Nagel's style is deceptively simple, masking an unusual depth and complexity of view. This is not a book for philosophical amateurs. For those who have read widely in the recent literature of political philosophy, it is a rare treat.

Bowdoin College CHARLES R. BEITZ

Democracy and Moral Development. By David L. Norton. Berkeley: University of California Press, 1991. 198p. $29.95.

Since its inception, liberal political theory has been criticized for positing moral ideals that have not been fully realized in practice. In recent years this line of argument, most closely associated with demands for social reform, has been overshadowed by criticism of the ideals themselves. So-called communitarians have decried liberal theory's removal of the individual from a meaningful social context and consequent postulation of an overly abstract conception of the right, regarded as prior to the good. Other critics have appealed to the virtues of the ancient Greeks and their belief in an objective human good, to the realization of which political life should be devoted.

David L. Norton has feet planted firmly in both of these camps. He describes liberal theory as an "ethics of rules" and criticizes it for moral minimalism in two senses. It regards only certain subjects as moral, and prescribes rules in regard to these that hold generally and so cannot require special or developed moral characteristics of their upholders (p. 21). Norton's eudaimonistic moral view, which he calls an "ethics of character," is based on the Aristotelian view that the good life consists of the full development of one's moral and intellectual faculties (intro.). Like J. S. Mill, Norton believes that individual development depends on making one's own choices, discovering one's true nature for oneself. In opposition to liberal individualism, which opposes the individual's self-interest to the interests of other people, Norton argues for an expanded conception of self-interest, which encompasses the interests of others.

Throughout his book, Norton draws from an impressive array of sources, including Plato's Socrates, Mill, Dewey, Emerson, Tocqueville, Maslow, and Oakeshott. His discussion is most valuable in providing a coherent framework for a range of important issues, both theoretical and practical, and in proposing concrete steps for implementing his ideas. Like Mill and John Dewey, Norton believes that active self-government should play an important role in self-development and criticizes "equilibrium democracy" upheld by many contemporary theorists (chap. 2). In the spirit of Dewey, he recommends restructuring education (e.g., by alternating academic subjects and practical experience) and supports youth public service (chap. 3). As one can imagine, Norton advocates meaningful—as opposed to alienated—work, through which, once again, one's potential could unfold (chap. 4). He takes a broadly communitarian view of the individual's relationship to society (chap. 6) and argues that government, along the lines of Plato's *Republic*, should concentrate on helping individuals to realize their potential (chap. 7). Norton's most sustained philosophical discussion concerns a view of rights based on responsibilities, rather than welfare (chap. 5). Rights should be founded upon what one requires in order to develop properly. Viewed from this perpective, rights, too, blunt the adversarial thrust of traditional liberal theory.

The main problem with all this is that Norton says little about the ideals we are to realize. He does declare that all individuals possess all the virtues *in potentia* (p. 83). Under the proper conditions, with their potential made actual, all would lead meaningful lives, in a society devoid of conflict. Virtually nothing is said about competitive market economies or the economic consequences of proposed educational and vocational reforms. Norton realizes the need to abandon the "closed teleology" of Plato and Aristotle for "a liberal open-ended teleology whose ends require to be discovered through exploration" (pp. 6, 163). But the only definite value he upholds is moral autonomy. In regard to this, one must ask, Autonomy to what end? Without a clear account of the good, Norton's depiction of worlds of meaningful education, meaningful work, and meaningful community are cloying in tone and largely devoid of substance. Indicative of the remorseless hopefulness that suffuses his book is Norton's interpretation of Plato's *Republic* as upholding a political system in which the rulers' power depends upon the consent of the governed (p. 160).

Norton is correct that contemporary liberal theory pays more attention to the public than to the private, to rules of justice than to desirable traits of character, to the right than to the good. But the reason for this is the need to provide a stable framework within which people of diverse moral, religious, and political views can live together in harmony. Norton's open-ended eudaimonism would do little to obviate the need for this task. In emphasizing responsibilities over rights, the place of others' happiness in our own self-interest, and the importance of developing our latent powers, Norton has something important to say. But without a clear account of the good (or goods) that all citizens should pursue, his views provide a supplement, rather than an alternative, to existing liberal theory.

University of Virginia GEORGE KLOSKO

The State: Its Nature, Development, and Prospects. By Gianfranco Poggi. Stanford: Stanford University Press, 1991. 214p. $29.50 cloth, $9.95 paper.

Gianfranco Poggi is an experienced, learned, and sophisticated political sociologist who has authored several valuable works on political theory. *The Development of the Modern State* (1978) was an impressive short history of the rise of the modern European state. Not only was it interesting for scholars because it summarized so much European, particularly German scholarship, but it was also extremely valuable as a classroom text. Undergraduates found it difficult; but it introduced them to

such concepts as feudalism, the *Ständestaat*, absolutism, and liberalism in a neatly comprehensible way.

This new work is meant to add to the earlier, successful volume. It is a more difficult, and also a more rambling book because it grapples with Poggi's rather mixed assessment of the direction of modern politics in Europe and North America. Perhaps it tries to cover too much by providing introductory material, a review of several European lines of theoretical thinking about the state, and a good bit of personal opinion.

Poggi begins by reviewing the history of the rise of the European state. He places insufficient stress on the survival of the *Ständestaat*—particularly in England, but in the Netherlands, as well, as the precursor of the liberal state. Continental absolutism, whether of the French, Prussian, Habsburg, or Russian type all proved to be dead ends, though it took two centuries (1789–1989), three bloody world wars (the Napoleonic Wars and World Wars I and II), and the intervention of England's heir (the United States) to save the liberal state. It is true, as he points out, that the modern liberal state is a vastly more powerful entity, and controls a much larger portion of our lives, than it did in the eighteenth century. But it is an error to see the modern liberal state as derived from European absolutism. Not only Montesquieu but much of the aristocratic opposition to absolutism (and it was aristocratic, not bourgeois, opposition, that began the French Revolution) looked to England precisely because it had preserved an important balancing role for its elite estates. How the United States managed to preserve some of this through its complex constitutional arrangements, at least until quite recently, is the part of the story that most European theorists tend to miss, though Americans (e.g., Samuel Huntington) know it well. The more modern, efficient, centralized bureaucratic systems of continental Europe, combined with the rise of mass participation in politics and of an egalitarian ethos produced totalitarianism, not the modern liberal state. Only the Anglo–American victory in 1945 and the subsequent defensive wall erected against communism in Europe kept continental Europe liberal. And all totalitarian systems have proved to be too inflexible to adapt well to the demands of rapidly changing technologies.

Poggi then goes on to describe the development of the modern state and to stress the disjunction between increasing democracy and the growth of specialized bureaucracies. Again, his summary and review of important works on this topic are elegant and useful. But in the end, he cannot explain why, in the past decade, there has been a revolt throughout Europe and North America against this old trend of bureaucratization and reliance on specialized civil servants to run the state. This has gone much further in the United States than in Europe, probably because the United States never went through an absolutist royal stage. Here, for reasons that are not very clear, the civil service has lost its legitimacy. It remains large and powerful but also underfunded and despised by most of the population. This has produced a kind of vicious circle in which the quality of high civil servants (those whom some Europeans like to call "mandarins") has declined, the efficiency of key portions of the bureaucracy has degenerated, and contempt for it has increased.

It is sobering to read Poggi's chapter on Gorbachev and the Soviet Union, in which he explicates the failed Soviet system as an alternative to the liberal state. Since he wrote this section, the centralized Soviet bureaucracy has virtually disintegrated. Ironically, the extreme expression of European absolutism—the Stalinist state—has failed at the same time that its arch enemy, the United States, the great bastion of liberalism, faces the incipient collapse of large parts of the central bureaucracy. That shows the advantage of preserving old-fashioned local and private centers of economic status and political power. In a liberal society, even one as degraded as the United States, the failure of the central bureaucracy leaves much of the rest of the society functioning tolerably well. In an absolutist state, the collapse of the bureaucracy leaves only chaos. In his next book, Poggi may take on these large questions, which he introduces, but does not fully elaborate in this volume. There are few comparative political sociologists more able to accomplish this task than he.

University of Washington, Seattle DANIEL CHIROT

Value-Free Science? Purity and Power in Modern Knowledge. By Robert N. Proctor. Cambridge: Harvard University Press, 1991. 331p. $34.95.

The question whether science can or should be "value-free" is one of those perennial topics on which it is difficult to say anything that is both new and sensible. A primary cause of the failure to be sensible is the tendency in such discussions to reify the critical terms, especially *science* and *value*. We blithely assume that there are two distinct entities, science and value, and ask how they are related to each other. But the real issue is always how science and value and other related concepts (e.g., fact, objectivity) are understood or constructed. What is at stake in these discussions, as Proctor clearly shows, varies with the intellectual, social, and political context in which they occur. In the ancient world, in early modern thought, in the great *Werturteilsstreit* of German social theory at the turn of the century, and in post-1945 American social science, different meanings were attached to the key terms, and different issues were at stake. Thus, members of the Royal Society in the seventeenth century may have been concerned to defend their investigations against religious censorship, while postwar American social scientists reacted against Nazi efforts to claim scientific warrant for their monstrous projects. Because standard accounts of the relationship between values and science are conducted on too philosophical and too abstract a plane, Proctor argues, they fail to realize the complexity and the variability of these issues, and an historical approach is required. By explicating the arguments of the proponents of value-freedom, Proctor clearly demonstrates how this set of issues has changed, reflecting the intellectual, moral, and institutional pressures and concerns of different times.

Many of the individual chapters addressing particular thinkers and their contexts are illuminating and reflect a sure grasp of the relevant scholarly literature. But, perhaps because it covers such a wide range of cases, the work is sometimes an unsure guide to the territory. In some cases, for example, the argument becomes tendentious, to the point of deliberately misreading his sources. Citing Tönnies, he argues that neutrality "was proposed

in opposition to socialism, the expansion of women's rights, and the mixing of races"; yet he quotes Tönnies as saying, "As sociologists, we are neither for nor against *socialism*, neither for nor against the *expansion of women's rights*, neither for nor against the *mixing of races*" and adds that sociology's task is not to further or obstruct particular ideas or movements (p. 92). Similarly, on the basis of his examination of the views of prominent defenders of the ideal of value freedom (Sombart, Simmel, and Weber), Proctor argues that the commitment to value-freedom functioned to exclude women from science. But it is far from clear that their beliefs about value freedom (as opposed to beliefs about women's alleged capacities) had anything whatever to do with their attitudes toward women is engaging in scholarship. Indeed, they reached significantly different conclusions in spite of the similarities in their commitments to value freedom.

In other cases, important errors creep into the argument. In the chapter devoted to Weber, for example, he fails to recognize that Weber's view of value-freedom is qualified by his recognition that "ideal-types" are constructed with an eye to their "cultural significance": different investigators, working from different points of view, will select different traits in constructing "an ideal-typical view of a particular culture" (*The Methodology of the Social Sciences*, 1949, p. 91). Proctor also appears to confuse Weber's ideal-types with the "idealizations" of the physical sciences (p. 146). In a similar vein, we are also told that "the positivists" believed that "methodology must be closely linked with subject matter" (p. 146), though we later learn (this time closer to the mark) that positivism is committed to "an assumption of the unity of science" (p. 159).

More seriously, however, the work loses its way in forgetting its primary lesson, that the call for value-freedom in science is not one thing but means different things and that it is advocated for different reasons in different contexts. Although granting that the ideal of neutrality was once "progressive," it no longer is so, Proctor asserts, because "science has become a power in itself" (p. 270). Warming to his theme, he argues that "all science is politics, or ethics," because "science *should* respond to practical problems of human need and suffering" (p. 270). But if this work teaches anything, it is that *science* is not a unified agent to which power and responsibility can be ascribed. Proctor dismisses the ideal of neutrality on the grounds that "the priorities of science are shaped by larger social priorities" (p. 267). But few advocates of value-freedom would disagree with that observation. The problem is to organize the practice of, and to set priorities for, research without compromising the objectivity—or, to use an even more old-fashioned term, the truth—of the results; it is to guard against the kinds of abuses epitomized by Lysenkoism and Aryan physics. Theory, as Proctor argues, can "shape the world" (p. 230), in part because research can lead us to alter what we believe and how we act in unexpected ways. And precisely because of that, the course and outcome of research can never be fully determined or controlled. Whatever else they advocated, the proponents of value-free science understood that point and, with it, the limits of Proctor's claim that "science is politics."

Wesleyan University J. Donald Moon

Post-Modernism and the Social Sciences: Insights, Inroads, and Intrusions. By Pauline Marie Rosenau. Princeton: Princeton University Press, 1992. 229p. $35.00 cloth, $12.95 paper.

Political Theory and Postmodernism. By Stephen K. White. New York: Cambridge University Press, 1991. 180p. $39.50 cloth, $12.95 paper.

At a decade or so past midcentury, with the dissemination of the writings of John Austin and Ludwig Wittgenstein on language, the once secure epistemological status of statements was called into question. Apart from the impact on philosophical discourse, the resulting blurring of the line between descriptions and other linguistic acts and the evocation of a vast domain of normative conventions intervening between statements and their referents, acts, and effects put tremendous pressure on many of the conceptual props of political theory and the social sciences in general.

There were many reactions, but here I refer to two very prominent and polar ones. One kind of response took the challenges seriously and attempted to rethink such domains as the history of political theory, the status of normative versus empirical judgments, the epistemology of the social sciences, and so on. The second was a defensive posture that regarded the texts with shallowness and hostility and reproached Austin and Wittgenstein's conceits as dangerous attacks on morality and "the real." These attacks tended to be obtuse to the problem in that their reproaches made use of the very distinctions that Austin and Wittgenstein's analyses had called into question.

Now, as we approach the end of the century, a variety of philosophical, historical, literary, political, and critical/social analyses called postmodernism have offered a new set of challenges. It is important to note that the challenge has gone beyond the Austinian–Wittgenstinian destabilizing of the warrants for treating statements and has destabilized the grounds for evaluating "discourses"—the collections of narrative, rhetorical, grammatical orientations (sets of statements in various enunciative modes) through which fields of practice are organized and the subjects and objects of discourse are situated. The implications for political theory, political science, and the social sciences, among other domains of inquiry, have been far-reaching.

Stephen K. White's *Political Thought and Postmodernism* represents the first kind of reaction. It is an intelligent book; and although it is an assembly of chapters whose prototypes appeared separately, it is a coherent piece of analysis. It is held together by two of White's compelling interests: (1) his Habermasian inclination to save a model of intersubjectivity within which community can be negotiated rationally (he chides postmodernists for "cavalierly dismissing Habermas") and (2) his Heideggerian hope for a frame that would unite the critical interpretive interest in disclosure with a political–communitarian interest in norms for responsible action.

Convinced that Heidegger has left a legacy for postmodernism, White argues that Heidegger's concept of *Gelassenheit* overcomes a sharp dichotomy between passivity and activity and offers hope for moving from the critical process of disclosure to the normative legitimation for action. These strong positions give White's book both its strengths and weaknesses. On the positive side, White's determination to find in Heidegger a chance to bridge criticism and action and thereby vindicate a

Habermasian version of enlightenment reason is consistently argued against various postmodernist challenges that he poses to his hopes and views. In chapters on Heidegger and various postmodernist thinkers and in more thematic treatments of "difference feminism" and the problem of justice, White's treatments of postmodernist positions versus his own are nuanced, fair-minded, and scholarly.

The book's weaknesses, however, stem from its strengths. Because it is primarily a work of exogenous criticism, postmodernist thought is neither well elaborated nor critically assessed on its own ground. Postmodernist thinkers are not so much analyzed as judged on the basis of White's interests. As he puts it baldly, he is after an "acceptable approach to ethics and politics." What emerges as acceptable comes out of an attempt to maintain the ontological and moral conceptions that come from his hermeneutic–critical orientation, edified by postmodernist criticism. As a result, his position is never confronted by a strong version of postmodernism, for example, a postmodernist questioning of whether morality and "truth" (even an intersubjectively negotiated version of it) are compatible.

In his attempt to incorporate some of postmodernism's critical postures into an ecumenical synthesis with his Habermasian and Heideggerian interests, White involves himself in an interesting, engaging, and edifying struggle, even though he fails to allow postmodernist thought the space to articulate fully its cautions about such neoenlightenment projects and the different problematics it would substitute.

Many postmodernist positions do not dismiss the idea of a normative ground for action. But they try to exercise "patience" (as Foucault put it) and consistently disclose what is lost by fixing interpretations that permit the legitimation of action. This is not a rejection of legitimation; it is an enactment, rather, of the recognition that legitimation involves a never-ending negotiation that requires the dissolution of certainties. It is thus negotiation all the way down. It is not a joint search for communality or grounds, nor can it count on a transcendent narrative—a temporally unfolding ontology (destiny) that will attract agreement.

However, whatever position one might take on the success of White's attempt at theoretical reconciliation, it does raise the level of debate among Habermasian critical theory, Heideggerian hermeneutics, and postmodernist inquiry. Both those familiar and those unfamiliar with postmodernist thought will find White's book challenging. It is an important contribution to contemporary political theory.

Pauline Marie Rosenau's treatment in *Post-modernism and the Social Sciences* belongs to the more obtuse genre of reaction I have noted. Its scholarship is thin (and often secondary) and its treatment of positions often uninformed and confused. Postmodernist thought, which has a variety of different and challenging implications for the social sciences, is unfortunately often known and characterized on the basis of rumor. One hears that it is a celebration of irrationality, that it is a wholly skeptical and depoliticizing attack on the very possibility of rational political and moral action, that it rejects any conception of history or truth, and so on. Rosenau's book, despite occasional suggestions that there are more reasonable (what she refers to as "affirmative") postmodernists, is a sustained attempt to perpetuate these rumors. Although the advertising blurb on the back of the book portrays the author as neither hostile to, nor apologetic for, postmodernism, the text tends to represent postmodernism as a series of perverse attitudes with very little philosophical depth.

On its face, the chapter-by-chapter list of topics is promising and comprehensive, treating issues of the subject, authorship, history, truth, and a broad range of other epistemological issues central to the social sciences. But, alas, almost every issue is seriously misrepresented. A frequent topic sentence is "Post-modernists argue, . . ." typically followed by a confusing collage of positions that represent the views of no particular thinker and often tend to conflate widely conflicting positions. We are told, for example, that a postmodernist reader has complete license "to attribute meaning to the text without consequence or responsibility" (p. 25). Apart from the fact that most postmodern thinkers are text-oriented, not reader-oriented, it is hard to imagine whose position this might be. We learn also that postmodernism is anti-subject. It is the case, rather, that postmodernist thinkers tend to treat subjectivity as an unstable, interpretive imposition, rather than a fact about consciousness. Accordingly, they often undertake inquiries into the histories of different modes of imposed subjectivity along with analyses of the institutional and other correlates of those modes. Rosenau offers no information or analysis on these undertakings.

Confusions abound. One of the most eggregiously uninformed treatments is that of the issue of "presence" as it is encountered in the writings of Jacques Derrida. Even a slight familiarity with Derrida's texts would make it evident that for Derrida "presence," the idea that the meaning of something is present to the speaker or writer is to be juxtaposed to "representation"; for his argument is that the world of things and relationships is always mediated through representations. The condition of possibility for apprehension is a script—a system of meaning—that precedes and preorganizes any individual's consciousness.

Whatever one might think about the validity of this argument, which is sustained throughout Derrida's early writings, the idea of presence is not to be simply juxtaposed to absence—as Rosenau does, for example, in this vexed passage: "As we have seen, post-modernists argue presence is never absolute: the absent is always present to some degree, and the present is always absent" (p. 79). Adding to the confusion, Rosenau characterizes postmodernists as generally hostile to representation (a position that could be better applied to Marx's attack on the commodity form).

In perhaps her most polemical section, Rosenau states that "almost all postmodernists reject truth even as a goal or ideal because it is the very epitome of modernity." (Here she cites Michel Foucault and Richard Ashley). Apart from the fact that answering the question about what modernity is was central to Foucault's work, this is a puzzling thing to say about a thinker whose historical analyses were organized around discerning the "will to truth." Certainly, Foucault impugned the traditional empiricist view of truth as correspondence (as has, indeed, even empiricist philosophy of science for several decades now) and criticized the hermeneutic view of truth as a recovery of depth, which has supported expressivist theories of meaning. Intensely concerned with truth, Foucault posed the question of how "truths" understood as unchallenged interpretations

have emerged and the correlative question about what forms of power they have enabled.

Here, again, Rosenau makes no philosophical defense of a more traditional view. Implying that "truth" (in the form of an apparently unproblematic presence) is both a fact and a moral necessity, she treats postmodernist alternatives as morally offensive. She does attempt to moderate, however, her characterization by again summoning her "affirmative postmodernists," who are less immoral, because they accept some (albeit relative) truths. Here, again, she has missed what is at issue for the thinkers whose work she trivializes. Although it is not the most familiar form of investigation in the social sciences, one of the most significant postmodernist contributions has been its treatment of the historical process by which some interpretations succeed and others fail, contextualized within a concern for both the political implications of the successes and failures and the losses associated with the imposition of historical narratives that gloss over those historical struggles.

In short, readers will not learn very much about postmodernist thought or its implications for the social sciences in Rosenau's treatment; for she has reduced a complex set of philosophical positions, interpretive orientations, and practices of inquiry to simplistic and misleading slogans.

University of Hawaii MICHAEL J. SHAPIRO

What's Left? The Ecole Normale Supérieure and the Right. By Diane Rubenstein. Madison: University of Wisconsin Press, 1990. 215p. $40.00 cloth, $19.95 paper.

This book raises a question that has perplexed political theorists and philosophers interested in the phenomenon of fascism in the twentieth century: How do we explain the complicity of intellectuals with the heinousness of Nazism? Diane Rubenstein's deconstructive reading of the Ecole Normale Supérieure (ENS) cleverly reveals the danger of this question, namely, that posing the question might reveal the rather remarkable fact that a single intellectual discourse and institutional logic may be capable of housing *both* resistors and collaborators. The urgency with which the choice of fascism must be explained, expressed in works such as Sartre's *Anti-Semite and Jew* (1964), Merleau-Ponty's *Sense and Nonsense* (1964), and Simone de Beauvoir's *Force of Circumstance* (1965), is felt still in Robert Soucy's confession that what motivated his writing *Fascist Intellectual: Drieu La Rochelle* (1979) was the nagging question, "How could such a sensitive, intelligent, cultivated intellectual. . . become a fascist?" (quoted p. 76). Rubenstein's strategy in *What's Left* is to turn the question back on the poser, implicitly rewriting it to read, How could someone like me become a fascist?" Her work engages not with the explanatory power of different theories of fascism, but with the power of intellectual discourse to remain blind to what motivates its own efforts to distance itself from mistaken choices by defining them as aberrations or as thought gone wrong: "The 'riddle' of the ENS is *not* how a few rightist *normaliens* can be explained away, but rather, how both right and left can be recuperated within the institutional logic and discourse of The Ecole Normale" (p. 13).

Rubenstein's strategic reversal of the question of fascist intellectuals leads her to resituate "the right within the ENS political tradition" (p. 16). Her decentering of the hold of "leftist stereotypes of the ENS" (p. 12) leads her to "reinscribe writing within politics, ideology within institutions, and at the same time, develop a methodology (or principles of a reading) for the study of intellectuals" (p. 16). Refusing to accept the evidence that because the ENS produced "numerically more famous 'leftist' normaliens" (p. 27), its political affiliation is automatically established, Rubenstein embarks on a systematic (although somewhat tedious) debunking of the representation of the ENS as a left-wing breeding ground.

In Rubenstein's convoluted narrative of the production of the *normalien* from the initial selection of candidates through rigorous examinations to the internalization of an elaborate *normalien* culture (which drew very heavily on elitist symbols, including a pompous language canonized as the signal of belles lettres and worked to create familylike ties among *normaliens*), infamous ENS offspring of the interwar years (e.g., Robert Brasillach, Jean Luchaire, Claude Jamet, and Thierry Maulnier), who penned collaborationist propaganda for a network of journals, move to center stage. Rather than seeing them as exceptional, Rubenstein prefers to make them and their fascism paradigmatic of the ENS sensibility: "(T)here would appear to be a fundamental compatability of notions of cult, athleticism, physical ordeals, eccentricity, dandyism, self-conscious elitism, and distrust for the *moyenne*, evidenced in the *normalien*'s self-perception of its rite of institution. . . with those themes of fascist ideology" (p. 68). That this same school could have produced Jean Paul Sartre, Jean Hyppolite, or Simone Weil becomes, in Rubenstein's reading, what needs explanation.

There is an unarticulated connection between "writing" and the "right" that ought to be taken seriously, Rubenstein contends, not only in order to understand the ease with which fascist support was found among *normaliens* but to appreciate more fully the significance of the postwar trials of French intellectuals such as Brasillach and Jamet, who were accused and ultimately condemned for collaborating with the enemy. These trials animated French intellectuals of the period, leading some writers associated with the resistance to circulate petitions for clemency. Rubenstein's book makes an important contribution to the literature on what Otto Kircheimer called "political trials." But instead of reading these trials only as one way for a successor regime to distance itself from its tainted past by symbolically purging—one easily delineated segment of the population" (p. 158), Rubenstein proposes to interpret the trials "as both a judgment on and protection of an educational system that ritualizes speech" (p. 139): "What made the French purge trials noteworthy . . . was the insistence that words were deeds and should be so tried" (p. 139). These trials of "purely literary collaboration" (p. 138) led to the damning of intellectuals for their words and their signatures. Brassilach and others were condemned to death.

The strength of Rubenstein's interpretation of the ENS as a likely producer of fascist collaborators rests on her articulation of the hidden circuit between politics and writing and her insistence on the "tie between the principles of linguistic and political authority" (p. 14). Ironically, this linkage may exceed the boundaries of Rubenstein's own construction of it. She notes in pass-

ing that many of the codes for establishing the *normalien* discourse as an authoritative discourse—linguistic codes such as neologisms, a language of hyperbole, and "poetic devices such as repetition, alliteration, rhyme, etc."—are not wholly unique to this elite" (p. 102). These codes, however, may be more pervasive than Rubenstein intends. Her work draws heavily on "current poststructuralist thought, much of it produced by former students of the ENS: Derrida (promotion 1952), Bourdieu (promotion 1951), Foucault (promotion 1946), and Debray (promotion 1960)" (p. 16). Despite its insistence to the contrary, the discourse of poststructuralism can be read as trafficking in some of the same codes that Rubenstein contends led to the articulation of "notions of hierarchy, difference, and exclusion implicitly, in a manner similar to that of the right" (p. 102). After all, Rubenstein relies on Derrida's and Foucault's own deconstruction of the concepts of agency and subjectivity as disciplinary practices when she concludes that "we should view the author as a victim of his writing which is the social product of an institutional practice—in this case the Ecole Normale" (p. 138). If we can no longer read a text as the property of its author or search for the author's intention as the key to decoding, then the same deconstructivist practice is permissible with regard to poststructuralist texts as well.

Since the political allegiances of one of poststructuralism's most celebrated figures, Paul de Man, have been widely debated, it is strange that he remains unmentioned (except for one reference) throughout Rubenstein's work. Despite the fact that this book is about French intellectuals in the twenties and thirties, the ghost of de Man haunts these pages. The unintended contribution of this densely argued book is to invite us to reverse the question and its focus yet again and ask whether, if we are to see deconstructivist readings and writings as "active interventions . . . that transform contexts" (p. xv), we will not have to ask, What's Left? again.

San Diego State University KATHLEEN B. JONES

Discourses on Society: The Shaping of the Social Science Disciplines. Edited by Peter Wagner, Bjorn Wittrock, and Richard Whitley. Boston: Kluwer Academic, 1991. 386p. $136.00.

In bringing this fifteenth *Sociology of Science* yearbook to a close, the editors claim that the sociology of science is "in a sense the very reflective core of social science." This claim would have made little sense not too many years ago when the sociology of science was just as causal, structural, functional, and nonreflective as sociology itself. The apparent truthfulness of the claim today depends on the sociology of science's having taken a historical turn, made alliances with disciplinary historians and philosophers outside of sociology, and joined the collective effort to undertake detailed investigations of the diverse discourses, practices, and political involvements of flesh-and-blood social scientists in different disciplines, contexts, and times. Thankfully, this sort of reflection is impressively on view in this volume by twelve European and North American scholars in political science, economics, philosophy, and history, as well as sociology.

The 13 essays focus on the shaping of the social science disciplines, particularly in connection with their institutionalization and affiliations to the state. In moving away from history, moral philosophy, and Enlightenment reformism, the social sciences were institutionalized mainly during the late nineteenth century with the formation of different academic associations and theoretical discourses. As a collection, the essays indicate that this process was uneven and differentiated, however, in various national contexts, especially the United States, France, Italy, and Germany. Moreover, the institutionalization was not always at research universities but at training centers for administrative elites (as in French political science) or at commercial colleges and mechanics' institutes (as in English economics). The state played similarly diverse roles in these processes, from actively providing directives about the education of experts to passively playing the constitutive object of grand theorizing. Desrosieres writes, "As the very etymology of the word shows, statistical activity [was even] in league with the State". Yet the intellectual fields established in the late nineteenth century did not generally persist, either in the case of German(-inspired) theories of the state, or even in the case of the so-called classical sociology of Weber, Durkheim, and Pareto. In British political science and Swedish sociology, a clearly articulated social "science" did not emerge until after World War II when "the American model" of behavioral and empirical studies completed its domination of the European imagination. Today's social sciences largely conform to this model and play, according to the editors of the present book, "the correlate of a full-blown modern interventionist welfare state".

The principal casualty of this collective and differentiated portrait, as Anthony Giddens points out in the preface, is the neopositivist view (held by hardly anyone these days anyway) that the social sciences progressively accumulate knowledge in strict autonomy from the rest of social and political life. The methodological consequences of this casualty are not spelled out, unfortunately, save for the editors' fleeting reference to an alternative "critical realism." This philosophical stance, is not shared by all the contributors and would make little if any difference to social scientific practice even if it could be verified.

More engaging methodological issues, however, are raised (or at least displayed) in connection with the historical and sociological interpretations provided by the contributors themselves. Gunnell advocates a "disciplinary archaeology" that peruses the textual monuments of the past and acknowledges only the "congenial ambience" (not the explanatory power) that contexts provide for understanding their meaning. (The editors should have glossed this as a "contextually sensitive textualism" as opposed to a "textually sensitive contextualism"; and much more remains to be done under that label in the case of the history of American political science). Vout would turn our methodological attentions to the "idioms" of social science and its precursors; and he does this, in part, by composing an imaginative "pastiche of inaugural addresses" by Oxbridge chairs of politics between 1920 and 1950. Heilbron rightly calls attention to the importance of "predisciplinary history" for establishing the discourses of incipient disciplines. Desrosieres hails a "social history of cognitive forms" that would connect conceptual schemas to political cat-

egories, especially those about, or provided by, the state. Tribe insists that we should understand the public discourse of the social sciences in institutional, not theoretical, terms and proceeds to attend to the syllabi, class rosters, and fiscal endowments of a variety of educational sites (rightly calling attention to economic historians' "sheer ignorance of what went on outside Cambridge and London"). These various methodological strategies are not all in league; but they prove by their substantive fruits the merits of methodological pluralism in the history of the social sciences if not, indeed, in the social sciences themselves.

Given the strengths of the volume, one complaint must be lodged. If, (as the contributors imply) the separation of academic from public discourse that resulted from institutionalization is regretiable, then what, if anything, might repair that relationship, and can we be sure the academic history of social science does not reinforce that very separation?

University of Minnesota JAMES FARR

AMERICAN POLITICS

Politics and Economics in the Eighties. Edited by Alberto Alesina and Geoffrey Carliner. Chicago: Chicago University Press, 1991. 296p. $45.00 cloth, $17.95 paper.

Shifting the Burden: The Struggle over Growth and Corporate Taxation. By Cathie J. Martin. Chicago: University of Chicago Press, 1991. 251p. $43.00 cloth, $15.95 paper.

It would be hard to find two books on American economic policymaking that were more different than these two. Alesina and Carliner's broadly focused book is an edited volume of articles by major figures in the public choice tradition writing on a wide variety of economic policy areas. It is primarily concerned with the question of whether events in the Reagan–Bush period represented a new relation between economics and politics or simply confirmed existing relationships. Cathie Martin's narrowly focused work is a first book by someone in the quasi-Marxist "state politics" tradition, primarily concerned with the underlying changes in political economy since the 1950s that led to alterations in the corporate income tax. The writers in the Alesina and Carliner volume try to trace everything to personal interest and have little room for the role of beliefs. Martin thinks economic ideology is a prime driver of American economic outcomes. Martin looks at qualitative historical data to determine how policy was made. The Alesina and Carliner writers prefer to look at quantitative indicators where possible. The reader is particularly struck by the fact that the literature most cited in each book is largely ignored in the other. Nonetheless, both are useful and interesting studies that widen our knowledge of economic policymaking.

While neither book will take your breath away, both have something to offer. Martin's book is divided into three parts. In the first two chapters she outlines her theory. In the bulk of the book, she examines five case studies of corporate tax bills. In the short final chapter, she talks of implications for the state autonomy and business power literature.

She wishes to make the case that changes in corporate taxation were predominantly due to a series of alliances between the presidency and various parts of business aimed at promoting economic growth. Although she calls this a coalition, she clearly sees business as the junior partner, organized by the executive branch in pursuit of its growth strategies. Because these growth strategies change over time, the executive allies itself with different sections of business at different times, generally choosing the section that gains the most or loses the least from the proposed changes. She identifies four different periods in the postwar era: a neoclassical period, a Fordian–Keynsian period, a hyperaccumulationist (or supply side) period, and a high technology period with different ideologies on growth. She thinks that the executive linked itself with different sections of business in each period and that major changes in corporate taxation resulted.

Having laid out this theory, she then presents a series of five case studies of corporate tax change since 1960. I found these case studies to be well researched, well laid out, and interesting. She made extensive use of material from presidential libraries for the early period and of interviews with participants for the later case studies. The case studies reveal interesting details about splits within administrations and splits between different sections of business. They also provide new material on the organization of business coalitions by the executive branch in pursuit of corporate tax changes. They are, however, somewhat unbalanced. She gives too little attention to what happens in Congress, to Congress's role in initiating legislation, and to coalitions between Congress and business. In the later cases, I also thought that she was sometimes stretching thin material to try and prove her thesis. For example, an executive–business coalition where only 20 of the top five-hundred corporations sign on is not one that overwhelms the reader with its power. However, one cannot carp too much. Precisely this focus on one element of the political spectrum produces most of what is new and fresh in the book.

Do the case studies support the theory? As is so often the case, the answer is *yes* and *no*. She makes a case that both political and economic views on what causes economic growth have changed over time and that these have sometimes affected corporate tax changes, especially in the short term. Her focus on the business–executive relationship also brings into prominence an element of the political process that has not been much emphasized in other literature. She also clearly demonstrates that the executive branch has often tried to organize a supportive business grouping. Thus, what she stresses is true as far as it goes.

But what she omits is as important as what she includes. There is little discussion of distributive motives, the role of parties and party ideology is shortchanged, and there is only cursory consideration of electoral motives and the interaction between changes in corporate taxes and other tax changes. She also downplays the role of Congress as an initiator of policy (especially in 1981) and fails to look seriously at the alliances between Congress and business. And, despite her mention of Ronald King's work on redistributive taxation, she did not look very seriously at the possibility that growth arguments are a way of disguising tax changes that have unpopular distributive consequences. To be fair, many of these points are mentioned in one or another of the case studies; but they are then downplayed in the summaries and theoretical sections.

A few other points bear mentioning. I found her grasp of the literature in the area somewhat selective. There is no mention, for example, of Pierce's earlier study of the Kennedy–Johnson tax changes nor of relevant work by Hibbs, Tufte, Gordon, Buchanan, Sundquist, Page, or Wildavsky. I found the part of her theory arguing that we have had four paradigm shifts in 30 years unconvincing. I read her case studies as showing that business acted mainly in its short-term interests, rather than as part of an alliance. I also have a bias toward testing one's theories against plausible alternatives. There was little attempt to do so in this book. The reader will get from this book the first serious look at the politics of corporate taxation, some interesting case studies, and an attempt

to create a theory that is interesting, if not always clear or supported by the data.

The Alesina and Carliner book is an attempt to apply the insights of public choice theory to economic events under the Reagan administration. There is a conscious attempt on the part of most (but not all) of these writers to eschew their usual mathematical models and quantitative tests and to make what they have to say more accessible to the mathematically impaired. There are two obvious questions. One is, What does the book have to say about the political roots of the economic changes under Reagan? The second is, When shorn of the equations, what insights does the public choice perspective give into economic policy making?

The articles in the book deal with most of the major macro policy areas. They discuss political business cycles, monetary policy, tax policy, welfare expenditures, the deficit, trade policy, the savings-and-loan crisis, and minimum wage legislation. Most of the articles contain as part of their substance a brief summary of developments in each area in the 1980s. With the exception of the article on the deficit (which I found misleading), these minihistories are well executed and informative, going beyond mere description to provide insights into the motivations of key policymakers and how external events impinged on them. I. M. Destler's account of trade policy developments is especially well done. The articles also contain excellent summaries of the state of the art in the public choice literature. Anyone wanting to find out what the public choice theorists have been doing in this and related areas in the last five years could not find a better place to start. Fiorina's summary of the political business cycle literature is especially masterful.

But what does this approach teach us that we did not know before? The answer is *not a whole lot*. We learn that presidents do better when the economy is strong; that regulatory agencies get captured by members of congress, who themselves get captured by active constituents; that the vote of members of congress is affected by their party affiliation and their ideology; that when the two parts of Congress are in the hands of different parties, there is more conflict and that this conflict is often resolved by increasing expenditures; and that the president's veto power is important. While these points are developed professionally and applied well to the data, they are not breakthrough insights.

The book is blessed with a number of smaller insights and elaborations on common models that add to our knowledge on the margins. But there are also one or two more provocative insights. My own favorites were the ruminations on the role of the Federal Reserve and the Office of Trade Protection in the articles by Jim Alt and I. M. Destler. The latter has an interesting variant on Kane's (1987) model of regulatory agencies as convenient scapegoats. Alt uses principal–agent theory to combine the somewhat disparate evidence on who really controls monetary policy. I also liked Fiorina's attempt to show that party affiliation was a lagged effect of economic policy. While I was unconvinced by his model specifications and found his evidence less than awe-inspiring, the idea is one that I have always thought had possibilities; and Fiorina makes a good logical case for it.

While these chapters have many virtues, they also have omissions and shortcomings. The most obvious is the excessive concentration on Congress. While Martin gives Congress too little attention, the writers in this book give it too much. Eager to combat the view that Reagan altered policy, this group of congressional specialists want to attribute most of the changes to Congress. Six of the eight papers look at little but Congress, and all downplay the role of the president. Private actors are important only insofar as they affect congressional action and are viewed through a congressional filter. This concentration often produces interesting insights into how Congress deals with economic policy, but it gives a somewhat distorted view of the total policy realm. There is also an excessive tendency to claim that extraordinary policies followed from ordinary political processes. While this might be plausible once, it is less plausible over the entire range of policies.

Finally, while many of the explanations offered were reasonable, others would often have been equally reasonable. Congressional timidity on trade issues could be due to a fear of being labeled unpatriotic when the president is combatting trade antagonists; deficits could be due to changing economic views, rather than a divided Congress; the savings-and-loan crisis could be primarily the result of Reagan's policy and high deficits, rather than congressional capture; and so on.

The two books together show that what one gets out of the process depends significantly on the models one takes into it. The Martin book comes out of traditions that emphasize the state, business power, and ideology; and she finds that corporate taxes are formed by an executive–business alliance that is affected by current growth ideology. Most of those writing in the Alesina and Carliner collection study Congress, and believe in the power of rational self-interest and institutional structure to shape outcomes; and they find that economic policy outcomes are largely determined by congressional structure and the self-interest of members of Congress. Such specialization is both the strength and the weakness of these books.

Overall, these are good books written by intelligent people in a difficult area. While the Alesina and Carliner volume is clearly the stronger of the two books, both are well worth reading, and both add to our knowledge about economic policy and our understanding of the uses and misuses of political models.

California State University, Fullerton PAUL PERETZ

Assessing the President: The Media, Elite Opinion, and Public Support. By Richard A. Brody. Stanford: Stanford University Press, 1991. 198p. $22.50.

It is difficult to break new ground in an area of research as well trod as the study of presidential popularity; yet this book succeeds admirably by offering noteworthy theoretical and empirical insights. Brody provides a worthwhile synthesis of much of his earlier work and perceptive new appraisals of the subject. Especially for people not in the field, his cogent review of the voluminous literature on honeymoons, rally events, time, and the economy is "must" reading.

The central thesis of the book is that Americans judge presidents based on their impressions of news reports about presidential policy successes and failures. According to Brody, the news is not merely a reporting of the details of an event itself. It also involves interpretations of the event by political opinion leaders (or elites). When the significance of an event is appreciated by the public, their evaluations of a president will depend primarily on

the description of the event in news stories. When the significance of an event is more ambiguous, its meaning will be supplied by the reactions and interpretations of opinion leaders, which are carried as part of the news. If these interpretations are flattering toward a president, Brody argues that the public's evaluations will be similarly buoyant. If public opinion leaders are less enthralled, so, too, is the public at large. Thus, there are two parts to the theory: the news covers elite opinions and the news and elite opinions shape public opinion.

Brody's news model of presidential approval does not preclude consideration of such factors as the honeymoon and rally events, which have been pivotal in other explanations of the rise and fall of public evaluations. Brody maintains that opinion leaders tend to mute their criticisms of a president early in the term (the honeymoon) and during dramatic international crises that pit the United States against an unrelenting foe (rally events). Brody offers the first systematic comparison of the early period of presidents' first and second terms. The results suggest that while there is a honeymoon plateau of support in the first term, there is none in the second term. Presumably by the second term, opinion leaders are comfortable criticizing a known commodity. Brody also describes elite reactions to various international crises, from the U-2 incident during the Eisenhower administration to the Iran–Contra affair of the Reagan administration. He observes that during some of these crises, when the danger seems remote and presidential folly is apparent, elite criticism, rather than kudos, mounts. In this way, the international crisis (e.g., Iran–Contra) becomes a negative event, rather than a rally event, causing presidential approval to fall.

The core of the book is an intriguing analysis of the news model, offered in two parts: Kennedy through Ford and Carter and Reagan. Unhappily, because of some lost data sets, a combined analysis from Kennedy to Reagan is not presented. The news stories are distinguished between foreign and domestic news; policy proposals and policy results; and good, bad, and neutral stories. The results show that the net difference between good news and bad news affects public approval (relative to the effects of presidential broadcasts and the honeymoon in the first period and to the honeymoon, the economy, past approval, and the hostage taking in Iran in the second).

Even with this ambitious effort, work remains to be done in three areas. First, while Brody clearly outlines the relationship between media coverage and public opinion, he leaves for another book a test of the indirect relationship posited between opinion leaders and public opinion. As currently presented, opinion leadership is only vaguely defined, and opinion leaders constitute a somewhat amorphous group. They are primarily reporters' sources, including the president, vice president, presidential candidates, some members of the White House staff, the congressional leadership, some committee chairs, and columnists. No mention is made of governors, cabinet members, business leaders, or reporters and anchors themselves. In addition, the empirical treatment of elite opinion is largely anecdotal. Future efforts can develop a classification scheme that distinguishes news coverage of opinion leaders' comments about an event from news coverage of the event itself. This would provide a systematic test of the posited effect of elite opinion on news coverage and offer a way of judging whether opinion leadership takes place.

Second, the book does not fully distinguish between presidential opinion leadership and other elites' opinion leadership. In the Kennedy–Ford period, a variable measures presidential broadcasts, but this is not repeated for the Carter–Reagan period. The book acknowledges, but does not study, White House efforts to counter elite criticisms, create elite support, and generate its own favorable publicity. Other projects can build these activities into the news model more fully. Third, as part of presidential opinion leadership, presidents often offer symbolic presentations, as well as the policy proposals and outcomes Brody discusses. Many news events are mixtures of both. It would be important to know how these symbolic components of presidential news affect public approval.

In all, this valuable book offers scholars of the presidency, the media, and public opinion an approach that should be taken seriously and that offers an opportunity for future research.

University of Arizona LYN RAGSDALE

Ballots of Tumult: A Portrait of Volatility in American Voting. By Courtney Brown. Ann Arbor: University of Michigan Press, 1991. 232p. $34.50.

Courtney Brown's book is an ambitious one. He attempts to model electoral volatility in the United States in such a way as to resolve the debate about mobilization versus conversion during the New Deal realignments; develop a general picture of the impact of third parties on the American electoral universe; explain "where all those new female Republican voters came from in 1920"; and build a model of the congressional mobilization cycle incorporating variables derived from a wide range of theories about congressional voting. Brown argues that he addresses these questions from a new perspective, namely, "the possibility of fixed dynamic structures as characteristics of volatile mass electoral behavior differentially related to social context and evident across a wide range of events has not been extensively explored. . ." (p. 11).

Ballots of Tumult contains, in addition to its theoretical chapters, a case study of the dynamics of presidential voting during the New Deal realignment (1928–36); a chapter examining the sources of third-party support (and the subsequent movement of "demobilized" third-party supporters in the instances of the Populist party, Roosevelt in 1912, La Follette in 1924, Wallace in 1968, and Anderson in 1980); a chapter on the 1920 election that examines the differential mobilization of women into the Democratic and Republican parties; and a chapter that attempts to build a new and synthetic model of voting behavior in off-year congressional elections. Brown develops systems of differential equations to investigate each of these problems. For example, in the New Deal chapter, he illuminates (in my view quite successfully) the relative impact of conversion and mobilization by proposing three equations that together constitute an interdependent system describing the over-time fluctuations of three groups in the population: Democrats, Republicans, and nonvoters. Moreover, to communicate the results of his estimations, Brown offers the reader innovative and generally appealing graphic devices (though some are more successful than others).

Brown's is clearly a "bottom-up" perspective on po-

litical change. Leaders follow the masses; therefore, it makes sense to work on developing theories of mass behavior in the relative absence of theories of elite behavior. He makes fascinating and cogent points about how organizational dynamics might tie into his model. For example, he speculates that the differential mobilization of women into the parties in 1920 was a function of the local parties' electoral requisites. Nonetheless, he often seems more comfortable talking about mass behavior as a response not to intentional behavior on the part of elites but to "social forces" or "particular social chemistries indigenous to localized milieus" (p. 187).

This said, Brown does take into account critical contextual variables. Not only are his models "conditioned" so that we can see clearly, for example, the relationships between x and y for farm areas versus urban areas, but local levels of two-party competition are central to his view of how electoral dynamics work, and these kinds of variables are built into his models. This seems to me a clear strength of the book. Another is his lucid and useful discussion of the advantages and disadvantages (or pitfalls) of both aggregate voting data and cross-sectional survey data in the analysis of electoral change. He argues persuasively that neither is to be preferred consistently over the other. Finally, independent of the book's argument, Brown has clearly accomplished a monumental and valuable task by integrating diverse data from the ICPSR into a single data set containing county-level electoral and census data.

Ballots of Tumult will serve an important heuristic function, stimulating not only attempts to develop alternative models, but micro-level historical research, as well (which the author suggests is necessary to reach a better understanding of the mobilization of women in 1920). The chapter on the New Deal realignment is perhaps the most clear and convincing. The chapter on the congressional mobilization cycle and that on women in 1920 have a certain ad hoc quality about the explanations; but both, like the book as a whole, raise all sorts of interesting questions. Any reader interested in American voting behavior will find an idea or problem in this book that will encourage the rethinking of a question, the redoing of an analysis, or the revision of a conclusion.

Syracuse University KRISTI ANDERSEN

Catholic Bishops in American Politics. By Timothy A. Byrnes. Princeton: Princeton University Press, 1991. 189p. $29.95.

The Bible and the Ballot Box: Religion and Politics in the 1988 Election. Edited by James L. Guth and John C. Green. Boulder: Westview, 1991. 250p. $34.95.

These two books, one a focused examination of a particular religious elite, the other a collection of essays and research reports about religion in a single election, illustrate well both the strength and weakness of contemporary research on religion in American politics.

In studying the political role of American Catholic bishops, Timothy Byrnes might have emphasized the *process* by which the church hierarchy formulates political policy and strategy. The fascinating story of how the bishops balance their own views with the conflicting imperatives of the Vatican, parish priests and nuns, professional staff members, Catholic interest groups, the various religious orders, and the variegated and increasingly vocal American Catholic community has yet to be fully told. Alternatively, a book devoted to the bishops as political actors might have explored their *impact*, asking how their well-publicized messages on subjects as diverse as nuclear weapons, abortion, and the American economy influenced political elites, ordinary Catholics, and the American public. Eschewing both approaches in this slim book, Byrnes's principal aim is rather to chronicle and explain the emergence of the bishops as a provocative political force in recent American politics.

The recent change in the bishops' leadership style—their increased visibility on a range of controversial issues—was associated with the social transformation of American Catholicism. When they represented an immigrant church whose members suffered poverty, discrimination, and accusations of disloyalty, the bishops' principal political role was local in scope and defensive of Catholic interests and cultural values. When Catholics came out of the ghetto in the mid–twentieth century, the bishops similarly shifted their political role to encompass a broader range of political issues and values, pursue a more national political agenda, and assert a distinctly Catholic political ethic. The increased self-confidence of American Catholics and the enhanced organizational capacity of the bishops—the most common explanations for the new involvement—are only part of the story. According to Byrnes, the bishops simply adjusted to major shifts in American political life—the nationalization of American politics, the politicization of new issues, and efforts by other political elites to capture the Catholic vote. If the bishops became major actors on behalf of the prolife movement in the 1976 and 1980 presidential campaign, that is largely because the Supreme Court transformed abortion into a national issue, numerous candidates attempted to associate themselves with the bishops' agenda, and dealignment loosened the ties binding Catholics to the Democratic party, making them an attractive target for mobilization by conservatives. To those who regard the bishops as unwelcome interlopers trying to impose Catholic values on politics, one might say the bishops were more sinned against than they were sinners.

While the 1988 election may have seemed less overtly religious than its recent predecessors, the essays collected by James Guth and John Green in *The Bible and the Ballot Box* demonstrate a considerably more complex reality. While many observers discounted the role of religion once Jackson and Robertson departed the scene, the studies show a continuing if subterranean religious presence animating elites and ordinary citizens. The chapters following Allen Hertzke's essay—essentially a cultural argument that religion supplied the populist motif in the campaign—examine the political activities of denominational leaders and organizations, the impact of religion on political activists, and surveys of religious influences on the voting of major religious groups—white Protestants, black Protestants, Catholics, and Jews. The collection contains considerable original research, utilizing surveys of Protestant clergy, campaign contributors, and black Americans, as well as elite interviews and secondary analysis of more familiar exit polls and data sources.

In their conclusion, the editors extract an important theme from the diverse studies: "The United States is moving away from the ethnocultural foundations of

political alignments, based on conflict between religious traditions, toward a more European pattern, in which conservative parties draw heavily from religious groups and leaders, while parties of the left are supported by more secular forces" (p. 207). As they recognize, this conclusion applies with more force to elites than to masses and does not fit some groups, notably Catholics, black Protestants, and Jews, as well as others. The strongest evidence for it, the disparity in religious commitment between contributors to Republican and Democratic political action committees in chapter 7, is also somewhat suspect. The lower mean score of Democratic contributors on a measure of "traditional religiosity" is potentially an artifact of the relatively large proportion of Jewish contributors in the Democratic camp—a group whose religious orientations are not well represented by an essentially Christian index including questions about biblical literalism and life after death. To appropriate Milton Yinger's dictum, Democratic contributors may be just as religious as their Republican counterparts but religious in a different way.

Both books do a good job of challenging conventional wisdom that portrays religion as a marginal, predictable, and reactionary force in American politics. Byrnes shows, for example, that the Catholic bishops are not a monolithic force but are seriously divided between those who elevate abortion above all other issues and those who regard it as one element in a package of concerns for a "consistent ethic of life." His analysis, along with the studies of religious elites in the Guth and Green volume, demonstrates that the extent of political engagement in any particular campaign depends both on internal factors and the stimulus offered by the political system. Similarly, the studies of groups as diverse as campaign contributors, convention delegates, and voters shows that religion may support a wide variety of political positions and values. After reading these volumes, there is clearly no justification for the all too common tendency to overlook or caricature religion as a political force.

But the two volumes also demonstrate a conspicuous weakness among studies of religion in electoral politics—a tendency to favor description over theorizing. Precisely because of their descriptive nature, these books are rich sources for lecture material and could profitably be incorporated in undergraduate courses. Yet it is hard to say that our efforts to build conceptual understanding of the politics of religion are much advanced by either volume. Byrnes modestly avoids calling his work a theory of elite Catholic mobilization, though there is something approaching theory lurking in his case study. I wonder, for example, whether the same forces he credits with bringing Catholic elites into the political arena might equally well explain the contemporaneous political emergence of fundamentalist Protestant clergy or even some nonreligious groups. A framework such as resource mobilization might make the results of Byrnes's research more interesting to other scholars, and using it could enable Byrnes to offer insights that transcend his case study. Similarly, the excellent studies in the Guth and Green volume tend to stick to the facts rather than connect findings to extant theories about mass political behavior. This is a pity because the studies shed valuable light on such interesting themes as group consciousness and cohesion, social identification, cultural politics, and organizational encapsulation. Unless research on religion is connected explicitly to the theoretical concerns of the larger scholarly community, it is unlikely to influence mainstream research. It would be a supreme irony if scholars of religion in American politics should build a research ghetto just as the subjects of their labor—major religious groups—have emerged to claim a place at the heart of American politics.

University of Florida KENNETH D. WALD

Collective Action and the Civil Rights Movement. By Dennis Chong. Chicago: University of Chicago Press, 1991. 261p. $42.50 cloth, $16.95 paper.

This fascinating book brings together a number of intellectual and research activities that are usually carried on by different kinds of scholars, usually in different forums and without mutual interaction. It would be a mistake for the reader to suppose that this book is a richly detailed, substantive account of the postwar Civil Rights movement in the United States. Rather, it is a successful and needed illustration of how formal theory is developed and used to explain a complex and important phenomenon, in this case, the Civil Rights movement in the United States after World War II. Although the substantive focus is the Civil Rights movement, the author often demonstrates the wider applicability of the approach and analysis to other "public-spirited" movements.

Building on the work of Russell Hardin and Mancur Olson, theorists of collective action have sought to explain the conditions under which utility-maximizing, rational, and self-interested individuals act to produce results that require their voluntary contributions of money, time, effort, and risk to personal well-being. When the object is to achieve justice, fairness, due process, and other public-spirited objectives, the usual problems associated with the efficient production of public goods are accentuated. The special difficulties associated with private provision of public goods like civil rights, women's and gay rights, and even resource preservation and historic preservation are plagued with such routine public goods traits as jointness of supply, nonexcludability, and nonrivalry in consumption.

Dennis Chong formulates a general model of collective action and then applies it to the modern Civil Rights movement. Moreover, he accomplishes this in a manner that should not disaffect those who are uninitiated in the argot of rational choice approaches. Whenever possible, the conceptual apparatus of game theory and public choice are defined in direct, conventional terms, thereby illustrating that there is no necessary reason for formal theory to be surrounded by a notational thicket of symbolic logic or mathematics. Only reflexive fear or hostility should prevent a reading and understanding of the straightforward mathematics and graphical presentation that are sometimes used; in all cases, the verbal explanations are clear and comprehensible.

Considering its conceptual apparatus, it is a relief to find that the text is logically organized. Chong begins with an introduction to his topic, generally phrased as the problem of explaining "public-spirited collective action." The overarching puzzle of collective action is nicely summarized, as are the traditional terms employed to account for it, including public goods, prisoner's dilemma (and its variants, such as an iterated

prisoner's dilemma), free-rider, and expressive benefits, among others. The outline of *Collective Action and the Civil Rights Movement* is spelled out clearly and, more importantly, implemented in subsequent chapters.

Chong's analysis is energetically eclectic. For example, early in his analysis, Chong employs the notion of an "all-or-nothing" public good to explain why boycotts and nonviolent demonstrations were effective and sustained in the early days of the postwar Civil Rights movement. He sprinkles the narrative and explanation with references to primary and secondary historical sources and concepts borrowed from the study of social psychology and communications. He ends the second chapter by pointing out that while the persistence of boycotts and protest can be accounted for in game-theoretic and public goods language, the account still does not explain why individuals with every incentive to free-ride actually participate in boycotts and nonviolent demonstrations.

In chapter 3, a variety of "social incentives and reputational concerns" are introduced to answer this question. Friendship, social standing, social networks, and other nonconventional and nonpecuniary incentives are joined with a game-theoretic application of Axelrod's iterated prisoner's dilemma to help explain individual decisions to join and sustain civil rights activity. Chong illustrates how individual behavior and expectations interact in groups so as to create social incentives and reputational concern sufficient to incite and sustain participation in civil rights activity. This chapter is especially interesting, since it focuses on perhaps the core collective choice problem and even provides implicit guidelines on how to mitigate the tendency to free-ride. Chong fails, however, to account for how one can anticipate the conditions under which particular social incentives or concerns for one's reputation will work for any individual. Indeed, there is more than a whiff of post hoc and tautological reasoning in evidence here. After all, concern for one's reputation as a reason for participation is selectively supported by the biographical or repertorial evidence cited by Chong. How to anticipate when such factors do or do not exert influence is not addressed.

The benefits and shortcomings of the overall approach are further illustrated in Chong's treatment of "narrowly rational expressive benefits." These benefits refer to the satisfaction an individual gains from the mere act of doing something, rather than from the putative goal of the participation (e.g., justice, equal opportunity, or abortion rights). A sense of revenge, a feeling of community, and a feeling of fun are presumably folded into calculations of benefits and costs and often produce unexpected levels of participation in public-spirited movements. Finally, with sufficient introduction of nonmaterial, psychic benefits and social-psychological qualifications, Chong gets us to the critical notion of "assurance games," a family of the more general coordination games. A formal model of collective action in pursuit of public-spirited objectives is eventually provided; and only enough mathematics is used to draw out inferences and generate expectations about the impact of various interacting variables on civil rights participation (e.g., the relationship between group demand making and official response, the impact of the schedule of response by officials, and the number of participants in the collective action). Ultimately, the model provides an explanation for the conditions under which participation, success, and, finally, decline in the Civil Rights movement occurred.

In the end, Chong explains that the Civil Rights movement experienced collapse because it was successful in satisfying its participants with its initial agenda and its various "material, social, and psychological benefits." The concluding portion of this book is perhaps least impressive. Chong simply suggests the disappearance of civil rights activism was the consequence of "tired radicals who [were] satisfied with their efforts or disappointed over the impact of their achievements" (p. 239). Saddled with either satisfied or frustrated former activists or cynical contemporaries who are unmotivated by the older schedule of reinforcement, the Civil Rights movement, as it traditionally manifested itself, died.

Yet even though Chong's conclusions about the Civil Rights movement are not startling, he does illustrate the value of rational model approaches to generating a framework for cumulative and replicable social inquiry. The reader should not dismiss this very useful, interesting text for the whimper of its conclusion. The bang here is in the demonstration of how formal and mathematical reason can be employed on behalf of substantive, even qualitative concerns. In this sense, Chong has provided a valuable, successful contribution.

University of California, Riverside MAX NEIMAN

The Postreform Congress. Edited by Roger H. Davidson. New York: St. Martin's, 1991. 354p. $24.00 paper.

Congressional Careers: Contours of Life in the U.S. House of Representatives. By John R. Hibbing. Chapel Hill: University of North Carolina Press, 1991. 213p. $29.95 cloth, $12.95 paper.

Although discussions of the state of congressional research regularly call for fresh data to reassess extant theories and for longitudinal studies that track and explain change, much of what we think we know about the Congress still comes from time-bound snapshots that may no longer be accurate. Congressional scholars need to be concerned with change in the behavior of individual members of the institution and change in the structure and practices of the institution as a whole. A concern with the former drives John Hibbing's careful analysis of congressional careers and a concern with institutional change motivates the essays on the "postreform" Congress that Roger Davidson has drawn together.

Typically, change in Congress has been described in institutional terms, utilizing time series data of the sort reported in *Vital Statistics on the Congress* or in over-time analyses of legislative voting patterns. Hibbing, however, is interested in change at the individual level, specifically during a member's career. He points out that although the literature is filled with findings and assertions about phases of the congressional career and about the impact of increased tenure on the behavior of legislators, the evidence in support of these conclusions is not always very strong. Some are based on little more than anecdotes; others are arrived at either by comparing the behavior of more-senior members with that of less-senior members during the same time period or by comparing cross-sectional data collected at different times. Such research designs can only suggest the change that takes place as members move through their

careers and, more importantly, cannot distinguish the change attributable to increased tenure from the "period" effects that impinge on the entire Congress.

To remedy that situation, Hibbing takes a longitudinal approach, developing and analyzing a huge data set covering the full careers of each member of the House of Representatives who entered the body from 1946. As members move through their careers, he looks at five aspects of change: in their electoral situation, in their formal positions within the Congress, in their roll-call voting behavior, in their legislative activity, and in their district activity. In order to test for change across a legislator's career, Hibbing uses standardized measures so that, for example, changes in member involvement in legislative activity attributable to tenure can be distinguished from changes attributable to revised institutional rules and norms governing participation.

These institutional changes have been especially apparent during the last two decades as the Congress moved through the reform era of the 1970s to the postreform era of the 1980s. The Congress of the earlier period was characterized by weak party leadership, strong subcommittees, highly decentralized power, and wide open participation by all members on all issues. This structure, it was argued, well served the needs of members increasingly dependent for their reelection upon their own individual efforts.

The Davidson volume demonstrates that although important elements of the 1970s system remain in place, changes did occur during the 1980s. The scholars contributing to the volume find a resurgence of partisanship in legislative voting behavior (David Rohde), an enhanced role for national political party organizations in congressional elections (Paul Herrnson), a strengthened role for party leaders in the House (Dan Palazzolo), new strategies and opportunities for party leaders (Barbara Sinclair), and new techniques that subcommittees use to defend their proposals in a more democratized House (Barry Weingast). Davidson provides a highly readable historic overview of the emergence of the postreform Congress; and Paul Quirk evaluates congressional performance, a project all too seldom undertaken by congressional scholars.

For the most part, these articles explain change in terms of institutional adaptation to external variables, particularly the altered political environment and policy agenda that arose in the 1980s as a result of changes in voting behavior, divided government, sharper ideological cleavages between the two parties, and higher levels of conflict between the president and the Congress. James Pfiffner, James Thurber, and John Gilmour provide strong discussions of how these changes have affected the manner in which Congress and the president make public policy.

As one would expect, there is some unevenness in the quality of the articles in the Davidson book. They display the wide range of approaches that always has characterized legislative research, from the purely descriptive, even impressionistic, to the more rigorous theoretical and empirical work typical of journal literature. Hibbing's book, in contrast, is a methodological tour de force. He carefully reviews the extant literature on congressional careers, identifies areas of consensus and controversy, and uses his vast data base to reassess much of what we know or think we know about careers.

In the process, some conventional wisdom is reaffirmed. Increased tenure in the House means increased legislative involvement and specialization, lower participation rates on roll calls, a more conservative and somewhat less partisan voting record, and, possibly, somewhat less attention to the district (although the data on this last point are not very strong). But some conventional wisdom also goes by the boards. Increased tenure does not mean greater electoral security. Although formal positions of power come somewhat earlier in the careers of members elected after 1969 than for those elected before, there is little evidence that power is more equitably distributed now than in the past. And Hibbing's data suggest that the widely reported death of the apprenticeship norm may well have been exaggerated. In recent years, the gap between participation rates of new and senior members is greater than it was in earlier years when the apprenticeship norm was supposedly in full flower.

Generally, Hibbing questions the prevailing view of a cyclical congressional career, discovering at several points that recent careers are characterized more by constancy than by change. Increasingly, behavior early in a legislator's career predicts behavior later in the career. The one exception to this generalization—the clear growth in legislative involvement and specialization over the legislative career—leads Hibbing to the conclusion that term limitation would be a bad idea, because it would deprive the Congress of valuable legislative expertise.

Although both of these volumes will find their way into the library of every scholar interested in the Congress, they are also written in a manner that will make them accessible to students and to those in the profession who do not specialize in the Congress literature. The Davidson book will replace a number of reform era anthologies that have long been staples of undergraduate Congress courses and will, I suspect, contribute to the updating of more than a few introductory Congress lectures. But if, as Hibbing argues, there is no longer a life-cycle for legislators, there certainly is one for Congress books; and with the possible exception of the Rohde and Weingast pieces, there are no "classics" in the Davidson collection. Rather, its strength lies in its timeliness; and as times change, the utility of this volume will decline. Because Hibbing takes the long view, because he builds explicitly on the research literature, and because he is meticulously attentive to data and its proper analysis, his book constitutes the more solid and enduring contribution to scholarship on the Congress.

DePaul University MICHAEL L. MEZEY

Why Americans Hate Politics. By E. J. Dionne, Jr. New York: Simon & Schuster, 1991. 430p. $22.95.

America's Constitutional Soul. By Harvey C. Mansfield, Jr. Baltimore: Johns Hopkins University Press, 1991. 236p. $25.95.

Why have Americans lost faith in government? How has American politics gone awry? What has led voter participation in presidential elections to decline steadily since the 1950s and divided government to persist and rendered strong presidential leadership so elusive? And, finally, what is to be done?

E. J. Dionne, Jr. and Harvey C. Mansfield, Jr. address these questions in their books. The failure of both

liberalism and interest group pluralism in the 1960s, for both authors, is at the root of the problems confronting Democrats and Republicans in the 1990s. Both also look to a revival of the tradition of civic republicanism in American political thought. But they would revive republicanism in different ways, because they draw different lessons from that tradition for constitutional politics.

Writing for a popular audience, Dionne aims to provide a kind of intellectual history for what has gone wrong in American politics. Voters are frustrated, he argues, because the Left and the Right pose "false choices"—for example, between prochoice and prolife stances on abortion. Americans remain ambivalent about abortion, however. They overwhelmingly favor allowing women the legal right to choose an abortion but deem most abortions morally wrong. Liberal Democrats have lost touch with the values of the middle class, Dionne observes, while conservative Republicans increasingly fail to represent the interests of Americans. Sharply polarized campaigns, sound-bite commercials, and attenuated presidential debates divert us from a serious quest for common ground, or a "new political center" that would revive civil responsibility and build consensus on policies for education, the environment, health care, and other problems facing the middle class and the poor (p. 338).

The liberal consensus that dominated politics from the New Deal coalition, through the Eisenhower administration, to the Great Society programs broke down in the 1960s. That was due to its successes and excesses, as well as from mounting pressure from the Left and the Right. The New Left railed against the "liberal establishment" for not moving far enough toward a more egalitarian, participatory democracy at home and for waging the Vietnam War abroad. Conservatives also distrusted "the establishment," though for different reasons: the establishment was liberal and pushed social welfare policies too far. Notably, Dionne fails to mention that the Warren Court also came together in the 1960s, revolutionizing criminal procedure and greatly expanding civil rights and liberties. Rulings of the Warren Court—and later the Burger Court—reinforced the defection of white middle-class voters, especially in the South, from the Democratic party. Already angry over the passage of the Civil Rights Act, they became increasingly bitter over affirmative action, forced integration, and much else. "Judicial activism," "crime control," busing, and quotas became powerful symbols for Republican presidential candidates from Richard M. Nixon to George Bush. In this regard, the influence of race, civil rights, and economic issues on American politics is handled much more persuasively by Thomas and Mary Edsall in their book *Chain Reaction* (1991).

Dionne follows conventional wisdom in pointing to the decline of political parties and how reforms in the nominating convention of the Democratic party opened up the process at the cost of rendering it the party of special interests. With the breakup of the old New Deal coalition and unable to integrate interest group politics anew, Democratics promised virtually every group something and delivered little, winning only one in the last six presidential elections.

From the failures of liberalism, the second half of *Why Americans Hate Politics* turns to the ascendancy of the conservative Right. After the "fusionist consensus" (p. 161) forged among champions of free-market economics and traditionalists concerned with civic virtue, Dionne surveys the rise of the right wing of the Republican party. Prominent in his story is the neoconservatives' influence and critiques of social programs that went wrong, produced unintended consequencies, and raised social expectations. Republican victories in the 1980s, Mansfield agrees, repudiated much of the 1960s counterculture. Yet they also rested on a precarious coalition of libertarians, religious fundamentalists, neoconservatives, and conservative populists. And both authors note how easily that coalition could come apart.

Government once worked reasonably well. Still, it is little wonder that Americans are losing faith. Both the New Left and the New Right preached distrust of government: "Government is not the solution, it is the problem." The performance of Democrats and Republicans rarely matched their promises. Government succeeded in its failures, rather than building on successful policies. Conflicts over race and civil rights remain, though transformed, from the "cultural wars" of the 1960s and 1980s. They are compounded, moreover, by the further deterioration of communities and inner cities; overcrowded prisons, despite a decades-old battle against crime, tough new laws, a freer hand for law enforcement, stringent federal guidelines for sentencing, and more executions; the excesses of deregulation that led to the savings-and-loan crisis; and a budget deficit that looms ever larger.

Dionne and Mansfield agree on some factors contributing to the problems of governance: the decline of a competitive two-party system and patronage, the pervasive influence of the commercial media and incumbents' preoccupation with campaign contributions, populist appeals, and overly heightened expectations about governmental programs. However, Dionne looks for a new blend of political pragmatism, whereas Mansfield confesses he has "pretty much given up on liberals" and "appeal[s] more directly to conservatives" (pp. ix–x). The problem with liberalism for Mansfield runs deeper than for Dionne. Indeed, the problem lies precisely with pragmatism, participatory democracy, and the abandonment of the formalism and "liberal constitutionalism" of limited government.

America's Constitutional Soul is largely a collection of previously published essays. Part 1 attends to each presidential and congressional election in the 1980s. Mansfield looked toward a possible party realignment and President Ronald Reagan's returning to public discourse respect for the Constitution, while also warning against the New Right's embrace of pragmatism and populism. Pragmatic adjustments nonetheless prevailed; Reagan's legacy is "summed up in the deficit" (p. 62). Part 2 addresses pride and constitutional conservatism, while part 3 deals with religion, separation of powers, and choice and consent in modern constitutionalism. Finally, part 4 defends formalism and "constitutional forms" against the other preoccupations of political science, the mass media's "formless representation" and the informalism of populism and participatory democracy (p. 174).

Americans, according to Mansfield, have been led astray by pragmatism into believing in interpretative choices in their individual and collective self-determination and thus turned away from the "soul" of American constitutionalism: "What America needs is a certain constitutional space between people and government to allow the government to regain control of its affairs, thereby enabling the people to regain control of its

government" (p. 45). By contrast, for Dionne, pragmatism and public choice remain the heartbeat of American politics. Scholars already converted to the work of students of Leo Strauss will find Mansfield's arguments useful, particularly in debates over the revival of republicanism. Others may find them, however engaging, less convincing in light of the robust debates waged over rival theories of republicanism (romantic, rhetorical, and antiscientific pragmatism vs. more behavorialist, quasi-scientific versions), as well as over the call for a return to a jurisprudence of original intention. At the same time, Dionne's invocation of the republican tradition and recommendations for reaching compromises on "back-to-basics priorities, [such as] a kind of GI Bill for the 1990s" (p. 348) and vouchers will strike many readers as too easy and conciliatory.

In short, for Dionne, the "body politic" ails because voters confront "false choices," whereas Mansfield maintains that more is at stake: America's "soul is not healthy today" (p. 209) because voters believe they are entitled to choose and, confused about their interests and values, face too many choices. Dionne's solution—more deliberative pragmatism in renewing public life—for Mansfield, only perpetuates problems: what is needed is renewed respect for the formalism of the Constitution, government institutions, and public life. Both books thus merit as much attention for their opposing understandings of the theory and practice of constitutional politics as for their assessments of what is wrong with the political process.

University of Virginia DAVID M. O'BRIEN

Antitrust and the Triumph of Economics: Institutions, Expertise, and Policy Change. By Marc Allen Eisner. Chapel Hill: University of North Carolina Press, 1991. 314p. $34.95.

The first three paragraphs of this book hold out great promise for what is to follow. With a sense for the broad historic vista, the author links antitrust to the foundational principles of the American political economy. He then begins to build his argument, contending that major transformations in governing institutions and alterations in antitrust policy are closely intertwined. Happily, the book fulfills its initial promise. Although the author does not establish connections between changes in antitrust and large-scale political and economic changes that have taken place over the hundred years that antitrust law has existed (as one is led to hope for by the initial discussion), overall, he superbly integrates institutional, organizational, and process perspectives in explaining the evolution of antitrust policy.

The author offers an encapsulated version of his core argument in the introductory chapter and then plays out the various strands in subsequent chapters, rarely losing command of that argument, which is built on the premise that "to understand changes in antitrust, it is essential to examine the way in which the institutions of antitrust have evolved" (p. 15). The engine of policy transformation after World War II has been the "status and organizational presence of economic expertise" (p. 15).

As the author explains, antitrust policy, as embodied in the Sherman Act, was originally ambiguous. It encompassed a host of social, economic, and political goals and was animated by "a liberal apprehension with respect to growing concentration of economic power and its potential effects on local economies and individual autonomy" (p. 228). The ambiguity, reflecting a lack of consensus about what beyond the mere existence of trusts ought to be the object of public policy, placed a substantial burden on the institutions responsible for enforcement—the attorney general and the courts, soon joined by the Federal Trade Commission. Underdeveloped as organizations, the antitrust divisions of the Justice Department and the Federal Trade Commission were largely at the mercy of the courts and Congress in their effort to give more definition and substance to antitrust. The result of court-centered policy refinement and congressional limits placed on agency activism was policy incoherence, and antitrust remained mired in triviality and irrelevance through the New Deal era.

The author argues that building administrative capacity in public organizations requires a conscious effort at professionalization and expansion of a core of expertise. Agencies successful at such an endeavor realize a greater capacity for planning and policy coordination. The price to be paid for this success is that an agency becomes open to, and interconnected with, the external body of experts and other actors concerned with the agency's policy domain.

When the policy domain is characterized by high levels of complexity and is relatively unpoliticized, a special set of subsystem actors employing a common, specialized set of analytical tools tends to emerge, which the author terms a "community of expertise" (p. 92). A community of expertise is "seldom monolithic and static: there are competing groups within the community promoting different visions of policy and administration" (p. 95). Hence, the community and the agencies are vulnerable to changes in doctrine as different groups and their visions rise to prominence.

This is precisely what happened in antitrust policy. Economics provided the logic for a coherent antitrust policy in both the courts and the antitrust agencies, as well as the structure upon which the agencies could build capacity for planning and coordinated implementation. As long as economic structuralism remained the dominant paradigm, moreover, antitrust policy dominated by economics remained consistent with the ambiguous liberal values at its foundation. Through the 1970s, however, Chicago School doctrine replaced economic structuralism in the antitrust community of expertise. The result was the transformation of antitrust policy in the courts and antitrust agencies (the so-called Reagan revolution in antitrust was merely an extension of this change) and the abandonment of the long-standing and still reasonable concerns about market organization and concentration.

I am most impressed with the author's success in tying the internal organizational dynamics of change to changes in the larger institutional and intellectual context of policy, although I believe he understates the extent to which his own case study evidence shows how political appointees provided effective leadership in organizational change.

I am less certain about his contribution to scholarly understanding of how ideas influence policymaking. He provides a challenging discussion; but given his concern for the historical and institutional context underlying antitrust policy and its transformation, it is troubling that he acknowledges only in passing other institutional

or even systemic changes to which the antitrust changes may be linked; particularly the rise to prominence of economics in policy analysis and policy decision making generally during the 1960s and 1970s. This led to penetrating analyses of the problematic nature of policymaking dependent on expertise by the likes of Henry Aaron. The author will need to consult these in any further research on the role of ideas and expertise in policymaking.

Eisner also misses the chance to point out that almost precisely the same kind of transformation to a new emphasis on economic analysis in the antitrust agencies occurred at the same time in the Environmental Protection Agency, Occupational Safety and Health Administration, and other regulatory agencies. It would be interesting to know how the author would interpret this more general phenomenon.

These relatively minor shortcomings notwithstanding, I admire this book. It provides rich case study material well placed in a larger historic and political–economic context, no small accomplishment.

Clark University BRIAN J. COOK

Order Without Law: How Neighbors Settle Disputes. By Robert C. Ellickson. Cambridge: Harvard University Press, 1991. 302p. $39.95.

Order Without Law brings academic discourses on dispute processing, informal systems of social control, state power, property law, rational choice, and the like to an analysis of property disputes involving traditional cattle ranchers, new "ranchette" owners, and local officials in Northern California's Shasta County. Just north of Butte County and not too far from Paradise, Ellickson studied how ranchers resolve disputes over cattle trespass, fencing, and negligence law. This is a multipurpose project. Ellickson wants to test empirically Ronald Coase's "theorem" about how cattle ranchers behave relative to law when their cattle wander onto someone else's property and thus confront theorem with data. He also wants to formulate a general theory of informal order pulled in part from law-and-society research yet modeled by economics and game theory and thus confront data with theorem. In addition, Ellickson wants to build bridges between law and economics and law and society by importing some of the "realism" of the latter and exporting the rational actor model of the former. The book earns considerable respect for imagining such a project and for moving it forward.

Ellickson assembles a picture of dispute resolution in this community, after studying the geography and history of Shasta County, conducting 73 interviews with ranchers and officials, and combing through state statutes, small claims court records, and California Highway Patrol logs. He tells us, "It turns out, perhaps counterintuitively, . . . [that] legal rules hardly ever influence the settlement of cattle-trespass dispute in Shasta County" (p. 40). When "adjoining landowners there decide to split the costs of boundary fences, they typically reach their solutions in total ignorance of their substantive legal rights" (p. 141), and they achieve cooperative outcomes "by developing and enforcing adaptive norms of neighborliness that trump formal legal entitlements" (p. 4). Even when ranchers turn to the law, in cases where cattle wander onto a highway, "most Shasta County residents badly misperceive the substantive law that applies to road accidents" (p. 141).

Do Ellickson's data square with his conclusions? Is law virtually irrelevant in property disputes among ranchers? Ellickson presents a compelling case *only* if we accept an excessively narrow and fundamentally formal view of law. Law *is* virtually irrelevant if in order to find it at work ranchers must know section 841 of the California statute dealing with the allocation of boundary fence costs. However, contrary to Ellickson's conclusions, his data suggest that ranchers do articulate a general principle of "fence cost allocation" that tends to "follow a norm of proportionality" quite similar to section 841 (p. 71). Yet Ellickson insists there is no direct evidence that the statute contributed to the evolution of the norm; thus, he regards "it as more plausible in this instance that norms had influenced law than vice versa" (p. 75).

Impact studies of the 1960s and 1970s also used formal indicators of law. To the surprise of a few, these studies found that the public did not know Supreme Court cases. Lawyers' law does not capture the dynamics of law as a social relation, nor is it an appropriate litmus test when studying popular legal knowledge. What is most interesting about Ellickson's data is not what it says about a knowledge gap between statute books and the experiences of ranchers but what it says about the interplay between property law expressed in texts, like statutes, and property law enacted everyday. Instead of concluding, as Ellickson does, that ranchers "misperceive" their legal risks when their livestock run loose and that they wrongfully worry about liability and the costs of insurance (pp. 104–5), we might reach the opposite conclusion with a more dynamic concept of law. We might study how insurance company–led tort reform in California shaped ranchers understanding of liability. In this type of analysis, law is embedded in, rather than separated from, cultural and political forces that are at work in constituting the everyday social relations of property.

It is against a narrow and formal conception of law that Ellickson portrays the ranching "community" as a nonhierarchical, close-knit, informal group whose norms produce "welfare-maximizing behavior and cooperation without law" in a setting of shared cultural symbols (e.g., living rooms decorated with portraits of John Wayne and rifles). Again, Ellickson's data tell a different story. Rather than confirm his theoretical assertion—"Informal groups are not hierarchies" (p. 232)—we learn that traditional cow-and-calf ranchers in Shasta County are struggling to determine the meaning of property rights with ranchette owners, who are the new retirees and young migrants from the city raising a few farm animals or doing some agriculture on 5 to 40 acres. Stratification among ranchers is not only evidenced in struggles between different classes of ranchers, but Ellickson's data also describes the allocation of status based on whether someone's "word and deed were most unswervingly committed to being good neighbors" or not (p. 211).

Ellickson's treatment of property holders as an "informal group" functioning outside the law is similarly questionable. Not only does the law give them title to the property on which their entire status is constituted for purposes of this study, but the power of property is central to how this group lives. Again, Ellickson's conclusions aside, his description of how traditional ranch-

ers respond to proposals for closed-range ordinances is evidence of the dialectic between property owners and local officials (country supervisors) at work in the constitution of property relations. Near the end of the book, Ellickson suggests that the arrows may in fact go the other way: "Legal policies themselves influence the vitality of informal systems of social control" (p. 284). Readers will be confused by this shift yet perhaps relieved to think that Ellickson is really less tied to the positivist conception of law and the model of causality he embraces earlier (see p. 158).

Ellickson is more successful when he speaks to law and society scholars about the relevance of a "theory of norms" than he is at interpreting his data with this theory in mind. He is on target when he says that a "key shortcoming of the law-and-society school has been its failure to develop a theory of the content of norms. . . . [They] have tended to treat observed norms as exogenous, rather than as dependent variables whose contents are to be explained" (p. 149). Understanding the relationship between rules and norms is a serious empirical and theoretical problem that has motivated law-and-society scholarship for nearly three decades. Ellickson is sensitive to the problem and develops a comprehensive "taxonomy of systems of social control" that serves as a useful heuristic device. Also key to this problem is understanding the relationship between norms and rules by studying the content of both; that is, through an analysis of the content of social ordering, we can better comprehend how boundaries between law and norms are constructed. In places, Ellickson goes beyond his taxonomy, breaks out of his categories separating law and norms, and suggests that indeed the "more ambitious theory would make the content of constitutive rules endogenous" (p. 136, n. 34). For Ellickson, "constitutive norms" are the "informal rules that help glue an informal group together. . . . In contexts where members might not otherwise recognize each other, constitutive rules governing dress, speech, or etiquette may aid identification" (p. 233). While Ellickson speculates that "constitutive and other norms emerge to provide the glue that makes possible a surprising degree of order without law" (p. 236), some law-and-society scholars are now analyzing how law constitutes those norms in particular settings. Studies of the production of legal ideology in ostensibly "informal" settings like mediation question how boundaries between law and norms are constructed by law itself. Again, Ellickson escapes his own boundaries in places, noting that the "law itself explicitly authorizes self-help in many situations" (p. 144). Nonetheless, because of his adherence to a formal conception of law, Ellickson gives little attention to the interpretive processes that invoke and translate legal rules into everyday legal practices.

To law-and-economics scholars and game theorists alike, this book provides a healthy dose of data on the everyday of cattle ranching. Once again, the fiction of zero transaction costs is dispelled. More important for Ellickson, law-and-economics scholars are exposed as "legal centralists"—believing that people bargain from "any initial set of legal entitlements to achieve an identical, and optimal, allocation of resources" (p. 280). It is, however, ironic that while Ellickson seeks to move beyond legal centralism, and even beyond the study of informalism as "bargaining in the shadow of the law," to negotiating "beyond the shadow of the law," he retains a formalist view (p. 40). He marginalizes discursive approaches that might help explain how constitutive norms are produced and circulated in symbolic orders, such as law, because he is unwilling to stray far from the assumptions of the rational actor model, the model that props up legal centralism.

Despite his self-admitted tendency to "exaggerate" law-and-economics and law-and-society perspectives, Ellickson is to be commended for taking on the daunting task of arguing with both camps, serving as translator for each, and in the end seeking to bring them closer together. This book not only examines the debates, it engenders debate. In this sense, *Order without Law* will play a significant role in future debates on the order of property.

New York University CHRISTINE B. HARRINGTON

Political Ambition: Who Decides To Run for Congress. By Linda L. Fowler and Robert D. McClure. New Haven: Yale University Press, 1990. 247p. $25.00.

What decides congressional elections? Why do incumbents do well in most elections, but not in all? Why have the Democrats been able to win majorities in the House of Representatives for 19 consecutive elections, no matter what the national conditions or trends? These are questions that have been central in political debate in Washington among campaign and congressional professionals and among students of congressional elections. While political scientists for decades focused on macro issues of voter attitudes, economic and issue trends, and the impact of presidential elections on congressional races, the roles of recruitment of individual candidates and of political ambition have increasingly come to be a central focus of research.

Early work on political ambition by Joseph Schlesinger and progressive ambition by David Rohde and insights by Samuel Kernell and Gary Jacobson on candidate recruitment in congressional elections have given us a base to build on and spurred further research. *Political Ambition: Who Decides To Run for Congress* is one of the products, and it is a very good one.

While Jacobson and Kernell analyzed broad patterns of candidate recruitment and quality, Linda Fowler and Robert McClure decided on the case study approach. They looked at ambition and recruitment by focusing in detail on one congressional district, New York's Thirtieth District, which, with Barber Conable's retirement in 1984, became one of the most competitive open districts in the country. They believe that by looking at how individual ambition shapes the choices voters have on their ballots and how local traditions and forces shape that ambition by creating or deterring opportunity, we can learn a great deal about how congressional elections work.

Their look at the Thirtieth District extended through both the 1984 and 1986 election cycles—the election of Conable's Republican successor, Fred Eckert, and his defeat two years later by Democrat Louise Slaughter.

By focusing in depth on one district, Fowler and McClure were able to look at all the *potential* candidates for Congress in both parties, including the unseen candidates who never surface in broader press and public speculation because they decide, often tacitly, not to run. In the Thirtieth District in 1984, one of the most

interesting and surprising features was that an expected donnybrook over Conable's successor never materialized. Of the more than 30 potential candidates mentioned in the press or by party and community leaders, only 6 formally announced an intention to run, including only 3 who had the recognition and resources to be serious contenders.

In other words, for each formal candidate, 10 serious possibilities opted out. One of them was Louise Slaughter, Democratic member of the state assembly and a top-flight contender, who, for a variety of political and personal reasons, despite the lure of the open seat, decided it was not the right time to run. In 1986, even though it meant taking on an incumbent in the age of incumbency, Slaughter came to a different conclusion and won the seat she continues to hold.

Fowler and McClure carry us through the entire political season in Rochester and its environs, looking at all the possible candidates, placing them in the geographic and political contours of the district, examining their psyches and political and social circumstances. They look at the role of the state legislature and its leaders on the ambitions and decisions of the large number of state lawmakers who considered the congressional race; the role of important interest groups; and the roles of gender, personality, timing, and luck.

Choosing a case to study is risky business; the bill you examine to show how a law is made may never be enacted, and the election contest you study may prove to be no contest at all. Indeed, Conable's seat, when it opened, seemed to be a perfectly sound district to analyze but proved to be anything but routine for the authors:

> In 1984 we followed a low-cost, low-key campaign—without even a primary—that met none of our expectations about a race for an open seat, but still managed to convert a safe Republican district into a highly competitive one. Two years later we saw a modern election involving big money and the mass media, in which a liberal, Democratic woman defeated a right-wing, incumbent Republican in a district with a conservative tradition dating back a century. We could not have invented so many unlikely twists and turns, much less expected them. But this extraordinary chain of events served our purposes exceptionally well, because it drove home the basic premise of our book: results on Election Day depend on decisions made by prospective candidates months or even years beforehand.

The unexpected twists and turns of these two campaigns did, fortuitously, serve Fowler and McClure well. More important, they took full advantage of them to make a good book even more interesting and compelling. With vivid writing, a sophisticated understanding of the district and of politics in both parties and real insights into the motives and perspectives of all the personalities involved, Fowler and McClure have written a gem of a book. There may be no theoretical breakthroughs here, but *Political Ambition* makes a genuine and important contribution to the political science literature on Congress and elections. Scholars of these subjects are not the only ones who can enjoy this work. Everybody interested in politics and elections, from reporters and columnists to lawmakers and campaign professionals, would benefit from reading it.

American Enterprise Institute NORMAN ORNSTEIN

Regulatory Choices: A Perspective on Developments in Energy Policy. Edited by Richard J. Gilbert. Berkeley: University of California Press, 1991. 339p. $39.95.

Reinventing Rationality: The Role of Regulatory Analysis in the Federal Bureaucracy. By Thomas O. McGarity. New York: Cambridge University Press, 1991. 384p. $59.50.

These two books focus on the role of economic analysis of regulation. Significantly, neither book is written by a political scientist McGarity being a law professor and Gilbert an economist. McGarity carefully explores the role that analysis itself (particularly, detailed benefit–cost analysis of particular regulations) has played in recent federal regulatory decisions. Gilbert's book applies microeconomic analysis to energy policy in our largest and perhaps most influential state, California. Both books have implications for the political process of regulation. Both are written well and provide scholars interested in regulation with much useful information, although neither can be described as seminal, path-breaking, or widely appealing to broader audiences in political science.

McGarity contrasts benefit–cost analysis with other approaches to the development of regulations, presents case studies, summarizes positive and negative elements of benefit–cost analysis, details several structural models used in federal agencies, and considers review of agency analysis by the president's Office of Management and Budget and by the judicial branch. Using case studies from the Environmental Protection Agency, Occupational Safety and Health Administration, Food and Drug Administration, and National Highway Traffic Safety Administration from the 1980s, McGarity compares what he characterizes as the technological or bureaucratic approach to regulatory decision making to the analytic or rational–comprehensive approach that has been increasingly favored by economists on theoretical grounds and by recent presidents, most prominently Ronald Reagan, because it tends to support their policy agenda of minimizing government intervention into private markets.

McGarity includes substantial detail on regulations dealing with leaded gasoline, airborne particulate matter, mechanically processed meat, driver obstructions in automobiles, and workplace hazards. The bureaucratic and interest groups battles reflected in these stories will be fascinating to those who study regulation but might seem tedious to a more general reader. The book provides the reader with an excellent sense of the increasing importance of regulatory analysis as one input into the politics of governmental choice. The detailed stories provide a strong case for the importance of both bureaucratic and presidential staff actors, in contrast to more narrow congressional dominance theories. If the book included a chapter on congressional review of agency analysis, it could be a valuable text for graduate courses in regulation or policy analysis.

The case studies are more interesting than the many typologies or taxonomies McGarity develops to characterize models of agency structure that bring analysis into the decision-making process. To be of greater use, these models should be tied more closely to existing literatures on public administration generally, the role of the policy analysts in government, and the politics of structure, such as Terry Moe's chapter in John Chubb and Paul Peterson's *Can the Government Govern?* (1989). Of the

many models he considers, McGarity stresses the superiority of a teamwork approach, an adversarial approach, or a hybrid, as compared to hierarchical or outside advisor approaches.

The balanced treatment of the value and limitations of regulatory analysis is very much like Steven Rhoad's discussion of microeconomic analysis of public policy (*The Economist's View of the World*, 1985). The reader's head nods in agreement when McGarity discusses the positive aspects; but when he next presents the limitations, you wonder why you were so enthusiastic about the value of benefit–cost analysis in the previous chapter.

Gilbert's book applies the microeconomists' useful set of tools to energy regulation. As the product of research by Universitywide Energy Research Group of the University of California, the book covers a broad range of energy policy issues, including electricity rate structures, nuclear power plant economics, natural gas deregulation, alternative energy supplies, the role of supply subsidies, and conservation programs. Chapter authors, oddly, are not identified by profession or affiliation; but they seem to be economists or engineers.

Gilbert does a fairly good job tying the different chapters together to form a coherent book, partly through his role as author or coauthor of 6 of the 10 chapters. Like McGarity, the authors include much substantive detail, illustrated well by many charts, tables, and graphs. The economic analysis is not too complicated and is explained fairly clearly (at the level of a typical Brookings Institution policy book); but political scientists without much microeconomic background may find it difficult. The reader who is not specifically interested in energy policy may find the book too detailed. Still, if the reader wants to know the economics of the various American responses to the "energy crises" of the 1970s, from wind power to conservation to nuclear safety concerns, this book has answers.

The extent to which the book reveals anything about the politics of regulation is overstated. The first sentence states, "This book is an attempt to apply an economist's microscope to the process of public utility regulation." This is misleading, since Gilbert and his coauthors do *not* analyze the process in the way that a political scientist would but, rather, analyze whether the results of regulation meet the criterion of economic efficiency. The politics of the process are not addressed (as they are, e.g., in William Gormley's 1983 classic *The Politics of Public Utility Regulation*). When the authors find that regulation does not measure up to economic efficiency standards (as is usually the case), they then offer some general comments about the likely politics of the issue and why efficiency is not the main goal of politicians and regulators; but the political angle is not emphasized at all.

To someone familiar with microeconomic analysis of public policy, the conclusions of most of the chapters will not come as a great surprise. Typically, the public regulatory intervention has distorted market efficiency and achieved whatever specific goal at a very high cost in efficiency terms. The authors do take great care to test whether the policy choices, like the Diablo Canyon nuclear power plant, were appropriate, given reasonable expectations at the time the choices were made about likely future energy price hikes.

While both books focus on economic analysis, McGarity discusses much more how the analysis influences the politics of regulation and, conversely, how the politics influence the analysis. Gilbert's book treats politics more as a constraint on achieving economic efficiency, rather than something to be studied explicitly. The choice of analytic technique is less controversial in Gilbert's book because it involves comparisons of costs using technologies that have revealed themselves over recent years, while McGarity's discussion of benefit–cost analysis inherently involves the larger unknowns of social regulation's long-term benefits and costs.

Regulatory Choices will be a more useful piece of policy analysis for the regulators (the California Public Utility Commission, other state public utility commissions, the Federal Energy Regulatory Commission, and energy analysts)—, while *Reinventing Rationality* will be more useful to political scientists and policy analysts studying the more general phenomenon of bureaucratic use of analytic information. At its best, the McGarity book can be seen as a parallel to Derthick and Quirk's *Politics of Deregulation* (1985), which focused on how ideas shaped "economic" deregulation. McGarity shows how "social" regulation, too, has been influenced by the increasing penetration of analytic ideas, crystallized in the form of benefit–cost analysis, over the last two decades.

State University of New York, Stony Brook PAUL TESKE

Forging the Military–Industrial Complex: World War II's Battle of the Potomac. By Gregory Hooks. Urbana: University of Illinois Press, 1991. 303p. $39.95.

The Rise of the Gunbelt: The Military Remapping of Industrial America. By Ann Markusen, Peter Hall, Scott Campbell, and Sabina Deitrick. New York: Oxford University Press, 1991. 341p. $35.00.

Why did the military industrial complex develop? What are the effects of this development? These questions are the immediate focus of these two books. Each book also contributes to a more general literature. *Forging the Military–Industrial Complex* contributes to the literature on the theory of the American state, *The Rise of the Gunbelt* to that on the theory of industrial location.

Sociologist Gregory Hooks, whose concern is to describe "the domestic influence of the military in economic governance" (p. 15), traces the origins of the military industrial complex to the New Deal:

> Ultimately the most enduring legacy of the New Deal was not that of reform—it was the legacy of state building, the centralization of power within the executive branch, and the state's growing capacity to shape economic activity. These trends were apparent in the institutions that gave direction to the World War II mobilization—the Roosevelt Presidency, Congress, emergency civilian planning agencies, and military bureaucracies. (p. 83)

Against those who have written that New Deal state development fizzled out in the late 1930s, Hooks argues that during the World War II the New Deal state was converted into the national security state. If anything, the state as a whole was strengthened; but the New Dealers lost out to military bureaucrats and corporate leaders. This happened because "the New Deal depended first and foremost on a secure niche in the federal government and the active support of the president" (p. 123). But the war preoccupied the president and nurtured three agencies—the armed services, the

Reconstruction Finance Corporation, and the FBI—that were hostile to the New Deal (p. 123).

Hooks contends that a major policy instrument used in the mobilization to war was state-sponsored industrial investment, which increased from less than 5% of the nation's capital investment in 1940 to 67% between 1940 and 1943 (p. 127). In the aviation industry, for example, "by 1945, the Reconstruction Finance Corporation held title to 71% of the plants and equipment used to manufacture aircraft and aircraft engines. . . . Only 11% . . . was privately financed" (p. 242).

Finally, although the military industrial complex was born and the New Deal died in the mobilization, both changes were consolidated during the reconversion to peacetime production:

> Reconversion enabled monopoly-sector firms in civilian industries to emerge from the war better insulated from statist planning initiatives and capable of exerting sectoral control. Conversely, the potential for civilian planning by the federal bureaucracy declined as a defense-oriented state sector emerged. . . .
>
> In the process of reconversion, the Pentagon acquired the production facilities at the heart of the military–industrial complex and the administrative authority to operate them in peacetime. (pp. 151, 160)

In short, the engine in Hooks's military–industrial complex theory is the enhanced capacity of the military to govern American industry.

The Rise of the Gun Belt sees the major geographic effects of the military–industrial complex as occurring after the war. After showing that military industry is located far from the industrial heartland, Markusen and her colleagues attempt to explain why. As with Hooks, the explanation for the location of defense industries stresses the "shifting national military mission [and] changing service roles" (p. 5) But it also includes "rapidly evolving technology [and] the adaptive capacities of local entrepreneurs in industry, science, and civic boosterism" (pp. 5–6).

The argument is that World War II involved a change in the military mission of the United States from defense of the domestic shores to a global one. Aviators succeeded in convincing policymakers that World War II proved the superiority of air over land and sea forces. The Air Force became separate from the Army and, in interservice competition, won large shares of the postwar military budget (pp. 16–17). Since Air force doctrine favored "going to industry and having industry develop and produce for us" (p. 32, quoting a general) and the Army had been wedded to developing weapons in the in-house arsenal system and contracting with the automobile industry for fabrication, the military–industrial complex was born.

Which areas won? Basically, a few new centers in areas in which older industries were either absent (as in the South and West) or dying (the Northeast). They were located outside the industrial heartland partly to avoid having to deal with unions and a somewhat antimilitary culture, partly because industry in the heartland had civilian customers and sought to avoid Pentagon regulation, and partly because a new technology was required. The new military requirements were for a limited number of technologically advanced weapons whose construction was extremely labor-intensive. Therefore, the big Midwest-based manufacturing companies with unionized labor forces that had bent metal for World War II weapons were replaced by "seedbeds" of small firms in areas to which highly educated technicians could be attracted. These were often in sunny areas near military bases or engineering schools. The decisions of local boosters (mayors, chambers of commerce), entrepreneurs (founding fathers), and generals and colonels also affected such locational decisions. Case studies of Los Angeles, New England, Seattle, Colorado Springs, and Washington, D.C. show that combinations of these factors were involved in the development of military industries in these areas.

Which areas lost? Mainly the Midwest. For example, about Detroit, which had produced aircraft during the war and had been allied with the army's Huntsville missile production team, Markusen and her colleagues say, "What stands out in this story is the difficulty of a truly distinctive, revolutionary technology taking root in a region where another, entirely different one is still robust and commands resource markets and business culture" (p. 68). Much the same was true of Chicago. Thus, "Until the late 1970s, the major midwestern companies, heavily invested in producer goods and highly successful in consumer durables markets, saw no reason to pursue purely defense outlets" (p. 77). Moreover,

> It was not that the midwest failed to innovate, just that innovation is carried out so differently in commercial and in defense markets. Particularly in consumer goods, the product has to be very simple. . . . This produced a management style inimicable to that favored in defense procurement, where tailor-made esoteric equipment is fashioned with little concern for cost and no presumption of long-term mass production. (pp. 77–78)

Both books address the economic effects of this pattern of military–industrial development Hooks sees it as a failed industrial policy—misdirected capital investment resulting in de facto national deindustrialization and economic decline. Markusen and her colleagues agree but also see it as a regional development policy with other pros and cons. It did promote economic equality among the regions and stimulated seedbeds of technological innovation although it also created undifferentiated local economies subject to boom–bust cycles and contributed to the urban problems of the current period, including suburbanization and the residential segregation of the poor in declining inner cities. Markusen and her colleagues also say that by attracting middle class migration toward the coasts, it contributed to the political realignment of the country.

These books make several contributions. First, they go a long way toward moving the apparently narrow subjects of American military and military procurement policy toward the center of the study of American politics and political economy. Second, to those who have focused on cross-sectional studies to test parochialism, ideology, deference to the military, and other hypotheses about military policymaking behavior, they offer developmental theories and carefully and subtly interpreted evidence about the historical context to worry about. Third, they challenge researchers in a variety of subfields (e.g., federalism, urban politics, public administration) to investigate historically how the military industrial developments may have affected, and been affected by, their subject matter. Fourth, they, of course, imply a host of questions about how the winding down of the Cold War will affect interservice competition and regional development. Finally, they challenge comparativists to ask whether in other countries the

same causes (or their absence) account for military–industrial relations with the predicted societal effects.

Gunbelt is written for a more general audience and would be useful in undergraduate courses, especially if it comes out in a less expensive paperback edition. Both books would do well in graduate courses.

University of Illinois, Chicago BARRY RUNDQUIST

The Logic of Delegation: Congressional Parties and the Appropriations Process. By D. Roderick Kiewiet and Mathew D. McCubbins. Chicago: University of Chicago Press, 1991. 286p. $34.00 cloth, $12.95 paper.

Parties and Leaders in the Postreform House. By David W. Rohde. Chicago: University of Chicago Press, 1991. 232p. $39.95 cloth, $13.95 paper.

After more than 40 years of American political scientists' decrying the decline of party in the U.S. Congress, it is heartening to read two books that point to its resurgence and characterize its importance. The books, *The Logic of Delegation* by D. Roderick Kiewiet and Mathew D. McCubbins and *Parties and Leaders in the Postreform House* by David W. Rohde, reach similar conclusions about the importance of parties in Congress (and principally the House). This is all the more interesting in that they treat entirely different subjects. On the one hand, the Kiewiet and McCubbins book is concerned with whether Congress has abdicated its role in overseeing the appropriations process. On the other hand, the Rohde book is propelled by the empirical observation that in recent years, partisanship and party leadership have increasingly left a mark on the Congress. Both books conclude that party plays a crucial role for shaping behavior in Congress and for providing oversight over important components of the policy process.

There is a good deal that these books share. They begin from a common perspective that has its foundation in contemporary formal models of political actors. This is somewhat unusual, since those ordinarily identified with the rational choice school have given party short shrift. Parties have usually been viewed as temporary amalgams of interest or conveniences used by representatives to minimize information costs for their constituents. By and large, however, political parties have had little status for this group for trying to understand Congress.

Both books share an affinity for providing party a role that is more than descriptive and holds theoretical content. They share a view that political parties are crucial instruments for holding together otherwise atomistic actors. For some time congressional scholars have noted how members of Congress have become insulated from one another and how this has transformed representatives into independent agents who act on their own agendas. The usual caricature is the incumbent—an individual aloof from partisan concerns, a specialist over a narrow policy range, and a delegate tied to the fancy of constituents. What is absent in such a view, however, is the important role played by party in Congress for binding together a majority of incumbents. Kiewiet, McCubbins, and Rohde recognize that party is crucial and begin to offer a theoretical justification for why party is important.

While the clearest statement of a theory of party comes from Kiewiet and McCubbins, a similar view is implicit in parts of Rohde's book, as well. Political parties within the institution are crucial for solving three key problems. The first involves solving coordination problems. In the absence of parties (or leadership, as Rohde argues), even groups of individuals with similar interests can find themselves working at cross purposes. Parties and leaders serve as a focal point around which members of Congress can easily coordinate. Second, parties are key for solving collective action problems. These problems stem from its being in the interest of each representative to pursue a particular policy end (e.g., obtaining a new grant for mass transportation in the district). Yet if all pursue conflicting private ends, all are left worse off (the budget is broken). The key problem here is how to ensure that all bind themselves to agreements not to raid the Treasury. Parties again provide a useful means for binding individuals to collectively desired goals. Finally, the collective choice problem must be solved for legislatures dominated by independent agents who are bound to highly variable districts. In such instances, vote cycling is an all too real problem. While, in recent years, institutional structure has been viewed as one way in which impermanent and cyclic majorities can be thwarted, the authors here suggest that parties also play a crucial role. Parties are important for minimizing voting cycles on the floor through agenda control, constraints on rules, and binding members together. While such observations may not seem earth-shattering, developing a theoretical basis for party in the Congress is key. Then to use those theoretical insights to inform empirical scholarship is impressive and represents a progressive shift for scholars.

Both books point out that party is far more than a label or descriptive attribute that should be included when studying Congress. Instead, party must be understood from a theoretical basis. Both books provide a useful start for stimulating increased theorizing about the nature of parties in Congress.

Rohde's *Parties and Leaders in the Postreform House* begins by surveying the large literature decrying the steady decline of partianship in the House of Representatives. At the same time, Rohde notes that during the 1980s there was an abrupt resurgence of party-based voting. This empirical observation, then, frames the book and raises the important question, "What happened?"

First, Rohde explores the counterintuitive idea that congressional (particularly Democratic) reforms in the 1970s had a delayed effect that contributed to increased partianship in the 1980s. The standard view of those reforms is that they led to increasing decentralization in the House and further undermined already weakened parties. Through a careful blend of theoretical argument, institutional interpretation, and empirical analysis, Rohde shows how the Democratic Caucus was transformed into a useful coordinating mechanism in the 1980s. This was accomplished not just by institutional fiat but with a decline in sectional divisions.

Second, Rohde demonstrates that these reforms strengthened party leadership, with leaders' granted tools that helped them in structuring the legislative agenda. Yet leadership was not given carte blanche. While leaders could shape the agenda, they were bound as agents to the caucus. The combination of enhancing the ability of leadership to lead and binding leaders to an

increasingly homogeneous Democratic party contributed to increased partianship.

Rohde is not insensitive to the reaction of Republicans. The 1980s have perhaps best characterized the conflictual nature of divided government, with House Democrats proposing their own agenda to that offered by a Republican President. Rohde is careful to elaborate on the role of Republicans in the House and their response to a more unified majority party. However, the result led to an increasingly frustrated minority cut out of policy formulation. Presidential leadership, he finds, has an interesting effect. While Democrats responded with greater unity in response to Reagan's programs, Carter's own policy agenda tended to fragment the Democratic party.

At the conclusion, Rohde has a very thoughtful, extended discussion of his findings. These are useful in a number of ways. On the one hand, he raises a number of points that question conventional wisdom. In particular, the claim that divided government will inexorably destroy parties does not find much empirical support. On the other hand his speculations give rise to a number of new areas for research. Further exploration of the linkage between electoral responses and the strength of partisanship are certainly in order. So, too, are concern expressed over the nature and strength of leadership.

Kiewiet and McCubbins' *Logic of Delegation* begins by detailing a common view that Congress has abdicated its role of policymaking through delegation. These authors, however, challenge that view, claiming that "it is often the case that desired outcomes can be achieved *only* by delegating authority to others" (p. 3). The received wisdom and Kiewiet and McCubbins' counterclaim are thoroughly subjected to theoretical and empirical scrutiny. The empirical case they detail is the appropriations process. It is an interesting case, since the opportunities for abdication are manifold: the Appropriations Committee has often been portrayed as an independent watchdog of the Treasury, presidential budget making sets important parameters on the appropriations process, and bureaucrats claim specialized information that limits the questioning of their claims. All are sufficient to undermine Congress from generally playing any positive role in the appropriations process.

Kiewiet and McCubbins make an important distinction between abdication and delegation. It is largely accomplished through a theoretical discussion of principal–agent problems. Central to their argument is that political parties are crucial instruments which constrain their agents. To support their point, the authors then dissect a number of institutions in Congress concerned with the appropriations process. Beginning with the role played by party leadership, they then show the power exerted by the party over the Appropriations Committee and committee assignments more generally. Their empirical work certainly undermines the view that the Appropriations Committee acts as a watchdog of the Treasury and clearly points out that both parties have been successful in pursuing their own policy ends. Likewise, their data generally support the point that appointments to Appropriations are not taken lightly and that the parties manage to clone likenesses of themselves on that committee. So, with shifts in party fortunes, we can expect Appropriations to reflect those changes.

After detailing why the Appropriations Committee functions more as a delegate of party than as an independent entity, Kiewiet and McCubbins go on to explore how appropriations bills survive scrutiny on the floor. Certainly, members have every incentive to alter appropriations once such bills come to the floor. Allowing this to happen certainly plays into the hands of those who argue that Congress has abdicated its responsibility. However, Kiewiet and McCubbins contend that party control of Conference Committee appointments provides an ex post veto over amendments. Their theoretical insights here are very useful, and their empirical examples are quite suggestive. Their conclusion seems quite reasonable: the order of the day is delegation, not abdication, since party holds a firm grasp over the final play of the appropriations game. Even when the budget process is removed from Congress, as with the executive and the Office of Management and Budget's initial proposal, Kiewiet and McCubbins demonstrate that congressional parties exert enormous control over what is churned out of Congress.

The most persuasive part of this book lies in chapter 8, where the authors take a careful look at a number of competing theories to see whether party influence stands up. Using some rather elegant econometric estimations of presidential budget requests and actual appropriations, it is quite clear that congressional parties are key to understanding the appropriations process. While the preceding seven chapters are interesting and suggestive, they never cement the argument. Chapter 8, however, ties together the earlier chapters in a very satisfying way.

All in all, the conclusion from this book is quite simple. Congress has not abdicated its responsibility, as too many scholars have argued. Instead, Congress has chosen to delegate authority in particular ways in order to grapple with the contemporary complexity of the appropriations process. While this system of delegation may look rather weak, it is integrally tied to political parties. Kiewiet and McCubbins' argument and findings deserve careful consideration. While the conclusion may seem simple, as they point out, the implications of their argument and findings are quite general and suggestive.

Both *Parties and Leaders in the Postreform House* and *The Logic of Delegation* bear considerable attention from scholars. Both go a long way toward documenting the role of party in Congress. Both rely on important new theoretical considerations about parties in Congress. Both are well-crafted pieces of scholarship. Finally, both will surely pave the way for new research.

Rice University RICK K. WILSON

The Union as It Is: Constitutional Unionism and Sectional Compromise, 1787–1861. By Peter B. Knupfer. Chapel Hill: University of North Carolina Press, 1991. 285p. $29.95.

Too few scholars attempt to draw connections between political culture and politics. It is this attempt that makes Knupfer's book worth reading. The central task of this book is to demonstrate the relationship between political culture and political compromise, or to examine the relationship between civic attitude and constitutional development. While most scholars, especially those focused on legislative relations, look at compromise from the stance of political process, Knupfer presents compromise as a political ideology unto itself.

Instead of being a means to an end, compromise becomes an end unto itself. More than a process of mutual concession, compromise was to be a form of association with distinctive qualities. Compromise is then a metaphor for the union as it was from 1787 to 1861, forming the basis of constitutional theory from the Founders' early vision. By 1861, however, that vision had eroded and was beginning to yield to a new theory.

It is this notion of political compromise transcendent of political process which makes the thesis unique and therefore a contribution to the field. To make his case, Knupfer presents the sectional quarrels of the 1840s and 1850s as a subtext for demonstrating the collapse of compromise as political ideology. The key figure is none other than Henry Clay, the Kentuckian who had served as Speaker of the House. Though Clay is by no means presented as a deep thinker, he is portrayed as a politician who seriously understood the meaning of compromise as the basis for maintaining a constitutional union, which as Madison asserted in *The Federalist* was to be neither wholly federal nor wholly national. Just as Madison, whom Clay admired and worked with, understood that the politics of limited government would flow from a constitutional structure designed to contain power, Clay understood that the politics of compromise arose from the premise that the union was founded on compromise as its own theory; for the most consistent theme of Clay's public life was unionism—fidelity to union. This is what guided his understanding of the constitution and the policies needed to preserve it (p. 123). It is an understanding within the context of a constitutional tradition whose roots are in the early republic. If there is a hero, it is Clay who emerges as the last exponent of compromise.

While Knupfer uses compromise to symbolize the old political order, the rise of political parties, especially the Radical Republicans, comes to symbolize the new order, in which the sectional differences that were tolerated in the past would no longer do. The Compromise of 1850 is then presented as the culmination of a compromise tradition that many had regarded as a successful means of managing sectional conflict: "The political crisis of the 1850s would test a new generation's confidence that parties could save the Union rather than destroy it" (p. 200). Ultimately, then, 1861 is a watershed in American history, since it signifies the death of Madison's union and the birth of Lincoln's.

To this end, Knupfer has succeeded. He has offered us a thesis and supported it through historical scholarship. Nevertheless, some omissions must be noted. While the book begins with an interesting theoretical discussion of the meaning of compromise, one is left to wonder, to what end? What is he trying to show, exactly? If he is trying to add to the general debate as to the Framers' intentions (or original intent, as some might suggest), he nowhere mentions such debate. Knupfer presents compromise as though it was Madison's intention to create a federal system within the context of a liberal framework in which each state could structure itself in accordance with its own political culture. Yet there are those who have suggested that the Framers really had a hidden contempt for federalism, along the lines of the late Martin Diamond. If so, compromise is the result of—not the theory underpinning—the union. It is the process by which the union endures (as Knupfer has correctly noted) and consequently the politics of maintenance. Whether or not the Framers did have contempt for federalism is a debate that may never be resolved, but to omit it does much to undermine the premise that compromise is ideology. Or it may be that compromise was inevitable if the Union was to be at all, in which case compromise could spawn its own culture and brand of politics. That, however, is unclear and remains to be shown.

Nevertheless, the book should be considered for what it is—as attempt to make sense out of a deeply divisive period in American history. And insofar as Knupfer attempts to draw a connection between political culture and politics, he will have made a contribution that is sadly lacking in the political science literature. In this vein, I believe that the strengths of the book do outweigh whatever weaknesses it has. The notion of compromise as political culture and ideology is surely a notion that deserves examination. Insofar as this may add a new dimension to the general debate on the origins of American constitutionalism, the book will have succeeded in making an additional contribution.

Seton Hall University OREN M. LEVIN-WALDMAN

Representation Rights and the Burger Years. By Nancy Maveety. Ann Arbor: University of Michigan Press, 1991. 257p. $34.50.

In this book, Nancy Maveety seeks to accomplish two tasks. First, she argues that in the area of representation rights, "the Burger Court made a unique and distinctive jurisprudential contribution and was not simply an atheoretical interregnum" that followed the Warren Court. Second, she sets forth "the current status of representation law as a result of the Burger Court's work" (p. 221). Demonstrating that the Burger Court undertook the unenviable task of trying to develop a workable case law directed toward the goal of ensuring "fair and effective representation" set forth by the Warren Court in *Reynolds* v. *Sims*, Maveety shows that in so doing it broke away from the simplistic one-person-one-vote standard and propagated what she describes as a "group-balancing approach to representation rights" (p. vii).

By focusing on group-based representation, the Court, Maveety argues, brought constitutional doctrine "into harmony with pluralist politics" (p. 221). The manifestation of this pluralist vision took on several forms, which she orders and explicates in her typology of the diverse groups and images of group representation that the Court recognized. This typology forms the core of her work.

The Burger Court, says Maveety, ultimately recognized five types of representation: geographic (by political subdivisions), economic (e.g., by special district governments), demographic (e.g., racial), partisan (the rights of political parties to police primaries and set membership requirements) and administrative–litigational (access to the courts in order to restrain government agencies). Drawing upon the diverse decisions and opinions in each of the five areas, Maveety demonstrates not only the complexity of the concept of representation but also the Court's difficulties in using the concept as a basis for a coherent case law.

Although the extent to which it can be argued that the Court itself consciously sought to organize its jurispru-

dence along such lines may be a matter for debate, Maveety's organization of the Court's attempts to cut its way through the thicket of representation serves the vital purpose of bringing order to what appears to be a very chaotic province of the law. As she illustrates, the concept of representing or being represented is quite protean. Not all forms of representation are necessarily inclusive of the interests of the entire society, nor are they intended to be. Accordingly, the establishment of organs for the representation of specific types of interests (such as water district rights) may occur within a society despite the fact that the interests and population of the community involved are distinct and separate from the rest of the society. Furthermore, as the Court argued in *Salyer Land Company* v. *Tulare Lake Basin Water District,* the weight of one's representation in such special apparati may be based justifiably on criteria other than a one-person-one-vote standard.

Maveety's bringing a sense of order to an area of jurisprudence rife with internal contradictions is a welcome and desperately needed addition to our understanding of the Court's attempt to develop a jurisprudence of representation. Instead of exposing a particular resolve within the Court's collective mind, however, it seems that her typology portrays a Court being pulled in several different directions.

One gets the impression that there may, in fact, have been less method to the Court's madness than Maveety contends. In order to sustain her assertion that the Burger Court followed a coherent theoretical path in addressing representation issues, Maveety must subdivide her categorizations several times in order to accommodate and reconcile cases and decisions that do not always complement each other. As a result, the typology is somewhat complex.

This is especially evident in her discussion of partisan representation and the rights of political parties. Despite her primary division of the Court's decisions along the lines of the three functions of the political party (organizational, electoral, and governmental) and the twofold "dualistic historical tradition between a hierarchical party tradition and a populist party tradition" (p. 149), Maveety is still compelled to concede that the model is not comprehensive and that "the justices could be accused of giving primacy to their individual views of what constitutes freedom of association in party operations" (p. 184). Although she shows that the Burger Court's decisions regarding partisan representation were evenly balanced between the two traditions (p. 185), one concludes ultimately that her imposition of an order upon the Court's approach serves more as a means of tracking the Court through a thicket than of excavating a coherent jurisprudence.

This, however, is a reflection more on the Burger Court's inability to grapple with the complexity of representation issues than on Maveety's analysis. Her work is a thorough tour de force of the Burger Court's meanderings in an extremely complex area of constitutional law. It provides an ideal benchmark from which future analysts might embark when attempting to assess the status and development of the Court's conceptualization of representation.

Washington and Lee University MARK E. RUSH

The Closing Door: Conservative Policy and Black Opportunity. By Gary Orfield and Carole Ashkinaze. Chicago: University of Chicago Press, 1991. 254p. $22.50.

In the late 1970s articles began to appear in the nation's press touting Atlanta as a black mecca. The city's growing economic dominance of the entire southeastern United States, its pragmatic embrace of the New South ethic, and the rise of black political power had all helped to attract black in-migrants, many of them from the North, and to encourage the emergence of a significant black middle class. If the barriers to opportunity for the black masses were ever really to fall, it certainly should have happened in Atlanta. But as Gary Orfield and Carole Ashkinaze demonstrate in this passionate book, for most blacks the promise of Atlanta was stillborn.

The Closing Door documents in careful and painful detail not only the relative absence but the deterioration of opportunities open to black Atlantans today; and its authors lay the blame on a decade of conservative politics in Washington and the state capital. Along the way, the book offers reflections—indeed, a sort of test—of various elements of the underclass thesis and of various expectations that accompanied the emergence of black political power at the local level.

Using mainly aggregate data from government records in chapters devoted to income distribution, housing, high schools, college access and performance, and job training, Orfield and Ashkinaze show that things have gotten worse. Rent burdens have increased for poor blacks since the 1970s. Black home ownership rates have declined. Schools are more segregated than ever. Black college matriculation rates are lower, and so on. In part, they blame decisions in the Reagan administration not to enforce civil rights and affirmative action rules vigorously and not to push busing, the dispersion of subsidized housing, or fair housing enforcement. But they also blame the more diffuse conservative assumption that with legal discrimination laid to rest, the market would eventually solve the problem of racial inequality: economic growth and, as William J. Wilson argued, tight labor markets would yield enough work for all and incomes would provide access to better housing, better schools, and better colleges. Finally, Orfield and Ashkinaze blame a misplaced faith in the efficacy of black local political power (though why they consider belief in the benefits of minority political achievement part of the conservative credo is not clear).

What the conservative solution fails to take into account, they argue, is that the color line in the real estate system impedes the operations of the rest of the market. In this book, housing location is everything. Residential segregation is the "fundamental underlying feature of urban racial inequality," and "where a family lives is the single most important factor in the quality of its members' lives" (pp. 12, 29). The black underclass, pinned and isolated in the ghetto—and, indeed, the black lower middle class segregated in suburban enclaves—find it almost as difficult to get a good public education, advance to college, and find meaningful employment as if there were a formal color bar in those institutional settings.

Furthermore, the limits of local political power become painfully obvious, especially in a black central city surrounded by white suburbs. Blacks have controlled Atlanta's city hall since the election of 1973. They control

the school district and many city agencies. Black mayors can expand opportunities for blacks in public employment, guarantee a share of city contracts for minority-owned firms, and heighten the sensitivity of public servants, particularly the police, to their minority clientele. But control of city government offers no serious way of gaining access to the suburbs, where employment, educational, and housing opportunities are generated. Nor does city hall have anything to do with education financing or the enforcement of federal civil rights policy.

If neither economic growth nor accession to local office serve to open opportunities, then what is to be done? The authors offer various suggestions, few of them very novel, some of them probably politically impossible, many of them dependent on federal action. A restoration of civil rights enforcement, metropolitan approaches to desegregation of schools and housing, grants for college education, basic skills training, and public employment are among their recommendations. But this is a pessimistic book, and one does not finish it with much sense of possibility.

The book is occasionally repetitious and is full of typographical errors; but these, finally, do not detract from its several important contributions. One of these is the compelling quality of the sheer cumulative impact of the case for declining opportunities, even if much of the material is familiar to students of race relations in the United States. And here and there, amongst the well-established documentation that realtors and lenders discriminate and that schools are segregated, the authors do provide some novel material, such as the account of black Atlanta's trading control of the school system for an end to busing and the data on black access to college.

A second contribution is the book's demonstration that a rising tide does not float all boats. Blacks are worse off in "the city too busy to hate" after a decade of extraordinary economic growth. Market solutions to racial inequality fall short when blacks do not enjoy unimpeded access to the market.

Finally, the book provides a convincing antidote to the charge that the black condition is a product of the failure of the liberal welfare state (as Charles Murray and company would argue). Orfield and Ashkinaze point out that liberal Democrats controlled the national agenda only for a couple of years in the mid-1960s and that after the Great Society, black opportunities widened, and measurable gains were recorded. The deterioration that the authors document sets in under President Reagan's watch and in response to the intellectual agenda of the conservative revolution. It is hard to see in this grim account how it will be undone.

University of Wisconsin, Madison PETER K. EISINGER

The Transformation of the Supreme Court's Agenda: From the New Deal to the Reagan Administration. By Richard L. Pacelle, Jr. Boulder: Westview, 1991. 264p. $39.95.

Deciding to Decide: Agenda Setting in the United States Supreme Court. By H. W. Perry, Jr. Cambridge: Harvard University Press, 1991. 316p. $39.95.

In the last two decades, case selection in appellate courts has been studied with great effectiveness by Larry Baum, Greg Caldeira, and other students of judicial institutions. Since almost all the work on appellate court agendas has appeared as journal articles, however, the two book-length treatments reviewed here are welcome additions to the literature. While both books focus on Supreme Court agendas, the vectors of inquiry are somewhat different. Perry wants to provide a better understanding of how the Supreme Court sets its case agendas and what influences play upon the process. Pacelle's queries have a different accent. Examining 14 policy areas, he asks, What changes have occurred in relative space allocations on the Court's issue agenda over a 56-year period, and what factors have structured the pace and scope of that change?

While Perry focuses on the individual justice as decision maker, Pacelle, following the lead of Thomas Walker, Lee Epstein, and a few others, has characterized his approach as neoinstitutional. This follows from his belief that institutional rules and arrangements "structure the aggregation of individual preferences" (p. 13). Perry suggests, further, that "Cert. votes are primarily not the result of strategic calculations about outcome on the merits" (p. 15). Such calculations are considered "the exception . . . for all of the justices" (p. 276). Again, by contrast, Pacelle sees the "personal values and attitudes [of the justices] and their conception of judicial role" as primary but the impact of neoinstitutional considerations as significant.

In seeking a better understanding of the Court's agenda-building decisions, Perry interviewed 64 of the 161 clerks who served in the 1976–80 terms. He also interviewed five current members of the Court, seven judges of the District of Columbia Circuit Court of Appeals, four solicitors general, four attorneys in the solicitor general's office, and one Court employee. Pacelle, in tracing changes in the Court's issue agenda, uses 7,688 cases decided in the 1933–88 terms.

Perry's volume consists primarily of excerpts from his interviews—information from which he eventually constructs a "process" decision-making model. Other chapters cover such topics as bargaining behavior, internal procedures, and the signals or index of importance to the justices. A useful discussion of jurisdiction is appended.

Pacelle offers an impressive theoretical framework for agenda building and change in his second chapter. Other chapters deal with the transformation of the Court's agenda through relative space allocations to economic, federalism, regulatory, and civil liberty issues. While Pacelle has no concluding chapter, he offers a concluding statement in his last chapter. The book also includes four appendixes, the first three of which define his policy areas, list Supreme Court chief justices by tenure, and catalog Supreme Court cases cited in the book. The fourth is a digest of the important cases used. Both books are extensively footnoted and indexed; and Pacelle also adds a 10-page bibliography.

In spite of Bob Woodward's (1979) *The Brethren* and the circling of the wagons that occurred in the Court subsequently, Perry's work is encouraging. It shows us that the interviewing of Court elites is not impossible and that such interviewing can produce massive amounts of detail in areas in which our knowledge is somewhat general, or perhaps only tentative. Perry's conduct of these interviews also makes the implicit point that best results are obtained when the interviewer "learns" from one interview to the next. Perry has been

quite creative in refusing to stick to preproject interview protocols. He frequently shapes later questions to reflect what he has learned in earlier encounters. He is also adept at asking the same question in several different ways during the same interview, (sometimes, it may be noted, gaining a different response). Equally implicit is the significance of "acceptance" by those who are to be interviewed: through his professional contacts and reputation, Perry gained that acceptance. As a consequence, the degree of openness that characterize many of his interviews is quite surprising.

This openness occasionally produces suggestions that conflict with earlier reports in the literature. For example, on the basis of interviews with four justices, Perry reports that the "chief justice begins discussion of the first case on the discuss list" (p. 43) followed by the other justices in order of seniority. He states further that certiorari votes are usually announced at the time of discussion and quotes one justice as confirming the same order for votes on the merits. This is inconsistent with reports by other political scientists relying (as Perry did) on unattributed justice sources.

In the process of preparing this review, I took the liberty of calling this confusion to the attention of Chief Justice Rehnquist. He has now graciously informed me that at present, the justices vote on argued cases beginning with the chief justice and continuing in descending order of seniority to the most junior justice. The discussion and voting is a combined process. Each justice, in turn, first discusses and then votes. When considering petitions for certiorari, the person who put the case on the discuss list goes first, then the vote to grant or deny is taken in order of seniority. This adds more and different information to the picture from an authoritative, attributed source. It should help clear up the confusion to which Perry has directed our attention.

Pacelle's analysis of 56 Court terms reveals that in general, the space allocated to economic, federalism, and regulatory issues declined. At the same time, that allocated to due process, substantive rights, civil liberty, and equality issues increased. While such empirical findings are certainly important, one should not overlook the theoretical and conceptual richness that characterizes Pacelle's work. His efforts in this realm are quite superior to what we normally see in our journals. His ability to start with a general theory and then break it down into components and sketch their interrelationships and ramifications is starkly evident. And once one begins to think he has exhausted the parameters of a theoretical construct, he peels another layer off the onion and stimulates potentially new insights or an occasional feeling of serendipity, though not strictly accidental.

Pacelle's notion of a "bifurcated agenda" for issues and his institutional focus are departures from much earlier work in this area. By devoting his attention to issues, rather than to the decisions of the justices to grant or deny jurisdiction, he directs inquiry to an area about which we know very little. Here he reminds us of issue fluidity and the fact that the decision of the Court to grant jurisdiction is distinct from a decision to confront and resolve any given question. We know from earlier research that issues may metamorphose even in the relatively short time between the jurisdictional decision and case decision. Thus, in the long run, a metamorphosis in agenda space allocations should cause no great surprise. Previous research on the behavior of justices over time has shown that behavior to be dynamic and, in several instances, parabolic. By contrast, Pacelle finds change in issue space allocations to be generally linear. Pacelle's choice of a longitudinal analysis over a static or cross-sectional cut reminds us again that with the exception of Burton Atkins and a few others, we have given insufficient attention to the dynamic processes that characterize the Court and the behavior of its justices.

Pacelle's explanation for the linear patterns he discovers on issue agendas is not extremely radical if stated without adornment. It says simply that institutions—the Court included—reflect their environment. But by conceptualizing the Court as a political entity and suggesting certain changes in the environment as a significant influence on agenda space allocations, he takes a tack that is pregnant with opportunity. Concomitantly, he has left it to others to corral and impose measurement on relevant environmental variables and to determine systematically whether his theoretical notions will bear pineapples or cockleburs.

Finally, it may be noted that the epistemological foundations of these two studies appear to be somewhat disparate. Pacelle appears to accept the very associational or variance models of analysis that Perry finds inadequate and incomplete. Whether the more direct approach of interviewing Court elites is better is certainly subject to question. Almost all the accepted generalizations that characterize our knowledge pool in this area have been produced via the use of quantitative data and some form of statistical analysis. Recognizing that his population of Court elites is not a scientific sample, Perry says, "Much of this book, without apology, is descriptive" (p. 17). But, of course, no apology is necessary, since he offers the book for what it is—a highly qualified and carefully written book—rather than for what one might wish it to be.

Nevertheless, Perry's use of descriptive data permits one to pose a rhetorical question suggested by the comments of two of the justices he questioned. In interviewing his elites, Perry found that the justices were more willing to discuss bargaining and strategic behavior than were the clerks, many of whom, apparently, went into shock when those terms were mentioned. Thus, one of the justices, denying that Warren gained unanimity in *Brown* by force of brute leadership skills, reported that it resulted from a trade of "all deliberate speed" for one or more votes (p. 148). Another said, "I think any one who suggests that this is an objective institution is just wrong; the notion that we are objective is just fallacious" (p. 201). It may be suggested that such a justice would have no qualms about bargaining or strategizing to gain his subjective ends or, at least, that the Court would have no such reservations. This raises the question: Whereas Perry interviewed 64 clerks and 5 justices, would his book have been the same had he interviewed 64 justices and 5 clerks?"

In the final analysis, Perry does not claim to have delivered on his promise to provide a better understanding of how the Court sets its case agendas. He concludes, indeed, that the matter is more complex than he realized and that a broader theory is needed. Yet at bottom, the book has a number of attractive qualities and quite pronounced "discovery" values. It is chockfull of comments by clerks and justices that beg for systematic conceptualization and testing with hard data, if such can be obtained.

To the extent that a book makes a significant contribution to the study of a particular subject, it does so by bringing something new, different, novel, or innovative to a relevant intellectual arena. Another standard is whether the book stimulates one to think in new ways about familiar topics. By either measure, I would give high marks to both the books reviewed here.

University of Kentucky S. SIDNEY ULMER

The Case for Justice: Strengthening Decision Making and Policy in Public Administration. By Gerald M. Pops and Thomas J. Pavlak. San Francisco: Jossey–Bass, 1991. 199p. $26.95.

The authors argue that public administrators understand and implement justice, grounded in morality and practical application, just as implementation of justice strengthens bureaucratic decision making and government policy. Justice, according to the authors' interpretation, incorporates serving the public interest, achieving social equity, and striving for efficiency.

The contribution of this book to existing scholarship is that Pops and Pavlak raise a much-needed agenda of justice in public bureaucracy. This book, for the most part, is descriptive and is not analytical of public administration literature and its varied particulars. The authors never define *justice*, nor do they establish a paradigm for implementing justice in public bureaucracies. The authors offer a paradigm of *administrative injustice* but fail to qualify and/or quantify it.

An antecedent of this work is Frank Marini's *Toward A New Public Administration* (1971). The authors, however, make no attempt to comment on the variety of issues developed in the Marini volume or other relevant literature. For example, the absence of pertinent literature (e.g., Theodore Lowi's interest group liberalism, Arthur Okun's equality and efficiency, Harold Seidman's politics of federal organization, Herbert Simon's decision-making formula, and Aaron Wildavsky's partisan, policy, and systems politics) makes this research quite incomplete. Without references to such literature, any discussion of justice in public bureaucracy is out of context.

This treatment of justice in public bureaucracy is rather esoteric. One presumes, however, that abstractions of justice, by definition, are only intended for, or comprehended by, a relatively narrow audience. In order to attract a more diverse audience, the conceptual material should be interpersed with illustrations and/or case studies.

Despite these flaws, *The Case for Justice* raises an important agenda for partisan–policy–systems politics. The authors do stimulate thinking about administrative justice issues. They argue that a commitment to justice may fill the "legitimacy gap" confronting public administration, stating that justice underlies our constitutional system, that bureaucrats must accept personal responsibility for their discretionary actions, and that advocacy of administrative justice promotes acceptance of change.

Pops and Pavlak examine administrative justice as administrative law with a focus upon the roles of administrative law judges and the Administrative Procedure Act. The authors state that such judges "have shifted increasingly away from rulemaking and an administrative perspective toward adjudication and a judicial perspective [and] have become politically active in representing and promoting their own interests" (pp. 42–43). Meanwhile, the Administrative Procedure Act has helped "to legitimate the role of public administration in American government" (p. 45).

As decidedly more descriptive than analytical, *The Case for Justice* lacks a definitive and consistent methodology. Pops and Pavlak review an array of literature, but they provide virtually no interpretative analysis of illustrations or case studies. Qualities of the just administrator include knowledge and cognitive skills, attitudes, and personal attributes.

The authors elaborate on the multiple justice roles of public administrators. Roles include adjudicator, policymaker, manager, supervisor of professionals, advocate, public role model, and consumer of goods and services. However, Pops and Pavlak do not illustrate or apply these concepts and roles to particular behaviors of public administrators or case studies.

The most analytical—and valuable—aspects of this text explore types of administrative injustice with pertinent examples. Sources and causal agents of administrative injustice are external and internal, individual and systemic. Type 1 injustices originate from external sources and individualistic causation (e.g., unjust laws); type 2 injustices take origin from external sources and systemic causation (underfunding); type 3 injustices derive from internal sources and individualistic causation (unethical acts of administrators); type 4 injustices result from internal sources and systemic causation (work-flow problems).

Pops and Pavlak end their case for justice on an optimistic note. The crisis of legitimacy in public administration, unethical and illegal conduct by civil servants, and the necessity for expertise, technologies, and resources in public bureaucracies may reform and refocus citizen interest in administrative justice and lead to a more just public sector.

The case for applying justice, for moral and practical reasons, in all public sector activities is a pressing one. Although Pops and Pavlak raise an important agenda, they do not argue very effectively how justice will strengthen decision making and policy in public administration.

Ball State University JOHN E. ROUSE, JR.

The Hollow Hope: Can Courts Bring About Social Change? By Gerald N. Rosenberg. Chicago: University of Chicago Press, 1991. 425p. $29.95.

No one who is seriously concerned about social reform and the role of the courts in the American system can afford to ignore the lessons of this important book. Over the last three decades, *Brown* v. *Board of Education* and *Roe* v. *Wade* have stood at the center of virtually all of our theories, normative and empirical, about the role of the Supreme Court. Social reform litigation more generally has been seen as the hallmark of the modern Court, serving as a lighting rod for both praise and critique. *The Hollow Hope* examines much of the significant social reform litigation of the last three decades, giving particular attention to *Brown* and *Roe*. It persuasively demonstrates that for the most part, the Court has been ineffective in producing "policy change with nationwide impact" (p. 4). The author argues that as a

result, groups seeking significant social reform foolishly squander their resources by turning to litigation and, by implication, that in spinning arguments both for and against a Court that serves the interests of political minorities, we have foolishly assumed that the Court has an important independent role in shaping social reform. If Rosenberg is right, and it is very difficult to leave the text unpersuaded, one has to question why scholars, politicians, and reformers attribute as much influence to the Court as they do.

Rosenberg begins with the question, "When and under what conditions will U.S. courts be effective producers of significant social reform?" (p. 9). He juxtaposes two prototypical views of the role of the Court in producing social change, extracting from them an analytical framework for systematically understanding when and why the Court can succeed in producing social reform. Specifically, Rosenberg posits three familiar constraints on the Court that impede the success of social reform litigation: (1) the limited nature of constitutional rights, (2) the lack of judicial independence, and (3) the judiciary's lack of powers of implementation. These constraints can only be overcome when three corresponding conditions are met: (1) ample legal precedent for change, (2) support for change from substantial numbers in Congress and from the executive, and (3) support from some citizens (or at least low levels of opposition from all citizens), with one of the following: (a) incentives for compliance, (b) costs to noncompliance, (c) implementation left to the private market, or (d) individuals crucial for implementation seeking either political leverage or cover (pp. 35–36).

Rosenberg compiles a formidable array of empirical evidence to assess both the direct and indirect effects of social reform litigation. For example, in assessing the influence of *Brown*, Rosenberg not only demonstrates that by and large integration of the schools occurred as a result of congressional and executive branch action, not Court action, he also demonstrates that it was *not* the Court's decision in *Brown* that placed civil rights on the political agenda, precipitated congressional and executive branch action on civil rights, favorably changed the views of white Americans, or served as a stimulus for the Civil Rights movement of the late 1950s and early 1960s. The same thoroughgoing analysis is applied to *Roe* v. *Wade* and various other women's rights cases. A brief overview of how the constraints-and-conditions model can be used to explain the successes and failures of environmental, reapportionment, and criminal procedure litigation is presented in the final section of the book. Rosenberg concludes that "given the constraints and conditions, . . . U.S. courts can *almost never* be effective producers of significant social reform" (p. 338).

The power of this book comes, in part, from the ease with which we can accept Rosenberg's specification of constraints and conditions; they have been drawn from a rich heritage of public law scholarship. What is new is the way in which he synthesizes the common wisdom into a coherent analytical model supported by an impressive compilation of empirical evidence. While every reader will undoubtedly have a quibble with some specific piece of empirical evidence relied on, the totality of the case Rosenberg makes is overwhelming and compelling. This is not a polemic; it is first-rate scholarship.

The combination of Rosenberg's specification of constraints and conditions and his empirical attempts to disentangle the effect of the Court from the effects of the other branches sometimes creates the appearance of a heads-I-win-tails-you-lose scenario. Political support is one of the three conditions necessary for Court-ordered social reform to be effective; in practice, when Rosenberg finds such support, it is sometimes used as evidence that the change would have occurred without the Court's intervention, especially in regards to abortion reform. Given the way the evidence actually plays out, however, this is not as problematic as it may seem at first. Indeed, one of Rosenberg's most intriguing findings is that predecision elite support often evaporates once the Court issues its decision. Similarly, in examining the indirect effects of social reform litigation, Rosenberg intimates several times that while the Court's decisions did not serve to mobilize support for social reform, it did seem to mobilize opposition, although the latter observation is not subjected to the same careful empirical testing that the former is. Repeatedly, the book suggests that not only does social reform litigation unwisely divert group resources away from more productive strategies but that the Court's decisions themselves at times have a counterproductive effect.

As the title intimates, many will find *The Hollow Hope* disheartening (as one suspects the author himself did). They may find some solace in the thought that Rosenberg may be asking too much of the Court by asking that the Court go it alone. His empirical analysis is directed at assessing how much social reform the Court is able to bring about independently; but acting alone, neither Congress nor the executive branch can bring about much social reform, either. Those branches each have their own sets of constraints and conditions. The unasked question is whether the Court, in concert with one of the two branches can bring about social reform (either directly or indirectly) without the support of the other—or in concert with the states, without either of the branches. While it is clear that social reformers who rely solely on the Court for significant reform are bound to fail, that does not necessarily mean that they will not find it useful to employ litigation strategies in conjunction with explicitly political strategies, something few of the reformers involved in the litigation Rosenberg examines attempted to do. Further solace may be gained from remembering that Rosenberg's analysis is limited to "litigation attempting to change the functioning of a whole set of bureaucracies or institutions nationwide" (p. 4). Such aberrational litigation is far from being the whole of the Court's participation in the process of policy development.

This is a tremendously important book. In profound and persuasive ways. it challenges many of the assumptions that undergird the Supreme Court scholarship of the last three decades. *The Hollow Hope* will fundamentally reshape how we see the courts and what questions we ask about them.

Rutgers University SUSAN E. LAWRENCE

The American Political Nation, 1838–1893. By Joel H. Silbey. Stanford: Stanford University Press, 1991. 348p. $35.00.

Imagine a society in which parties dominate the political system. They select the candidates, articulate distinct ideologies, oversee the conduct of elections, virtu-

ally monopolize political communications, mobilize voters, organize legislatures, structure roll-call votes, and (more generally) determine the shape of public policy. Perceptibly connected to the daily experiences of most citizens, these entities function, in other words, as political science texts claim parties should.

For those of us familiar with the parties of the 1990s, imagining such a political order strains our creative capacities. Yet only about a century ago, the United States was such a society. And Joel Silbey's book brilliantly captures and recreates that political world.

The American Political Nation, 1838–1893 synthesizes an incredibly diverse array of materials, primary as well as secondary. In the process, it offers an analysis of the genesis of parties as organizations; of their slow, sometimes halting, but eventual acceptance by the mass public; and of the dominant roles they played in campaigns, elections, and governing. There are chapters devoted to each of these topics, as well as treatments of the patterns of popular voting, the ethnic–religious and socioeconomic bases of partisan loyalties, and of those who challenged the reigning partisan norms. Each of these chapters offers a cogently argued, detailed, and richly textured picture of a bygone world in which citizens were avowedly, uncompromisingly, and proudly partisan. It was also a world marked (not coincidentally, Silbey argues) by high rates of turnout on election day, by the enthusiasm of citizens for politics and political activities, and by the capacity of elected officeholders to respond to grassroots impulses.

Silbey's analysis contributes materially to understanding nineteenth-century politics. Along two distinct dimensions it provides a comprehensive picture of that lost world. First, Silbey's view is cross-sectionally comprehensive. It treats all types of political activity—governing, as well as electioneering. Thus, he shows how parties bridged the gap—how voting became related to public policy.

Second, Silbey's view is longitudinally comprehensive. While most studies of nineteenth-century politics focus on what distinguished the second and third electoral–party systems from each other, Silbey, emphasizing what they shared, treats them together as a distinct *political era*. The spread of sectional norms during the 1850s led to the breakup of one major party, the creation of another, shattered electoral coalitions, and culminated in civil war. Yet through it all, "the central reality of partisanly defined and shaped political activities remained" (p. 139).

More generally, Silbey offers the concept of a political era as something of an antidote to the dominant party–electoral system framework. This new perspective, he argues, allows the development of a classification scheme based on political attitudes and actions other than popular voting. The outline of that scheme he offers as a supplement to the critical-election model (pp. 6–8). This aspect of Silbey's argument is less persuasive than most others. To justify his new taxonomy, he construes the party–electoral system framework too narrowly. In Walter Dean Burnham's analysis, for example, it is as broad and inclusive—as capable of dealing with the complex web, or relationships and interactions among voters, officeholders, and political institutions—as the notion of a political era. Moreover, Silbey's rubric really does not seem to designate anything more than others have included under the label *political culture*.

There is another soft spot in the book: too much of its evidence and too many of its examples (especially the great political one-liners) are drawn from the years prior to 1870.

Those who have specialized in looking at shorter time slices and/or smaller geographies, no doubt, may find other reasons to quarrel with some specifics. That is inevitable with syntheses of this sort. But the fact that this book will raise questions, evoke intellectual disputes, and stimulate new research is simply another sign of its significance and importance.

Northern Illinois University PAUL KLEPPNER

Eisenhower and the Management of Prosperity. By John W. Sloan. Lawrence: University of Kansas Press, 1991. 192p. $25.00.

Was the real Dwight David Eisenhower the complacent, reluctant president described by intellectuals in the 1950s or the savvy "hidden hand" president portrayed by revisionists in recent years? The truth is somewhere in between, concludes John Sloan in his analysis of economic policy making in the Eisenhower administration. Far from complacent, Eisenhower emerges in Sloan's book as a conservative activist, deeply involved in domestic policy. Yet contrary to the revisionists, Sloan argues that Eisenhower's political effectiveness dropped precipitously during his second term, when he was less likely to employ hidden hand tactics or effectively balance righteous zeal with political finesse. And despite the revitalization of his image as a leader, presidential aspirants still do not evoke the memory of Eisenhower as they have those of Roosevelt, Truman, and Kennedy.

Drawing upon the resources at the Eisenhower Library in Abilene, Kansas, as well as a wealth of secondary sources, Sloan sought to fill a gap in the revisionist literature concerning Eisenhower's economic policy. He adopts Graham Allison's bureaucratic politics approach to analyze how economic policies were a product of accommodation among various actors, their interests, and their relative influence. The bureaucratic politics approach is more commonly applied to foreign policy decision making; but it is quite helpful in analyzing various economic decisions during the Eisenhower administration. Because of the more formal, hierarchical organization of the administration, the bureaucratic politics approach probably works better for the Eisenhower White House than it would for other presidencies.

Sloan sets the stage for his analysis with a review of the economic philosophy of the administration, the key players involved, and the president's economic advisory system. Brief biographical profiles of advisors such as George Humphrey and Arthur Burns and key decision makers such as William McChesney Martin are offered. The political economy of the 1950s is also considered: the state of the economy, the Cold War, and the partisan context. As frequently occurs with a bureaucratic politics emphasis, however, consideration of external factors is relatively thin. While some of the relevant elements of the political and economic environment are reviewed, the analysis would have benefited from greater breadth and depth of coverage.

Sloan develops evidence to support his assertion that Eisenhower was more of a "conviction politician" than is often assumed, actively pursuing firmly held economic ideas. One of those convictions was to balance the

federal budget, which he accomplished three times during his administration, a remarkable feat viewed from the 1990s. However, Ike and the Republicans paid a price for his obeisance to the balanced budget in the 1958 and 1960 elections. The main thrust of the analysis in the book is contained in separate chapters dealing with the budget, monetary policy and anti-inflationary efforts, and fiscal responses to the recessions of 1953–54 and 1957–58.

One of the more interesting sections of the book is a reevaluation of the battle of the budget for fiscal year 1958. This episode has been enshrined in the presidency literature through Richard Neustadt's widely read *Presidential Power* (1960). Neustadt disparages Eisenhower's amateurish political skills because he allowed Secretary of the Treasury George Humphrey to undercut his budget on the very day it was released. Sloan's analysis of the record reveals that not only was the president aware of Humphrey's proposal for further cuts in spending but actively worked with his advisors to determine exactly how the revised proposal would be presented. After editing Humphrey's original four page memo suggesting further cuts, Eisenhower decided that Humphrey should hold a press conference, duly noting his support for the president's budget message. Unfortunately for Eisenhower, the media coverage focused exclusively on Humphrey's extemporaneous comment about a possible "depression that will curl your hair." Sloan shows that there was much more involved in this episode than is indicated by Neustadt, although Eisenhower's political wisdom in allowing the press conference in the first place remains suspect.

Eisenhower and the Management of Prosperity makes an important contribution to the scholarly literature on the presidency, economic policymaking, and in particular to the study of the Eisenhower era. By focusing on the different aspects of economic policy, he provides a sense of how presidents balance competing objectives and interests, use their advisory systems, and respond to external developments. Because the administration portrait presented in the book is necessarily incomplete, this work is most likely to be useful in conjunction with other recent works, particularly Greenstein's *The Hidden Hand Presidency* (1982); it provides a policy focus that supplements biographies such as Steven Ambrose's *Eisenhower: The President* (1984); and it reveals Eisenhower to be less Keynesian in outlook than is suggested by Herbert Stein in *The Fiscal Revolution in America* (1969).

Despite the book's many merits, the contribution to the field is less than it could have been. The book simply is too brief and condensed to do justice to the topic. Much more should have been added about many of the topics covered, both in terms of original data and analysis. The author briefly quotes, but rarely presents, original sources. On many occasions, reproducing the actual notes, memos, or correspondence would have helped make the case much more convincingly and created more of a feel for the Eisenhower White House. The separate chapters treating the budget, monetary policy, and the antirecession measures are not as well integrated in terms of process and outcomes as they could have been. The writing is stiff, sometimes ponderous, and occasionally hard to follow.

While we could have learned more along the way, Sloan's conclusions end the book on a strong note. Eisenhower clearly was not "above politics"; he was more ideological than popularly perceived and occasionally dogmatic about issues such as a balanced budget. He turned away from the more liberal aspects of "modern Republicanism" and towards fiscal orthodoxy as his term progressed. Despite his relative success in the management of prosperity during the 1950s, both he and his critics were dissatisfied by the end of his term. As Sloan concludes, "By the end of the 1950s, Eisenhower's presidency seemed to lack the required vision, and he left office with feelings of rejection" (p. 162). Despite some shortcomings, John Sloan's book does a good job in showing when and how the president's vision faltered, diminishing his political effectiveness and policy achievements.

University of Missouri, St. Louis LANCE T. LELOUP

The Pro-Choice Movement: Organization and Activism in the Abortion Conflict. By Suzanne Staggenborg. New York: Oxford University Press, 1991. 229p. $27.50.

Following the Supreme Court's 1989 *Webster* v. *Reproductive Health Services* decision, journalists spoke of a rebirth of prochoice activism and renewal of energy for moribund prochoice organizations. This view comported with the conventional scholarly wisdom that prochoice groups languished after *Roe* v. *Wade*, while antiabortion forces mobilized. Suzanne Staggenborg challenges this perspective, arguing that the prochoice movement remained viable in the post-*Roe* era by developing formal organizational structures, hiring professional leaders, and employing a conventional political strategy. Becoming an insider, however, did not stop the movement from continuing grassroots organizing. Institutionalization and ongoing grassroots activism prepared prochoice forces for *Webster*. Furthermore, Staggenborg notes that prochoice mobilization following *Webster* was not unprecedented; the Hyde Amendment of 1976 (limiting use of federal Medicaid monies for abortion) also stimulated organizing.

Staggenborg examines newsletters, correspondence, and other documentary evidence of 13 (6 national and 7 Chicago-based) prochoice organizations. Her analysis includes representatives of the population organizations, single-issue abortion organizations, and women's organizations (e.g., Zero Population Growth, the National Abortion Rights Action League, and the National Organization of Women, respectively). Interviews with 50 activists supplement documentary evidence. *The Pro-Choice Movement* provides the most richly detailed and nuanced narrative of the strategies and tactics of prochoice organizations available. It also is one of the first works written by a scholar (rather than an activist, journalist, or freelance writer) chronicling activities of the prochoice movement. Specialists in abortion politics will appreciate the first two appendixes; one presents a brief history of each organization and the other discusses the location and accessibility of the documents used.

The Pro-Choice Movement is organized chronologically into four sections. Part 1 discusses the origins of the prochoice movement from the early 1960s to 1973. Staggenborg contends that the movement originated from within established institutions, as well as through outsider challenger groups (e.g., the National Organization of Women). Seasoned activists who had worked on reform proposals formed new organizations devoted to

abortion repeal and were later joined by the burgeoning women's liberation and population control movements. Staggenborg's research expands that of Kristin Luker (*Abortion and the Politics of Motherhood*, 1984) and Raymond Tatalovich and Byron W. Daynes (*The Politics of Abortion*, 1981), who view the transition from reform to repeal largely as a response to the nascent women's movement and to a redefinition of abortion as a moral argument (controlled by women), instead of a medical issue (controlled by physicians).

From 1973 to 1976, intense countermobilization kept the movement alive, as did activism within the women's movement. National prochoice leadership became more professionalized, organizational structures more formalized. After *Roe*, support solidified among such inside organizations as the American Civil Liberties Union and Planned Parenthood (groups now synonymous with the prochoice label). Transformation, rather than demobilization, is the appropriate way to classify this period.

Paradoxically, the prochoice movement gained strength between 1977 and 1983 following passage of the Hyde Amendment (the first prolife victory). The threat to abortion rights represented by the passage of Hyde created additional resources that accelerated organizational trends toward professional leaders and formalized structures. Prolife organizations, however, dictated the terms on which the abortion battle would be fought. In response, prochoice groups emphasized grassroots organizing, increased their use of institutionalized tactics (legislative lobbying, party politics), and adopted a single-issue political focus. Prochoice organizations that advocated multiple-issue agendas (notably the Reproductive Rights National Network) met with little success. Unlike other scholars, Staggenborg contends that growing professionalization did not lead to the demise of grassroots organizing.

In 1983 prochoice victories in the Supreme Court and Congress quashed immediate threats to legal abortion. While many prochoice constituents considered the battle over, direct action tactics by prolife activists coupled with antiabortion activities of the Reagan and Bush administrations kept the prochoice movement alive and prepared for *Webster*. While Staggenborg notes that prochoice organizations are employing increasingly sophisticated strategies and tactics that may not require grassroots activists, they still are promoting grassroots efforts. If these organizations remain resource-rich, conflict between professional and grassroots organizing need not occur.

As a political scientist, I find several weaknesses in the book. Staggenborg writes of triumphs and difficulties in organizing the National Abortion Rights Action League of Illinois, yet the legislature remained staunchly antiabortion after *Roe*. What effect did Springfield's hostile climate have on organizing? Staggenborg's findings may have limited generalizability because her cases do not include variations in state political context. Few references to relevant political science scholarship appear; noticeably absent in Jane Mansbridge's *Why We Lost the ERA* (1986). Last, the book's theme is that mobilization begets countermobilization, an analysis that is easily subsumed within Trumanesque pluralism.

Staggenborg's principal theoretical contribution is to the study of social movements. Social movements that survive the "dry" periods of mobilization generally do so by establishing formalized structures and professionalized leadership (or its equivalent). Her first-rate, theoretically informed history of the prochoice movement is a much-needed addition to the abortion politics literature. While not as lucidly written or as powerfully argued as Luker's work, *The Pro-Choice Movement* ought to be read by students of women's politics, abortion politics, interest groups, and social movements.

Furman University GLEN A. HALVA-NEUBAUER

Public Service Liberalism: Telecommunications and Transitions in Public Policy. By Alan Stone. Princeton: Princeton University Press, 1991. 296p. $35.00.

In renascent conservative ideology, government "is the problem, not the solution." Since the 1970s, this message found receptive ears in a populace disillusioned both by government's social programs and the performance of the economy. Celebrating the miracle of Adam Smith's invisible hand, the virtues of free markets, free enterprise, and laissez-faire, policy designs advocating privatization, deregulation, and competition have been formulated by the policymaking communities in the United States and Western Europe.

The revival of conservatism as a theory of public policy is due more to the lack of competing, consensual theories than to its intellectual rigor or empirical validity. Like other ideological movements, it has reconstructed its own idealization of history mixing myths liberally with facts. One of the most cherished myths about the nineteenth century in the United States is that there was no government intervention in economic and social affairs and, consequently, remarkable technological progress and economic growth, enhancing, in turn, social progress. Historical evidence contradicts this myth. Government intervention was extensive in local and state levels, where most economic activities and social initiatives took place.

The economic–political history of the American telephone industry from its inception until 1934 is examined in this interesting book. More than yet another well-documented case study of government intervention, Stone advances the thesis that public service liberalism was responsible for the many impressive achievements in the nation-building stages and that its revival as a theory of public policy, rather than the indiscriminate institutionalization of conservatism, could assist in resolving certain current problems, such as the savings-and-loan institutions and the cable television industry.

According to Stone, the state role in a capitalist society is not simply intervention versus nonintervention, regulation versus laissez-faire. Policy choices are wider and more complex. They involve not only economic criteria (efficiency being the acid test) but social and political values, as well. If the free market cannot satisfy the desired values, government intervention can help to do so. Intervention can be short, long, or permanent (e.g., the regulation of public utilities) depending on the values to be achieved. In fact, even heavily regulated sectors, such as the telephone industry until 1934, can operate efficiently when they are monopolies. At the core of public service liberalism is a "presumption in favor of free competition that can be rebutted by showing that government intervention is necessary to attain social values that the unfettered market may not achieve" (p. 4). For example, primary and secondary education are now considered as necessary for society's

well-being as water distribution, gas for cooking, or electricity. As society modernizes, increasing numbers of services become central to the nation's well-being, presenting opportunities for government–business cooperation. Such cooperation often enables economic efficiency, as well as social progress (as illustrated by the telecommunications industry).

The idea of public service liberalism differs from other forms of government regulation and intervention. When an industry is classified under the heading *public service*, explicit obligations are imposed on it: to serve all who apply and are willing to abide by the reasonable regulations of the firm, to serve adequately, to act impartially to all, and to charge only reasonable rates. These obligations are intended to attain social values in addition to economic efficiency. Conflicts over the practical operationalization of these obligations are inevitable, and the rules covering their application have become more complex and intricate as the volume of cases brought to courts and commissions has increased over time. Furthermore, the research controversy over the extent to which public service decisions tend to favor the regulated industry (the "capture theory") is far from being resolved. To make his theory more tenable, Stone introduces another controversial assumption: "Public decision makers can cooperate in achieving the public welfare not by balancing the demands of interest groups, but by making explicit, reasoned decisions designed to attain predetermined goals" (p. 50).

Public Service Liberalism is a fascinating case study of the history of government–business relations in the telephone industry. The concept is intuitively appealing and more humane than the value of economic efficiency as the exclusive consideration in public policymaking. At present, however, public service liberalism is neither an explanatory, nor a predictive, theory of public policy. More conceptual and empirical research is needed to clarify basic assumptions, contextualize propositions to contemporary structural issues, and explicate testable hypotheses amenable to comparison within and between vital industries.

University of Wisconsin, Milwaukee DAVID NACHMIAS

Mobilizing Interest Groups in America: Patrons, Professions, and Social Movements. By Jack L. Walker. Ann Arbor: University of Michigan Press, 1991. 272p. $39.50 cloth, $14.95 paper.

In January 1990 the profession lost one of its most thoughtful students of American politics, Jack L. Walker, in an automobile accident. At the time he was at the midpoint of a year at the Center for Advanced Studies in the Behavioral Sciences working on a book that was to have been the culmination of a decade-long investigation of interest groups in Washington. An outline of the entire manuscript and several chapters had been drafted. Other significant pieces existed in the form of a distinguished set of papers that had appeared at regular intervals throughout the preceding decade.

A group of present and former students and colleagues (Joel Aberbach, Frank Baumgartner, Thomas Gais, David King, Mark Peterson, and Kim Scheppele) have assembled the pieces and crafted this volume as Walker's legacy to all of us who care about American politics as he did. In the process, they created a book; they have not merely stitched together a set of preexisting papers. Their efforts constitute a tribute to a cherished colleague and friend, a testimony to his ability to inspire students and work with colleagues, and an immense service to the study of American politics.

Based on large-scale mail surveys—conducted in 1980 and 1985—of membership associations active in Washington, *Mobilizing Interest Groups in America* weds systematic data to clear-headed thinking about American politics to probe basic questions about interests groups: Where do they come from? What inducements do they offer supporters in order to stay in business? What influences the choices they make with respect to political strategy? Especially significant are the findings on group mobilization and maintenance. Walker points out the irony in political scientists' adopting the perspective contained in Mancur Olson's path-breaking work and pointing out the barriers to organization just when Washington was witnessing a massive mobilization of new groups into politics. Without losing sight of Olson's fundamental insight that those who wish to start an organization or keep one going must provide some kinds of incentives to supporters, Walker uses multivariate analysis to probe the multiple sources of recent group mobilization. Of particular note is the extent to which contributions from patrons (wealthy individuals, foundations, and the government itself) have facilitated the organization of new groups, especially among those not based in occupational or commercial communities. In addition, in a chapter coauthored by King, Walker presents extensive data about the benefits that group leaders deem important for attracting members to their organizations. The findings not only present a challenge to Olson's by-product theory by demonstrating that according to association leaders, collective goods are important inducements to members but also elaborate the circumstances under which an organization's members are likely to value such nonselective benefits.

Walker also addresses the question of the multiple factors that influence an organization's choice of political strategies. The data in a chapter coauthored by Gais indicate that among other things, groups that operate in what is perceived to be a conflictual policy environment are more likely to be politically active and, in particular, to adopt such insider tactics as seeking influence through established government channels. A chapter coauthored by Scheppele on the litigation strategies pursued by membership associations is particularly subtle. Rather than treating litigation in an undifferentiated manner, Walker presents alternative models to demonstrate the differences among the factors that predict three different forms of legal action: filing amicus briefs, filing suits on behalf of members, and filing class action suits. In addition, he presents an unusually complex picture of the meaning of group litigation for the political process, demonstrating that consistent with the stereotype, the disadvantaged and liberal advocates of public interest causes do go to court to file class action suits but that the groups most likely to engage in litigation are unions and well-heeled organizations in the profit sector whose aims are conservative.

It is difficult to know how to treat the shortcomings in this important book. Presumably, it does not diminish the achievement of those who labored so unselfishly to assert that this is not the same book that Walker would have produced had he lived. Therefore, it is unfair to hold him responsible for failings in a volume that he left

unfinished. Still, it would seem churlish to blame any imperfections on six people who worked quickly under difficult conditions to complete a project they did not originally conceive. But clearly, the unfortunate circumstances under which this book was finally assembled exacted a price. With six surrogate authors standing in for a single intellect, the chapters do not achieve the coherence one might have otherwise expected had Walker been able to complete it himself. Also, although the bibliography appended to the book is extensive, several of the chapters are stingy in citing recently published work that reaches similar conclusions.

Some of the difficulties are more intrinisic to Walker's style and to the project itself. Walker tends, as do so many of us who do quantitative analysis of survey data, to reify the findings. Often the strong assertions in the accompanying prose do not contain sufficient reminders to the reader that what is, in fact, being characterized is a probabilistic relationship of statistical significance based upon indicators that are approximations of the concepts for which they stand. Moreover, although Walker's data are superb for answering certain questions, they are less suited for others. Because he surveyed membership organizations, Walker has no data about the thousands of organizations active in Washington (e.g., corporations, universities, and think tanks) that have no members in the ordinary sense. In addition, the poor return rate from labor unions forced him to omit them from most of the analysis. This means that Walker's conclusions about the aggregate set of organizations attempting to influence Washington politics are much less convincing than his analyses of the internal workings of membership organizations. Furthermore, although Walker makes a seminal contribution to our understanding of group mobilization, he neglects a parallel process. The expansion of the Washington pressure system over the past few decades has resulted not only from the birth of new groups but also from the politicization of existing, but previously apolitical organizations. Their movement into politics has had a substantial impact on the character of organizational activity in Washington.

I wish I could have made these points to Jack himself while the book was still in manuscript and congratulated him personally on his achievement. Like his six comrades who undertook to complete what had already come so far, I shall miss him.

Boston College KAY LEHMAN SCHLOZMAN

Senate Elections and Campaign Intensity. By Mark Westlye. Baltimore: Johns Hopkins University Press, 1991. 265p. $38.50.

The central thesis of this well-written and insightful volume is that elections to the U.S. Senate are a good deal more varied than current wisdom suggests. Against the backdrop of an avalanche of research on elections to the House of Representatives, there has grown a small body of work that describes Senate elections as quite distinct from House contests. The literature presents a view of Senate elections as competitive races with incumbents facing tough policy-oriented challengers compared to House contests in which nearly invisible challengers are ritualistically trounced by popular and well-financed incumbents. Westlye argues that only some Senate contests fit this description.

Senate Elections and Campaign Intensity examines Senate elections over the 1968–84 period to argue that campaign intensity is a fundamentally important variable for differentiating among Senate elections. Westlye groups campaigns as *hard fought* or *low-key* in terms of their campaign intensity, and this distinction becomes the principle organizing concept of his analysis. Campaign intensity is conceptualized as the amount of information available to voters during the election period. There is a potentially troublesome distance between this theoretical definition and the operational measure of campaign intensity, which is based on Congressional Quarterly preelection summaries, augmented (in cases) by actual election returns. Westlye does, however, demonstrate that campaign intensity, as measured, is related to amounts of newspaper coverage in a sample of races.

Hard-fought contests, by Westlye's count, amount to 57% of Senate elections in the 1968–84 period. These generally have more experienced challengers and are the more issue-oriented and ideological battles of the conventional wisdom. The remaining, low-key contests generally have a popular incumbent facing an inexperienced, underfinanced, and ineffective challenger. These elections closely resemble the general view of House elections. The failure of previous research to appreciate the diversity among Senate elections, Westlye argues, stems from researchers' reliance on the National Elections Studies data, which (until the recent special Senate election studies) had too few respondents in the low-key contests. This is because the low-key Senate elections tend to cluster in the less-populated states, which are not well represented in national surveys.

To make his point about the variation in campaign intensity, Westlye arms himself with two important new data sources. One is an impressive collection of state-level surveys from a host of different organizations. Here, he does a fine job of skirting the dangers of data incomparabilities to pull out important comparative generalizations. Second, he draws on content analyses of the full preelection newspaper coverage in a dozen Senate campaigns. His focus on newspapers is well justified in an insightful discussion of the public's sources of news (chapter 3), and his case studies here persuasively demonstrate his point about the considerable variety in campaign intensities across Senate elections. Throughout, there is a skillful blending of his quantitative and case study analyses to reinforce and illuminate his basic argument.

Westlye takes on some important issues of electoral research, and generally does an excellent job of relating these to his organizing *hard fought/low-key* distinction. Ideology and issues, for example, loom as more important factors in hard-fought contests, while partisanship and incumbency are more dominant in low-key elections (chapters 5 and 6). He challenges the idea that state population size is a consistently important variable (chapter 7). Contingency tables are the primary vehicle for presenting his analyses. These make his findings easily accessible to a very wide audience; but in places, regression or probit might have provided stronger evidence for some of his conclusions.

The most sophisticated analysis is saved for the end with the examination of the effects of divisive primaries on general election outcomes. The conclusion is important and persuasive: strong challenges in the primaries

increase incumbent vulnerability. The election model Westlye develops for this particular hypothesis is more powerful and complete than anything that precedes it in the book, and it might have been adapted for more powerful tests of propositions offered earlier in the book. It is curious that his final analysis is not tied back to the central distinction.

Westlye seems to assume that mixing elections that vary by campaign intensity is like comparing apples and oranges. However, whether a campaign is hard fought or low-key (or even somewhere in between) is a function of variables we usually want to assess in congressional elections, not an independent factor that can be easily isolated. Thus, while Westlye properly focuses our attention on the important feature of campaign intensity and how it varies in Senate elections, he has not emphasized its endogeneity as completely as he might have.

The main argument of this book is solid and important. Senate campaigns vary a good deal, and research will be better for taking this into account in these and other subpresidential elections. This is a fine book and a useful addition to the burgeoning literature on Senate elections.

Indiana University GERALD WRIGHT

Coming to Public Judgment: Making Democracy Work in a Complex World. By Daniel Yankelovich. Syracuse: Syracuse University Press, 1991. 290p. $34.95 cloth, $16.95 paper.

In *Coming to Public Judgment,* Daniel Yankelovich begins with a premise with which few would argue: the quality of American public opinion could use substantial improvement. But the book is actually far more interesting than this common thesis might suggest. Yankelovich calls for a more engaged, thoughtful public dialogue; but unlike most who decry the quality of American public opinion, he emphasizes the limits of information in remedying this situation.

His argument revolves around several major concepts. Foremost among these is public judgment, which he describes as "the state of highly developed public opinion that exists once people have engaged an issue, considered it from all sides, understood the choices it leads to, and accepted the full consequences of the choices they make" (p. 6). If this seems a tall order for the public as most political scientists know it, Yankelovich has a set of practical suggestions for bringing the public closer to his ideal.

Coaxing public judgment into existence is seen as an urgently needed remedy for a widening gap between the public and policymakers. As the formal institutions of government have become increasingly democratic in terms of the participatory roles that they extend to average citizens, the public has had less actual influence on political decisions. Yankelovich claims that this problem is of such proportion that the distance between America's elites and its average citizens is as great or greater than the distance separating the aristocracies of prerevolutionary France and Russia from average people in their countries. Although this may strike readers as an overstatement, it seems less so when one comes to understand that he is speaking of attitudes, rather than differences in class or power. He refers to a "form of intellectual snobbery" in which political elites (and academics) denigrate public opinion and fail to respect its capacity for wise decision making (p. 4).

The reason for the public's lack of influence is a phenomenon he dubs *creeping expertism,* that is, the increasing tendency to allow expert opinions to guide policy decisions. This practice is deemed dangerous because expert opinion is qualitatively different from public judgment. Public judgment goes beyond well-informed opinion to incorporate values and ethical aspects of policy decisions, rather than emphasizing their factual, informational components. Creeping expertism is seen as a symptom of the *culture of technical control,* a societal emphasis on specialized knowledge, science, and empiricism that has undermined other modes of knowledge. Although Yankelovich's ideas in this vein are similar to other critiques of empiricism, they are particularly interesting as argued by a person whose livelihood is steeped in numbers.

Yankelovich's most intriguing and controversial claims occur in his discussion of knowledge, opinion, and public judgment as a form of knowledge. Drawing on philosophical and historical writings, he concludes that opinion is what society relies upon in the absence of knowledge; it is an inferior substitute that we make do with in a pinch. The underlying assumption is that if people were given more information, their opinions would come closer to knowledge and thus would be better opinions. But more information is not the answer, in his view, because public judgment is more than simply well-informed public opinion. He advocates moving away from a quality-as-information model for judging opinion and toward a model that values consistency, stability, and the extent to which people have thought through the consequences of their positions.

The book covers the expert side of the power imbalance between experts and the public less thoroughly. "Expert opinion" is depicted as if it were all of one cloth. Yankelovich implies that the objective character of technical expertise should lead all experts to roughly the same conclusions. Differences between mass and expert opinion are noted as if it were possible to identify a singular expert opinion on any given issue and evaluate its distance from the public consensus. This is troubling because it downplays the extent to which experts have become pawns in political battle. As any television news program demonstrates, experts can be found to espouse almost any policy position. The author contends that the imbalance between public and experts results from a cultural emphasis on scientific information, not from a power struggle; but the increasing importance and visibility of experts seems inextricably tied to struggles for political power.

Toward his goal of improving public judgment, Yankelovich provides Ten Rules for Resolution—instructions, essentially for leaders, on how to encourage the development of public judgment. These are useful suggestions, and the goal is clearly a worthy one; but the underlying assumption is that leaders are disinterested, which most leaders clearly are not, nor should they be. Thus, the goal of creating a national consensus becomes one of persuading people to a particular conviction. Although Yankelovich points out that cultivating public judgment has some benefits for leaders, it remains unclear what would motivate them toward this end when they would seem to have far more to gain from manipulating public opinion.

Despite antiempirical undercurrents, Yankelovich ar-

gues that polling can be utilized in the service of democracy when it is used to elicit public judgment, rather than mass opinion. Of particular interest to those concerned with theories of the survey response is his contention that stable opinions can and do exist and that they can be tapped through traditional survey methods. This is an interesting contrast to survey response theories suggesting that the search for pure underlying opinions is a misguided one.

In *Coming to Public Judgment*, Yankelovich provides an insightful commentary on the nature of contemporary public opinion, as well as a normative prescription for improving it. The book should be of great interest to political leaders, students of public opinion, and anyone concerned with the relationship between public opinion and policymakers.

COMPARATIVE POLITICS

Currents of Radicalism: Popular Radicalism, Organized Labour, and Party Politics in Britain, 1850–1914. Edited by Eugenio F. Biagini and Alastair J. Reid. New York: Cambridge University Press, 1991. 305p. $49.50.

The title of this collection of essays does not indicate that in its pages a battle is being waged—a battle over the past and, by implication, over the future of the British labor movement. For both editors and contributors, the history of the British labor movement in the nineteenth century has been needlessly and illegitimately divided into three distinct periods: a period of early radicalism (Chartism); a period of stagnation in which Labor was economistic in its demands and politically beholden to the Liberal party (old unionism and lib.-labism); and a period of the emergence of a genuine, independent labor politics (new unionism and state socialism).

The culprit responsible for this division is what the editors in their introduction call the "Marxist assumption" in the literature on the British labor movement, an assumption tacitly shared even by non-Marxist historians. This "assumption" (*paradigm* would have better captured the editors' intended meaning) tends to evaluate the experience and history of the British labor movement in the nineteenth century according to a priori notions of class struggle and state socialism as yardsticks of "maturity" ("identity" here would have been the better term): the closer the labor movement appears to conform to these yardsticks in its politics and programmatic goals, the more "mature" (genuine) it is deemed to be (p. 3). Against this orthodoxy, the 11 essays in this volume, ranging from political-biographical reassessments to studies of tax and labor law reforms, attempt to cast a wider net over the history of the British labor movement, integrating it in a larger history of British radicalism. Thus, nonconformity, liberalism, and trade unionism are viewed as three continuous "currents" in the history of the British labor movement that present a link to an original British radical tradition, as well as a source of continuous strength and vitality. To the editors and contributors of this volume, the future of the British Labour Party lies squarely in the renunciation of "socialism" and the general acceptance of the "currents of radicalism" presented in the volume.

Despite the high level of historical scholarship displayed, I have my doubts about the link between the essays and the general argument developed by Biagini and Reid in their introduction. To begin with, as the editors themselves realize, the contemporary focus on working-class *experience* (Who were those workers? What did they really do, think, read, etc.?) is significantly indebted to the (neo-)Marxist historians' dissatisfaction with the concepts of class and class struggle as *empirically* meaningful entities (p. 14). Furthermore, the emphasis on a distinctively British radical tradition that was fueled by "notions of rights, justice, 'fairness', independence, dignity and individual freedom" (Thane, p. 269) and that was hostile "to the intrusion of the state" (McWilliam, p. 60) is not that new or revolutionary.

Even more importantly, the essays themselves provide plenty of material with which to contest the positive spin editors and contributors want to give to the thoughts, ideals, and practices that the "Marxist assumption" casts aside as "immature" or "labourist." Thus, Rohan McWilliam, in his fascinating essay on the Tichborne case, sees the irony of a popular mass movement that was concerned with restoring the inheritance to an aristocrat—even if that mass support was based on the popular notion of "fair play" and an "alternative morality" (p. 56). Jon Lawrence, in his equally fascinating case study of Wolverhampton, explains working-class support for Conservatism by "a powerful suspicion of party organization and the party 'wire-puller'" that was channeled into support for "a new type of populist Tory politician" who could claim to be independent from the ruling Liberal apparatus. Yet Lawrence has to admit that this was not a particularly smart move on the part of Wolverhampton's workers, who were basically dazzled by antiestablishment rhetoric (p. 75, 84).

Ultimately, of course, the age-old question of reform or revolution (Whither Labor?) cannot and will not, be settled in a collection of essays. Nevertheless, political scientists interested in the history, ideology, and practice of the labor movement might miss in this volume sophisticated nods to industrial capitalism and system-transcending reforms. In my view, it is certainly not enough to laud Robert Knight's "instinctive libertarianism," as A. J. Reid does, by a simple reference to the contemporary British "practical experience" with "centralised welfare and nationalised industry" (p. 238).

The essays in this collection present a vital contribution to a general revision process under way in the fields of labor movement history and labor movement politics. Bolstered by a useful and sharp introduction, this book should interest both historians and political scientists working in those fields.

Rutgers University F. Peter Wagner

Of Time and Power: Leadership Duration in the Modern World. By Henry S. Bienen and Nicolas van de Walle. Stanford: Stanford University Press, 1991. 215p. $25.00.

The question of political survival—why some political leaders hold power longer than others—has been at the heart of political inquiry at least since Machiavelli penned *The Prince*. Although political survival has been the subject of a considerable amount of empirical investigation, this small but fascinating book is the broadest, most rigorous empirical consideration to date of the varying political life spans of national leaders.

The book is divided into two parts. The first part is a careful consideration of the possible effects of a number of factors on the political life span of individual national political leaders. The second part of the book presents the entire data set of 2,256 national leaders from the 167 countries upon which the study is based.

Using the statistical techniques of survival analysis as developed in demography, Bienen and van de Walle

draw upon two broad sets of variables to estimate political life spans. The first set of variables taps attributes of the leaders and the situations in which they found themselves. Here they recorded, for example, measures of age, temporal position in the leadership queue, whether the leader came to power by constitutional or nonconstitutional means, and whether they had a military or civilian background before coming to power. The second set is directed toward measuring characteristics of the leader's country and include, among other things, prior colonial rule, economic growth, income levels, the magnitude of ethnic conflict, and size of population.

The fundamental finding emerging from this study is simple, important, and intriguing. The best predictor of continued political survival is prior survival. Just as the cold, impersonal statistics of actuarial tables say, those who have survived have the best chance of surviving longer. There are some small wrinkles to this finding across different regions, but the result is generally robust.

Why is this the case? At least two possibilities present themselves. One is that those who manage to survive some minimal undetermined length of time successfully consolidate their power and use it to increase their tenure by suppressing the opposition and/or rewarding their supporters. The rival to this is a sort of Darwinian explanation in which "less clever leaders get winnowed out earlier" (p. 98). Although it is disappointing that Bienen and van de Walle do not pursue these two models of survival further, it is nonetheless encouraging that they are able to establish the basic accuracy of their empirical generalization across a broad spectrum of time and space.

The second part of the book reports in considerable detail the main elements of the data analyzed in the first part of the book. The data they report (understandably more limited than the total data set collected for the entire study) identify the state, its geographic region, the leader, the length of time the leader held office, the year of entry, whether entry/exit was constitutional, whether the leader was a member of the military, and how many separate times the leader was in power.

Although the data are extensive and carefully reported, they are not without their curiosities and problems. It is, for example, curious that although data for many Third World nations (particularly in Latin America) extend well back into the nineteenth century, the data for the developed nations typically begin in the early part of this century. Thus, O'Higgins' tenure in Chile is recorded beginning in 1817; but British prime ministers begin only with Balfour in 1905. No explanation is offered for this, nor is there any speculation on what effect such a gap might have on the findings.

Doubtless, anyone who is familiar with history will find things with which to quibble in the data. For example, is it accurate to regard the reign of Haile Selassie (1930–74) to have been uninterrupted, considering that he was forced into exile in London by the Italian occupation (1936–41)? Or can we consider Stalin as actually being the leader of the Soviet Union as early as 1924? Or how can it be recorded that de Rosas left power constitutionally in Argentina in 1852 when he fled after losing the battle of Caseros to insurgents abetted by both Uruguay and Brazil? There are a few other points on which the data seem questionable, but a data set of this sweep is inevitably open to doubt on the part of those with different information or views.

The limits of the analysis and a few problems with the data should not, however, obscure the fundamental contribution of this book to our understanding of political survival. Moreover, it points the way for further exploration of the data and the testing of a variety of models that may account for the differing fortunes of political leaders.

University of California, Davis RANDOLPH M. SIVERSON

Crossing the Industrial Divide: State, Society, and the Politics of Economic Transformation in Malaysia. By Alasdair Bowie. New York: Columbia University Press, 1991. 222p. $40.00.

Bowie has written an intellectually stimulating case study with interesting conclusions that are relevant to a larger sample of countries. In this book, he sets for himself the task of explaining how and why development strategies change in late-industrializing, ethnically divided, Third World nations. In Malaysia (the case he considers), development strategy has changed from a market-led approach during the country's first decade after independence (1957–69), to a mixed market–regulatory policy during the 1970s, and finally to a state-centered strategy for most of the 1980s.

In seeking an explanation for these changes, Bowie first reviews the literature on industrial policy choice in Europe and finds that extant explanations for policy change have little to offer for an understanding of the Malaysian case. Explanations that look to the material interests of actors (whether individually or aggregated in the form of the usual intermediate associations) cannot explain policy change in cases where the principal actors have in common their communal, not material, interests. These communal interests combine diverse material interests and cross class lines. Structural explanations emphasizing either domestic or international factors are inadequate, since the major policy changes occurred in 1970 and 1980 without any corresponding or precipitating structural changes. Likewise, a political culture framework is found to be inappropriate for explaining change that occurred within one generation in a single country.

With the literature derived from the European experience unable to explain his case, Bowie returns to, and reformulates, a more societal-based explanatory framework. In this effort, he joins other recent graduates of the University of California, Berkeley in providing a needed corrective to the more state-centered approaches to explaining Third World developments. This seems especially appropriate for the study of the rapidly industrializing parts of Southeast Asia, where the state has generally not been as central to industrialization as elsewhere in Asia. Bowie's position is that "changes in Malaysian economic development strategy can best be explained as products of the changing nature of a communal settlement that has prevailed in Malaysia since 1957" (p. 9).

The original settlement, engineered by the British at the time of independence, gave the Malays control of the political system. In exchange, the Malays agreed to accept the ethnic minorities as legitimate residents of Malaysia and not to use their control of the state to

challenge minority economic interests. During this market-led period, the Chinese and foreign-owned corporations flourished.

A market-led development strategy did not, however, advance Malay interests, especially those of the poor. This contributed to the 13 May 1969 communal violence, which, in turn, contributed to the revision of the communal agreement and the emergence of the New Economic Policy of the 1970s. In effect, the result was a mixed market, regulatory, affirmative action program for the Malays.

The next shift in policy in 1980 led to a far more activist, state-led process of heavy industrialization. The economic justifications for this policy shift are acknowledged, but Bowie argues for the importance of political considerations. In essence, the Mahathir government, given its ethnic base, was sufficiently independent of Chinese economic interests to use state power to promote a Malay-controlled set of heavy industries.

This last portion of Bowie's argument is less well substantiated; the evidence of Malay pressure for a more activist government role is less clear than in the earlier, 1969 period of communal violence. Since his explanatory framework looks for causal variables in society, it would have been helpful to see more evidence of how the Malay community influenced their communal leadership. Lacking this kind of supportive evidence, the reader is left to speculate about governmental claims to be advancing communal interests. This becomes more important in the light of scholarship such as that of Jomo Kwame Sundaram, which asserts that a Malay administrative elite has, since the end of British colonialism, used its position in government to transform itself from a "statist petty bourgeoisie into a statist capitalist class accumulating on the basis of control of state power" (*A Question of Class* [1988], 289).

Thus, for the Malaysian specialist, Bowie's book will leave unanswered the question of who are the primary beneficiaries of policy choice. However, Bowie's goal was not to write a political economy of policy outcomes. He wanted to explain policy choice, and his major contribution is to the scholar interested in the comparative political economy of development in the Third World. For this audience, Bowie has written a persuasive—even compelling—argument that we must be more sensitive to societal explanations for policy choice, especially in ethnically divided nations.

Ohio University GARY HAWES

Shaping the Political Arena: Critical Junctures, the Labor Movement, and Regime Dynamics in Latin America. By Ruth Berins Collier and David Collier. Princeton: Princeton University Press, 1991. 877p. $75.00 cloth, $19.95 paper.

This is a monumental work, a tour de force. It is one of the most important books in the field of Latin American politics in several years. The "Collier thesis" will now have to be confronted by all students of the role of state–labor relations in political development.

The Colliers emphasize the type of labor incorporation as a key to the modern political trajectory of developing nations. That focus is convincing, whether explaining the phenomenon of Juan Perón in Argentina or Salvador Allende in Chile. To make their case, the authors use the comparative historical method to provide excellent coverage of eight countries. Their achievement will be welcomed by historians and sociologists, as well as political scientists. It will make valuable reading for scholars concerned with democracy, dictatorship, corporatism, the state, political parties, or trade unions.

Their central argument is that countries differ significantly as to whether the working class was incorporated by the state or by political parties. Whether labor was admitted to the political arena under government control or through mass mobilization set in motion a distinctive sequence of conflict and accommodation. The initial period of institutionalization and legalization constituted a "critical juncture." It followed a spurt of reform and tended to crystallize certain types of political parties and systems. That period of assimilation was succeeded by predictable political consequences in the short-term "aftermath" and long-term "heritage." The Colliers trace these processes both from the top down and from the bottom up. They do so in the eight Latin American countries with the strongest development of an urban working class. They place those cases in the context of very wide reading on comparative politics and labor movements in other parts of the world.

Their classification of cases is surprising, provocative, and fruitful. The Colliers cleverly juxtapose similar patterns in different countries in different time periods. (For example, for labor incorporation under authoritarian rule, the 1920s in Chile resembled the 1930s in Brazil.) Although bound to be controversial among country specialists, their typology will change how scholars think about the timing, sequence, and direction of alternative paths to development in Latin America. The Colliers establish four categories: (1) state incorporation (Chile and Brazil); (2) electoral mobilization by a traditional party (Uruguay and Colombia); (3) labor populism (Peru and Argentina); and (4) radical populism (Venezuela and Mexico). These four contrasting modes of bringing labor into legitimate politics produced, respectively, (1) multiparty polarizing systems, (2) electoral stability and social conflict, (3) a stalemated party system, and (4) an integrative party system.

These pairings illuminate unusual parallels between political systems. Although Chile possessed much stronger parties and democratic traditions than did Brazil, both countries underwent political polarization and fragmentation that ushered in durable antilabor authoritarian regimes. Uruguay succumbed to military dictatorship longer than did Colombia and suffered less private violence, but both maintained electoral domination by multiclass parties with weak links to labor organizations. Although highly different economically and ethnically, both Argentina and Peru saw their attempts at working-class incorporation result in the banning of the major labor parties and the repeated breakdown of democratic governments. Meanwhile in oil-rich Mexico and Venezuela, although the first was a one-party and the second a two-party system, unions in both cases were tied to centrist parties and became stabilizing influences. By spotlighting these similarities between otherwise contrasting political histories, the Colliers underscore the autonomy of some political factors and the decisiveness of the form of integration of trade unions.

The only drawbacks to this book are the excessive length and repetition, as well as the imprecision of some of the organizing concepts. Particularly fuzzy are the different historical stages and, above all, the notion of

critical juncture. It is difficult for an objective observer to determine when such an inflection occurs, what causes it, how long it lasts, and what it produces. Although the authors make a convincing case that such watersheds, or turning points, profoundly affect political development, they are unable to sharpen its definition much beyond "a period of significant change" (p. 782). Their identifications of critical junctures in each country case are persuasive, but the concept remains slippery and elusive as a traveler across borders in comparative politics.

Quibbles aside, this extraordinary synthesis will stand as a starting point for Latin Americanists for many years. For students of other world areas, it should be a major source of reference and debate. As a bonus, the authors provide an appendix listing all the heads of state since 1900 and a stupendous bibliography of secondary sources. This book is further enhanced by the clarity of the writing and arguments. It will undoubtedly find its way into many libraries and classrooms.

University of California, San Diego PAUL W. DRAKE

The Accidental Proletariat: Workers, Politics, and Crisis in Gorbachev's Russia. By Walter D. Connor. Princeton: Princeton University Press, 1991. 374p. $39.50.

In the political section of a March 1992 issue of the *Independent Newspaper*, a Russian biweekly, the respected labor sociologist, Leonid Gordon, asks a question whose answer is likely to be of central importance in determining the outcome of political reforms now underway in that country: "With tough reform days ahead, whose side will the workers take?" Walter D. Connor's excellent study of the emergence of a Soviet working class and its implications for politics in the former USSR does not try to offer a definitive answer to this question, but it does provide us with the best basis to date for informed speculation.

A key to Connor's thesis can be found in the title of his book. He contends that industrial development under Stalin unintentionally, but inexorably, created a social basis for the emergence of a genuine working-class movement in the USSR. In the post-Stalin period, the hereditization and greater education of workers made possible by industrialization laid the seeds of a class consciousness that began to germinate under Khrushchev and Brezhnev but came to fruition only in the Gorbachev era. According to Connor, the Soviet proletariat had gradually come to realize that their interests were subordinated to those of a new set of bosses, who claimed legitimacy by ostensibly ruling in their name. As they began to acquire consciousness of the division between "us" and "them," opposition along class lines became unavoidable, although it was rarely expressed openly until Gorbachev's leadership. That the Soviet proletariat acquired *class* characteristics, despite every effort by the regime to ensure the opposite, leads Connor to label them "accidental." That they are finding their voices at a time of great economic trouble could seriously complicate the introduction of market-oriented reforms, many of which can easily be portrayed as "antilabor." This is what gives particular significance—even urgency—to Gordon's question and to Connor's book.

The theoretical framework for this work is minimal and employs the four criteria for class consciousness set forth in Michael Mann's *Consciousness and Action among the Western Working Class* (1973). After a historical overview of the Stalin years, Connor examines Soviet labor policies and practices from 1953 to 1988 for evidence that these criteria are becoming apparent. Most of the book is given over to chapters detailing worker career patterns, wage equalization, employment, and control of the workplace. In each case, the reasons for growing worker dissatisfaction are shown; and Connor makes a convincing case that class identity and class opposition were well advanced even before *perestroika* and are only likely to be accelerated by the economic reforms currently under way. Particularly valuable is the extensive documentation of strike activity before 1985, which the author has compiled. The final chapter and an epilogue chronicle events through the spring of 1991.

To say that the theoretical framework is minimal is not to say that the book is ill-informed theoretically. The author is clearly aware of the controversy over state-versus-society-based explanations for political change in the former Soviet Union. Although the weight of the analysis is intended to show that long-term societal transformations are driving contemporary political change, Connor is not unmindful of the particular role played by the state in the Soviet context (p. 6). The state's ability to manipulate the terms of the "social contract" or, when necessary, to employ coercion account for the general absence of a politically active working class prior to 1985.

The information on which this book is based comes not from extensive field research (a brief visit to Moscow in early 1988 is noted) but from a magisterial review of Russian- and English-language source materials. As a result, the picture we get of the Soviet blue-collar worker lacks the feel of the shop floor, although Connor makes good use of anecdotal material from published sources. In its place is a surfeit of descriptive and statistical information—meticulously noted, but often leavened only by the author's felicitous writing style. This is not a book for the casual reader.

I find Connor's central thesis persuasive and of critical importance for anyone who wants to understand Russian politics today. One may differ, however, with Connor's emphasis on what might be called blue-collar conservatism. He pays considerable attention to the right-wing United Worker's Front and to the attempt of the older trade unions to create a new constituency among the workers by appealing to antimarket populist sentiments. He also finds relations between workers and intellectual reformers characterized chiefly by mutual antipathy (pp. 227–29). Much less space is accorded to proreform worker movements. If, as Connor frequently points out, most of the voting-age population are workers and if there is, indeed, hostility among workers toward reformers who favor market solutions, why did the UFT, and conservatives generally, not do better in the elections of 1990? And why did Yeltsin win 54% of the presidential vote in 1991?

The article from which Gordon's question is quoted portrays a more differentiated proletariat than does Connor's book—a proletariat in which support for democratic market reform is at least as strong as opposition to it. This, of course, does not contradict Connor's main thesis of an emergent and politically relevant working class. But if Gordon is right, our assessment of how that

working class will affect Russian politics would be more hopeful.

Villanova University JEFFREY W. HAHN

The Invisible State: The Formation of the Australian State, 1788–1901. By Alastair Davidson. New York: Cambridge University Press, 1991. 329p. $65.00.

This account of Australian state building is likely to be controversial. Alastair Davidson uses conceptual tools forged in the thought of Antonio Gramsci and Michel Foucault, among others, to move beyond a more traditional descriptive approach to political history. He focuses on the production of citizens in Australia and how this particular citizenry shaped the political institutions that ultimately emerged. In a striking conclusion, Davidson argues that the result was and is an Australian state that lacks popular sovereignty and consequently is not a democracy.

His chronological presentation begins with the conditions in England leading to the use of Australia as a penal colony. Two groups not usually considered central to state building are highlighted: the criminal class that grew up around the perimeter of London (to which most of the transportees belonged) and the theorists and administrators of punishment, who were responding to the growing problem of crime. It was from the descendants of these two groups—the convicts and their jailers—that the raw material for Australian citizens would be drawn. Consequently, the particular cultural and political values of these groups became the British legacy shaping Australian political development. The values that went across the Indian and Pacific oceans to Australia were not the same as the fear of strong government and commitment to personal rights that came across the Atlantic to the United States. This is at the root of why Americans revolted and insisted on popular control of government, while Australians, ultimately, did not.

Given these beginnings, it is not surprising that the process of colonization and expansion was unique. In a community where control had traditionally been the first concern, the freedom implied by a frontier posed problematic issues of personal responsibility, property, and even family structure. Davidson describes how these issues became administrative concerns, resulting in the authoritative construction of everything from work habits to marital relations. Against this background, various segments of Australian society vied for power as political institutions evolved during the nineteenth century. The result was that the inherently hegemonic place of the law in a prison was transformed into a traditionally hegemonic place for the people involved in the judicial system in the postprison community. Lawyers emerged as the dominant group in Australian public life; and in a series of conflicts leading up to the Constitution of 1901, the relative place of political and legal authority was established, effectively carving out a space for political activity while maintaining the dominance of the law. Even in the central political document establishing the state, the long arm of the law was institutionalized; for leaving critical issues of authority vague left ultimate sovereignty to the courts.

Davidson has made an important contribution to the state-building literature by using a general theoretical perspective to explore a unique historical case. Indeed, it inspires the kind of inconsistent criticism that only surfaces when a book is really worth reading. On one hand, the sheer volume of detail can be overwhelming, so that the multiple strands of the description do not always link up easily to the major thread of the argument. At the same time, it is impossible not to wish for more, especially more comparisons with other countries and more contrasts with related literature. The obvious comparison is with the United States, which also had a frontier and ended up with judicial review. Bringing wider experiences and theoretical concerns into the discussion could be valuable in many ways, however, for Davidson's work falls within the purview of some very significant efforts by other scholars. For example, consider the interesting questions that would be provoked by trying to situate the Australian experience into the framework used by Barrington Moore in *Social Origins of Dictatorship and Democracy* (1966) or by examining the early authority structure and relation of citizens to political organization in Australia and looking for parallel insights in the work done by Perry Anderson in *Lineages of the Absolutist State* (1975) and Reinhard Bendix in *Nation-building and Citizenship* (1964). Comparison with a nonrevolutionary change in state structure during the same time period like that described by Stephen Skowroneck in *Building A New American State* (1982) could address issues of continuity in the administrative side of state development.

These are, of course, unfair expectations; but it is important that this work not be classified as simply a history of Australia. The wider significance of Davidson's achievement is the way in which he supplies a new dimension to the discussion of fundamental issues such as political development, state formation, sovereignty, and democracy. These are complex and difficult issues; but when history and political science can be brought together to mine generally significant insights from unique cases like the development of the state in Australia, real progress can occur.

Pennsylvania State University JAMES L. CURTIS

The Japanese Voter. By Scott C. Flanagan, Shinsaku Kohei, Ichiro Miyake, Bradley M. Richardson, and Joji Watanuki. New Haven: Yale University Press, 1991. 497p. $45.00.

This book sets out to bring the study of Japan into the mainstream of cross-national and comparative research on voting behavior. Rather than treating Japan as the unique case of non-Western industrial democracy, the authors apply theories derived from Western Europe and North America to the Japanese case. It accomplishes, however, far more than being merely "Voting Behavior: The Japanese Case." In addition to applying European-style sociological models and American-style psychological models, the authors develop a *social network model* that owes its heritage primarily to Japanese studies. Though derived from Japanese studies, the social network model is also a comparative model, supported by evidence from Europe and North America and meant to be applied to voting behavior in any industrial democracy. Thus, the authors both apply Western models to Japan and also challenge Western researchers with a "Japanese" model.

The volume contains a trove of valuable insights into Japanese voting behavior, many of which also raise questions about Western voting behavior. Perhaps the most surprising findings concern family versus adult socialization. Miyake finds that "when parents' partisanship conflicts with one's group partisanship, the latter tends to prevail" (p. 210). Miyake's exploration of partisanship in Japan is also stimulating and informative on several levels. Less surprising are Kohei, Miyake, and Watanuki's findings on the effect of issues on the vote, concluding, "If over a quarter of the voters have no positions on the issues, over half are unable to identify any party that represents their views, and over three-quarters fail to link their issue preferences with the party they voted for, then it seems unlikely that a study of issues will contribute greatly to an explanation of voting outcomes" (p. 284). Watanuki's treatment of social structure and voting behavior provides an excellent analysis of the development of the postwar cleavage structure. Flanagan's final chapter uses the theories developed in the volume to analyze the most recent electoral results and to think about the future of Japanese politics.

The two most exciting chapters deal directly with the social network model. Although we do not, in the end, arrive at a coherent new model of Japanese voting behavior, we do make significant progress in that direction. The literature on Japanese politics contains many studies of social networks from the candidate's point of view. The picture we get from these studies is of a tightly knit, candidate-centered voting bloc (*jiban*) that effectively insulates the candidate from electoral tides. These two chapters give us the first systematic look at social networks from the voters' point of view and find little support for the picture of a highly organized hierarchical social structure.

Scott Flanagan deals with the mechanisms of social network influence on Japanese voting behavior, distinguishing assimilation effects, reference group effects, opinion leader effects, and mobilization effects. He finds that "Japanese social networks will in many cases supply an apolitical voter not only with name recognition and a favorable image for a particular candidate but also with a strong motivation to vote" (p. 158). Bradley Richardson analyzes influence communications and finds that "the choices of roughly one-quarter to one-third of the Japanese electorate are directly affected in some way by influence communications processes in House of Representative elections" (p. 355). Not only are these proportions smaller than the literature had led us to expect, but candidate images prove more powerful than personal requests. In the 10% of the cases in which there was a conflict between these two forces, "candidate images prevailed over requests three times as often as requests overwhelmed candidate images" (p. 361). Candidates may have effective organizations but they seem to consist of activists and opinion leaders and do not include a large number of loyal voters.

These findings bring our image of the Japanese voter closer to our image of voters elsewhere. Instead of a "feudalistic" personality imbedded in a social structure so tight that it often renders individual preferences irrelevant, the Japanese voter emerges as relatively unconcerned about politics, with political beliefs and behavior influenced by many different factors. The picture that emerges is complex and not particularly complimentary but is completely recognizable as a variant on the theme of voting behavior in industrial democracies.

University of Alabama STEVEN R. REED

Parties and Voters in France. By John Frears. New York: St. Martin's, 1991. 240p. $49.95.

For the first 20 years of its existence, the French Fifth Republic was regarded suspiciously by domestic and foreign observers: How could a political system so deliberately shaped to conform to the political philosophy and skills of one man—Charles de Gaulle—survive the disappearance of that great man and his immediate successors? Well into the second decade of its existence, many still talked of the Fifth Republic as only a "parenthesis" in the history of French democracy. However, in the last 10 years, the regime has successfully met two key challenges: the transfer of power from the Gaullists and their allies to the Left and the division of power (*cohabitation*) of a president and the parliamentary majority from political adversaries.

In his latest book, John Frears points to these events as confirming conclusively the strength and durability of the regime and the breadth of cross-partisan support for the institutions of the Fifth Republic. He suggests that this may very well end the kind of regime instability that has characterized French political history for the past two hundred years. He argues that the consolidation of an effective and simplified party system played a major part in these successes. Frears points to the emergence of parties with the capacity to form and support governments in power as the major innovation of the Fifth Republic and the source of the strength of its institutions. He argues, further, that it was the transformation of the Gaullist party from one of personal supporters of General de Gaulle into a large, catch-all party that brought together almost all the previously contentious strains of the French Right and Center. The early successes of Gaullism created a "majority habit" that compelled opposing parties to unite and seek to develop their own majoritarian potential. Thus, Frears sees the changes in the Right as pressing the parties of the Left to change and to unify.

After presenting these arguments in a persuasive manner, Frears then provides separate chapters treating the background, policy positions, electorates, and organizational structures of the politically significant parties and party coalitions of contemporary France. Frears includes discussions of some parties that are relatively neglected, such as the French Greens. Later chapters describe the rules and procedures for presidential, parliamentary, and local elections and referenda and give brief descriptions of the issues and major contenders in each national election since 1958.

Frears' contentions about the importance of party change in explaining the success of the Fifth Republic and the key role of the Gaullists in bringing about these changes are briefly but persuasively presented. However, the major strength of this book is the valuable resource it offers students and scholars on the overall party system and election scene in France. It is the only up-to-date general survey on this subject in French or English. It is clearly written and accurate. The chapters on the individual parties are rather short; and a longer bibliography would have been helpful in directing those

who need more information to more comprehensive studies.

This is not a book that applies sophisticated theories on political parties to France, nor does it report on important new field research. Specialists on French politics will find little new. But the Frears book does do something that we sometimes neglect in American political science by providing a reliable, readable, and thoughtful synthesis of the theoretical and empirical research on a key set of political actors. As such, *Parties and Voters in France* will serve as a valuable resource for students and scholars.

Purdue University FRANK L. WILSON

Revolution and Rebellion in the Early Modern World. By Jack A. Goldstone. Berkeley: University of California Press, 1991. 608p. $34.95.

Living in an age when new-style revolutions have toppled regimes from Bucharest to Budapest, we find ourselves once again (as in the days of Vietnam) seeking to explain why and how revolutions occur. Familiar theories of imperialism (Eric Wolf, James Scott), class conflict (Barrington Moore, Jeffery Paige), relative deprivation (Ted Gurr, James Davies), or state incapacity (Charles Tilly, Theda Skocpol) seem less applicable to the revolutions of 1989 than to the "great revolutions" that occurred earlier in this century. Perhaps our models of revolutionary change will have to become more historicized, more tailored to the specifics of different periods and cultures.

Jack Goldstone, in his stimulating study of revolution and rebellion in early modern Europe and Asia, makes a similar point. He notes that most theories to date have been "concerned with explaining twentieth-century revolutions, in which the collisions of international colonial and economic forces with traditional regimes played a major role. . . . The theory of revolutions has yet to address early modern political crises in their own right" (p. 23). Goldstone further criticizes previous work for neglecting "the impact of cultural differences, without which one can hardly comprehend the varying effects of state breakdown in early modern Europe and Asia" (p. 23).

For his own part, Goldstone offers a "demographic/structural model" of state collapse, arguing that revolutions occurred when population pressures overwhelmed intransigent political, economic and state institutions. This is not crude Malthusianism; Goldstone concentrates on "the *distributional* effects of relative shifts in population and resources, rather than on massive shortages for whole societies" (p. 37; emphasis original). Moreover, he sees population pressure as developing in a pattern of recurrent waves (driven by changes in climate, disease, food supply, etc.), rather than in linear fashion.

Goldstone's focus on early modern uprisings, on ecological crises, and above all on European–Asian comparisons (the English Revolution, the French Revolution, the crisis of the Ottoman Empire, and the transition in Ming–Qing China) brings a fresh perspective to the study of rebellion and revolution. The chapters on England and France are impressively detailed, presenting both qualitative and quantitative evidence to raise questions with prevailing scholarly interpretations of these familiar events. The analysis of the Ottoman and Chinese Empires, though less original, is useful for further debunking the old myth of an East mired in stagnation while progressive revolutions in the West gave rise to democracy and capitalism.

Insightful as his approach is for the study of early modern rebellions, Goldstone seems overly anxious to extend its applicability across time and space. Area specialists will surely shudder at his claim that "the states of early modern Eurasia—including the European monarchies, Russia, China, the Ottoman Empire, and Japan, in roughly the sixteenth through the nineteenth centuries—were not greatly different from each other" (p. 4). And historians are likely to recoil from the temporal leap involved in the assertion that "the study of early modern history suggests that the current U.S. course [of failing to reduce consumption] will lead to heightened factional conflict and economic weakness" (p. 496). Greater attention to the peculiarities of different periods and places would have strengthened, not diminished, the overall impact of the book. As it is, the concluding chapters (one on ideological and cultural factors, the other on lessons for the present) seem like afterthoughts, intended to stretch the conclusions of the study beyond their legitimate boundaries.

Whether or not this volume has much to tell us about the current fiscal predicament of the United States or, for that matter the revolutions of 1989, it is in any case a major contribution to our understanding of earlier uprisings. While other scholars (most notably members of the Annales school of French history) have shared Goldstone's interest in demography and ecology, none has developed the analysis in such rigorous fashion. This is an important book from an innovative and broad-gauged scholar. It belongs on the reading list of anyone interested in the dynamics of revolutionary change.

University of California, Berkeley ELIZABETH J. PERRY

Public Choices and Policy Change: The Political Economy of Reform in Developing Countries. By Merilee S. Grindle and John W. Thomas. Baltimore: Johns Hopkins University Press, 1991. 222p. $38.50 cloth, $13.95 paper.

Ideas and Institutions: Developmentalism in Brazil and Argentina. By Kathryn Sikkink. Ithaca: Cornell University Press, 1991. 263p. $35.00.

Political and economic upheaval have refocused attention on the origins and determinants of major policy shifts; and growing dissatisfaction with reductionist, often agentless explanation has reawakened interest in the roles of individual policymakers and the ideas and values they hold. The timing is therefore auspicious for the publication of this pair of first-rate books, both of which (despite differences in emphasis and intended audiences) address these critical subjects. As Kathryn Sikkink observes, "It is a paradox that scholars, whose entire existence is centered on the production and understanding of ideas, should grant ideas so little significance for explaining political life" (p. 1), while Merilee Grindle and John Thomas note that despite their absence from many explanations of policy reform, "people . . . change policy, and do it from motivations and perspectives that are imbued with personal and profes-

sional values that frequently include serious concern for the public interest" (p. xiv).

Both books seek to explain where policymakers' ideas come from and how and how much their ideas and actions shape outcomes. Both offer similar criticisms of existing approaches: societal (class, pluralist, public choice), statist (state autonomy, bureaucratic politics), and rational choice. In general, the authors conclude, such arguments are meaningless without reference to, as Sikkink (p. 243) puts it, the ideas "without which no understanding of interest is possible"; or else they fail to account for the significant room for maneuver that policymakers possess or for how policymakers choose among options within it. Neither Sikkink nor Grindle and Thomas dismiss these approaches entirely or treat ideas and individuals as fully autonomous. Instead, they fashion arguments that locate policymakers, their ideas, and their motivations within historical, institutional, and societal settings, permitting us to assess how specific policymakers come to decisions about specific policies and how and how fully they succeed in implementing their choices, given state institutional capabilities and state–society relations.

Of the two books, Sikkink's *Ideas and Institutions* has the wider academic appeal, fitting neatly into the growing literature devoted to "bringing ideas back in," where it compares well with the work of Ernst Haas, Peter Hall, Aaron Friedberg, and John Odell. Sikkink poses two questions: "Why were similar developmentalist policies adopted by Brazil and Argentina [in the 1950s and early 1960s]? and why did these economic policies have such different outcomes?" (p. xiii). *Ideas and Institutions* offers an excellent study of a critical era in the history of two major Latin American countries during which their development trajectories diverged sharply in ways which still shape their capacities to implement structural adjustment. Sikkink draws on extensive archival research and interviews with many of the key figures. Finally, as befits a book about ideas, *Ideas and Institutions* is gracefully written. Sikkink shows a nice ability to bring high-flown analysis back to earth with a single, telling observation.

Sikkink begins with a précis of her argument and a review of alternative explanations and then moves to a fascinating intellectual history of developmentalism in Latin America as a whole and Argentina and Brazil in particular. The chapters on the developmentalist experiments in each country offer cogent explanations for the very different ways in which developmentalism was adopted, implemented, and consolidated in Argentina and Brazil and challenge pat understandings of this period. In fact, for Latin Americanists, Sikkink's major contribution may be her richly documented addition to our knowledge of this critical, but underresearched, subject. Not content to discuss ideas in isolation, however, Sikkink devotes two chapters to where developmentalist ideas lodged in the Argentine and Brazilian states and to "how differences in state autonomy, state capacity and state purpose influenced the implementation of developmentalist policies" and thus explain "the different economic and political outcomes" (p. 28). A final chapter returns to the role of ideas and the problems of constructing explanations that capture the recursive relationship among objective conditions, material interests, and actors' ideas.

While very good, *Ideas and Institutions* has faults. Perhaps most important, Sikkink does not always demonstrate the need to turn to ideas when more parsimonious explanations exist. She expresses surprise, for example, that Argentine industrialists failed to support the Frondizi government, which was, she asserts, "firmly committed to industrial development," a failure attributed to the distorting "lens" of industrialists' "prevalent ideology" (p. 108). Conversely, she ascribes Brazil's greater success to the support of industrialists who shared the Kubitschek government's developmentalism. Yet Sikkink notes that Frondizi's industrial policy called for a 50% cut in import taxes, which threatened inefficient Argentine firms (p. 109), while Kubitschek's tariff policy called for "strongly protectionist . . . new rates," which protected domestic industry (p. 142).

Though they, too, have academic readers in mind, Grindle and Thomas address themselves first to practitioners. They endeavor to provide a model of the policy reform process in order "to enable policymakers better to manage implementation" (p. 122). They offer not a predictive theory of policy reform but a "framework" that "systematizes thinking" and maps out "the intuitive knowledge of skilled policymakers and public managers" (p. 187). To illustrate their story, Grindle and Thomas use "mini-cases" of policy reform from a variety of Third World countries. They thus achieve that rare hybrid—a readable fusion of abstract argument and nitty-gritty detail that should interest and enlighten students, academics, and policymakers alike.

Public Choices begins with a generic picture of government decision making in the Third World and a critical review of the literature, whose aim is to show that reform is the norm, not the exception, and that policymakers are more autonomous and possess more room for maneuver than is generally conceded. The book then follows the policy process from start to finish, seeking to specify what accounts for variation. Thus, having identified environmental factors and personal characteristics affecting policymakers, Grindle and Thomas analyze agenda setting, focusing on the implications of crisis versus "politics-as-usual." They go on to analyze how these differences shape the decision process in light of the public and bureaucratic characteristics of specific reforms. Finally, they apply their model to the dramatic reforms of the 1980s and "test" it (though this is too strong a word) in 14 mini-case studies.

Public Choices, too, has faults. The dependence on mini-cases is methodologically suspect. They are at best illustrative and cannot provide a test of the authors' propositions. Moreover, their cumulative effect leaves the impression that each situation is unique and that generalization is impossible. This impression is reinforced by the authors' model, which is as complex and ambiguous as reality itself, since it includes, just by way of scene setting, the "ideological predispositions, professional experience and training, memories of similar policy situations, position and power resources, political and institutional commitments/loyalties, and personal attributes and goals" of policymakers and the "societal pressure, historical context, economic conditions, international context, administrative capacity, and other policies" that constitute the context of any given policy choice (p. 184). In other words, while this model may permit the descriptively accurate categorization of all the elements of completed reform initiatives, it possesses no *explanatory* power for an academic analyst and limited utility as a guide to practitioners.

Their problems notwithstanding, these are important,

informative, and compelling books. Sikkink must be congratulated for her excellent paired case study and for her contributions to the intellectual history of Latin America and to the effort to understand how and under what conditions ideas shape policy outcomes. Grindle and Thomas offer a critical reminder of the role individual policymakers play not as "creatures of the societies or classes from which they come" (p. xii) but as leaders in the proper sense of the word. Their work should, as they hope, "help generate principles of action for reform leadership" (p. 193) and challenge scholars to look beyond the obstacles to change and engage the reforms that are transforming the Third World.

Rutgers University D. MICHAEL SHAFER

Public Enterprise in Kenya: What Works, What Doesn't, and Why. By Barbara Grosh. Boulder: Lynne Rienner, 1991. 223p. $32.00.

African Successes: Four Public Managers of Kenyan Rural Development. By David K. Leonard. Berkeley: University of California Press, 1991. 406p. $55.00 cloth, $18.95 paper.

Kenya has long been considered a development success story on a continent where most other countries have recorded negative economic growth and significant cutbacks in social development programs. Using a cross-section of economic and social indicators listed in the annual *World Development Report* (published by the World Bank) as the measuring rod, Kenya comes out among the top five African countries in almost all instances. More recently, however, questions have been raised about the solidity of the Kenyan successes. The increasingly autocratic and corrupt nature of Kenyan politics under President Moi has left many admirers of the country's proud development record in doubt about the prospects of keeping it alive in the 1990s. In late 1991, Kenya's principal donors took the unusual step of freezing their development aid for six months or until they see proof that President Moi has introduced democratic reforms and curbed the widespread corruption in the public sector.

The two books under review here help us understand many of the reasons for Kenya's progress but also draw our attention to how arbitrary and ill-conceived decision rules have increasingly come to threaten further advancement. Both authors assume that the human factor is important in development and provide convincing evidence that what public managers do makes a difference. This emphasis on agency, rather than structure, is refreshing and provides a useful counterpoint to the overwhelmingly structuralist interpretations that have for long dominated the literature on Kenya and other African countries.

Barbara Grosh's study covers the operations of 32 public enterprises over a 25-year period (1963–88). The sample contains almost all the firms that depend on revenue from sales and that are overwhelmingly state-owned. It includes enterprises serving agriculture, finance, and development finance institutions, as well as parastatal enterprises providing infrastructure services.

The principal conclusion of her study is that public enterprises in Kenya work remarkably well. She questions, therefore, the validity of the prevailing opinion in the Kenya government, as well as among donors, that they constitute a major problem. In her view, there is cause for neither extensive privatization (as the donors insist there is) nor greater political control (as the Kenya government believes is necessary). To be sure, not all enterprises operate equally well; but the reason for poor performance is typically external, not internal, to the enterprise. A main culprit is the government itself, by setting prices or insisting on decision rules that leave management without a chance to run the enterprise in the black. Kenya's parastatal managers, therefore, are not villains but victims of circumstances beyond their control. With greater sensitivity to the commercial needs of these enterprises, the Kenya government could provide them with a much more enabling environment.

Grosh has no major theoretical pretensions in her study. It is a down-to-earth examination of a long series of financial records. Its principal value is twofold. The prevalence of public enterprises in African countries notwithstanding, few independent studies have been done of these institutions. To be sure, there have been several public inquiries and reviews; but largely because of difficulty of access to relevant records, only a small number of academics have tried their luck in this field. Thus, Barbara Grosh's study is filling a vacuum. Second, her pioneering effort is enhanced by the comprehensive and longitudinal nature of the investigation. The result is a more nuanced picture of these enterprises and a greater appreciation of the many factors that shape their performance.

The flip side of the extensive examination of performance records is, of course, that the author has no time to carry out any in-depth study of the many cases she includes: statistics are speaking for themselves. One wishes that Grosh had provided her readers with more feeling for the reliability of the records she examines. Another criticism I have is that she fails to recognize that the conclusion she draws about the variable performance of these enterprises and the constraints placed on "heroic" managers echoes concerns expressed by these managers for over two decades now without any effective reforms having been taken. For example, a closer examination of the published records of the seminars held in the 1960s and 1970s under the auspices of the African Association of Public Administration and Management and its precursor, the Inter-African Seminar of Public Administration, would have placed the analysis in this study in a better historical perspective.

Fifteen years ago, Leonard made a major contribution to the field of development administration with his *Reaching the Peasant Farmer*, a systematic study of the agricultural extension service in Kenya's Western Province, using hypotheses derived from organization theory. With *African Successes*, he confirms his position as one of the leading scholars in this field. This study, however, is very different from his first one and contrasts also with that of Grosh. Using the life stories of four exceptionally successful public managers, Leonard explores the reasons for Kenya's positive development record since independence. Thus, he is this time more concerned with generating, rather than testing, hypotheses. This inductive approach leads him to two major conclusions: (1) that Kenya's advance can be attributed to the emergence of a class of independently wealthy people based in agriculture, rather than in urban-based enterprises, and (2) that professionalism makes a difference and needs to be carefully nurtured.

Leonard's book is not your usual political science text.

Though bold and imaginative, his methodology in the end earns him a lot of empirical mileage. With the help of some three hundred intensive interviews (some lasting almost a whole day) with the four principal personalities of this study and their relatives, friends, and former colleagues, he is able to provide a unique and fascinating insight into how policies were made in Kenya and what factors seem to have shaped the evolution of its politics. In weaving together the innumerable threads that his study engenders, Leonard moves in a masterful manner back and forth between the micro and macro levels of his analysis.

The author never gets lost in his rich empirical material. The book is very well organized. A principal set of arguments is consistently pursued. To make his story as readable and accessible to as broad a readership as possible (a gesture that few academics make), Leonard relegates his quantitative analyses to two appendixes. The result is that when you come to the end of the book you realize that you have a human interest story and an academic treatise in one, perfectly merged. This is a mark of outstanding scholarship, rare among even the more experienced and meticulous.

There is so much about this unusual book that one would wish to discuss, but suffice it to say that it is of interest not only to scholars in development administration. It makes a contribution in its own right to the study of Kenyan politics and also, albeit more distantly, to broader concerns of comparative politics at large. One also wishes that as many political scientists as possible get a chance to become familiar with his methodology, including his choice of emphasis on "deviant cases."

The latter is obviously not uncontroversial. What conclusions can one really draw from, in this case, the lifetime achievements of four public managers who stand out as different by virtue of their professionalism and leadership abilities? Leonard may be accused of overdramatizing the significance of his conclusions, particularly as they relate to the managerial significance of "pockets of professionalism" in the contemporary African developmental context.

This and other criticisms notwithstanding, Leonard's book must be counted as one of the most thorough and best-crafted studies by an Africanist political scientist in recent years. What is more, its significance and value transcends the boundaries of African studies.

University of Florida GORAN HYDEN

Free to be Foolish: Politics and Health Promotion in the United States and Great Britain. By Howard M. Leichter. Princeton: Princeton University Press, 1991. 281p. $35.00.

Doctors and the State: The Politics of Health Care in France and the United States. By David Wilsford. Durham, NC: Duke University Press, 1991. 355p. $49.95 cloth, $19.95 paper.

Whenever governments intervene in a policy area, they encounter complex webs of technical, economic, and political interrelationships. All these factors are present at an extraordinary level in the health policy arena. Governments confront well-organized and powerful interest groups of health care providers. They must also confront powerful funding agents for medical care. The politics are no less intense when government itself is the principal funder of medical care. Increasingly, government also confronts interest groups attempting to redefine the very nature of health care and to redirect the attention of well-structured, functioning policy communities. Understanding these relationships between state and society is important within any one country; but to conduct the analysis comparatively presents a much greater opportunity for developing political theory, as well as generating more real substantive knowledge about the policy area.

The two books reviewed here make significant contributions toward an enhanced understanding of the changing role of government in health care. David Wilsford's *Doctors and the State* discusses the more conventional question of the confrontation between the power of the state and that of the organized medical professions. Howard Leichter's *Free To Be Foolish* addresses the less frequently discussed issues of the role of the state in health promotion and the use of its power to make individual citizens behave differently to improve their own health. While the subject matter may appear somewhat different, the fundamental questions raised by the two volumes are really very much the same. One question is how the state can exercise its power effectively to improve the health of its citizens. The other question is the normative one of the appropriate role of government in altering behavior of both providers and consumers. Does the financial power, combined with its substantive knowledge, justify government's substituting its collective judgement about health for that of individuals?

My saying that the Wilsford book addresses a rather conventional question is not intended to denigrate this volume. The question is a familiar one, but this is an excellent treatment of the subject of the relationship between government and the health professions. The discussion extends the usual arguments to examine a range of connections between state and society. The selection of the United States and France as the two cases appears to make the question of state power versus professional providers too obvious for the researcher and reader; and to some extent it does. However, the author pursues the implications of the differential power of the state in interesting ways and also points out many of the subtleties of the two political systems. This is especially true in the case of France. In particular, Wilsford points out that the (relatively) strong and autonomous state in France is not omnipotent and cannot guarantee policy success, as the characterization of the "continuity of crisis" in French health care indicates. In addition, the two-country comparison is extended to include four other systems with varying degrees of government involvement in the provision of health care. This extended comparison helps to clarify the author's findings for the two major cases.

As noted, Howard Leichter addresses a somewhat more novel question of the role of the state in modifying individuals' behavior that can affect their health. It is hardly news that a great deal of an individual's health and well-being is a function of life-style. The question is whether government should encourage or require people to change unhealthy life-styles. Not only can government be seen to have some moral responsibility to improve the health of its citizens, it has a real financial stake as a major funder of health care (even in the United States) to reduce illness. These claims must be set against the claims of individuals for personal autonomy

and individual freedom. These conflicting claims have very direct life-and-death importance in health care; but analogous conflicts can be pointed to in other policy areas in which government can be argued to be producing a merit good (e.g. education or the environment).

Leichter also bases his analysis of health policy on the comparison of two countries: the United States and the United Kingdom. He discusses an interesting and significant range of health issues, ranging from smoking to AIDS. Here, the findings are somewhat different from those in Wilsford's book, with the United States' being somewhat more interventionist and the British government tending to rely more on voluntary agreements. In each case, however, the effects of this "second public health revolution" is to shift much of the blame for poor health onto individuals and their own behavior, leaving government only the option of altering individual lifestyles if they are to be successful in promoting health. That leaves unanswered, however, the more basic question of whether governments should be in the business of promoting health, especially when it requires intervention into personal liberty. Leichter is to be complimented for his manner of raising these thorny questions and willingness to accept indefinite and partial answers to them. The analysis might have been improved, however, by some greater attention to issues of agenda setting and to how policy issues are socially and politically constructed.

These two books, taken together, are a useful introduction to the health policy issues facing governments in the 1990s. On the one hand, governments must make difficult economic decisions about funding health care and their willingness to use their powers to combat the powers of private health providers who can profit from public programs. On the other hand, governments must think about how to make citizens healthier as another means of reducing their costs of health care. The two strategies of intervention are complementary, and both involve substantial political costs. Readers will understand both the strategies and the costs better by having read these books.

University of Pittsburgh B. Guy Peters

Communities of Grain: Rural Rebellion in Comparative Perspective. By Victor V. Magagna. Ithaca: Cornell University Press, 1991. 277p. $42.50.

Serious study of peasant rebellion is a relatively new phenomenon; but the field has been greatly enriched in recent years by the work of Migdal, Paige, Popkin, Scott, Tutino, Wolf, and others. Magagna's volume seeks to make a contribution to this growing body of literature by proposing a different framework to answer the question, Why do peasants rebel?

The central thesis of this work is that agricultural societies cannot be understood in terms of class (as Marxists theorists argue) or in terms of subsistence (as those coming from the moral economy tradition would have it). Moreover, historical sociologists, such as Barrington Moore, Jr. and Theda Skocpol, who have analyzed such societies primarily from the point of view of nonagricultural elites and states are also in error. Such analyses have been faulty, it is argued, because they have led to ambiguous conclusions by an undue emphasis on economic issues.

According to Magagna, the most appropriate way to understand rural rebellion is to view the problem from the perspective of community, specifically "communities of grain." He acknowledges that the use of the community as the unit of analysis is not new, since it has been the staple of ethnographers for many years. But Magagna seeks to tighten the definition of community by focusing it on territoriality and land tenure and arguing that bucolic notions of egalitarian communities are largely inaccurate, since most communities are characterized by inequality and hierarchy, based on such factors as status, gender, and age. Despite these inequalities, they are offset by reciprocity and widely accepted rules that draw together communal residents, thereby allowing them to undertake mobilized political action. It is out of this community action that rural rebellion becomes possible.

Although there are many specific causes of rural rebellion, including conflict over land, religion, taxation, and so on, Magagna argues that no one of these can really explain the phenomenon. Neither relative, nor absolute, deprivation sparks such rebellions. Rather, such insurrections are a form of a broader phenomenon that he calls *representative violence*—an unfortunate use of terminology that will end up confusing many readers. He rejects the clearer term *bargaining by riot* for he fears its use might lead to confusion with urban movements. What is meant is that rural rebellion is to be interpreted as a means for communities to present (or re-present), in a violent fashion, their demands for a change in elite behavior. These movements, then, are a mechanism of community defense.

Communities vary along two closely related dimensions: autonomy and cohesion. This framework gives rise to three types of communities: redistributive, regulative, and residual. The case studies used in the book to illustrate these various types are compiled from cases that meet two criteria. First, they must be cases for which an extensive secondary literature has been compiled, a factor that results in the bulk of the cases being selected from Europe. Second, the cases must be central to the debate over the historical sociology of rural rebellion. These criteria motivate Magagna to select cases from France, Spain, and Russia. He adds England and Japan to the list as control groups—England because the individualistic tradition found there presents the most difficult test for a theory based on community and Japan so as to include a non-Western case. The illustrations are, for the most part, pre–twentieth century. The focus of the chapter on England is the period 1500–1800, that on France covers the period 1500–1900, that on Japan, 1600–1868. Those on Spain and Russia cover more modern periods, 1800–1939 and 1300–1930, respectively; but none of the material deals with the contemporary era. Each country is covered in a separate chapter, and extensive use is made of an impressive array of secondary materials, all carefully footnoted to enhance its accessibility to the reader.

The review of the cases produces two broad categories of rural rebellion: movements of secession and movements of reconstitution. The Russian and Japanese cases are an illustration of the former process, whereas the illustrations from England, France, and Spain are seen as efforts of communities to alter the nature of the relationship between local community and external elites and markets. The type of rebellion is not a function of macro societal factors, such as the evel of modern-

ization or commercialization. Rather, when commercialization occurs from above and becomes "coercive commercialization," secession is most likely to result, whereas, when it comes from below, a rebellion demanding reconstitution is the likely outcome.

The concluding chapter of the volume attempts to draw together all of this material via the presentation of nine hypotheses. Magagna admits that the hypotheses are not operationalized; but, he says, "The application of these hypotheses, even to third-world countries, may help to explain much about the nature of rural politics" (p. 256). He goes on to argue that the communities-of-grain concept is applicable, at a minimum, to Mexico and the Andean countries and portions of sub-Saharan Africa and Southeast Asia. One group of hypotheses deals with the question of the stability of communities; a second, with differences in levels of violence; and a third, with the variation in the impact of ritual on community cohesion.

The hypotheses presented will disappoint those who are looking for a theory of peasant revolution. Indeed, Magagna argues specifically that the rural rebellions he has studied, "do not add up to a revolution in the classic sense" (p. 258). Moreover, Magagna acknowledges that the enormous power of modern armies makes the rural rebellion of the type dealt with in this book increasingly obsolete. Yet he suggests that Vietnam may be a case in which rural rebellion is still an active force today, although few readers would agree that this is an instance of local community violence. In the end, he is compelled to admit that rural rebellion may now be "out of date" (p. 263), so that his study appears to be of little utility to those who wish to understand such important contemporary cases of rural rebellion as those found in Guatemala, El Salvador, Peru, and elsewhere.

This is a book with a large scope, both theoretically and substantively. It is an excellent illustration of comparative analysis; and the reader cannot fail to be impressed by the richness of its treatment and the effort to synthesize greatly divergent case material into a parsimonious set of nine hypotheses. The ultimate utility of the volume, however, will depend on scholarly acceptance of the notion of "communities of grain" as the appropriate organizing construct for understanding and explaining rural rebellion.

University of Pittsburgh MITCHELL SELIGSON

Militarism and Politics in Latin America: Peru from Sanchez Cerro to Sendero Luminoso. By Daniel M. Masterson. Westport: Greenwood, 1991. 345p. $47.95.

Daniel Masterson has done Latin American (especially Andean) specialists a considerable favor with this book. By concentrating on one country (Peru) and one fairly short historical period (60 years), he has produced a monograph that in extraordinary detail describes the decades-long search for what Masterson calls the Peruvian military's professional mission or rationale—in a word, its raison d'être. All militaries everywhere have two basic missions: to protect the nation–state from external aggression and to assure domestic order. But Third World militaries may not be threatened by outside aggressors or may play only a peripheral part in global power struggles. For example, in the twentieth century, Latin America did not have a major role in hemispheric defense, because the United States assumed such responsibility throughout the Cold War. Latin American militaries have thus found themselves doing either or both of the following: (1) protecting borders that (with a few notable exceptions) were not about to be invaded from the outside (which did not prevent arms races and very large military budgets), and (2) concerning themselves with internal affairs. The question that occurs, of course, is, What shape or form should such concerns take? The search for answers to this question comprises the core of Masterson's book.

Peru has for many years had one of Latin America's more idiosyncratic militaries. It has intervened in the political arena to such an extent that a constitutional transfer of presidential power has occurred only three times since World War I (1945, 1985, and 1990). Yet these interventions have not taken place simply because one caudillo wished to take the place of another. One of the strengths of Masterson's book is his ability to point out the multiple, often overlapping, and even contradictory motives behind the military's coups. Masterson traces the influences first of France and later of the United States, as countries that dominated Peruvian military training and describes the schizophrenic reaction as Peru switched from one to the other. But Masterson also takes care to show how domestic political circumstances in Peru affected the military. Conventional wisdom, for instance, has long held that the military intervened throughout the 1930s and 1940s primarily because of its deep-seated enmity for (APRA), Peru's then radical party. But Masterson demonstrates that such an explanation is simplistic by stressing the divisions within the military about APRA and the degree to which young, reform-minded officers often sided with APRA in planning uprisings and coups against oligarchic rulers who were supported by senior military officers. He also convincingly argues that interservice rivalries based on ideological and personal differences also played major roles, especially during the 1950s and 1960s and notes, as well, that the United States' insistence on anticommunist strategic planning and counterinsurgency techniques also played a role, as did the military's self-perception during the late 1960s as the only organization within Peru able to take on the reforms needed for independent development to take place. All of these arguments have been made previously, of course, but Masterson is especially successful in showing how these several themes become differentially interwoven over time and how they influenced the military's activities. Such success is possible thanks to his use of a wide variety of primary and secondary sources, including archival materials in Peru, as well as the United States, Peruvian military journals, and personal interviews.

Masterson's intent—to detail the Peruvian military's search for a clear professional rationale—is thus accomplished. For political scientists searching for an understanding of Peru and its military within some larger, more generalizable context of civil–military relations, however, the book is less satisfactory. No mention or use is made, for example, of Stepan's work on Latin American militaries or of the 1980s literature on transitions to democracy (O'Donnell and Schmitter; Diamond, Linz, and Lipset, etc.) to understand Peru's own transition in 1980. Social scientists attempting to fit the Peruvian case into a larger explanatory framework will therefore be left to their own devices. Since Masterson is, in fact, a historian, perhaps such a complaint is unjustified;

nevertheless, the main title should perhaps be dropped, since the book addresses Latin America in general not at all. That being said, Masterson allows Andean specialists to fill in numerous gaps in their knowledge and Latin Americanists to gain a much greater comprehension of Peru and its military than was previously available. How Peru can be best analysed and explained by a more general framework, or how such a framework might have to be modified to take account of the idiosyncracies of the Peruvian case, remains to be done.

University of Texas, Austin HENRY DIETZ

Partial Visions: Culture and Politics in Britain, Canada, and the United States. By Richard M. Merelman. Madison: University of Wisconsin Press, 1991. 287p. $40.00 cloth, $15.95 paper.

This is an ambitious, highly innovative, and partially successful work. Richard Merelman has produced an important and idiosyncratic study of popular culture and its relationship to democracy in the United States, Canada, and Britain. Though the back cover of the book hails it as a "pathbreaking study of political culture," the author is careful to distinguish his approach from "the dominant mainstream political science approach to the study of political culture," which is fraught with "insufficiencies," has "yielded few fruits," and consequently is a methodological antimodel, an example of "how not to proceed" (pp. 39–40, 44).

Though Merelman shares with Almond and Verba a deep concern for the cultural ecology of democracy, he insists that their approach, which relies on survey data and analysis of political attitudes, must be placed "within a broader theoretical framework" derived in part from anthropology (p. 44). While recognizing that there are several different anthropological schools of thought about culture, Merelman opts for the "symbolic" approach, which sees "culture as a system of discourse" and contends that "social behavior proceeds from and acts out symbolic systems, texts, or . . . *collective representations*" (p. 45).

Merelman undertakes to study cross-nationally collective representations of four collectivities (the *family*, the *corporation*, the *polity*, and the *world of consumption*) and their corresponding social roles (*family member*, *employee*, *citizen*, and *consumer*). Each of these collective representations become infused into the "system of discourse" of the "popular culture." Each therefore affects the understanding and practice of democracy, whose essential qualities, Merelman insists, entail a healthy amount of "conflictive democratic participation." He summarizes his argument by stating that "certain qualities of a society's popular culture subtly prepare people either to seek out political participation and welcome group conflict or to resist political participation and to reject group conflict" (p. 8).

In order to analyze these cultural tendencies in each of four collectivities, Merelman turns to the source of what he believes is the most influential collective representation of their corresponding social roles: television programs (family member), corporate publications (employee), high school textbooks (citizen), and magazine advertisements (consumer). Using qualitative analysis of these primary sources, supplemented by contextualizations drawn from selected secondary sources, Merelman provides us with interpretative essays on the unique "cultural configurations" of each of the three countries. This is followed by a chapter entitled "The Political Embodiment of Liberal Democratic Culture," in which he analyses voting behavior, public opinion, and elite political discourse, which are "surface embodiments" of the "deep structures" that comprise the cultural configuration. By far the most interesting aspect of this analysis is the quantitative and qualitative examination of political language in each of the three societies. Merelman presents paired comparisons of debates in Britain and the United States on party reform and texts of important documents on bilingual education in Canada and the United States. Like his use of the primary sources that underlie his characterization of the cultural configurations in the three countries, these analyses are methodologically innovative and enlightening. They do not, however, link up very well to his hypotheses; nor do they provide convincing elaboration of his definition of democracy as implying conflictive participation.

In a final, reflexive chapter, Merelman looks back over his work which he succinctly indicates is a "partial argument" and criticizes its limited validity. Merelman accepts that the problem of the intelligibility of culture, its relationship to institutions, and the problem of cultural dynamics and political change are not taken up thoroughly in his book. But he never extends his self-criticism to his characterization of democracy itself, which remains idiosyncratic and incomplete.

Despite its shortcomings, this book is, nevertheless, an important path-breaking study that should open the way to new research directions and inspire much controversy in the discipline. Merelman has explored new ways of conceptualizing culture and displayed exciting examples of qualitative and quantitative empirical analysis. Although it is perched uncomfortably on the conjuncture of positivist and postpositivist methodologies, it has much to contribute to the renaissance of interest in culturalist approaches.

York University, Toronto DAVID V. J. BELL

Social Currents in Eastern Europe: The Sources and Meaning of the Great Transformation. By Sabrina P. Ramet. Durham, NC: Duke University Press, 1991. 434p. $49.95 cloth, $19.95 paper.

This lengthy and ambitious volume seeks to describe and explain the social roots of the collapse of the socialist states in Eastern Europe in 1989. The author boldly includes all the countries of the region, although the coverage of Poland, East Germany, and Yugoslavia is more thorough than that of the remaining countries. The final chapter offers a hasty summary of political developments in 1989 and 1990, but the main focus of the study is on independent social groups and movements in the 1970s and 1980s.

The author's argument is that the popular basis of the East European regimes was steadily eroded by a broad variety of social processes, so that by the late 1980s, the arrival of Gorbachev could serve as a catalyst sufficient to trigger their collapse. In the abstract, one can hardly disagree with such a thesis; but the author does not offer a more probing analysis of the precise links between the social phenomena she describes and the regime changes that took place in 1988–89.

The social processes covered in the book are a fairly eclectic selection: Solidarity in Poland, dissident intellectuals in East Germany and Czechoslovakia, Yugoslav feminists, rock musicians, and churches and sects throughout the region. The author states that these are all manifestations of a process of "modernization"; but apart from some rather mechanical references to the works of Samuel Huntington and Crane Brinton, the analytical framework is not really elaborated and explained. For example, there is no systematic discussion of social mobility, urbanization, or education levels, all usually regarded as central to modernization theory. Most surprising of all, there is virtually no discussion of the role of nationalism, apart from a case study of the Albanians of Kosovo, Yugoslavia (Chapter 7). Developments since 1989 have, of course, clearly shown that nationalism has the capacity to displace group identity in several, if not most, countries of the region.

Thus, the value of the book is that it provides a selection of detailed case studies of social phenomena of East Europe in the 1970s and 1980s. Although the book is primarily derived from journalistic sources, including the invaluable Radio Free Europe reports, the material is so rich that even area specialists will discover something new in this volume.

Duke University PETER RUTLAND

Crisis and Choice in European Social Democracy. By Fritz W. Scharpf. Ithaca: Cornell University Press, 1991. 303p. $49.95 cloth, $17.95 paper.

This absorbing study, first published in German in 1987 and now appearing in a clear and elegant English translation, exemplifies two current trends in comparative political research. The first is the move away from general, inclusive theories toward more nuanced and theoretically more modest treatments that take account of differing national and institutional circumstances. The second is the renewed interest and concern with the impact of institutions themselves and the correspondingly greater emphasis on what is conditional and contingent.

Scharpf's subject is the question of political control of the economy. His data concern the experiences of four European countries (Austria, West Germany, Sweden, and the United Kingdom) during the economic recession of the 1970s and, more specifically, the differing policy responses of the then social democratic governments of these countries to that crisis. Rejecting any notion of "crisis as fate," Scharpf points out that while there was a general worsening in the indicators of economic performance throughout Western Europe in the early 1970s, variation between the subsequent performances of the different countries also increased. His goal, then, is to account for this variation by selecting a group of countries governed by essentially similar social democratic governments that found themselves, at least initially, in similar economic circumstances. This "most similar systems" design enables him to assume a communality in the goals of each of the four governments and to assume, in particular, a shared commitment to full employment. This also allows him to assume that the subsequent variation in performance did not derive from differences in policy priorities. Rather, and of necessity, this variation must have derived from the differences in the capacity to govern and the ability to steer the economy through the crisis, which, in turn, depended at least in part on the differing institutional circumstances of each government.

This is the thesis that Scharpf sets out to argue in his overall analysis. His results are very convincing, and the end product is a genuinely excellent piece of work. Theoretically sophisticated, empirically grounded, and closely and persuasively reasoned, this book is a powerful example of how good comparative political analysis can be; and it constitutes one of the most important contributions to the rapidly growing literature on the political economy of contemporary Europe. We learn that politics and governments matter and that institutional structures are more than simply neutral arenas but have a capacity to condition and facilitate particular policy responses, while discouraging others. And along the way, we gain a valuable insight into the dynamics and constraints of macroeconomic policymaking, as well as a clear understanding of the parameters of the relations between trade unions and governments. There is, in short, a wealth of wisdom here, extending far beyond the ostensible limits of a study of four countries during a relatively short and distant period of time.

What also becomes clear from this study (albeit less directly) is that while governments in general matter a lot, the sheer importance of institutional structures also means that any individual government does not matter so much. This becomes evident when Scharpf addresses two of the key questions set by his study: under what institutional conditions unions will opt for a politically motivated strategy of conciliation with government, rather than an economically motivated strategy of confrontation and under what conditions governments can actually act on the basis of their chosen policies (pp. 169–237). In both cases, it seems, the die was pretty well cast well beforehand. In the case of union strategy, confrontation tended to be avoided in circumstances where there already was an established tradition of employer–labor cooperation and union–government cooperation and where there existed a cohesive union organizational structure. In the case of the government, the governing capacity itself tended to be enhanced when central government had direct control of the relevant monetary and fiscal instruments. Yet both sets of circumstances are clearly long-term legacies, quite beyond the scope of any government to alter substantially in the short term. In this sense, the fact that the Austrian social democratic governments managed to weather the crisis more effectively than their British counterparts may have more to do with their being Austrians than with their being better social democrats.

Scharpf concludes his study with an insightful account of the changing international economic circumstances of the 1980s and an analysis of the difficulties that confront social democratic ideologues in the new, non-Keynsian world: "Ideologically, and in public debate, at any rate, the hour of supply-side policies has always been the hour of employers and conservative parties" (p. 270). The continuing inability of contemporary social democrats to elaborate a convincing program that can tackle these new circumstances in the interests of their traditional constituencies clearly bodes ill for the future of the movement as a whole.

University of Leiden PETER MAIR

Radicalism and the Origins of the Vietnamese Revolution. By Hue-Tam Ho Tai. Cambridge: Harvard University Press, 1992. 325p. $34.95.

The Vietnamese have a profound consciousness of history—are, in fact, burdened by it (unlike the Americans). And, as their late prime minister Pham Van Dong once observed, they are incurable romantics about politics. Both of these cultural characteristics are amply demonstrated in this study of the principles, ideals, and operational methods of Vietnam's young radicals of the 1920s. The author is a leading ethnic Vietnamese woman in the American academy. Her field is twentieth-century Vietnamese intellectual thought, which locates her in that grey area where history overlaps political science.

This work has a distinct biographical orientation to it, a roll call beginning with the godfathers of the Vietnamese revolutionary movement (members of the turn-of-the-century Scholars movement who launched the intellectual revolt against traditionalism and French colonialism) and running through the nationalist and proto-Marxist figures of the next three decades. Tai's treatment is in the spirit of Woodrow Wilson's contention that history is but the lengthened shadow of great men. (Presumably, today he would add, "and great women"). A plethora of names appears here, although the radicals probably numbered less than two thousand of what today would be called dedicated activists led by not more than 250 of what today would be called cadres. Only a few of these are familiar to even reasonably well informed outsiders. Few survived to take a place in the history of the revolution that was to come, even as footnote.

It must have been an exhilarating time for these young political groundbreakers. And young they were, few past their midtwenties (Ho Chi Minh, in his early thirties, was their grand old man of revolution). They debated, plotted, published, organized, experimented with politics. They split into factions, regional groupings, and personal entourages. Most were elitist. Theirs was a cat-and-mouse game played with the French, encouraged by supporters in metropolitan France, and also, a darker game against the malignant French Indochina *colon*.

Their heritage was traditionalism with its strong Confucian, Buddhist, and Taoist influences that had created such a disciplined Spartan-like people; the millennia-long China threat of *han-hwa* (sinoization); a singular style of politics of clandestinism, whereby the Vietnamese dealt first with the Chinese, then with the French—all of which meant that by the 1920s, Vietnam was an ideal environment for political conspiracy.

The book is divided into eight chapters, treating the Confucian–French educational system, which shaped the young radicals and created the initial streams of revolutionary thought, more anarchial than anything else; the female radicals and feminization of the cause, about which virtually nothing has been written; the scandal sheets where young editors thundered against the relentless corruption of French colonialism; and three final chapters about the radical cause's taking on true political coherence.

Initially this contention pitted the nationalists (chiefly the Viet Nam Quoc Dan Dang, patterned after the Kuo Min Tang of China) against a proto-Marxist youth group, Thanh Nien, which metamorphosed into Trotskyist and Stalinist groups in the 1930s, finally to be captured by the latter. All streams were militantly anticolonial; but the Stalinists considered the others mere bourgeois revolutionaries, individualistic, non- or anticollectivist, and unwilling or unable to break completely with past value systems.

A common perception of academics viewing Vietnamese history, particularly those who come to it from a China background, is that accidents of history cheated Vietnam out of a vigorous intellectual tradition with national focus; that the literate class in Vietnam was always far smaller proportionally than in China; and that romanization of the Vietnamese language and other factors reduced Vietnamese access to China in ways that it did not in Japan and Korea. It is precisely this perspective that Tai seeks to challenge. Her second major thesis (as I read it) is that the spirit of the Vietnamese revolution was not chiefly a matter of borrowed westernism but was authentically Vietnamese, rooted deep in its culture. A third point is that this early radicalism was very much a young people's enterprise and, to a large extent, a young Vietnamese women's enterprise. (For those of us who have lived long in Vietnam this work reminds us just how really tough, mentally and physically, are Vietnam's women).

My chief quarrel with Professor Tai is that she tends to treat the Vietnamese revolution—indeed, Vietnam's political history in general—as a coherent entity and sharp-edged, as a clear progression of events, when, it seems to me, it is a great muddy river of events full of backwaters and eddies. The Vietnamese revolution, in particular, I see as a messy shaking out of history whose meaning is still being sorted out. Tai also seems excessively harsh on Confucianism, which is, after all, one of the great intellectual streams of thought: it produced a governing system that lasted longer than any other, save Egypt.

This is a bittersweet book. One puts it down with feelings of admiration for those young Vietnamese radicals of the 1920s but also with a sense of tragic waste. There were then (it is clear now) many roads to revolution in Vietnam. Almost any one of them would have been better than the one taken. Perhaps it was inevitable, as Tai seems to conclude. In any event, this is a fine book, commended to all.

INTERNATIONAL RELATIONS

The Water's Edge and Beyond: Defining the Limits to Domestic Influence on United States Middle East Policy. By Mitchell Geoffrey Bard. New Brunswick: Transaction Books, 1991. 313p. $32.95.

A long list of books is available on U.S. policy toward Israel since its establishment in 1948. By several criteria, this one is distinctive. Most notably, perhaps, its approach to the subject is original and imaginative. The author applies several extant theories of the American foreign policy process to a series of case studies in Israeli–American relations. At the end of each, he evaluates the degree to which each theory is (or is not) useful in accounting for decisions taken by policymakers in Washington affecting the State of Israel. His approach, therefore, brings to bear an unusual combination of theoretical and eclectic insights in an investigation of the policymaking process.

Bard's study also stands out because he provides us with as objective and remarkably balanced an analysis of pro-Zionist lobbying activity and its impact upon American policy toward the Middle East as is possible for one of the most controversial and emotionally charged issues in American diplomacy. The author rejects the widely prevelant view that in most key respects, Washington's policy toward Israel has been "dictated" by the Zionist lobby. Time and again, he makes the point that a fundamental precondition for the lobby's success has been the underlying sympathy of the American people and their political leaders for the Israeli position—a factor that the Israeli government and its supporters in the United States have skillfully exploited. By contrast, this crucial reality has been lacking with respect to the "Arab lobby" (if, given its inherent disunity, this term can be meaningfully used to describe the Zionist lobby's main rival in the United States).

Another highly significant finding of Bard's investigation is that among several important variables contributing to the outcome of Zionist lobbying efforts, the ideological position of the president is crucial in determining the policy of the United States toward Israel. In his view, this is more influential than any other single factor. When, for example, the prior positions of the president and the pro-Zionist lobby happen to coincide, the latter can be expected to achieve a high level of success in attaining its stated goals. When they disagree, however, contrary to prevailing opinion about Zionist lobbying efforts, pro-Israeli groups are likely to have a relatively poor, or below-average, record in attaining their avowed goals. Bard also finds that as a rule, the Israeli cause tends to be supported more by Republican, than by Democratic, chief executives. In his view, this curious result can be accounted for largely by the fact that Democratic presidents and officials can and do take for granted widespread support for their party by Jewish voters.

Another distinctive contribution of Bard's study lies in focusing attention upon a phenomenon seldom dealt with in other investigations of the role of interest groups in the political process. This is the extent to which the president and his advisers often use pressure groups like the pro-Israel lobby to promote their own policy goals. Lobbying, Bard convincingly contends, involves something much more complex than merely a one-way attempt by interest groups to impose their views upon officials in Washington and public opinion. Much more frequently than even informed citizens of the foreign policy process are aware, for example, executive officials rely upon, or use, lobbies to achieve their own policy objectives.

Bard's study is clearly organized and interestingly written. The research relies upon both primary and secondary sources. Overall, he has given us an extremely valuable, informative, and provocative analysis of an important and recurrent issue in American foreign policy.

Louisiana State University CECIL V. CRABB, JR.

Command in Crisis: Four Case Studies. By Joseph F. Bouchard. New York: Columbia University Press, 1991. 325p. $45.00.

This is an important new addition to the literature on Cold War crisis decision making, even if such matters seem less pressing today in a world in which the chance of militarized disputes between great powers seems relatively remote. Bouchard is concerned with "the problems that can arise when using military force as a political instrument in crises" (p. ix). He focuses on a dependent variable of high policy relevance, namely, "the occurrence of inadvertant escalation in international crises" (pp. xiv, 188). What he really does in this book, however, is examine in detail the obverse side of the inadvertant escalation coin, that is, how the lid was kept on crises between the superpowers through various mechanisms of control.

In his effort to develop an explanation of this inadvertant escalation (or nonescalation) phenomenon, Bouchard adopts a comparative case study approach and examines the "interaction of military forces in crises and the impact of such interactions on crisis stability" (p. xiv). He selects four crises in which naval forces played a significant role: the 1958 Taiwan Strait Crisis, the 1962 Cuban Missile Crisis, and the 1967 and 1973 Arab–Israeli wars. Apart from this theoretical purpose in developing them, the case studies are useful summaries of events in these crises. The author also introduces new primary source material.

A significant limitation of the book is that it is difficult to generalize too far beyond these cases. Thus, one encounters problems extending the conclusions Bouchard draws from his detailed study of naval forces to ground, air, or joint forces that operate in very different contexts with different command-and-control mechanisms and levels of complexity. Moreover, his case studies are all about dyadic great power relations (i.e., U.S.–Soviet), so that his conclusions cannot be extended easily (and certainly not without caveat) to multipolar settings that also include small states (circumstances more characteristic of present-day world politics).

Bouchard observes that the U.S. Navy's institutional orientation is to put "peacetime missions" such as show

of force for political purposes as secondary to "wartime missions." Nevertheless, all four case studies illustrate use of naval forces for "political signaling or related political functions" quite apart from their wartime use (p. xxxi). In fact, it is peacetime use of the navy short of war that is the more common use of force, which accounts for much of the success the U.S. Navy has had politically in getting budgets to sustain its "naval presence" and "power projection" capabilities.

The author's conclusion that crises can be controlled politically—that "tactical-level military interaction normally will not escalate to war without a deliberate decision by national leaders"—is reassuring, at least for the two great power confrontations he examines. Certainly, the situation grows more complex as the number of powers involved in a crisis increases, which makes maintenance of political control more difficult. Moreover, the stability that obtained in U.S.–Soviet crises was also a result of having "tacit rules of crisis behavior and communications" that had become "well developed" over time (pp. 198, 222). Whether even the relatively simple dyadic structure of conflict that governed U.S.–Soviet Cold War relations would necessarily be so stable without these norms is a central question.

The need for maintaining political control over military forces is never more important than it is in crises. Bouchard observes, "In an acute crisis, in which strategic or tactical interactions between the two sides have become decoupled from political-level interactions, the security dilemma can trigger an escalatory spiral at the strategic or tactical levels of interaction" (p. 198). Beyond tacit rules of crisis behavior and communications, escalation-inhibiting factors Bouchard observed in each case included military "prudence," caution and restraint by commanders, national leaders' structuring the tactical environment to dampen military interactions, accurate and timely tactical intelligence, and "double-checking the accuracy of initial reports of military incidents" (ibid.).

Although Bouchard acknowledges that they may not always hold, he nevertheless concludes that "these factors tend to moderate the intensity of tactical-level interactions, prevent armed clashes from occurring, and produce disengagement rather than escalation when clashes do occur" (p. 198). This is an important conclusion, so long as one keeps in mind the danger of extending it to multipolar and other settings not considered by the author. Seeing crisis stability in part as a function of relations between tactical and political levels on each side, as well as relations between adversaries, is an important insight Bouchard develops.

Notwithstanding the positive conclusions from the four cases he studies, Bouchard still maintains that naval forces "have serious crisis stability problems"; in a "severe" crisis, for example, he observes that "tension between crisis management and naval strategy objectives would be acute" (p. 196). Indeed, as is well known, President Kennedy recognized this problem explicitly as he and Secretary of Defense McNamara tried to maintain control of naval forces in their confrontation with Soviet counterparts during the Cuban Missile Crisis. Add to this imperfect information and the uncertainty or Clausewitzian "fog" that hangs over the battle area, and meaningful control by the political leadership is elusive: "National leaders must expect that at least some things will go wrong when they employ military forces in crises" (p. 221).

The case studies examine the relation between decision making at tactical and political levels in what the author refers to as "stratified interaction" (pp. 36–56, 222). Understanding crisis decision making as being "stratified," Bouchard observes that "direct control" by political leaders was only "exercised selectively and to a limited degree"; instead, political leaders relied primarily "on mechanisms of indirect control' such as predetermined terms of reference that specified limits to guide decision making by tactical commanders (p. 221). Bouchard goes beyond such observations to argue that national leaders should "focus on communicating with the other side in order to avoid misperception" and other miscommunication, rather than trying "to seize direct control of tactical decisions"; indeed, to Bouchard, "the greatest danger of a crisis escalating to war may well arise from decision making at the political level of interaction, rather than from decision making at the tactical level of interaction" (ibid.).

The effectiveness of indirect mechanisms of control in crises between the Cold War superpowers was heavily dependent upon the professional character of military commanders—seeing their political subordination as being legitimate. Such an assumption about all the militaries of great and lesser powers in the complex, multipolar world politics of coming decades is difficult to sustain.

In the final analysis, the author is careful not to overextend the important arguments he makes. His conclusions from the structured comparative case studies are really hypotheses worth testing or examining under the different conditions and contexts that will likely apply in coming decades. After all, the relative simplicity and stability of bipolar relations was something of an aberration from the historically more common multipolar mode. We need to know more about crisis decision making in the latter context. But that is not a fault of this book, which stands on its own merits.

University of Colorado, Colorado Springs PAUL RICHARD VIOTTI

The Politics of Negotiation: America's Dealings with Allies, Adversaries, and Friends. By Linda P. Brady. Chapel Hill: University of North Carolina Press, 1991. 269p. $32.50 cloth, $12.95 paper.

Reviewers commonly choose a classic as a standard of comparison if they wish to point up shortcomings in a volume. I wish to use a classic—Fred Ikle's *How Nations Negotiate* (1964)—to identify the limited but, nonetheless, significant contributions made by Brady's monograph.

The longevity of Fred Ikle's masterpiece is attested by its continuing sales. Nevertheless, its concerns relate narrowly to the Cold War as seen from the perspective of the early 1960s. Scholars have welcomed several specialized but useful supplements. Linda Brady's book on how the United States negotiated military capabilities and operations in the 1980s is such a valuable supplement. It shares with Ikle's classic an admirable clarity of presentation and unwavering focus on a few, simply (but never simplistically) expressed factors and heuristics.

Brady's book is methodologically narrower than Ikle's. After an introduction, the book presents what is,

in effect, a matrix. Each cell offers the author's answer to one question about one case. Six sets of questions range from the predictable (What factors influenced the formulation of negotiating positions?) to the vital but often neglected (What additional action was required for implementation of the agreement?). The negotiations treated are wartime host nation support with West Germany in the early 1980s; the Dual Track long-range theater nuclear forces deployment negotiations of 1979; Mutual and Balanced Force Reductions (MBFR) 1973–89; Intermediate-Range Nuclear Forces (INF) 1980–87; logistical support for the Persian Gulf in the early 1980s; and NATO out-of-area activities in the early 1980s. Since these vary significantly in duration, internal complexity, and relation to other negotiations, the reader would be helped had the author given more attention to her constitution of a "case."

Scholars of contemporary international negotiation will not find much new regarding negotiating theory. Nor will close observers of the public record of these cases often be surprised by the facts presented. The contribution of the book derives from meticulously comparative treatment, where variations of context and process are itemized, and from which are drawn some hypotheses about future negotiations.

The book is honest to its title: without reservation it is a discussion of politics. Brady ignores economic models, even when they might underscore her conclusions. For instance, she observes in the Preface that the most difficult negotiations occur between friends. This claim begs for a baseline of comparison: most difficult to conclude? most inefficient in process? most ineffective in resolving the problems that motivated negotiations? most unlikely to reach mutually beneficial and lasting agreements?

Scholars whose interests transcend strictly political factors might object to a few features of the volume's organization and to a few of its theses. For instance, Brady divides the six cases into three main types, said to be characterized by dealings with *allies*, *adversaries*, and *friends* and *mixed relationships*. There is another perspective which maintains that all negotiations that actually get under way must either be responding to their participants' recognitions of mixed motive situations or be motivated solely by the pursuit of side-effects (in Ikle's terms). Even within her carefully maintained focus on politics, Brady demonstrates a near aversion to economic phenomena and to the economist's methods. This is surprising because at several points she relates decision calculi that explicitly incorporate anticipations of other parties' responses, and she often relates participants' sophisticated assessments of trade-offs.

As an experienced Pentagon insider, Brady's own policy analysis and writing must have sensitized her to often-conflicting requirements for advocacy of policy, on the one hand, and its ex post justification, on the other. That same practical experience must have conveyed the often overdetermined "logics" by which policies emerge. Her first question about each case is, "What prompted the United States . . . to enter into negotiations?" Typically, narrowly rational, means–ends thinking is ascribed. What she seems to report is an answer to a subtly different question, namely, "What is the best case that could have been made for the United States to enter into negotiations?" The possibility that there were a multiplicity of converging pressures and complementary (if not entirely reinforcing) reasons is often overlooked. At several points in the treatment of the MBFR and INF talks, she appears to accept as unproblematic the existence of a "U.S. position" and makes observations rather casually about shifts in that position.

Ikle aimed his comprehensive analysis at the improvement of negotiating practice. Brady's final chapter, "Implications for Policy," is quite thin. I think that the case analyses plus the author's experience in the Office of the Secretary of Defense empower her to hazard far more in the way of "implications," even if they were modestly labeled "suggestions." In only one of Brady's cases is the U.S.–Soviet competition not central. But her analytic framework—succinctly conveyed as six sets of questions—is broadly applicable. The analysis is germane for understanding post–Cold War negotiations.

Syracuse University JAMES P. BENNETT

Learning in U. S. and Soviet Foreign Policy. Edited by George W. Breslauer and Philip E. Tetlock. Boulder: Westview, 1991. 881p. $75.00 cloth, $29.95 paper.

This timely collection defines *learning* as a rigorous concept and applies it to return engagements with similar issues in American and Soviet foreign policy across the past 45 years. It defines a new level for studies of decision-making, adding an historical dimension to the Allison tradition of analyzing single-decision cycles. It is likely to define key lines of investigation in international relations during the 1990s.

Karl Deutsch pioneered the study of learning with *The Nerves of Government* (1966). In the late 1970s the National Science Foundation supported an initiative for a new, interdisciplinary field along these lines. Now, with additional decades of data, it is possible to place Deutsch's inquiry on a solid evidentiary foundation. The framework will be especially helpful to study how political leaders respond to, and shape, new and changing international realities.

The volume represents a major investment, with 19 contributors and chapters of unusually high quality. This partly reflects its sponsorship by the National Academy of Sciences and foundation support that afforded a distinguished advisory committee, discussions among participants (beginning in the spring of 1987), and two editors of unusual ability and commitment who challenged their contributors to produce an integrated volume.

The volume is divided into four parts. An initial section discusses conceptual issues (contributions by Tetlock and Haas being especially notable); three concluding chapters partially integrate the volume. Between, two sections offer a well-planned series of case studies by experts in each field: seven on learning in American policy toward arms control, détente, Western Europe, China, the Middle East, Third World intervention, and nuclear nonproliferation since World War II; then a parallel series of studies of Soviet policy. Leading scholars have written the chapters, which include extensive references and provide sufficient space to develop complex themes.

The editors devote the conceptual chapters primarily to definitional issues, apparently in an effort to achieve rigor and clarity about the nature of their inquiry. Several disagreements emerge: approximately, the con-

tributors divide into two camps. Some (like Tetlock) define learning broadly (and see more of it). Others (like Haas) would require an extraordinary set of changes, and substantial evidence, to infer that learning has occurred (i.e., as opposed to mere *adaptation*). As one of the editors (Breslauer) argues, a variety of definitions and different calibrations of thresholds probably matters little, so long as one is explicit about the dependent variable and processes under investigation.

But I would add a caution. Nonlearning (or mere adaptation) is not the same phenomenon as statistical randomness or an equivalent (an established baseline of governments); thus, Haas's null hypothesis is not a deep analysis. The sophisticated, surly, and cynical viewpoint that "governments don't learn (they merely *adapt*) because that is the *nature* of governments" would be as underspecified and unfortunate a causal explanation as Morgenthau's now-problematic claim that "objective laws" sustain the realist behavior of states.

Presenting definitions, Tetlock boldly argues that concepts of differentiation and integration from cognitive psychology are always correlates of policy learning. This hypothesis predicts that identical "Tetlock shifts" (beginner-to-expert) will occur in both international and domestic policies. When the editors conclude that both Soviet and American leaders "have learned that many indigenous processes in the Third World are out of the direct control of either superpower" (p. 13), one imagines a series of doctoral dissertations and books testing this theory against data drawn from domestic policy and implementation problems of the Great Society.

Can the theoretical apparatus of this book fully explain the end of the Cold War? Possibly not, because the authors' image of learning appears closer to learning in academic or scientific life. But by the beginning of the 1990s, one did not simply see reality more clearly, as a scientist. The nature of a socially constructed reality and its supporting emotional consensus changed for all participants—as if one were living inside a dream or a nightmare and awakened.

For example, viewing objective evidence, it was arguably crazier to have stopped the Cold War abruptly than to have started it. By the late 1980s, both sides had vast nuclear arsenals explicitly targeted at one another; 40 years of global conflict had shaped the relationship and given evidence to confirm the hostile images of ideological formulae; the American president had called the Soviets an "evil empire" and was engaged in the largest arms race buildup in history; both sides were engaged in open support for proxy armies (Nicaragua, Afghanistan) in one another's spheres of influence. But in the late 1940s, against a background of wartime cooperation, no objective evidence of such magnitude and persuasiveness was available to justify the beginning of the Cold War.

Thus, if we contrast the two end points, was it not profoundly irrational and dangerous for the Soviet leaders to call off the Cold War? Not just to reach an arms control agreement (this might be predicted by realism and many other theories) but to dissolve the Warsaw Pact? To allow the breakup of the entire Soviet state? To welcome Western investors with open arms? Emotions can either block or support new learning; and one suspects that at a gut level, Soviet leaders decided to *trust* the West. And if so, this deeper intervening shift in emotional consensus, more consequential than the "objective" evidence of American arms buildups, is a causal mechanism whose nature, amidst the discussion of cognitive changes, remains a mystery.

With Tetlock's definition of differentiation and integration, the reader is prepared to read a dazzling tour de force in the last chapter, a crisp, refined, detailed, and brilliantly integrated outline of the causal variables and theories of the previous eight hundred pages. Yet, although Breslauer's chapter (and Weber's) are thoughtful and rigorous, they only begin to mine the volume. We do not know the box score of existing theories. It is left to future researchers (or graduate students) to inventory the new boxes, subboxes, and arrows implicit in this de facto update of Deutsch. The volume is a wonderful start—and by its own conception, the field has more work ahead.

University of Toronto LLOYD S. ETHEREDGE

Systems in Crisis: New Imperatives of High Politics at Century's End. By Charles F. Doran. New York: Cambridge University Press, 1991. 294p. $49.50.

Charles F. Doran has written a wide-ranging and incisive book that argues persuasively that power cycle theory is a potent analytic tool of analysis for understanding international relations in general and the outbreak of major war in particular. The book is ambitious, and the result something of a triumph. The author constructs a powerful case for claiming that the key to understanding the behavior of great powers (especially the sort of irrational behavior that commonly precedes cataclysmic war) is the trauma associated with widening gaps between national interests (or roles) and power (relative, not absolute), trauma which is the consequence of the power cycle. He argues that when a number of such traumas occur simultaneously, as they must owing to systemic interdependencies, the probability of major war increases dramatically.

Doran builds his argument meticulously. In part 1, he lays out the power cycle model—its essential concepts, their operationalization, and the data used to measure them—and places it clearly in its metatheoretical context. (There is also a brief but useful mathematical appendix). Although firmly embedded in the power politics tradition, power cycle theory (unlike balance of power) is dynamic and focuses on long-term change itself. One may quibble with the way Doran chooses to measure power: for example, the absence of contextual factors. But his combining of economic and military variables is a reasonable compromise that avoids the biases that flow from overemphasizing one or the other. The author recognizes the greater difficulty in precisely measuring international role, with all of its normative baggage, but his elaboration of this inherently slippery concept through historical and case description is entirely satisfactory.

Part 2 makes a deceptively simple (and highly effective) shift from the state and dyadic levels to system-level analysis. Doran shows how structural disequilibrium flows from a situation in which a number of states simultaneously experience "critical points" in their power cycles (such points being defined as changes in the slope or direction of the cycle that negate foreign policy expectations). The author's wedding of empirical

data and historical analysis in making his case is unusually careful and illuminating. Indeed, his treatment of the causes of World Wars I and II illuminates geniune historical anomalies and shows the utility of political science for traditional historians.

Doran argues that such shifts are "perceived" by national leaders and publics, who are shocked by them and may respond in unpredictable ways. The link between structure and perception is necessary in order to avoid the charge of structural determinism and so prepare the reader for the prescriptive analysis to come. However, although the argument is plausible, there is tension between the claim that shifts are perceived and the central role played by surprise in the analysis. Moreover, the process by which perception takes place remains nebulous. Nevertheless, Doran ingeniously manages to open the national "black box" and to introduce and justify the splendid prescriptive essay that is to follow in part 3.

Parts 3 and 4 will assure that this book becomes required reading for graduate seminars in international relations theory. Having avoided the sort of frustrating determinism that characterizes long-cycle and hegemonic theories (which the author addresses), as well as the static bias of much of power theory, and having wisely ignored the putative "levels-of-analysis" problem, Doran examines at length the prerequisites of world order and the prospects for avoiding cataclysmic war. He then applies a similarly provocative analysis to contemporary world politics, especially to the implications of American and Soviet decline and Japanese and Chinese ascent (though from different points on their respective power cycles).

The examination of the recent past and future alternatives of the United States and the Soviet Union highlights the critical importance of linking system-level structural factors in order to make sense of international relations. Unfortunately, though imaginative, it also reveals the limits of power cycle theory in dealing with the domestic arena. These limits are especially evident in the (dated) discussion of probable future alternatives for the Soviet state and the causes of American behavior in Vietnam.

If Doran's effort to examine policy choices suffers from some of the drawbacks inherent in the power tradition, his willingness to tease normative implications concerning "justice" and "legitimate" behavior from the power cycle model constitutes an important contribution to the discipline. His claims regarding the relationship between power and justice and the obligations of leaders to design policies that will narrow status–power discrepancies in rising states are not uncontroversial. Nevertheless, the effort is an important and welcome step toward relinking empirical and normative analyses in international relations theory.

In short, whatever one's view of the statist and power politics tradition of which this book is a part, it is difficult not to be impressed and enthused by its breadth. It is among the most important theoretical and empirical additions to the causes-of-war literature of the past decade. More importantly, it suggests that there is life yet in what many observers believe is the increasingly moribund realist–neorealist tradition.

Iowa State University RICHARD W. MANSBACH

Moscow and the Middle East: Soviet Policy since the Invasion of Afghanistan. By Robert O. Freedman. New York: Cambridge University Press, 1991. 426p. $59.50.

Soviet Policy towards Syria since 1970. By Efraim Karsh. New York: St. Martin's, 1991. 235p. $59.95.

The USSR and Iraq: The Soviet Quest for Influence. By Oles M. Smolansky. Durham: Duke University Press, 1991. 347p. $55.00 cloth, $24.95 paper.

The political and economic changes associated with the tenure of Mikhail S. Gorbachev as president of the Soviet Union have had substantial impact on Soviet foreign policy. *New thinking* (as the reinterpretation of Soviet foreign interests and behavior is termed) has resulted in major arms control agreements and a substantial reduction of the Soviet military presence in Central Europe, the liberation of Soviet client–states in Eastern Europe, the withdrawal of Soviet troops from Afghanistan, a dramatic reduction in Soviet military support for erstwhile ally–clients throughout the Third World, and Soviet support for the U.S.-led military operation in the Persian Gulf. As this partial list indicates, Soviet policy in the Middle East has been affected by policy shifts as significant as those elsewhere throughout the Third World.

Three recently published book by established analysts of Soviet policy in the Middle East provide both background for, and an evaluation of, recent Soviet policy. Taken together, these books provide detailed coverage of key elements of Soviet policy throughout the region.

Over the past 20 years Robert O. Freedman has been among the most important and most prolific of Western writers on Soviet policy in the Middle East. His most recent *Moscow and the Middle East*, brings the story he first told in *Soviet Policy Toward the Middle East Since 1970* up to the Soviet withdrawal from Afghanistan in early 1989. As those familiar with his earlier writings would expect, his new study provides a detailed chronology of the development of Soviet policy in the key issue areas of importance throughout the region. Freedman weaves together a treatment of domestic developments within the Middle East, his interpretation of Soviet objectives, and the interaction of Soviet and other external actors to produce a comprehensive picture of Soviet policy toward the region during the 1980s. This book (like all of Freedman's work) is based on a wealth of documentation.

Freedman concludes that as of early 1989 when the Soviets withdrew their troops from Afghanistan, Gorbachev's policies toward the Middle East were characterized more by continuity than by dramatic changes associated with new thinking. The areas of continuity included (1) the Soviet plan for resolution of the Arab–Israeli conflict, (2) the Soviet unwillingness to use military force to challenge either Israeli or U.S. activities in the region, (3) the inability of the Soviet Union to effect reconciliation between Syria and the leaders of both the PLO and Iraq, (4) the policy of trying to balance between Iran and Iraq during the ongoing war, and (5) the Soviet disinformation campaign targeted against the United States (p. 323).

Freedman does find new elements of Soviet policy in the increased emphasis upon the role of the United Nations, the efforts to normalize relations with both Egypt and Israel, and the overall more flexible and active nature of Soviet policy in the region.

While Freedman provides the reader with a *tour d'horizon*, the other two authors provide detailed country studies. For almost two decades the Soviet relationship with Syria was a centerpiece in its overall policy toward the Middle East. In a perceptive analysis entitled *Soviet Policy Toward Syria since 1970*, Efraim Karsh examines the nature of Soviet policy toward Syria, including the basic objectives, the instruments employed in pursuing those objectives, and the costs and gains associated with that policy.

Karsh argues that the basic objective of Soviet policy remained essentially unchanged, namely, the establishment and maintenance of regional stability. Karsh begins by arguing that the Soviet–Syrian relationship has been neither one of patron and client nor one in which the smaller has been able to control the policies of the larger. He argues that although the Soviet Union has provided substantial military support to Syria, it has recognized the limitations of military power in the accomplishment of its objectives, especially during times of peace. After establishing the initial framework for his analysis, Karsh provides a chronological examination of the Soviet–Syrian relationship from approximately 1970 until the Gorbachev era. He notes the great concern among the Syrians for the negative implications of "new thinking" in the foreign policy area as it emerged under Gorbachev after 1985.

As Karsh argues, Gorbachev has recognized the legitimate interests of the West in the region and has emphasized the need for a negotiated settlement of the central issues that divide Israel from its Arab neighbors. The overriding objective of Soviet policy in the area from Brezhnev to Gorbachev has been the attainment and preservation of stability. While Gorbachev's approach to the attainment of these objectives has shifted, he has not abandoned the core goal of Soviet policy over the past two decades. This conclusion coincides quite well with the basic argument presented by Freedman.

Oles M. Smolansky's *The USSR and Iraq* is the first major study of Soviet–Iraqi relations to appear in English. Rather than providing a chronological survey of the evolution of relations, Smolansky focuses on specific aspects of that relationship. He does begin with a brief historical overview of relations from 1958 up to 1980 and the outbreak of the Iran–Iraq war. Smolansky argues that relations were characterized by both an overlap of short-term objectives and also by substantial disagreements on issues of major importance. Smolansky then examines several issues that exercise major influence on the relationship. During the first of these, the nationalization of the Iraqi oil industry in the early 1970s, the Soviet Union was strongly supportive, for Soviet and Iraqi interest tended to overlap. The second issue, the Kurdish question, resulted in periodic divergence between the Soviet Union and Iraq. However, by the mid-1970s and the culmination of the governmental suppression of the Kurdish movement, Moscow shifted its support back to the government of Saddam Hussein. The issue of the Iraqi communist party was one that also resulted in a periodic deterioration in Soviet–Iraqi relations. Though the Soviets, on occasion, virtually abandoned their communist allies, by the end of the 1970s when Saddam Hussein executed a substantial number of Iraqi communists, Soviet–Iraqi relations suffered seriously.

Besides issues of Iraqi domestic politics that exercised an influence on the relationship, issues concerning regional problems—Iraq's relations with Arab countries, as well as with Iran—were important. These issues culminated in the Iran–Iraq War of the 1980s, during which the Soviet Union greatly reduced its support for its Arab ally, either asserting a neutral position or on occasion even "tilting" in support of Iran.

The USSR and Iraq makes a significant contribution to our understanding of Soviet relations with an important Arab country. What emerges is a clear picture of a relationship characterized almost as much by divergence and conflict as it was by agreement on key issues of domestic and foreign policy. At no time could Iraq be viewed as a client state of Moscow. Despite the strengths of this book—and they are overriding in any overall assessment—one could wish that greater attention had been given to aspects of Soviet–Iraqi relations during the 1980s not directly associated with the war against Iran. Moreover, one might question the author's decision to exclude any attention to Iraq's role within the Arab–Israeli conflict and also the Soviet role in Iraqi–Syrian relations.

As all three of these well-written books demonstrate, Soviet policy throughout the Middle East has focused on efforts to stabilize conflict and protect Soviet interests. However, despite the infusion of massive resources, the Soviet Union generally was not able to impose its will on client states. In sum, the Soviet ability to affect events througout the region was very limited.

University of Illinois, Urbana–Champaign ROGER E. KANET

The Political Economy of Third World Intervention: Mines, Money, and U.S. Policy in the Congo Crisis. By David Gibbs. Chicago: University of Chicago Press, 1991. 264p. $29.95.

In a provocative study of U.S. foreign policy in the Congo crisis of 1960–65, David Gibbs provides a convincing reinterpretation of the motivations behind the interventionist policies of the Eisenhower and Kennedy administrations. Gibbs argues that foreign investors helped determine U.S. policy by influencing bureaucratic decision making in each administration. In the Eisenhower administration, key executive branch officials including the secretaries of State and Defense were close to business groups with investments in Katanga Province. According to Gibbs, the economic ties of Eisenhower officials to U.S. investors in Katanga conditioned their support for the attempted Katanga secession of 1960. In contrast, business groups close to the Kennedy administration were divided into pro-Katanga and anti-Katanga factions. The anti-Katanga faction consisted of business groups (e.g., Chase Manhattan Bank) who opposed the Katanga secession due to their economic competition with Belgian companies. These investors sought the establishment of a stable central government in order to facilitate increased U.S. investment in the Congo and to weaken Belgian economic interests concentrated in Katanga Province. Gibbs argues that the divisions within the Kennedy administration between pro-Katanga and anti-Katanga business factions explain the bureaucratic rivalry over whether to support the Katanga secession.

Drawing on a wealth of primary documents, Gibbs challenges many of the traditional claims made by scholars by U.S. foreign policy. He argues that U.S. policy

toward the Congo cannot be fully explained in realist or anticommunist terms. Traditional accounts of U.S. intervention in the Congo focus on Patrice Lumumba's communist ties as the primary factor motivating U.S. policy. Gibbs concludes that these accounts are misleading for two important reasons. First, the anticommunist argument fails to explain why the Eisenhower administration supported the Katanga secession, given its destabilizing effects on the Congo and the degree to which it motivated Lumumba to seek aid from the Soviet Union. The Eisenhower administration could have opposed Lumumba without supporting the Katanga secession. Second, there is ample evidence that Lumumba was not a communist and, in fact, sought aid from the United States and the United Nations several weeks before he accepted Soviet assistance. In fact, Lumumba received aid from the right-wing Liberal party of Belgium in addition to aid from the Belgian communist party (p. 99).

These factors lead Gibbs to advance a business conflict model to better explain U.S. policy toward the Congo. The model puts forward two propositions concerning U.S. foreign policy: that business groups are the most influential pressure groups in the foreign policy process and that business groups are divided by diverse sectoral economic interests. This interpretation challenges bureaucratic accounts of U.S. foreign policy which focus on the institutional dynamics of foreign policy decision making. The author provides an additional counterpoint to traditional pluralist and Marxist accounts of U.S. policy. Pluralists underestimate the importance of policymakers' informal business connections while Marxists exaggerate the unity of business groups in the political process.

However, Gibbs is careful to note that the business conflict model is not always the best model for explaining U.S. intervention. He insists that the model is insufficient in explaining the eventual decision of the Kennedy administration to oppose the Katanga secession. Here, the realist or statist model proves useful in accounting for the triumph of antisecessionist business interests close to the Kennedy government. Kennedy officials came to oppose the Katanga secession due to the pervasive fear that it would destabilize the country and lead to increased Soviet and Chinese influence in the region. This Cold War consideration allowed business interests opposed to the secession to win the arguments with their pro-Katanga rivals. In this particular instance, the business conflict and realist models are complementary in their ability to explain U.S. foreign policy toward the Congo.

This is a first-rate example of careful archival research and nuanced scholarship. Gibbs supports his claims with extensive primary documentation, much of it recently declassified. However, the theoretical framework could be enhanced by considering in more detail how the business conflict model might be compatible with other approaches to foreign policy. For example, what does the model have to say about the institutional variables which might influence whether or not one business group triumphs over another in the foreign policy process? Do business groups attain influence solely as a result of their informal connections to policymakers (as Gibbs suggests), or is such influence conditioned by the nature of executive–congressional interaction? Also, to what extent can domestic opposition groups influence U.S. policy by pressuring business and political elites to modify or alter their positions (as during the Vietnam War)? To his credit, Gibbs considers some of these questions in the last chapter of the book, suggesting both cases where the model could be usefully applied and cases where it would be inadequate.

Florida International University RONALD W. COX

The Lessons of History. By Michael Howard. New Haven: Yale University Press, 1991. 217p. $27.50.

In this book distinguished military historian Michael Howard collects a set of articles, essays, and lectures mostly written during the course of the tumultuous 1980s. The perspective in these urbane, thoughtful pieces is one that can at once beguile and frustrate political scientists. On the one hand, Howard is quick to note that historians "find it as difficult as anyone else to distinguish between the significant and the transitory" (p. 2) and urges "humility" in finding historical palliatives to apply to the present (p. 5). On the other hand, he often finds himself uttering generalizations of the most sweeping sort. Since, however, the generalizations emerge after a lifelong study of war and of society and since they are filtered through a mind that is reflective, agile, analytic, and careful, they require consideration and respect.

Howard's chief generalization concerns historical patterns of war, and many are likely to find his conclusions to be wildly optimistic. He expects that war will persist among "undeveloped" societies and suggests that civil war might still occur within both undeveloped and developed ones. Nevertheless, he believes it "quite possible that war in the sense of major, organised armed conflict between highly developed societies may not recur, and that a stable framework for international order will become firmly established" (p. 176). His more fleeting prognoses on economics (not his strong suit) suggest utter gloom: revolutionary socialism, he observes, "is disastrously inadequate for long-term economic development," while its alternative, free-market capitalism, creates "horrifying inequalities and widespread corruption, which in turn inhibit economic growth" (p. 5). Apparently, nothing works.

Howard's intriguing conclusion that major war may have become obsolete derives chiefly from a set of observations about the way people in the developed world have changed their attitudes toward war. At one time, he notes, they were organized into "warrior societies" in which warfare was seen to be "the noblest destiny of mankind." This was changed by industrialization, he argues, which "ultimately produces very unwarlike societies dedicated to material welfare rather than heroic achievement," with the result that "today everyone in developed societies belongs to 'the peace movement', even those who, in the name of stability, are most zealously building up their national armaments" (pp. 167, 175–76).

The main problem for this generalization (as Howard is fully aware) is that industrialization spoke with a forked tongue. If it encouraged some people to abandon the war spirit, it apparently propelled others to fall, if anything, more fully in love with the institution. Some of the finest pieces in the book, in fact, trace the persistence—even the rise—of a militaristic spirit that became wedded to a fierce and expansionistic nationalist

impetus as industrialization came to Europe in the nineteenth century. And of course, in the next century industrialized nations fought two of the greatest wars in history. The lessons of history, then, suggest that industrialization can inspire bellicose as much as pacifist tendencies.

Howard never really provides much of an explanation for how or why industrialization must inevitably lead to an antimilitary spirit. The horrors and holocausts that accompanied industrialization he simply attributes to the "growing pains" of industrial societies (p. 1).

For a man so keenly attuned to the force of ideas in history, Howard seems unnecessarily anxious to come up with a mechanistic, necessitarian explanation for attitude change. People in the developed world may have become disillusioned with war as they had become disillusioned with slavery. Because of unpleasant experiences with it and because of the machinations of skilled propagandists, they changed their minds about what they most valued and came increasingly to view war—at least war in the developed world—as immoral, uncivilized, disgusting, futile (particularly economically), and rather ridiculous. It is not at all clear they needed industrialization to come to that view.

University of Rochester JOHN MUELLER

Code of Peace: Ethics and Security in the World of the Warlord States. By Dorothy V. Jones. Chicago: University of Chicago Press, 1991. 208p. $24.95.

In *The Twenty Years' Crisis, 1919–1939* (1949), E. H. Carr argued that idealism and realism play vital interactive roles in the theory and practice of world politics. Scholarship in the postwar era has tended to ignore this interaction, suggesting that we live in a realist world in which ethical principles have little place. *Code of Peace* offers a lucid and persuasive challenge to this position that indirectly recalls Carr's influential study.

Code of Peace describes how a universal set of ethical principles has evolved in the twentieth century. This code expresses an image of an ideal world of peace, justice, and cooperation and serves as a standard against which the behavior of states can be measured and toward which their actions can be directed. Forged by leaders acutely aware of the appeal of short-term national gains, it is the product of their reflections on state relations and their attempts to develop ethical principles and viable institutions to guide these relations. States do not always respect this code, but they recognize it as the essential basis of a just and peaceful world.

Dorothy Jones's argument is presented in six chapters that take the reader from the turn of the century to 1989. The self-interested "world of warlord states" (p. 8) was shocked by World War I into developing institutions to promote peace. Although the most familiar of these, the League of Nations, is best remembered for its failures, her discussion of the much-neglected interwar period notes several successes. This "experimental" period was hampered by conflicting approaches to conflict resolution; an unshakable commitment to state sovereignty; and uncertainty about how to address revolutionary violence, secessionist movements, and human rights violations. But it produced a baseline against which later efforts could be measured; some of its institutions, such as the International Labor Organization, succeeded; and states gained experience in cooperation and problem solving. Unfortunately, its principal strategy for peace, which relied on collective security and public opinion, failed dramatically.

After World War II, elements of the interwar framework for peace were revised and refined. International conferences focused on identifying fundamental principles, as well as developing viable institutions. New states later extended these principles, most notably through the inclusion of an economic conception of social justice. The notion that states existed to serve the needs of people was expressed through conventions on human rights. Thus, over a period of 70 years, nine principles were worked out and repeatedly affirmed that reflect a universal desire for justice and peace. Two auxiliary principles, concerning distributive justice and protection of the environment, have recently received attention and may become part of the code. Jones concludes, "In the short term, the states' efforts may seem to make no difference at all, but in the long perspective of history, this code of international ethics stands as a possible bridge between the world the warlords have made and the world the warlords have dreamed" (p. 166).

Code of Peace was awarded the 1991 Lionel Gelber Prize. It is a model piece of scholarship that includes a clear and rigorously researched argument, several useful appendices (including a list of the 79 conventions and agreements that form the basis of Jones's code), and a bibliographic essay. It will be of special interest to those who study international law, organizations, and ethics but also offers insights into perennial debates over realism and idealism, independence and interdependence, and theory and practice. The text is suitable for teaching purposes and provides a good framework for discussing emerging agreements in areas such as development rights and environmental policies.

The book has only minor weaknesses. Jones's argument that the code of peace transcends cultural differences and is therefore universal is rather cursory. The extent to which the priority, meaning, and commitment given to these principles vary across cultural and other lines requires further attention. The state-centric focus of this study may limit its value in a world increasingly shaped by diverse nonstate actors. The contention that the code of peace is significantly more than the hollow rhetoric of states remains disputable. While it is noteworthy that states have expended great efforts to construct this code, a more cynical mind might emphasize the variety of violence manifest in the postwar era, attributing cooperation and the absence of war in some regions to self-interested cost–benefit calculations. Nonetheless, Jones's central claim that states have gradually created a universal code of ethical principles and a complex of supportive institutional arrangements is well argued. Her study stands as an excellent piece of scholarship that will reward readers throughout the field.

University of British Columbia RICHARD A. MATTHEW

Trappings of Power: Ballistic Missiles in the Third World. By Janne E. Nolan. Washington: Brookings Institution, 1991. 209p. $29.95 cloth, $10.95 paper.

The world watched transfixed as Saddam Hussein lobbed Scud missiles toward Israel and Saudi Arabia during the Gulf War. The military impact of the Iraqi

Scuds was small, but the political and psychological impact of Iraq's ability to throw inaccurate ballistic missiles at her neighbors was great. The issue of Third World ballistic missile proliferation has remained salient. The United States recently threatened to intercept a North Korean freighter suspected of carrying Scud–C missiles to the Middle East. In the wake of these events, Janne Nolan's balanced and informative book is an excellent introduction to the issue of ballistic missile proliferation, an issue that is having a major impact on the global distribution of power.

That Third World countries want ballistic missiles should come as no surprise. Nolan rightly notes, "Given an international system in which military prowess has been a leading determinant of national stature, the efforts of third world nations to acquire the most advanced weapons available in the international market should come as no surprise" (p. 16). Nor should it come as a surprise, she says, that Third World countries have been able to acquire ballistic missile technology. She outlines three strategies that Third World countries have pursued to acquire ballistic missiles.

Some countries have used the establishing of a space program as a launching pad for the development of a ballistic missile infrastructure. India received help in the development of its space industry from the United States, West Germany, France, and the Soviet Union. In pushing the development of space technology, those countries inadvertently pushed forward India's ballistic missile program.

Some countries have been pushed by the United States to develop an indigenous defense industry. The United States adopted this strategy in the early 1970s as part of the Nixon Doctrine, which urged U.S. allies to build their own defense industry to acquire the means to defend themselves. South Korea exemplifies this strategy, as it obtained most of its ballistic missile technology from the United States.

Finally, some countries, such as Iran and Iraq, have relied on external suppliers for the technologies needed for ballistic missiles. Here, the limits of the Military Technology Control Regime (MTCR) of 1987 are apparent. The industrialized nations have been unable to create an effective international regime to stem the flow of ballistic missiles to the Third World.

Those interested in international relations theory might find this book disappointing. Nolan at times alludes to important themes in international relations theory, but they are never fully developed. Though theory development is clearly not the book's goal, there is much data for those interested in the development of international relations theory. Nolan points to both domestic and international factors as explanations for the failure of stemming ballistic missile proliferation. One interesting area for research would be a look at the MTCR from the perspective of the rich literature on regimes: the reasons for the lack of an effective regime should be explored for this case.

In addition, Nolan's chapter on the bureaucratic dimension of U.S. policy toward arms transfers and ballistic missile proliferation is of particular interest for U.S. foreign policy specialists. Nolan aptly notes that the institutional structure responsible for these issues has lagged behind technological changes. Both intellectually and institutionally, U.S. policy toward this emerging issue remains fragmented without adequate coordinating mechanisms. That the bureaucratic apparatus within the American state has not changed despite the increased importance of this issue is consistent with the emerging literature in international relations that has focused on the importance of domestic political structures. Though Nolan does not make explicit note of this literature, her findings provide support for those who have stressed the importance of institutions for explaining foreign policy outcomes.

The author does not discuss another possible explanation for the lack of a coordinated policy toward ballistic missile proliferation: perhaps policymakers have judged ballistic missile proliferation not to be a problem at all. They may feel that the limited range of Third World ballistic missiles does not threaten U.S. interests. Or perhaps policymakers have judged that ballistic missile proliferation will not lead to increased conflict in the Third World. After all, U.S. policymakers have always stressed the deterrent and stabilizing effect of U.S. ballistic missiles and thus may see Third World proliferation through the same lens. Such a perspective is short-sighted, but it may partially explain why the industrialized nations have failed to pay adequate attention to a growing security threat.

Nolan shows that Third World ballistic missiles have had a limited military impact. For example, they are inaccurate and have a shorter range than many of the combat aircraft in the Third World. However, ballistic missiles do offer some advantages with their increased speed and ability to elude air defense. In addition, the lack of accuracy will not last forever (though Nolan does make clear that great technological obstacles make this a problem).

Policymakers must carefully identify the nature of the threat. With the Soviet threat receding, some U.S. policymakers have justified increased funding for the Strategic Defense Initiative on the basis of the Third World ballistic missile threat. However, at this time, China is the only developing nation that can pose a threat to the United States with ballistic missiles. Thus, U.S. policymakers must be careful to respond appropriately to this growing security concern, and must not take steps that would inadvertently exacerbate the threat. For example, the Pentagon has recently announced that it is considering reorienting U.S. nuclear targeting toward Third World countries. Unfortunately, this policy may serve as an impetus to nuclear and ballistic missile proliferation.

The author is careful to note that the threat from the proliferation of ballistic missiles may soon increase. Even inaccurate missiles present a serious problem if coupled with chemical or nuclear warheads. In this sense, Nolan's suggestion for increased attention to this issue and for certain institutional reforms to cope better with this problem are crucial. It is also clear that the United States cannot go at it alone and that multilateral solutions are essential. Nolan's analysis and prescriptions provide a good starting point.

University of North Carolina, Chapel Hill ERIC MLYN

Law and Morality in Israel's War with the PLO. By William V. O'Brien. New York: Routledge, 1991. 342p. $45.00 cloth, $19.95 paper.

It is an unfortunate but understandable reality that books on the Arab–Israeli conflict are often judged as

much by their consonance with the political views of partisans as by their intrinsic intellectual content. This will probably be true with William O'Brien's *Law and Morality in Israel's War with the PLO*, too—all the more because of the difficult and contentious ground it seeks to tread.

Thus, those who tend to emphasize the paramount importance of Israeli security will likely welcome this volume. O'Brien argues that ever since the initiation of armed attacks by the PLO in 1965, Israel has been engaged in a "just war" against an organization whose primary strategy has been one of "terrorist attacks" (pp. 3, 7, 320). Any attempt to ascertain the legality of Israel's action, he holds, must be set in the context not only of the formal content of international law but also a realistic appraisal of both the continuing nature of the conflict and the actual (as opposed to rhetorical) practice of other states in the international system. On this basis, he concludes that the actions of the Israel Defense Forces have been militarily discriminate and proportionate and hence in reasonable conformity with the laws of war (pp. 168–69, 210). The few exceptions are limited aspects of retaliatory policy in Lebanon and the conduct of the 1978 invasion, some Israeli shelling of Beirut and the Sabra–Shatila massacres of 1982, and the behavior of some soldiers since the start of the Intifada in the occupied territories.

By contrast, those who place greater value on Palestinian self-determination will be unconvinced. Their largest objection is likely to be the extent to which O'Brien reduces the conflict to one of PLO terrorism and Israeli response. The former term—ubiquitous throughout the volume—includes a great many acts carried out by groups outside the PLO (including groups the PLO has sought to suppress) and is also stretched to include such things as attacks on military personnel and vehicles in the occupied territories (p. 224). Moreover, by raising the wholly unrealistic specter of the destruction of Israel—and by implicitly or explicitly citing a standard of international practices that includes France's brutal counterinsurgency in Algeria; South Vietnam's treatment of captured Viet Cong; and the human rights practices of Saudi Arabia, Syria, and Iraq—O'Brien is able to defend the many thousands of civilian deaths exacted by Israeli attacks in Lebanon, the policy of beatings adopted to combat the Intifada (p. 258), official torture (p. 254), the closure of Palestinian schools (p. 249), and violations of the 1949 Geneva Conventions relating to prisoner-of-war status (pp. 197–201) and the deportation and collective punishment of civilian populations under belligerent occupation (pp. 259–260). In general, the sorts of charges leveled by Amnesty International, Human Rights Watch, al-Haq, B'Tselem, and the U.S. State Department receive far less attention than Israel's self-justifications. A number of factual errors could be pointed to, including the claim that the PLO initiated military action in 1965. (The action in question was attempted by a group not then part of the PLO.) O'Brien's treatment of Israel's decision to invade Lebanon in 1982 can be seen as seriously flawed, both in its treatment of the *causus belli* and in its failure to adequately address the extent to which that war was directed at installing a compliant government in Beirut. Finally, there is much that he simply does not deal with, ranging from the full activities of Israel's proxy "South Lebanon Army" to the legality of Israeli settlement activity in the occupied territories.

My own views are mixed. O'Brien's analysis is, indeed, clearly framed and thought-provoking. He is certainly correct in underlining the necessity of treating the conflict as a protracted and continuing one wherein individual events cannot be treated in isolation. Yet O'Brien commits precisely this error, focusing on sporadic acts of terrorism at the expense of a real understanding of the Palestinian Nationalist movement, and isolating the morality of Israel's military activities from the morality of its military occupation and opposition to Palestinian self-determination. This problem becomes particularly acute after 1977, with the accession to power in Israel of the hardline nationalist Likud party. Likud policies toward the PLO were clearly driven more by ideology (territorial claims to the West Bank, hence the need to suppress independent Palestinian political organization) than by concerns over the limited threat to Israeli security posed by Palestinian "armed struggle." Indeed, as Avner Yaniv has shown in the Lebanese case (*Dilemmas of Security*, 1987), Israel often used military force to preempt or undermine growing Palestinian moderation that might otherwise have led to a negotiating process and future political settlement involving territorial compromise.

For these reasons, O'Brien's study cannot really be seen as the "comprehensive and objective analysis" that its dustjacket proclaims. However, it does represent another contribution to the continuing legal, moral, and political debate regarding the Palestinian–Israeli conflict.

McGill University REX BRYNEN

On Internal War: American and Soviet Approaches to Third World Clients and Insurgents. By William E. Odom. Durham: Duke University Press, 1992. 271p. $29.95.

This book examines how the United States can best respond to internal wars backed by the former Soviet Union (and others) in key Third World countries and areas. The author, William Odom, selects three countries of concern to the United States—El Salvador, Guatemala, and the Philippines—as well as the Middle East and Southwest Asia, to determine what the United States can and should do in light of the actuality or threat of internal wars that will affect important American interests.

Odom's key contribution is to combine political development theory (with heavy emphasis on Samuel Huntington's work) with knowledge of counterinsurgency warfare (he was director of the National Security Agency and retired as a lieutenant general in the U.S. Army) to guide American policy with regard to internal warfare. He observes that the prospects for democracy in each of the countries he studies are not good. The economic, social, external, and cultural forces are just too weak to support democratic rule over the long term (although attempts at democracy are not precluded). Moreover, in the wake of the Cold War, Odom correctly sees instability rising, as the restraining impact of the superpowers on Third World conflicts diminishes.

Odom's key conclusions are both startling and persuasive. American assistance to governments fighting insurgencies does far more harm than good. Militarily, it saps the ability and incentive of the government to

defeat the insurgents on their own. Economically, it stands in the way of the government's establishing effective tax extraction measures. By way of example, Odom contrasts Guatemala's relatively successful efforts at suppressing an insurgency and bringing about economic development with El Salvador's often disastrous results. The key distinction for Odom was that Guatemala had to act with virtually no U.S. assistance, whereas El Salvador relied on massive American support.

Odom also challenges the conventional wisdom by arguing that external forces play a key role in internal wars. He makes the case that outside assistance (from the USSR, Nicaragua, and Cuba) has been crucial for the El Salvadoran and Guatemalan rebels and that outside support (from the USSR and others) has even played a significant role among the Filipino insurgents. He concludes that the most effective way for the United States to defeat internal wars is to strike at external sources of support. Odom acknowledges that this will often be politically impossible (and perhaps unwise, as well); but he makes a convincing case that if the United States is serious about defeating internal wars, it should either go to the source or stay out of the conflict entirely.

Odom concludes with a set of thoughtful policy recommendations. They include that the American government narrow its focus to specific areas where troops are likely to be engaged when planning force development and operations, reduce the size of counterinsurgency forces while improving their quality, develop small countercoup and rescue forces, redefine international law to allow the United States to cope with internal wars, and transfer principal responsibility for paramilitary forces from the CIA (where they do not receive adequate attention) to the Department of Defense.

There are some problems with this otherwise valuable book. Discussions of Soviet strategy in the Third World have a Cold War flavor that has been largely overtaken by events. The book suffers from repetitiveness (the phrase, *colonialism by ventriloquy*, is especially overdone), does not make the case why vital American interests are engaged by internal wars, and treats the Middle Eastern and Southwest Asian countries superficially. The informal and somewhat eclectic style of the book may put off some academics who seek a more rigorous scholarly approach. In addition, Odom does not adequately explain why outside support can be so vital to insurgents and yet so harmful to incumbent governments.

These quibbles aside, this is an important book. As Odom notes, even the collapse of the Soviet Union will not stop internal wars that affect American interests. Leninist precepts on seizing and holding power have not lost their relevance in the wake of the Cold War. Outside powers hostile to the United States (e.g., Cuba, North Korea, and Iran) may continue to play a role in assisting insurgencies. Most important, the notion that the United States can do more by doing less is a refreshing change from much of the burgeoning literature on "low-intensity conflicts" and warrants serious consideration. That this view comes from an individual who has combined a successful career in scholarship with firsthand knowledge of actually dealing with insurgencies adds a special potency to the analysis. Policymakers and scholars will do well to take heed.

Johns Hopkins University STEVEN R. DAVID

Joint Ventures in the People's Republic of China: The Control of Foreign Direct Investment under Socialism. By Margaret M. Pearson. Princeton: Princeton University Press, 1991. 335p. $39.50.

Beautiful Imperialist: China Perceives America, 1972–1990. By David Shambaugh. Princeton: Princeton University Press, 1991. 326p. $35.00.

Since its Open Door Policy of the late 1970s, China's role in the global political economy has concerned scholars from both inside and outside the mainland. In the West, in particular, China's new identity in the world has prompted China scholars to break from the traditional idiographic approach of area studies and utilize more general theories, concepts, and arguments of social science to help us better understand and explain developments in China and their repercussions for the world. Two recent attempts are David Shambaugh's *Beautiful Imperialist* and Margaret Pearson's *Joint Ventures in the People's Republic of China*. Shambaugh examines the impact of (elite) perceptions on (foreign policy) behavior, and Pearson investigates the ability of a socialist state to control the costs of foreign investment while absorbing its benefits. While both are commendable in their attempts to match theory with substance, they remain more grounded in the latter than the former.

David Shambaugh's *Beautiful Imperialist* presents the views, analyses, and prescriptions of China's "America watchers" from 1972 to the present. Three main questions motivate his study: (1) "What is the substance of [the America watchers'] articulate perceptions, what is the variation among them, and how have they evolved over time?" (2) "What are the key explanatory factors (political, diplomatic, intellectual, sociological) that shape the specific perceptions and the images that lie behind them?," and (3) How does perception affect policy? (p. 35). He draws on extensive published writings (both public and restricted) and lectures of China's America watchers, as well as his personal interviews with these analysts.

Shambaugh propounds the thesis that two schools of thought have emerged among China's America watchers: Marxist and non-Marxist. (A third, more traditional and nationalist group appears only in foreign policy analysis. The "hegemonist" school consistently accuses the United States, as well as the Soviet Union, of superpower chauvinism. This approach, says Shambaugh, originates from China's historical experiences during the "century of humiliation" and thus represents an historical, rather than ideological, legacy.) The Marxist group is distinguished by its rigid adherence to ideology, which insists on "deductive analysis": "Marx says X or Lenin says Y, ergo this must be the case in the United States. Thus, the Marxists proceed on this basis to marshal evidence to sustain the a priori theories" (p. 136). The non-Marxist group, however, is less ideologically motivated and more interested in interpreting current events "in a largely atheoretical manner that presents the facts to their readership" (p. 86). Regarding the U.S. economy, for example, Shambaugh adds that the non-Marxists "are not political economists but real economists whose evidence is more empirical and statistical" (p. 136).

By characterizing China's non-Marxist analysts as "atheoretical," "less ideological," "ad hoc," and "descriptive," Shambaugh suggests that they operate outside any normative, theoretical, or ideological bound-

aries. This presumed neutrality, therefore, indicates that they have no self-serving agenda like the Marxist analysts. Yet Shambaugh fails to notice that these so-called free thinkers accept the same units of analysis, methodological assumptions, and institutional framework of Western neoclassical economics and positivist realism. On economic issues, for example, the non-Marxists focus on interest rates, inflation, tax cuts and money supply, government regulations on business, deficit financing, and federal expenditures. They accept American intellectual conventions (i.e., inflation vs. unemployment, Democrats vs. Republicans) and do not question their validity or even relevance. On foreign policy, China's non-Marxists sound like typical realists, with their emphases on superpower politics, the arms race, mutual deterrence, and U.S. and Soviet interventionism in the Third World.

Divergent intellectual traditions in China warrant attention and identification. But just because China's non-Marxists are beginning to sound like Western technorationalists, they are not necessarily, therefore, "nonideological" and "real," as opposed to the "polemical unreality" of Marxist–Leninists. Shambaugh concludes by declaring that a "perception gap" continues to plague United States–China relations: "Both sides are imbued with severe cases of cognitive dissonance, wishful thinking, stereotypical imagery, misinformation, and misperception" (p. 302). Indeed, this condition goes both ways when scholars of either side hide under the protective belt of "objective rationality" and charge their counterparts with ideologically skewered analyses.

Equally important, this book fails to address the methodological weaknesses of individualistically based, cognitive analysis. For example, Shambaugh presumes that individual input (i.e., China's America watchers) leads to a collective outcome (Chinese foreign policy decisions). Aside from questioning the methodological validity of linearly extrapolating from the individual to the group, another issue arises: What accounts for the content and nature of individual input and its variations over time? Shambaugh himself attributes the rise of non-Marxist analysis in China to increased exposure to the United States and changing institutional demands. But additional questions nag at the reader: Why and how did these structural and institutional changes occur? Why did these changes assume one particular trajectory and not another? Such inquiries expose the liabilities of Shambaugh's premise that "behavior is principally a function of perception" (p. 3). Clearly, perception and behavior interact, but Shambaugh acknowledges only one side of the relationship. Until these ideological and methodological issues are redressed, cognitive studies of this variety provide limited explanations while offering, at the same time, rich sources of textual data and information.

In contrast, Pearson's study of Chinese state control of foreign direct investment demonstrates methodological rigor and avoids ideological self-congratulation. Using China as a case study, she tests the supposition suggested by some *dependencia* and other critics that "socialism in some form would overcome the problems experienced in capitalist developing countries and would provide a substantial increase in host bargaining power" (p. 13). She shows how the Chinese state has tried, through a variety of measures, to "contain" the negative effects of foreign investment (e.g., loss of sovereignty, loss of "Chineseness") while reaping its benefits (e.g., technology transfer, foreign currency, demonstration effects). Pearson accomplishes this by focusing on host country controls at the national, regional, and enterprise levels. Given its rich data base and meticulous research, this study offers a firstrate history of foreign investment in China from 1978 to 1988.

Pearson concludes that a socialist state does not necessarily exert greater control over its foreign direct investment sector; indeed, China's record is mixed. While the Chinese state was successful in maintaining some control in foreign direct investment sectors (e.g., enterprise welfare provisions, externally imposed economic regulations), it eventually ceded a certain level of authority to foreign management (e.g., obviating political study sessions and political secretaries in enterprises): "At the most basic level, some of the specific tools the government intended to use to control the negative effects of foreign investment were simply ineffective in the post-Mao environment" (p. 203). Equally important, China's liberalization process effected a change in the relations between the state and transnational corporations as Chinese economic reformers increasingly conceded that the overall economic benefits of foreign investment outweighed its potential social costs.

Pearson, however, remains curiously silent on a potentially significant contribution suggested by her research: If the nature of the host state (i.e., capitalist, socialist) matters little in its long-term ability to control or contain transnational corporations, then what does matter (if anything)? Pearson does not address this logical implication of her findings. Instead, she discusses the generalizability to other socialist states of her findings on China. But this discussion seems moot, given Pearson's own conclusions. If a continental socialist state as ideologically bound and economically sufficient as China's cannot resist the seduction of foreign capital, technology, and know-how, why should smaller, less well endowed socialist states like Vietnam and Tanzania be able to fare any better? Not surprisingly, Pearson remains pessimistic: "Any expectations that socialism will be adequate to allow these countries to control substantially the terms of investment while absorbing satisfactory amounts of such investment are unlikely to be met" (p. 223).

Furthermore, I disagree with some of Pearson's theoretical assumptions. She accepts too easily the double artificial divide between domestic politics and international economics. The ability of a host state to control foreign investment, Pearson writes, reflects "its domestic political and economic systems, on the one hand, and the international economy, on the other" (p. 9). Indeed, Pearson continues with this line of analysis to speculate on China's future foreign investment environment. "It is certainly possible," she states, "that problems in areas not specifically related to the 'open' policy—inflation, the social upheaval caused by modernization, or growing intolerance over 'bourgeois liberalization'—could spill over into the realm of foreign economic policy and provide an impetus to halt foreign investment" (p. 216). But where do these "domestic problems" come from? Why would an otherwise autarchic, totalitarian state like China's experience inflation, modernization problems, and fears over "bourgeois liberalization" were it not for linkages with the world economy? Such insistence on domestic–foreign and political–economic separations only muddles our understanding of the nature of global interaction.

These criticisms aside, though, both Shambaugh's and Pearson's works represent the "future wave" of China studies. They are to be lauded for striving to match theory with ethnography for a case study as perplexing and fascinating as China's.

Syracuse University L. H. M. LING

Righteous Realists: Political Realism, Responsible Power, and American Culture in the Nuclear Age. By Joel H. Rosenthal. Baton Rouge: Louisiana State University Press, 1991. 191p. $24.95.

Realism is being put to the test by sweeping transformations in the international society. Traditionalists are looking backward, reinterpreting historical approaches for guidance in a sea of change. Postrealists are looking forward, applying new theories culled from continental philosophy to understand the challenges of late modernity. And neorealists are waiting for the data to come in.

Joel Rosenthal, editor of the journal *Ethics and International Affairs*, is clearly in the first camp. In a very incisive manner he sets out to rescue realism from its critics, as well as from some misbegotten disciples. He does so by going back to its origins, not in the sense of some pristine past of pure realism but of a formative moment in international politics when a public debate among a cosmopolitan group of thinkers and leaders, including George Kennan, Hans Morgenthau, Reinhold Niebuhr, Dean Acheson, and Walter Lippmann, gave rise to an uniquely American brand of political realism. Trying to make sense and a new order out of the postwar flux, these prototypical realists tested the legacy of the U.S. foreign policy (moralistic and legalistic, isolationist and exceptionalist) against the European tradition of realpolitik (where national interest outweighed, but did not ignore, moral considerations). The result, according to Rosenthal, was the advocacy of a hybrid American realism that was philosophical yet practical, prudent but not passive, critical *and* consensual. In short, a "righteous realism" to lead the nation and to instruct the public in the new responsibilities and obligations of a superpower.

In structure and intent the book is a concise review of the lives and thoughts of these seminal American realists. Indeed, the strength of the book lies in its ability to strike a balance between historical context and theoretical content, allowing the author to elucidate the key ideas of realism, demarcate the limits of its influence on American foreign policy, and make the case for its renewal—all in less than two hundred highly readable pages. In the process, Rosenthal does the field of international relations a service by envisioning a more complex realism. The straw man so often constructed by realism's critics is dwarfed by Rosenthal's comparative analysis of how these self-conscious realists used philosophical, historical, and moral reasoning to deal with the pressing issues of the day. There was nothing neat or parsimonious about their theories: the constituent elements of protorealism (the inevitability of tragedy, the play of paradox, the intervention of contingency) made for a highly normative, yet pragmatic, system of thought. This made, realism, the author argues, rather than any competing worldview, the best vehicle for understanding the moral responsibilities and political ambiguities that came with America's new power.

These individual *Ur*-realists unquestionably left their mark on American foreign policy, yet their ideas as a school of thought never really took root in the halls of power, the public realm, or the universities. Rosenthal goes beyond a theoretical and historical approach to explain the limits of their influence by detailing the tension between their professional responsibilities and personal beliefs (and the not always successful attempt to reconcile them). In their pursuit of a public philosophy of realism, they were able to transcend their primary identities as academician (Morgenthau), theologian (Niebuhr), statesman (Acheson), or journalist (Lippmann). They did so without pandering to the public; and although all held at one time or another high positions in the establishment, they eschewed elitist prerogatives. Rosenthal never really makes it clear whether the status was one of choice or circumstance; but the righteous realists were most effective (and perhaps most comfortable) as outsiders, or in Rosenthal's words, "cultural critics."

These realists did run against an American tradition in that they were machiavellian to the extent that they openly recognized the paramountcy of power in both domestic and international affairs. They were not, however, willing to subordinate their principles to the pressing demands of the Prince or to the passing desires of the public. Perhaps they could best be described as "Odyssean" realists: early in their careers they had heard and survived the siren calls of power, wandered and been tested in the wilderness, and then returned to warn the public of grave dangers, of "technocratic illusions" (Niebuhr), "a new feudalism" (Morgenthau), and "the sophisticated mathematics of destruction in which we have been entangled" (Kennan) (pp. 118, 135, 160). Most of them challenged conventional wisdom with nuanced positions of opposition at critical moments in American politics: Niebuhr criticized area bombing in World War II, Lippmann took on McCarthyism in the 1950s, Morgenthau early on came out against the Vietnam War, and Kennan opposed the Reagan arms buildup in the 1980s.

The author puts great stock in historical exposition, intellectual tension, and moral struggle to explain the efforts of the early realists to overcome the isolationism and exceptionalism of American foreign policy. Yet, by leaving out the story of other influences and challenges, the book serves in a peculiar way to reinforce American parochialism. For instance, there is no mention of the important cross-fertilization of American with British realism. What of the claim made by E. H. Carr, the British father of modern realism, that his greatest intellectual debt was to Niebuhr? Or Morgenthau's alignment with Herbert Butterfield and Martin Wight against the "abstract rationalism" of American international relations theory. Can one ignore the role of the Rockefeller-funded Committees on the Theory of International Politics set up in the late 1950s on both sides of the ocean for the study of international theory?

In the end, Rosenthal's account of the fathers of American realism rings true but incomplete. A new appreciation of how these men profoundly influenced American politics is gained; but one is left wondering how these giants of critical and moral reasoning were so easily conquered by the Lilliputians: the game-theorists who made MAD make sense, the systems analysts who rationalized the Vietnam War, the vulgar realists who justified the second Cold War. For that purpose, a

sociology of institutional politics is needed, as well as a rhetorical study of how the language and the power of the early American realists, initially steeped in the theologicoethical lexicon of tragedy and providence, justice and order, was scrubbed clean and neutralized by a nascent social science seeking a value-free discourse, thereby handing the public philosophy of international relations back to the ideologues.

University of Massachusetts, Amherst JAMES DER DERIAN

Images and Arms Control: Perceptions of the Soviet Union in the Reagan Administration. By Keith L. Shimko. Ann Arbor: University of Michigan Press, 1992. 288p. $37.50.

Images and Arms Control, by Keith L. Shimko, is a pleasure to read. The book uses, and contributes to, a developing political–psychological framework increasingly referred to as "image theory." It examines important theoretical issues, raises provocative questions that should fuel debate in this theoretical orientation, and applies the framework in an explanation of a series of arms control issues during the Reagan administration.

The theoretical portion of the book should provoke questions and debates among readers interested in political psychology. It begins with a discussion of the concept of images in political psychology and explores the enemy image in detail. The author expands upon a simple one-dimensional assessment of this construct, which is an important task in the refinement of the framework. Shimko argues that subtypes of the enemy image can be developed by fleshing out the attributes of the image further. He suggests, for example, that discriminations among types of enemies are made in perceived distinctions between "dispositional" and "situational" motivational forces. Perceived enemy capability attributes are amplified by adding nuclear and conventional weaponry attributes to the superiority, equality, inferiority perceptions commonly associated with the enemy image.

This effort raises a host of interesting questions concerning the general images concept. One set of questions concerns the problem of conceptualizing an image in a form that is distinct from the actual "fit" of a particular state in the image. One can ask first whether the proposed additional perceived dispositional, situational, and capability characteristics are at a sufficiently high level of abstraction to be useful and cognitively efficient components of an image. If not, they are not likely to be elements of an enemy image at the abstract conceptual level. Instead, these attributes may be ad hoc operationalizations or potential operationalizing categories used by policymakers on a case-by-case basis and therefore crucial elements in furthering the analyst's ability to describe the policymaker's full picture of a state once it is categorized into an image. While Shimko suggests that these are elements of image subtypes, he uses them as indicators for delineating differences in perceptions of the USSR within the Reagan administration.

A second important question raised in this theoretical portion of this volume concerns the nagging question of whether it is theoretically wise to think of differences among policymakers with similar images in terms of subtypes of images or positions upon an image continuum. Shimko prefers the former, but psychological findings should be important considerations in a larger debate on this issue.

The empirical portion of this book should be of interest to all readers, whether they are attracted to the theoretical orientation or not and regardless of differences in methodological demands. It presents a careful, well-supported assessment of the variations in Reagan administration views of Soviet motivations, strategy, decision style, and negotiating behavior. Shimko uses content analysis to provide empirical support for his evaluation of five central figures in the administration: Caspar Weinberger, Richard Perle, George Shultz, Richard Burt, and (of course) Ronald Reagan. The content analysis technique and problems in the methodology are clearly addressed, and the author presents his data in a readable form.

Shimko finds important similarities in images of the Soviets among Weinberger and Perle, on one hand, and Shultz and Burt, on the other. They were shown to differ in terms of both the content and quality of their enemy images of the Soviets, with Shultz and Burt often appearing not only less hard-line but also less certain in their assessments of Soviet motivation and intentions. Reagan is found to contain elements of each camp's image, but is ultimately closer to Weinberger and Perle. The policymakers' use of these enemy images is compared in terms of content, cognitive style, interest, knowledge, and other patterns. Most interesting is Shimko's ability to specify which elements of the images were different. The impact of those differences is then shown in an analysis of the INF, SALT II and START, and SDI debates.

The author's discussion of the impact of images on policy preferences is particularly useful in addressing the problem of how precise an explanation of policy preferences and tactical choice one should expect from political psychology. Shimko shows that the concept can be used easily in explaining general policy preferences and disputes. He also does an admirable job of connecting small variations in the enemy image of the USSR with specific differences among policy advocates concerning not only arms control in principle but their positions on classes of weaponry. He does not make the mistake of demanding that a perceptual analysis explain the exact number of weapons selected, but he does push the concept as far as it will go.

Finally, this book explores the limits of image-based analysis. The author honestly notes and accepts positions that cannot be accounted for with images and suggests a variety of additional explanatory factors ranging from personality characteristics to national self-image. In the process, he may give Ronald Reagan credit for more cognitive wherewithal than he is due; but that too is a mark of the author's effort not to overstep the boundaries of what he can claim for his analysis.

Washington State University MARTHA COTTAM

The Diffusion of War: A Study of Opportunity and Willingness. By Randolph M. Siverson and Harvey Starr. Ann Arbor: University of Michigan Press, 1991. 141p. $29.95.

The question of why most interstate wars remain small and localized while a few become large and, more

rarely, global is the central concern of this volume. More specifically, the authors examine the degree to which geographical contiguity and alliance commitments affect the choices of states to join or not join an ongoing war. They also consider whether these factors have any impact on the timing of war-joining decisions. In a nutshell, the reported empirical findings support the following conclusions. States that are contiguous with, or allied to, states already at war are significantly more likely to join the war than those that are not. Moreover, among joiners, states with closer geographical and alliance ties to warring states are likely to join wars sooner than those with looser ties. These findings are based on an examination of the Singer–Small war data for the period 1816–1965. Geographical contiguity is measured in terms of three categories: land border, cross-water border (separated by 200 miles or less of water), and colonial border (which actually includes other types of dependencies such as occupied areas). The alliance data are essentially the Correlates of War set, and the authors employ the familiar three-part distinction (defense pacts, neutrality/nonaggression treaties, and ententes) found in these data in their analysis. With both measures, the relative strength of effect expected on war-joining accords with the order just given; for example, states that have a land border with a warring state are more likely to join an ongoing war than those with a cross-water border. In general, the empirical results do support these expectations.

If the authors did little more than report their empirical results, one might question the justification for the book when one or two journal articles could have conveyed the same information faster and cheaper. (Indeed, some of the results have appeared in articles.) The answer to this lies in the broader purpose of the authors, that is, to show by example how the scientific study of war should be conducted.

Many of those engaged in the scientific study of war have argued for some time that wars should not be viewed as events but, rather, as processes; that is, wars do not simply start and, after a period of time, stop but evolve through time in response to factors that continuously promote or constrain their size, magnitude, and duration. Although such a process orientation may seem obviously appropriate to the study of war, the vast majority of empirical studies of war done in the past have not been in accordance with it. For example, the many time series studies that have used nation-months of war or battle deaths in war as a dependent variable implicitly assume that the factors that account for the occurrence of war are the same as those which account for its evolution. Ignored in these studies is the strong likelihood that new, nonlinear forces are set in motion after the beginning of a war that determine its ultimate character.

According to this process conception of war, there is not *a* war puzzle but, rather, a series of connected war puzzles that require solutions in order to develop integrated, cumulative knowledge about war. A major virtue of *The Diffusion of War* is that the authors embrace this process conception of war and focus on one of the more important war puzzles, namely, Why do most wars remain small, while a few become very large?

Another desirable characteristic of the book is that the authors explore the opportunity and willingness framework more thoroughly than any previous study. According to this conceptual framework, in order for a war to occur, at least two states must have the *opportunity* and *willingness* to engage in combat with one another. Thus, it is useful to categorize the factors that affect the likelihood and character of war in terms of what impact they have upon perceived opportunity and willingness. The authors elaborate this framework and spell out some of its implications. A major contribution of this framework is that it reminds us that a war requires at least two decisions to fight, one to attack and a second to resist. This may seem obvious; but it contradicts the standard implementation of expected utility theory, since, based on objective conditions, the more desirable a war decision is for an attacker, the less desirable it is for a defender to resist. In short, we must explain not only why some states attack (or threaten to attack) other states but also why those other states resist these attacks or threats.

As promising as this conceptual framework is, it does contain some problems. It rests fundamentally upon an ends–means distinction that is hard to maintain even in the abstract. Opportunity engenders willingness and willingness creates opportunities, and the two may be so intertwined as to make a distinction between them impossible. This problem becomes much worse when we turn to the operational side. For example, does a common border affect the opportunity for war or the willingness to war or both? Since the correct answer to this question is most probably *both* and, lacking direct measures of opportunity and willingness, we have no empirical basis to apportion the effect of common border, we are left with an arbitrary assumption about the nature of its effect. This problem is not restricted to geographical factors, and it raises the question of whether opportunity and willingness can be empirically separated in a meaningful way.

The authors should also be credited with directing our attention to the interdependence of events with their focus on the diffusion of war. Almost all standard statistical inference procedures are based on the assumption of independence; and the authors rightly point out that much social behavior (e.g., war joining) violates this assumption, sometimes dramatically. The authors embrace a diffusion–contagion model but (to my disappointment) do not develop, estimate, and test probability models that incorporate interdependence.

A final important contribution of the book is its reinforcement of the "rediscovery" of geography. War studies (and quantitative international politics in general) have neglected the spatial factor in world affairs. Too often, this factor has been considered trivial, uninteresting, or constant (all of which it is not) in previous analyses; and the authors deserve praise for demonstrating its importance.

In contrast to these good points, the book does have some notable deficiencies. The empirical findings are thin in comparison to the expectations raised by the title and theoretical sections of the book. Many factors affect the decision to join a war, and the authors' focus on only two of these is regrettable. Their focus is further restricted by the fact that they are only concerned with whether and when states join wars and not with which side they join. No explicit models are derived or tested, and the methods used are not uniformly state-of-the-art. Finally, although the authors rely on the Correlates of War data, they take exception to a number of Singer–Small coding decisions. These are sufficiently numerous as to warrant a complete listing of the war data used.

In spite of these deficiencies, the book makes an important contribution to the study of war, largely because it points in the direction we need to go if we are to produce scientific, cumulative knowledge about the causes of war and conditions of peace.

State University of New York, Binghamton STUART A. BREMER

Myths of Empire: Domestic Politics and International Ambition. By Jack Snyder. Ithaca: Cornell University Press, 1991. 330p. $35.00.

It is often noted that our theories of the domestic sources of international conflict and security policy have never been as fully developed as systemic, bureaucratic, or individual-level theories. With the publication of Jack Snyder's *Myths of Empire*, this is no longer true. Snyder poses the question of how to explain the numerous cases of overexpansion in the industrial age. He constructs a modified rational choice explanation based on the parochial interests of key domestic and bureaucratic groups, the strategic myths they construct to rationalize their expansionist policies, the processes of coalition formation and logrolling among these groups, and the domestic structures and patterns of industrialization under which these dynamics are most likely to arise.

Earlier theories of imperialism or overexpansion focused on the interests of self-serving monopoly capitalists (Hobson and Lenin) or atavistic military–feudal elites (Schumpeter). These concentrated interests reaped the benefits of overexpansion, while the costs were diffused throughout society in the form of taxation. Snyder, building on theories of collective action and voting theory, argues that groups concentrated enough to benefit from overexpansion are too narrow to control state policy, whereas those broad enough to control policy lack the motivation for overexpansion because their interests are too diffuse to reap net benefits. Snyder argues that key internal groups—each with parochial interests in limited but different forms of imperial expansion, military buildups, or economic autarky—create logrolled coalitions that secure power at the cost of a more expansionist foreign policy than is desired by any single group, and a policy that cannot be supported by available resources.

But logrolled interests do not alone explain overexpansion or the stability of the ruling coalition behind it. Key elites justify their power and policies through strategic myths which suggest that security is possible only through external expansion. Snyder rejects the hypothesis that strategic ideas are derived from intellectually formative lessons from history and argues, instead, that they are constructed by actors to rationalize their preferred policies. But these elites often internalize their own rhetoric or become politically entrapped in it, which inhibits strategic learning and disengagement from increasingly costly expansionist policies.

These dynamics are most likely to arise in cartelized political systems dominated by distinct concentrated interests. Overexpansion is less likely and less extreme when it occurs in democratic systems (where interests are diffuse and where the absence of information monopolies works against strategic mythmaking) or in unitary oligarchies (which have encompassing interests in avoiding the costs of overexpansion). Overexpansion is less predictable in dictatorial systems in which there is no check on the preferences of the leader. Domestic structure is a function of the timing of industrialization, which correlates closely, Snyder argues, with the concentration of power in society and the concentration of group interests. Early industrialization (Britain and the United States) is associated with diffuse elite interests and mass democracy, late industrialization (Germany and Japan) with concentrated interests and a cartelized system, and "late late industrialization" (the Soviet Union) with a centralized system ruled by a unified elite with encompassing interests.

Snyder tests the theory against competing power-based realist and cognitive learning hypotheses for five important cases of overexpansion: Germany from Bismarck to Hitler, interwar Japan, Victorian Britain, and the Soviet Union and the United States during the Cold War. The research design is carefully constructed to allow cross-sectional comparisons across countries, longitudinal comparisons within each country over time, and comparisons of group and individual preferences and strategic mythmaking within a country at a given point in time. The individual case studies are strongly driven by the theory, thoroughly informed by the secondary historical literature, and for the most part quite persuasive.

Snyder's findings support his theory. The most cartelized political systems were the most overexpansionist, whereas democracies and unitary oligarchies were considerably less so. In addition, Germany and Japan were least expansionist during those periods when they were least cartelized, while democratic and unitary states were the most expansionist when concentrated interests were relatively strong. Snyder shows that strategic beliefs were not learned from history but, instead, constructed to rationalize domestic interests and that realist theory cannot account for observed behavior. He concedes, however, that external threats and opportunities influence internal coalition politics and suggests that a more complete theory needs to integrate power, interests, coalitions, and ideology at both the international and domestic levels.

Myths of Empire is the best-developed theory to date of the domestic sources of international conflict and security policy. The fact that it is confined to great power overexpansion in the industrial era raises questions, however, regarding the extent to which the theory can be generalized. Snyder does not pretend to explain overexpansion in the preindustrial era, and he also suggests that the coalition politics model probably does not fit small powers. Snyder's care in not overstating his case should be applauded, though the modification of the theory to apply to the different class, sectoral, and bureaucratic structures of preindustrial states and also of contemporary small states would be a fruitful area for future research.

Although not all overexpansion leads to war and not all wars grow out of overexpansion, Snyder's coalition politics theory is an important contribution to our understanding of the causes of war, particularly the underlying causes. But elite cost–benefit calculations for war may be different from those for expansion, in part because external threats may be more pressing and elites may not be able to pass the political and economic costs of war onto others or defer them to an uncertain future. Although Snyder's concept of self-delusion and political entrapment by earlier strategic rhetoric is undoubtedly

important here, decision-making variables and strategic bargaining with the adversary also needs to be included.

The generalizability of the theory may also be limited by its focus on overexpansion as the dependent variable. Although the German and Japanese cases may be rather obvious ones, the concept of *over*expansion is difficult to operationalize, particularly given uncertainties regarding the intentions of others and the consequences of one's own action. Moreover, realist explanations emphasizing state cost–benefit calculations may be more difficult to dismiss for less extreme cases of expansion, though Snyder's novel interpretation of Britain's limited expansion in the Crimean War case demonstrates the potential applicability of his theory to such cases.

But these are just quibbles. *Myths of Empire* is one of the most important books on international conflict to come out in several years. Snyder has constructed a reasonably parsimonious model of coalition politics supplemented, where necessary, by key variables from other levels. In so doing, he has taken a major step toward ending the theoretical impoverishment of the study of the domestic sources of international conflict.

Rutgers University JACK LEVY

Moscow, Germany, and the West from Khrushchev to Gorbachev. By Michael J. Sodaro. Ithaca: Cornell University Press, 1991. 423p. $49.95 cloth, $15.95 paper.

American international relations scholars and specialists on Soviet foreign policy tend to view events in the postwar period largely in terms of U.S.–Soviet relations. While that presumption is often valid, it can sometimes obscure important sources of Soviet behavior by treating it as a derivative of its U.S. policy. This is especially true in the case of Europe, where Soviet fears and hopes with respect to important countries such as Germany have their own logic. By taking the relative importance of the United States in Soviet–German relations as a variable, rather than as a given, Sodaro shows that the leadership and the secondary elite (academics, journalists, etc.) in the post-Stalin era have been divided on a very basic issue in Soviet policy toward Germany: Does the Federal Republic of Germany have any independence in charting its foreign policy course, or is it subordinate to American policy and influence? He argues (and demonstrates quite convincingly) that four widely ranging views on West Germany's role in East–West relations—maximalist, Europeanist, Atlanticist, and Americanist—existed throughout the period in the Soviet and East German leaderships and that the basic prevalence of Atlanticist views created a flexibility in Soviet policy that both made détente possible and limited its cooperative potential. The book also examines how the constraints of the Soviet–East German alliance played a role in the timing and extent of cooperative initiatives due to substantial differences in East German and Soviet interests and viewpoints.

Sodaro's primary concern is to demonstrate that Soviet and East German policy toward West Germany cannot be explained in terms of unitary actor approaches but must be evaluated in terms of domestic political structures and the varying policies and viewpoints within the leaderships. In chapter 1 he sets out four types of decision-making regimes (directive, conservative, centrist, and reformist) and four primary aspects of Soviet foreign policy activity (the scope of détente, degree of responsiveness, willingness to compromise with foreign governments, and openness to internal debate). Because of the internal dynamics of the different types of decision-making regimes, they tend to produce different forms of foreign policy activity. Ulbricht's directive regime assessed détente in very narrow terms, was unresponsive to changes or other states, was unwilling to compromise, and restricted debate. Gorbachev's reformist regime has exhibited the opposite tendencies on all these aspects, while Brezhnev's conservative regime, Khrushchev's centrist–reformist regime, and Honecker's centrist–conservative regimes occupied the middle ranges. Thus, Sodaro claims, variation in foreign policy between leaderships and within leaderships (early vs. late Brezhnev) can be explained only by the imperatives and course of domestic politics.

As such, this book is another important contribution to recent work dissatisfied with relegating Soviet and East European communist decision making to the "black box" simply because of the difficulty in obtaining hard data on politics and foreign policies. Most of the book explores the disagreements expressed by the primary and secondary leaderships and shows that at many points both the Soviet and East German leaderships entertained various policy options, with results due to both relatively constant national interests (primarily the need for West German aid, trade, and technology) and internal political images. For example, Sodaro shows that were it not for Khrushchev's fall in 1964, Soviet–West German détente would have taken an earlier and more comprehensive form, with less of the constraints of military competition that bedeviled policies in the late 1970s. Similarly, it is impossible to imagine a persistent Brezhnev leadership moving to a Gorbachev form of German relations, given their divergent domestic priorities and coalitions.

But this does not make for a *theory* of the role of domestic politics in Soviet and East German policies toward West Germany. It takes the different leaderships as basically given and demonstrates that they have different priorities that affect their foreign policies. Thus, it is not really a theory of domestic politics but of regime types. Evidence that different leaderships or regimes have different priorities and policies does not demonstrate the impact of domestic politics. Indeed, it is consistent with unitary actor models of foreign policy in which the preferences and strategies of the unitary actor change at a few points in time. The author does not use his evidence of debate on policy toward West Germany to test a theory of how disagreements within the five leaderships affected policy. Such a theory would have to show how the institutional structure or nature of power in a political system was likely to produce particular policies. Harry Gelman's *The Brezhnev Politburo and the Decline of Détente* (1984) is an example.

Indeed, the author at times falls victim to the unitary actor model himself in constructing explanations for puzzling policies. The decision to deploy the SS-20s in the late 1970s, when the Brezhnev leadership had committed itself to a strategy based upon the advantages of economic and political détente, seems irrational, given the likely effect on West Germany of an enhanced Soviet nuclear threat aimed directly at it. Rather than exploring how the contradictory imperatives of a diverse coali-

tional leadership might contribute to self-defeating policies, the author attributes the SS-20 decision to military modernization, the desire to promote U.S.–West German conflict and gain further political advantages from Soviet military power, and a calculated decision to keep the level of military confrontation in Europe high in order to prevent any warming in West German–East European relations (pp. 266–69). This analysis is plausible and may be correct; but it presents a consistent and largely unified leadership and explains Soviet policy by seeking to make the leadership's reasoning coherent.

In the end, these problems are due to the enormous task of sustaining a theoretical framework while documenting and analyzing a complex area of foreign policy in two closed societies for a period of nearly 20 years. As a result, the theoretical issues too often become submerged in the empirical chapters that focus on Soviet and East German official policies and elite debates. The research does sustain the author's primary contention. To understand what these two countries did outside their borders in Europe, one must understand what went on within the borders.

Harvard University CELESTE A. WALLANDER

Encountering the Dominant Player: U.S. Extended Deterrence Strategy in the Asia–Pacific. By William T. Tow. New York: Columbia University Press, 1991. 540p. $55.00.

In a well-written and well-researched book, the author presents an elaborate argument that the United States has too much projected NATO strategic concepts to the Asia–Pacific region. He concedes that South Korea may have been as geographically vulnerable to a Moscow-directed tank attack over the decades as West Germany but notes that the rest of the region has not been beset by threats requiring counterthreats of U.S. nuclear escalation. In light of this, according to Tow, the region has too often simply been used as an auxiliary to concerns about NATO (as with various versions of the "maritime strategy" and "horizontal escalation" and the playing of the "China card").

The author's argument might have been made more tightly, and presented more rapidly and effectively, in a journal article; his overarching logical structure is repeated quite often through the book and may thus inferentially be assigned somewhat more significance for U.S. policy planning than is warranted. Above all, the book (like almost all the books now on the shelf) is overtaken by events—by the collapse of the Soviet Union and by the U.S. "dominant player" role in liberating Kuwait and by the burgeoning fears of nuclear weapons proliferation to North Korea alongside the rapid evolution of the entire Korean situation.

Tow's analysis is basically that *other* security concerns, *or* economic concerns that do not translate into military security problems, have been more important than the deterrence of Soviet attacks as we have tried to optimize U.S. policy for the Pacific rim. The book draws in a great deal of detail and analysis on this region over the entire Cold War period and handles it in a very balanced and persuasive way. Tow also nicely sorts out a fair amount of what we think of as theory on international relations and American foreign policy. Nonetheless, it might be that the U.S. government has already long perceived that, except for Korea, it had no great need for extended nuclear deterrence in the Pacific. In that case, the book may at times be attacking a straw man.

University of Maryland GEORGE H. QUESTER

Securing Europe. By Richard H. Ullman. Princeton: Princeton University Press, 1991. 183p. $19.95.

Richard H. Ullman has boldly ventured a book on the future of European international politics, with the general thesis that, *pace* John Mearsheimer, we will not miss the Cold War. In his admirably lucid and brief book, Ullman argues that "the era Europe has entered will be qualitatively different from those it has known before" (p. 139). Although the international system remains anarchic, among the developed countries the causes of war have become muted and the incentives for peace have increased. Arrangements are within grasp that would render wars growing out of either aggression or arms races and the security dilemma extremely unlikely. Furthermore, the end of bipolarity and the Soviet threat mean that peace is divisible. Conflict in the Third World, Eastern Europe, and within the Soviet Union need not disturb the peace among the OECD countries. With Germany unified, all the countries of Western Europe are now satisfied with the status quo. The revolutionary changes within the Soviet Union and that country's abandonment of ideologically driven need for satellites to the East and fear of the West have rendered that country, too, little desirous for any change that might involve violence. Even without the unifying fear of the Soviet Union, the countries of Western Europe have nothing to fight about. Furthermore, existing institutions (NATO, the European Community) not only provide a framework for mutual economic and political benefit but also permit each state to see that the others are not about to threaten it. The fact that these countries are all liberal democracies contributes mightily to their good relations. The only remote danger Ullman sees is the possibility that other forms of government would appear, especially in Germany, as the result of a severe international depression (pp. 35, 41, 105).

The prospects for the Soviet Union and Eastern Europe are not so rosy—though even here Ullman is not as pessimistic as many other analysts. The ideas and structures of the Conference on Security and Cooperation in Europe and the West European Union could be used to construct a European Security Organization (ESO) that would include the United States and Canada. The United States would have a significant role in Europe, albeit not as unnaturally large a one as it played during the Cold War. Inspection, both formal and informal, could produce confidence and security. Promises of collective security would be credible, in part because there is little danger that a powerful aggressor will arise. One cannot, however, exclude the possibility of "an outbreak of warfare between Hungary and Romania or Greece and Turkey, or between two Yugoslav republics," in which case the ESO might find armed intervention excessively costly and settle for "walling off" the conflict instead (p. 68).

Because "only democracies share a commitment . . . to the rule of law and to the peaceful settlement of disputes," countries with other forms of government would be excluded from the ESO (p. 76). But (as Ullman

notes but might have discussed at greater length) excluding the Soviet Union or successor republics if it or they are undemocratic would create problems (p. 77). Together the developed countries could try to limit arms proliferation in, and terrorism from, the Third World and should maintain sufficient military force for some military interventions; but it would be neither necessary nor desirable for the ESO to try to police the Third World. Conflicts there, however unpleasant for the people concerned, are not likely to "spill over to engulf the advanced, industrialized states" (p. 135).

I find this optimism quite believable, but Ullman could have devoted more attention to things that might go wrong. First, an international depression could undermine democracies and create conflict. The role of Japan (excluded from this book) would need to be considered. Second, Ullman may be too sanguine about prospects for democracy in Eastern Europe and the Soviet Union. Third, keeping conflicts among these countries from spreading to Western Europe may be more difficult than Ullman expects, especially if Germany develops strong interests there. Indeed, the economic investment that everyone calls for, while perhaps reducing the chance of violence and war, would render more difficult a "walling off" strategy in the event its pacifying influence fails. Finally, the security dilemma may be troublesome in the absence of the Cold War, especially if each country begins to worry about becoming the target of pressure from a coalition of neighbors.

As Yogi Berra said, "Prediction is difficult, especially about the future." Time will tell whether Ullman's optimism is warranted. But he has made a strong case for it.

PUBLIC OPINION POLLING

Stephen Frantzich
U.S. Naval Academy

PUBLIC OPINION POLLING introduces the student to the various methodological choices in the polling process. Students become aware of the practical applications of concepts such as randomness, sample size, panel studies, question bias, etc.

Using the motivation of "beating the system," the student uses knowledge of polling methodology to bias a public opinion poll in order to support a particular ideological or political goal.

Requires an IBM PC with at least 128K memory, one diskette drive, DOS 2.1 or higher, and BASICA.

$39.95
$119.95 with a ten-copy site license

Order TASL software using Visa, MasterCard, American Express, check, or university purchase order. Shipping and handling is $2.75 for first item ($7.50 foreign) and $.75 for each additional item.

PUBLIC OPINION POLLING is a teaching module and simulation designed to introduce you to the choices that are made in the polling process. You become aware how sample size, randomness of sample selection, panel studies, and question bias influence the outcome of a poll.

Section 1 is an introduction to the concepts of public opinion polling: sample population and size, bias, and randomness.

Section 2 assumes that you have unlimited resources to carry out a poll on some of the basic public policies which divide liberals and conservatives in American politics. You are asked to make decisions about the sample, sampling method, and question phrasing. The program then analyzes how your decisions would influence the outcome of the poll.

Section 3 is similar to section 2 but with limited resources.

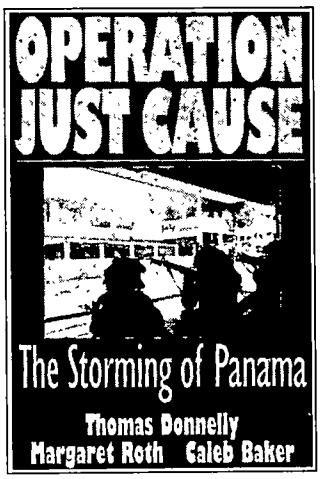
THE PRICE OF PEACE
The Future of the Defense Industry and High Technology in a Post-Cold War World

William H. Gregory

The end of the cold war, the dissolution of the Soviet Union, the wane of communism world-wide, and the quick victory in the Gulf have all led to calls for a smaller defense budget, reduced levels of military pesonnel, and fewer expensive high-tech weapons. The result of these cutbacks, Gregory argues, is not a peace dividend, but a further burden on the already shaky economy. Gregory explains the little-known and far-reaching effects of the defense cutbacks and calls for a new national technology policy that will ensure our military, technological, and economic survival.



Dec. 1992 0-669-27950-1 $24.95

THE INTERNATIONAL ARMS TRADE

Edward J. Laurance

The events of the past year in the Persian Gulf, which saw Iraq import enough armaments to defy the major powers, have brought the question of arms trading to the head of the international agenda. In the first book to address the arms trade in a truly global context, Laurance applies international relations theory to an issue at the heart of the contemporary state system—the transfer of military capability for the purpose of fortifying the national security of sovereign states. Laurance examines past patterns of arms transfer, and the influences of international factors on national policymakers, in order to show that the arms trade has gone far beyond the control of individual nation-states.

DEFENSE BEAT
The Dilemmas of Defense Coverage

Loren Thompson,
Georgetown University, Editor

As the recent Gulf war graphically demonstrated, there is an inherent tension between the interests of soldiers and those of the journalists assigned to cover military operations. This book shows how and why this friction between the military and the media, which has persisted since the founding of the Republic, has caused profound legal and ethical problems during both war and peace. Thompson traces the evolution of the military-media relationship from the American Revolution to Operation Desert Storm. He then provides thoughtful perspectives on the current status of this relationship written by experts who have experienced it firsthand from both sides.

THE SCIENTIFIC STUDY OF PEACE AND WAR
A Text Reader

John A. Vasquez and Marie T. Henehan

In this comprehensive overview, Vasquez and Henehan bring together the best scientific work on peace and war over the last twenty-five years—by leading scholars including Jack Levy, Bruce Bueno de Mesquita, Steven Rosen, Organski and Kugler, Rassler and Thompson, Randolph Siverson, and others. Together these pieces constitute an ample body of evidence illuminating the causes and consequences of war, and reflect the real progress that has been made towards a comprehensive explanation of war and peace.

"This book fills a significant void by providing a tangible guide to the scientific analysis of war as well as offering a basis for undergraduates to read and understand qualitative studies."

THE PLACE OF MORALITY IN FOREIGN POLICY

Felix E. Oppenheim

Provides a thought-provoking examination of an all-too-often overlooked question central to any discussion of international relations and ethics: to what extent is morality relevant in foreign policy decisions? Written to challenge students and experts to explore in what instances morality and moral commitments really matter in international politics.

1991 0-669-21452-3 $14.95 paper

DEATH IN THE BALANCE
The Debate Over Capital Punishment

Donald D. Hook and Lothar Kahn

"Capital punishment perhaps more than any other perennial issue of public argument, teaches intellectual humility. No matter which side of the issue you are on, if you do not feel the weakness of your position and see the strengths of the other side, you fully understand neither...if you doubt this is true, read this valuable volume. It is a fine guide to the broad gray areas of argument."
—**George F. Will**

FOR THE BEST IN POLITICAL SCIENCE

Pluralism, Socialism, and Political Legitimacy

Reflections on Opening Up Communism

F.M. Barnard

The processes of transition from communist rule in Eastern Europe and the dilemmas of reform in the Soviet Union invite reflection on the role of pluralism in rendering a political system legitimate and democratic. In this book, Frederick M. Barnard examines differing conceptions of political pluralism, focusing on the question of how political differentiation can evolve and flourish without leading to crippling political fragmentation.

40252-2 Hardcover $39 95

US-Japan Alliance Diplomacy 1945-1990

Roger Buckley

This book is a pioneering study of a remarkable postwar relationship. Based on extensive American primary sources, it traces how the United States moved from hostility to close friendship in its relations with Japan over the past 45 years.

Cambridge Studies in International Relations 21

35141-3 Hardcover $49.95

Talking Politics

William A. Gamson

William Gamson asks the question, how is it that so many people become active in movements if people are so generally uninterested and badly informed about issues? This book is an analysis of discussions among small groups of working-class people on affirmative action, nuclear power, the Arab-Israeli conflict, and the troubles in American industry contradicts popular conceptions of the public's inability to understand politics.

43062-3 Hardcover $49.95
43679-6 Paper $15.95

The End of the Cold War

Its Meaning and Implications

Michael J. Hogan, Editor

This timely collection of essays considers the origins of the Cold War, its ideological and geopolitical sources, the cost of that epic conflict, its influences on American life and institutions, and its winners and losers.

Contributors: Gar Alperovitz, Denise Artaud, Richard J. Barnet, Kai Bird, Noam Chomsky, Bruce Cummings, Alexei M. Filitov, John Lewis Gaddis, Raymond L. Garthoff, Michael J. Hogan, Robert Jervis, Nikki R. Keddie, Bruce R. Kuniholm, Walter LaFeber, Geir Lundestad, Ernest R. May, John Mueller, David Reynolds, Hermann-Josef Rupieper, Arthur Schlesinger, Jr., Ronald Steel, Samuel F. Wells, Jr.

43128-X Hardcover $44.95
43731-8 Paper $13.95

Soviet Foreign Policy in Transition

Roger E. Kanet, Deborah N. Miner and *Tamara J. Resler,* Editors

This volume presents a wide range of papers on Soviet foreign policy relations by leading scholars both in the West and in developing countries. They cover Soviet relations with Eastern Europe and Scandinavia as well as the question of Soviet neutrality and the new political thinking. A substantial part of the study analyzes the effects of recent changes in Soviet foreign policy on developing countries.

Contributors: Deborah N. Miner, Roger E. Kanet, Mette Skak, Ole Norgaard, Lena Jonson, Stephen Kux, Garth T. Katner, Anuradha M. Chenoy, Jan Adams, Pierre du Toit Botha, Carol Saivatz, Zafar Iman, Carlyle A. Thayer, Bilveer Singh, Ho-Won Jeong, Tamara J. Resler.

International Council for Soviet and East European Studies

41365-6 Hardcover $59.95

Theories of Political Economy

James A. Caporaso and *David P. Levine*

This exploration of some of the more important frameworks used for understanding the relationship between politics and economics includes the classical, Marxian, Keynesian, neo-classical, state-centered, power-centered, and justice-centered.

41561-6 Hardcover $49.95
42578-6 Paper $16.95

The Nature and Origins of Mass Opinion

John R. Zaller

This comprehensive theory explains how people acquire political information from the mass media and convert it into political preferences and is developed and applied to the dynamics of public opinion on a broad range of subjects.

40449-5 Hardcover $59.95
40786-9 Paper $17.95

Linking Citizens to Government

Interest Group Politics at Common Cause

Lawrence S. Rothenberg

The most elusive aspects of interest are examined in an in-depth study of one of the largest Washington groups, Common Cause, and the effects of its lobbying efforts with respect to the Congressional vote on the MX missile system.

41560-8 Hardcover $59.95
42577-8 Paper $18.95

TURN TO CAMBRIDGE

Language Repertoires and State Construction in Africa

David D. Laitin

The author of two previous books in African political culture, David Laitin turns in this book to the study of language planning in Africa and the role of language politics in the process of state formation. Written in an engaging style, the book takes the reader into the complex web of language use in Africa today, where the average citizen must employ a multitude of different languages for use in the home, at school, in the marketplace, and on the job.

Cambridge Studies in Comparative Politics

41343-5 Hardcover $42.95

Citizens and Community

Political Support in a Representative Democracy

Allan Kornberg and *Harold D. Clarke*

The related subjects of political legitimacy and system support are key theoretical concerns of students of democratic societies. They have received very little scholarly attention, however, because of the conceptual and methodological complexities they engender. In this book, the authors address these concerns through systematic multivariate analyses of the sources, distribution and consequences of variations in citizen support for key political objects in one such society, Canada.

Cambridge Studies in Comparative Politics

41678-7 Hardcover $54.95

Compliance Ideologies

Rethinking Political Culture

Richard W. Wilson

Drawing on a broad range of literature in the social sciences, this book deals with one of the most elusive subjects in the study of politics and society: the role of culture. Wilson first develops a definition of political culture and a theoretical argument about how political cultures are formed and how they evolve.

41581-0 Hardcover $44.95

Black Americans' Views of Racial Inequality

The Dream Deferred

Lee Sigelman and *Susan Welch*

"Sigelman and Welch make a major contribution to our understanding of racial attitudes....a well-written, clear, concise examination of perceptions of the amount of prejudice and discrimination against blacks."

— American Political Science Review

40015-5 Hardcover $24.95

Still the best book on the subject...

The Economist's View of the World: Government, Markets, and Public Policy

Steven E. Rhoads

"Definitely a book that a person who tries seriously to undertake multidisciplinary work between economics and political science ought to confront, for it usefully indicates the many ways one can display narrowness or overlook important causal forces in such endeavors."

— Roger C. Noll, American Political Science Review

30160-2 Hardcover $49.50
31764-9 Paper $17.95

Winner of American Political Science Association's 1992 Woodrow Wilson Foundation Book Award

Reasoning and Choice

Explorations in Political Psychology

Paul M. Sniderman, Richard A. Brody and *Phillip E. Tetlock*

"The research reported here is clear, compelling, and highly relevant to a broad social science audience. The first chapter does a very nice job of outlining the underlying theme of the book and the substantive chapters are first-rate. The book is, moreover, very well written. It will make a real contribution to the growing research in political psychology."

--Edward Carmines

40255-7 Hardcover $47.95

Nicholas of Cusa

The Catholic Concordance

Paul E. Sigmund, Editor

This is the first English translation of the most important political treatise of the conciliar movement, the unsuccessful attempt to constitutionalize and democratize the Roman Catholic Church in the fifteenth century

STRUGGLES FOR POWER

The Democrats' Dilemma

Walter F. Mondale and the Liberal Legacy

Steven M. Gillon

Can Bill Clinton succeed where other Democrats have failed? This timely study of American liberalism in the context of Walter F. Mondale's career uses classified documents, private papers, and extensive interviews to reveal a party beleaguered by profound generational and ideological disputes. Gillon's sharp depiction of the Democrats' internal divisiveness identifies the problems that Clinton now faces.

$16.50 paper, $49.50 cloth

Helping Others Or Themselves?

Investigating Japanese Foreign Aid

Margee Ensign

Ensign examines a central question of Japan's foreign aid policy: whether Japanese aid is "tied" to Japanese business interests. The book concludes that while aid is very much a part of national economic procurement, Japan also uses aid policies to increase its international acceptance and prestige.

112 pp., 42 graphs & tables, $24.50

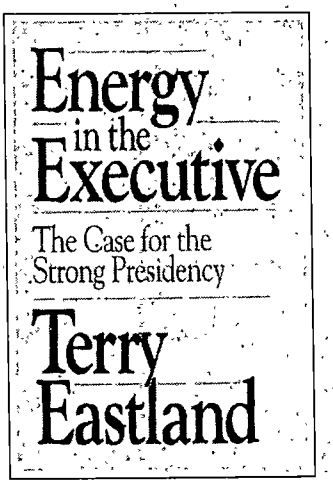
The Best in Political Science

RESTORATION
Congress, Term Limits and the Recovery of Deliberative Democracy
George F. Will



Long opposed to the idea of limiting the number of terms legislators can serve, George F. Will has reconsidered his thinking in the light of Congress's decreasing ability to formulate coherent policies and the public's decreasing respect for that institution. Term limits, he argues, are needed to restore Congress's role in the Founders' plan for deliberative democracy, and are coming as a cleansing backlash to recent scandals and the popular notion of Congress as "an incumbency machine." Dismissing conventional partisan objections to term limits, Will presents a powerful case for term limits as essential to the restoration of Congress's dignity.

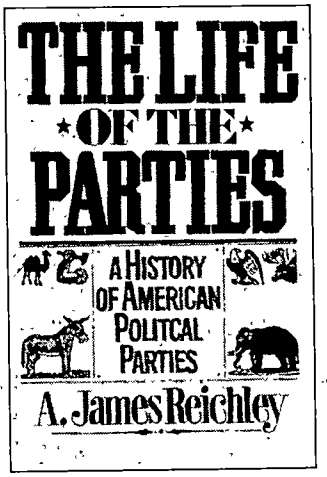
1992 0-02-934437-9 $19.95

INSIDE AMERICAN EDUCATION
The Decline, The Deception, The Dogmas
Thomas Sowell

In this hard-hitting indictment of the American educational system, Sowell shows why this system is failing both black and white students. He piles up overwhelming evidence of moral and intellectual corruption and bankruptcy, and demonstrates how our race-based policies are actually harming minority students.

September 1992 0-02-930330-3 $24.95

ENERGY IN THE EXECUTIVE
The Case for the Strong Presidency
Terry Eastland



In this insightful analysis of the modern presidency, Eastland shows that the chief executive's most potent weapons of governance lie in those structural powers of office originally given him in the Constitution. Drawing on his own insider's observations of the making of economic and civil rights policies, judicial appointments, and other behind-the-scenes events, Eastland shows how presidential power has been underused or neglected, and argues that the key to effective government, conservative or liberal, is understanding and carrying out the executive role with an energetic willingness to govern.

1992 0-02-908681-7 $22.95

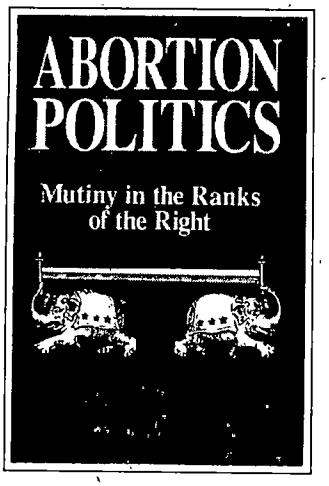
INFORMING STATECRAFT
Intelligence for a New Century
Angelo Codevilla

"Codevilla is an outstanding expert on the craft of intelligence. His new book focuses not only on the highly complex issues of gathering and interpreting intelligence data, but also on the sensitive problem of relating intelligence to politics. As Codevilla points out, quality intelligence remains a matter of high priority. It would be difficult to find a more sophisticated guide to the subject."
—**Richard Pipes**, Harvard University

1992 0-02-911915-4 $24.95

THE LIFE OF THE PARTIES
A History of American Political Parties
A. James Reichley

"It is hard to imagine a better time than now for reexamining American political parties. Reichley shows us how parties have developed and how they have managed 'incompatible ideological traditions.' The forthcoming debates on the future of American political parties will be informed by Reichley's careful and well-written study."
—**Charles O. Jones,**
University of Wisconsin-Madison



1992 0-02-926025-6 $24.95

UNDUE PROCESS
A Story of How Political Differences Are Turned Into Crimes
Elliott Abrams

In 1985, Secretary of State George Schultz asked Elliott Abrams to serve as his Assistant Secretary for Inter-American Affairs. Abrams moved into a world of secrets, spies, and covert armies aiming to topple the Sandinista government of Nicaragua. This is the story of how Abrams's service to his administration and its foreign policy was later turned, for the first time in our nation's history, into a criminal offense. His experience raises some urgent questions for public servants—and for the American public—in the years ahead.

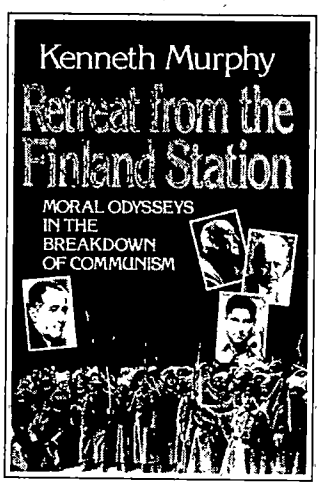
ABORTION POLITICS
Mutiny in the Ranks of the Right
Michele McKeegan

"The story of the 70s was *Roe v Wade*. The story of the 80s is abortion politics. McKeegan's book is mandatory reading for anyone who wants to know where we are headed in the 90s."
—**Sarah Weddington,** Assistant to President Carter, 1978-1981, Winning Attorney, *Roe v Wade*



1992 0-02-920533-6 $22.95

National Bestseller—

THE END OF HISTORY AND THE LAST MAN
Francis Fukuyama

"With one now-famous essay, Frank Fukuyama did what had hitherto seemed almost impossible: he made Washington think. His subject was, and in this far more sweeping book is, the place of America, and the American idea, in the stream of history. His conclusion is at once exhilarating and sobering. We have won the struggle for the heart of humanity. However, that will not necessarily be good for humanity's soul. Fukuyama is in, and is worthy of, a grand tradition. He takes up where de Tocqueville left off, wondering whether liberal democratic culture raises humanity only from its barbarism to banality, and whether banality breeds instability, atavism, and other old sorrows of history."
—**George F. Will**

1992 0-02-910975-2 $24.95

RETREAT FROM THE FINLAND STATION
The Moral Odysseys of the Men Who Abandoned Communism
Kenneth Murphy

"A thoughtful, highly intelligent, and edifying account of the Western intellectuals' infatuation with communism in the bright dawn of hope before the 'darkness at noon' set in."
—**John Patrick Diggins,** author of *The Lost Soul of American Politics: Virtue, Self-Interest, and the Foundations of Liberalism*

1992 0-02-922315-6 $24.95

SICK SOCIETIES
Challenging the Myth of Primitive Harmony
Robert B. Edgerton

Was a pure and peaceful American continent corrupted by the arrival of Columbus? Have Western contacts irrevocably tainted the pristine folkways of indigenous peoples around the globe? These popular notions reflect the current view about the legacy of Western civilization. But is this picture really true? Or does it simply reflect the fashionable dogmas currently entrenched in the academy? Edgerton challenges these comfortable orthodoxies in a thorough review of actual social conditions in both the developed and developing worlds.

1992 0-02-908925-5 $24.95

REINVENTING POLITICS
Eastern Europe from Stalin to Havel
Vladimir Tismaneanu

"The first well-balanced account of what led to the revolutions of 1989, and a starkly objective, but still positive appraisal of the difficult decade to come. Tismaneanu's practical experience under communism and depth of historical knowledge make this the book of choice for those who want to understand Eastern Europe in the 1990s."
—**Daniel Chirot,** University of Washington

COMMUNITARIANISM AND INDIVIDUALISM

Edited by SHLOMO AVINERI, *Hebrew University of Jerusalem* and AVNER DE-SHALIT, *The Hebrew University of Jerusalem*

This volume is the most up-to-date collection of essays on the nature of the individual self and its relationship to society. It raises questions such as: can we understand human behavior without considering social and cultural attachments held by individuals, and can or should the State promote an idea of the good?

(Oxford Readings in Politics and Government)

1992 248 pp. paper $19.95 cloth $56.00

ELECTIONEERING

A Comparative Study of Continuity and Change

Edited by DAVID BUTLER, *Oxford University* and AUSTIN RANNEY, *University of California, Berkeley, Emeritus*

In this book, acknowledged local experts explore how far elections have been "Americanized" in ten countries and regions, including the United States, Britain, Japan, and Latin America. Their essays shed light on the diversity of how democratic choice is made. They also discuss campaigning methods and whether the increasingly sophisticated techniques used by politicians to win votes actually make their campaigns more effective.

1992 304 pp.; illus. $59.00

GENERALS IN THE PALACIO

The Military in Modern Mexico

RODERIC AI CAMP, *Tulane University*

Mexico is one of the few Third World nations that has successfully withdrawn the military from political control, with one of the longer reigns of civilian government in Latin America. Camp provides in this work fresh empirical data for testing claims concerning civilian-military relations, and succeeds in his comprehensive analysis despite the military's intense desire to remain unexamined.

1992 296 pp. $49.95

BEYOND INDIVIDUALISM

Reconstituting the Liberal Self

JACK CRITTENDEN, *Arizona State University*

In the examination of the conception of human nature, a duality is commonly perceived—the liberal self as atomistic, self-contained, even selfish; and the communitarian self as socially situated and defined through its environment. Crittenden argues that neither view is acceptable, drawing on recent psychological research to expound on a theory of "compound individuality."

1992 240 pp. $38.00

CLASSICAL ANARCHISM

The Political Thought of Godwin, Proudhon, Bakunin, and Kropotkin

GEORGE CROWDER, *University of California, Berkeley*

"Interesting and original."—*Times Literary Supplement*

How can there be order in a modern society without government? Crowder considers the presentation of stateless order in the works of writers who epitomized the "classical" tradition of anarchistic thought—Godwin, Proudhon, Kropotkin, and Bakunin.

1992 224 pp. $48.00

ARISTOCRATIC LIBERALISM

The Social and Political Thought of Jacob Burckhardt, John Stuart Mill, and Alexis de Tocqueville

ALAN S. KAHAN, *Rice University*

"*Aristocratic Liberalism* makes an overwhelmingly convincing case for linking these three great nineteenth-century figures in a single intellectual and ideological tradition. This kind of group portrait is, in my view, among the most delicate achievements of the intellectual historian, and Kahan demonstrates a complete mastery of the necessary skills. He is an incisive analyst of his three thinkers (whose works he reads in the original), and his control over the scholarly literature is impressive."—Paul Robinson, *Stanford University*

1992 240 pp. $39.95

MARXISM AND THE CITY

IRA KATZNELSON, *The New School for Social Research*

"An imaginative, exhilarating, and critically argued survey of the contribution of marxist-influenced writings to our understanding of the development of modern western cities and to the ways they constituted and were constituted by statebuilding and the development of modern capitalism."—Steven Lukes, *European University Institute, Florence*

In this work, Katznelson critically analyzes the development of Marxist scholarship on cities in the last quarter century.

(Marxist Introductions)

1992 336 pp. $39.95

CIVIL RIGHTS AND THE IDEA OF FREEDOM

RICHARD H. KING, *University of Nottingham*

Focusing attention on the political ideas that were influential as well as those that were central to the civil rights movement, this pathbreaking book examines not only written texts but also oral history interviews to establish a rich tradition of freedom that emerged from the movement. *Civil Rights and the Idea of Freedom* concludes that the civil rights movement helped revitalize the meaning of citizenship and the political importance of self-respect in the contemporary world with implications reaching beyond its original setting.

PARLIAMENTARY VERSUS PRESIDENTIAL GOVERNMENT

Edited by AREND LIJPHART, *University of California, San Diego*

Parliamentary and presidential governments are the two principal forms of democracy in the modern world. Their respective advantages and disadvantages have been long debated, at first mainly by British and American political observers but with increasing frequency in other parts of the world. This volume brings together the most important statements on the subject by advocates and analysts—from Montesquieu and Madison to Lipset and Linz.

(Oxford Readings in Politics and Government)

1992 272 pp. paper $19.95 cloth $56.00

THE HIGHEST STAKES

The Economic Foundations of the Next Security System

WAYNE SANDHOLTZ, JOHN ZYSMAN, JAY STOWSKY, STEVEN VOGEL, and KEN CONCA

"The members of the Berkeley Roundtable on the International Economy constitute a national asset. They have thought seriously and originally about how the world economy really works. Everyone in the policy-world is saying that, with the collapse of the Soviet Union, the meaning of national security has changed. *The Highest Stakes* is a very useful, practical guide to how nations can advance their interests under these changed rules."—James Fallows, *Washington Editor, Atlantic Monthly*

1992 272 pp. $29.95

LAND AND POWER

The Zionist Resort to Force, 1881-1948

ANITA SHAPIRA, *Tel-Aviv University*

Translated by WILLIAM TEMPLER

Shapira traces the road along which the Zionist movement discarded its early mission of peaceful settlement in Palestine, to the incorporation of the use of force as a legitimate tool for realizing the idea of Jewish national sovereignty there. The emergence of a new "Israeli" national ethos, accompanied by its particular symbols, myths, and norms, is the topic of this book.

(Studies in Jewish History)

1992 464 pp. $59.00

THE FOUNDATIONS OF AMERICAN CITIZENSHIP

Liberalism, the Constitution, and Civic Virtue

RICHARD C. SINOPOLI, *University of California, Davis*

This study of exemplary writings from the debates over the ratification of the 1787 Constitution deals with the American constitutional founders' understandings of citizenship and civic virtue. Discussion of these debates is set in an analytical and historical context, addressing the rationales for and the nature of civic allegiance in liberal political regimes.

1992 224 pp. $32.50

THE BIRTH OF JUDICIAL POLITICS IN FRANCE

The Constitutional Council in Comparative Perspective

ALEC STONE, *University of California, Irvine*

"This is a first-rate study of a phenomenon of growing importance to European politics—the rise of constitutional review. Stone illuminates the problem with a fine eye for the nuances of French politics as well as judicial interpretation."—Peter Hall, *Harvard University*

1992 320 pp.; illus. $45.00

New in paperback!

Outstanding Academic Book for 1991-1992 by Choice

THE POLITICAL THEORY OF SWEDISH SOCIAL DEMOCRACY

Through the Welfare State to Socialism

TIM TILTON, *University of Indiana*

"Tilton's book certainly contributes to the ongoing discussion of economic systems and alternatives to simplistic ideas of freedom through exclusive reliance on private markets, et cetera."—*Journal of Economic Issues*

This book argues that Sweden's distinctive economic and social policies cannot be understood apart from the ideological convictions of several generations of political leaders and thinkers.

1990 (paper 1992) 314 pp. paper $23.00

New in paperback!

EMPIRE OF LIBERTY

The Statecraft of Thomas Jefferson

ROBERT W. TUCKER, *Johns Hopkins University, Emeritus* and DAVID C. HENDRICKSON, *Colorado College, Colorado Springs*

"An excellent book that is the best succinct account of Jefferson's foreign policy and a superb primer for understanding America's response to the outside world."—*New York Times Book Review*

"An impressive intellectual exercise. Two able political scientists have moved in among historians to produce an insightful history of Thomas Jefferson's public life written with verve and high style."—*Journal of American History*

1990 (paper 1992) 384 pp.; illus.

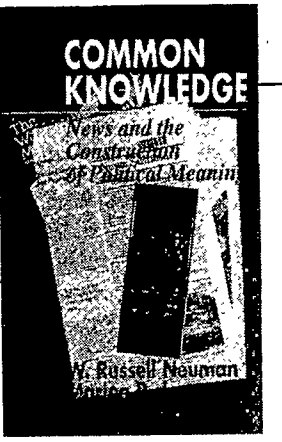
paper $12.95 cloth $24.95

HERBERT SAMUEL

A Political Life

BERNARD WASSERSTEIN, *Brandeis University*

"A valiant and scholarly attempt to present as warm and interesting a man who was basically a cold fish....Wasserstein explores an impressive array of sources, writes lucidly, and shows a sure grasp of all the relevant major historical debates."—*Times Higher Education Supplement*



Wasserstein's scholarly and readable biography, based on extensive research in all the available sources, provides a rounded portrait of a leading twentieth-century political figure.

1992 466 pp.; illus. $79.00

CHICAGO

COMMON KNOWLEDGE

News and the Construction of Political Meaning

W. Russell Neuman, Marion R. Just, and Ann N. Crigler

"Using survey research, content analysis, and in-depth interviews, [the authors] focus on what most people know about the world and how they know it. The result is a very valuable work for scholars, journalists, and all others who share an interest in the strange and wonderful world of press/politics."—Marvin Kalb, Harvard University

Paper $10.95 190 pages
Library cloth edition $29.95

REVOLUTION AND GENOCIDE

On the Origins of the Armenian Genocide and the Holocaust

Robert F. Melson

"This is an impressive synthesis and illustration of the connection between crises, ideology, revolution, and major genocides of the twentieth century, amply documented and well-written."
—Helen Fein, Institute for the Study of Genocide, The City University of New York

Cloth $29.95 384 pages

PATRIOTS AND REDEEMERS IN JAPAN

Motives in the Meiji Restoration

George M. Wilson

"In clear, often inspiring, language, George Wilson presents an original and convincing reinterpretation of the Meiji Restoration. This is a compact and eminently readable volume."
—Donald Roden, Rutgers University

Paper $14.95 218 pages
Library cloth edition $37.50

HEALING POWERS

Alternative Medicine, Spiritual Communities, and the State

Fred M. Frohock

An innovative and eloquent attempt to go beyond the often irreconcilable differences between "scientific medicine" and "alternative care" by clarifying the social and legal dilemmas they present.

Cloth $29.95 352 pages
Morality and Society series

In Paper

THE CYNICAL SOCIETY

The Culture of Politics and the Politics of Culture in American Life

Jeffrey C. Goldfarb

"One of the most important political books written in the last several years. . . . It belongs on the shelves of all those who care about the future of the democratic experiment."
—*United Press International*

Paper $13.95 212 pages

COVERING THE BODY

The Kennedy Assassination, the Media, and the Shaping of Collective Memory

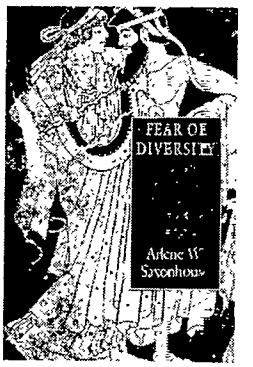
Barbie Zelizer

A powerful reassessment of the media's role in shaping our collective memory of the Kennedy assassination.

"Elegantly written and brilliantly argued."
—Michael Schudson, University of California, San Diego

Cloth $29.95 304 pages

FEAR OF DIVERSITY



The Birth of Political Science in Ancient Greek Thought

Arlene W. Saxonhouse

This wide-ranging and provocative book locates the origin of political science in the everyday world of ancient Greek life, thought, and culture.

"Required reading for anyone dealing with the history of political thought."—W. Carey McWilliams, Rutgers University

Cloth $29.95 272 pages

A VINDICATION OF POLITICAL VIRTUE

The Political Theory of Mary Wollstonecraft

Virginia Sapiro

Sapiro shows that Wollstonecraft's ideas about women's rights, feminism, and gender are elements of a broad and fully developed philosophy, one with significant implications for contemporary democratic and liberal theory.

Paper $16.95 394 pages
Library cloth edition $53.00

BETTER THAN PLOWING AND OTHER PERSONAL ESSAYS

James Buchanan

"A rare, intimate insight into how personal circumstances help shape some of the most influential economic and political ideas of our day."—Richard A. Epstein, University of Chicago

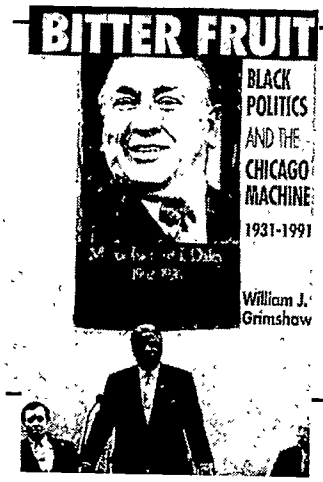
Cloth $23.95 208 pages

WHO BENEFITS FROM THE NONPROFIT SECTOR?

Edited by Charles T. Clotfelter

An accessible examination of how educationa and research institutions, health services, religious organizations, and arts and cultural organizations function, and how their benefits are distributed across various economic classes.

Cloth $22.95 304 pages



IMMIGRATION AND THE WORK FORCE

Economic Consequences for the United States and Source Areas

Edited by George J. Borjas and Richard B. Freeman

A revealing and original examination, this book will stand as a guide for further research on immigration and on the economies of developing countries.

Cloth $45.00 280 pages (est.)
An NBER Project Report

BITTER FRUIT

Black Politics and the Chicago Machine, 1931-1991

William J. Grimshaw

"Grimshaw takes the reader directly into the angry crucible of Chicago politics to explain why the big-city machine politics that worked so well in helping white immigrant ethnic groups bore bitter fruit for blacks."—Clarence Page, Pulitizer Prize-winning syndicated columnist for the *Chicago Tribune*

Cloth $24.95 264 pages

POLITICAL SCIENCE
NEW FROM CALIFORNIA

Breaking Through Bureaucracy
A New Vision for Managing in Government
MICHAEL BARZELAY
With the collaboration of Babak J. Armajani
Foreword by Alan Altshuler
"An invaluable overview of the way government can change. This book doesn't simply identify problems, it also provides solutions. Right on!"
—Lowell P. Weicker, Jr., Governor of Connecticut
"Provides a diagnosis of what inhibits effective governance and offers a highly workable remedy for those ills."
—Stephen Goldsmith, Mayor of Indianapolis
$35.00 cloth, $14.00 paper

Coordination Without Hierarchy
Informal Structures in Multiorganizational Systems
DONALD CHISHOLM
New in paper—"A significant contribution to our understanding of coordination among organizations, a topic that has received limited attention."
—*Policy Sciences*
$14.00 paper

What's the Matter with Liberalism?
RONALD BEINER
"The first attempt to show how the theory/practice of this society, by shying away from basic issues of the good life, sidelines important moral aims."
—Charles Taylor, McGill University
"Needless to say, it is entertaining to hear liberalism criticized by a socialist admirer of Allan Bloom and George Will."
—Stephen Salkever, Bryn Mawr College
$25.00 cloth

The Fourth Estate and the Constitution
Freedom of the Press in America
LUCAS A. POWE, JR.
New in paper—"A useful reminder of the crucial and complex function of the press in our democracy, a healthy corrective to the suspicion and even hostility that sometimes greet the work of the media."—*California Lawyer*
$14.00 paper *1992 Scribes Book Award*

America at Century's End
Edited by ALAN WOLFE
New in paper—"A massive, lively, often surprising portrait of America in the throes of change."
—*Publishers Weekly*
These essays, tracing the feel and pulse of American life, offer a candid snapshot of America approaching the twenty-first century.
$15.00 paper *A Centennial Book*

Containing the Atom
Nuclear Regulation in a Changing Environment, 1963-1971
J. SAMUEL WALKER
The late 1960s saw an extraordinary growth in the American nuclear industry just as public concern about the natural environment and suspicion of both government and industry increased dramatically. This is the first scholarly history of nuclear power regulation during those tumultuous years.
$50.00 cloth, illustrated

No Safe Place
Toxic Waste, Leukemia, and Community Action
PHIL BROWN and EDWIN J. MIKKELSEN
New in paper—"An excellent and readable account of the toxic waste crisis in Woburn, Massachusetts. . . . An inspiring lesson for citizens across the country struggling to protect the environment from polluters and unresponsive government officials."
—Senator Edward Kennedy
$14.00 paper

To the Right
The Transformation of American Conservatism
JEROME L. HIMMELSTEIN
New in paper—"There is much to commend to political scientists in this volume. The analysis of the realignment thesis and of why conservatives could not unite beyond the Reagan years is compelling."
—*American Political Science Review*
$14.00 paper

POLITICAL SCIENCE

NEW FROM CALIFORNIA

Punishment

Theory and Practice

MARK TUNICK

Contending that the theory and practice of punishment are inherently linked, Tunick draws on a broad range of thinkers, from the radical criticisms of Nietzsche, Foucault, and some Marxist theorists through the sociological theories of Durkheim and Girard to various philosophical traditions and the "law and economics" movement.

$35.00 cloth

Political Criticism

IAN SHAPIRO

New in paper—"Occupies a space somewhere between professional and political theory and intelligent political thinking. . . . Refreshing and thought-provoking and well worth attention."

—*Perspectives on Political Science*

$15.00 paper

Protectors of Privilege

Red Squads and Police Repression in Urban America

FRANK DONNER

New in paper—"A comprehensive and well-documented study of the political environment that spawned repression; police target selection and operations; the relationship of the squads to the power structure; the role of the press."

—*Political Science Quarterly*

$16.00 paper

Mountain Fires

The Red Army's Three-Year War in South China, 1934-1938

GREGOR BENTON

The dramatic story of the Chinese Communists in southern and central China has been hidden in the shadow of the Long March. Benton reconstructs their history to show how they survived terrible isolation and repressive counterrevolution.

$70.00 cloth, illustrated

A Philip E. Lilienthal Book

Two Faces of Protest

Contrasting Modes of Women's Activism in India

AMRITA BASU

"A pioneering work. Rather than examining feminist political activism directly, as is conventional, Basu elects to study how politics is engendered within two different forms of rural political organization."

—Mary Fainsod Katzenstein, Cornell University

$35.00 cloth

Freedom and Taboo

Pornography and the Politics of a Self Divided

RICHARD S. RANDALL

New in paper—"The strongest aspect of the work is its scope, ranging from anthropology to psychoanalysis to social theory."—*Perspectives on Political Science*

$15.00 paper

The Frontiers of Catholicism

The Politics of Ideology in a Liberal World

GENE BURNS

Drawing on interviews and archival research, Burns follows the development of ideological trends obviously at odds with the traditional values of Catholicism. He examines the origins of this contemporary diversity, illuminating as well the processes of ideological change.

$40.00 cloth

New Directions in Cultural Analysis

Steeltown, USSR

Soviet Society in the Gorbachev Era

STEPHEN KOTKIN

PRAEGER

NEW BOOKS FOR AN ELECTION SEASON

Leadership and the Bush Presidency
Prudence or Drift in an Era of Change?
Edited by Ryan J. Barilleaux and Mary E. Stuckey

This volume offers the most comprehensive coverage of any work on the Bush presidency to date, including chapters by the nation's foremost political scientists.

1992. 256 pages. 0-275-94418-2. $47.95.

Political Mischief
Smear, Sabotage, and Reform in U.S. Elections
By Bruce L. Felknor

An old pro on political mischief in the United States gives us an overview of U.S. campaign tactics and ethics from 18th-century pamphleteers to 1990s political consultants and media wizards.

1992. 312 pages. 0-275-94183-3. $47.95.

Televised Presidential Debates
Advocacy in Contemporary America
By Susan A. Hellweg, Michael Pfau, and Steven R. Brydon

This vital study employs a "television perspective" in examining the sponsorship, formats, nature, and impacts of presidential debates, stressing the 1960, 1976, 1980, 1984, and 1988 debates.

1992. 192 pages. 0-275-93621-X. $45.00.
paperback: 0-275-93622-8. $15.95.

The Politics of Transformation
Local Activism in the Peace and Environmental Movements
By Betty H. Zisk

Zisk studies the group and movement successes both short-run and long-run, and activist group adaptations to change in the larger social and political world in light of political upheaval in Eastern Europe, the Gulf War, and several environmental crises that occurred during the period in question.

1992. 280 pages. 0-275-94057-8. $49.95.

Enacting the Presidency
Political Argument, Presidential Debates, and Presidential Character
By Edward A. Hinck

Hinck develops an in-depth rhetorical analysis of the presidential and vice presidential debates of 1960 to 1988 which reveals ways in which the dramatic encounter forges images of presidential character.

December 1992. 0-275-93488-8. $46.00 Est.

My Fellow Americans
Presidential Addresses That Shaped History
By James C. Humes

A former White House speechwriter, Humes studies major presidential addresses from a new angle—their constuction and impact. This is a vital study of American political history seen through the prism of selected presidential addresses.

1992. 312 pages. 0-275-93507-8. $49.95.

News Verdicts, the Debates, and Presidential Campaigns
By James B. Lemert, William R. Elliott, James M. Bernstein, William L. Rosenberg and Karl J. Nestvold

This book provides new evidence that media assessments of presidential debates sway voters. The authors conducted 2,350 surveys and extensive analyses of news reports to during the 1988 campaign. They found that the news media influence voters as much as the debates themselves.

1991. 312 pages. 0-275-93758-5. $49.95.

The Political Pundits
By Dan Nimmo and James E. Combs

Nimmo and Combs discuss the key role political analysts play, their methods and strategies, and the potential danger they pose to American democracy—by transforming it into a "punditocracy" which replaces serious citizen debate with discussion guided by show business values.

1992. 208 pages. 0-275-93541-8. $47.95.
paperback: 0-275-93545-0. $15.95.

NEW FROM CORNELL

Black Earth, Red Star

A History of Soviet Security Policy, 1917–1991

R. CRAIG NATION

"This timely and original account is one of the very few to address Soviet foreign and military policy comprehensively from a domestic perspective and is perhaps the first to do so successfully for the entire Soviet period."—Raymond L. Garthoff, Brookings Institution. $29.95

Lawyers' Ideals/ Lawyers' Practices

Transformations in the American Legal Profession

EDITED BY ROBERT L. NELSON, DAVID M. TRUBEK, AND RAYMAN L. SOLOMON

Eight essays, written by leading scholars in the American legal profession, examine the relationship between changes in the practice of law and the professional ideals of American lawyers. $39.95 cloth, $14.95 paper

The Vanished Imam

Musa al Sadr and the Shia of Lebanon

FOUAD AJAMI

Available again in paper!

"Musa al Sadr . . . made his mark on Lebanon as a charismatic religious and political leader, disappeared while on a visit to Libya in 1978, and lives on as a powerful symbol for the Shia community. Fouad Ajami . . . has succeeded in drawing a striking portrait of the man against the background of the millennial Islamic culture and the murky present-day politics of the Middle East."
—*Foreign Affairs.* $12.95

Self/Power/Other

Political Theory and Dialogical Ethics

ROMAND COLES

Coles explores the writings of Augustine, Foucault, and Merleau-Ponty in order to fashion an ethos that emphasizes the value of dialogical relationships between the self and others. $29.95

Learning from Gal Oya

Possibilities for Participatory Development and Post-Newtonian Social Science

NORMAN UPHOFF

Uphoff shows how mainstream social science frameworks proved inadequate to explain or achieve the mobilization of people's cooperative efforts to improve productivity and the quality of life in rural Sri Lanka. He found himself assisted by concepts emerging from twentieth-century physics—from relativity theory, quantum mechanics, and, especially, chaos theory. $34.95

Guarding the Guardians

Civilian Control of Nuclear Weapons in the United States

PETER DOUGLAS FEAVER

"The best existing study of a very important, but neglected, part of our nuclear history: how well have civilian authorities maintained control over U.S. nuclear weapons? Feaver presents a well-conceived framework for studying the subject of civilian control and his case studies are superb."—Scott D. Sagan, Stanford University. *Cornell Studies in Security Affairs.* $34.50

Identity\Difference

Democratic Negotiations of Political Paradox

WILLIAM E. CONNOLLY

New in Paper! "Connolly's book is, in many ways, quite extraordinary. What we see is a mind, at once quizzical and forceful, trying to find its way through difficult and significant theoretical and political terrain in a manner that invites our participation."—J. Peter Euben, University of California, Santa Cruz. Connolly here reworks our understanding of the relationship between personal identity and democratic politics. $13.95

The Limits of Social Democracy

Investment Politics in Sweden

JONAS PONTUSSON

Pontusson traces the history of Sweden's industrial policy and persuasively demonstrates how the reconciliation of capitalism and social democracy is inherently precarious and unstable. *Cornell Studies in Political Economy.* $28.50

Bargaining for Change

Union Politics in North America and Europe

EDITED BY MIRIAM GOLDEN AND JONAS PONTUSSON

Eight essays deal with union politics in North America and Western Europe since the mid-1970s. The authors specify the problems confronting organized labor and explore the ways in which unions have responded. $49.95 cloth, $17.95 paper

Rethinking Obligation

A Feminist Method for Political Theory

NANCY J. HIRSCHMANN

"Nancy Hirschmann's treatment of the concept of obligation represents an excellent way for political theorists to come to understand the nature and importance of feminist critiques of the canon."—Nancy Hartsock, University of Washington. $39.95 cloth, $15.95 paper

Administrative Law in a Global Era

ALFRED C. AMAN, JR.

Tracing the evolution of administrative law during the regulatory eras of the New Deal and the 1960s and 70s, as well as the current global deregulatory era beginning with the Reagan presidency, Aman illuminates key trends in the interpretation of constitutional and administrative law. $28.95

ON LIBERTY, SOCIETY, AND POLITICS

NEW

By William Graham Sumner
Edited by Robert C. Bannister

"This is the finest single-volume edition of Sumner's works ever to appear."
—Ronald Lora, University of Toledo"

Chiefly remembered as one of the founding fathers of sociology, William Graham Sumner was also a strong classical liberal. Revealing his overall development, this collection shows he was uniquely sensitive to the relations between liberty, property, tradition, and progress, as well as to the need for a hardheaded realism to counter the "schemes" of those who feel more intensely than they think.

Peru under Fire

Human Rights since the Return to Democracy

Americas Watch

The people of Peru are caught in a deadly crossfire between government forces and a brutal insurgent movement, *Sendero Luminoso*, as the two battle for control of the country. Americas Watch describes the human rights violations committed by each side and discusses in detail the U.S. proposal to send military advisers and aid to the Peruvian government. $23.50

A joint publication of Yale University Press and Human Rights Watch

Justice between Age Groups and Generations

Philosophy, Politics, and Society, Sixth Series

Edited by Peter Laslett and James S. Fishkin

In this book, political philosophers—Peter Laslett, James S. Fishkin, George Sher, Richard A. Epstein, David Braybrooke, Jonathan Glover, Tyler Cowen, Derek Parfit, Larry S. Temkin, and David Thomson—reflect on issues of justice between age groups and generations, revising philosophical, political, and social theory to address these issues systematically for the first time. $30.00

Institutional Realism

Social and Political Constraints on Rational Actors

Robert Grafstein

Combining philosophy with an approach to social action drawn from rational choice theory, Robert Grafstein explores the nature of institutions and explains how these human products can influence—and sometimes coerce or constrain—their creators. Grafstein's discussion of electoral institutions offers a new solution to the problem of explaining turnout in mass elections.

"An enormously useful and wide-ranging contribution to a debate that is of growing importance."—Ian Shapiro $30.00

New in paperbound

Inquiry and Change

The Troubled Attempt to Understand and Shape Society

Charles E. Lindblom

In this prize-winning book, a distinguished social scientist analyzes our attempts—and our many failures—to understand society well enough to reshape it.

Winner of the 1991 **Woodrow Wilson Foundation Book Award** given by the American Political Science Association for the best book of the year on government, politics, and international affairs $16.00

Copublished with the Russell Sage Foundation

The Logic of Congressional Action

R. Douglas Arnold

In this prize-winning book, R. Douglas Arnold offers a theory that explains how legislators make decisions across the whole range of domestic policy, showing why organized interests frequently triumph and why the general public sometimes wins.

"One of the most important books on Congress published in the past decade."
—Thomas E. Mann, *Congress and the Presidency*

Winner of the 1991 **Richard F. Fenno Prize** of the Legislative Studies Section of the American Political Science Association $15.00

The Faces of Injustice

Cappella degli Scrovegni, Padua

Judith N. Shklar

In this book a distinguished political theorist formulates a new political and moral theory of injustice that encompasses not only deliberate acts of cruelty or unfairness but also indifference to such acts.

"Shklar's book makes a number of important and highly original arguments about the nature of injustice and the political institutions we construct to deal with it."—Bernard Yack, *Michigan Law Review* $10.00

Passions and Interests

Political Party Concepts of American Democracy

Gerald M. Pomper

"One of the most important books to be published on political parties in this or any decade. In the quality of thought and the intellectual intensity of the arguments made, the range of knowledge applied and the centrality of the issues addressed, and the creativity and originality of the enterprise as a whole, this study is outstanding. A gem!" —William Crotty, Northwestern University. "Pomper reminds us of the grand tradition of Michels and Ostrogorski. A major contribution to our understanding of democracy by one of America's leading political scientists."—Vernon Bogdanor, Brasenose College, Oxford University.

American Political Thought Series
200 pages. $27.50 cloth, $12.95 paper

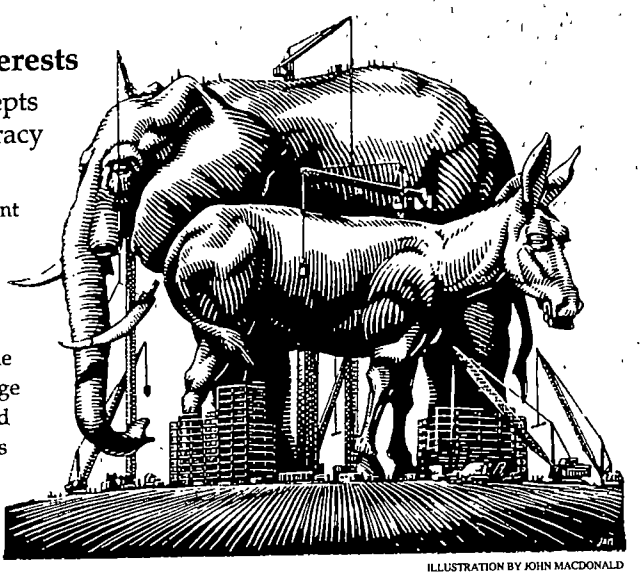

ILLUSTRATION BY JOHN MACDONALD

A Preface to American Political Theory

Donald S. Lutz

"A tour de force of reasoned argument that blends history, law, political science, and philosophy. A powerful, persuasive, and long needed book."—Kermit L. Hall, author of *The Magic Mirror: Law in American History*. "Lutz articulates well the complexity of assessing American political theorizing about real political problems."—George J. Graham, Jr., Vanderbilt University. "A masterful introduction that will be used with great profit for many years by students of the subject."—Daniel J. Elazar, author of *The American Constitutional Tradition*.

American Political Thought Series
192 pages. $27.50 cloth, $12.95 paper

Even the Children of Strangers

Equality under the U.S. Constitution

Donald W. Jackson

"Both graceful and solid, this book covers all the bases for an initial study of equality in America. Jackson is equally comfortable parsing legal doctrines or recounting political battles. Most importantly, he breaks through the usual debate between groups and individuals with the sophisticated but simple concept of 'distance travelled.' It is potentially of great use to policy makers as well as policy analysts." —Jennifer L. Hochschild, author of *What's Fair: America's Beliefs about Distributive Justice*. "A book that must be read by those who question or believe that equality is a viable part of America's essence. It made me proud of the struggle we as a people have waged and continue to wage to bring definition and clarity to the issue of equality. "—Barbara Jordan.

364 pages. $35.00 cloth, $14.95 paper

Our Limits Transgressed

Environmental Political Thought in America

Bob Pepperman Taylor

"Must reading for all serious students of environmental politics. This book is one of the most important and successful attempts to analyze and synthesize the major themes and trends of modern environmental thought."—Marc Landy, coauthor of *The Environmental Protection Agency: Asking the Wrong Questions*. "Taylor provides a good balance between—without confusing—the moral and prudential arguments for protecting nature and the environment." —Mark Sagoff, author of *The Economy of the Earth: Philosophy, Law, and the Environment*.

American Political Thought Series
192 pages. $25.00

Left Coast City

Progressive Politics in San Francisco, 1975–1991

Richard Edward DeLeon

"An outstanding case study of big city electoral politics that perceptively analyzes the nuts and bolts of constructing a progressive governing coalition and illuminates the dynamics and contradictions of contemporary urban liberalism."—John Mollenkopf, author of *The Contested City*. "First-rate. It's a winner. DeLeon's analysis of coalition politics and of the referendum process shows him to be a master of the regime concept and to be acutely aware of the tensions within populist alliances."—Clarence Stone, author of *Regime Politics: Governing Atlanta, 1946–1988*.

Multiculturalism and "The Politics of Recognition"

An Essay by Charles Taylor

With commentary by Amy Gutmann, Editor, Steven C. Rockefeller, Michael Walzer, and Susan Wolf

Can a democratic society treat all its members as equals and also recognize their specific cultural identities? Is political recognition of ethnicity or gender essential to a person's dignity? These are some of the questions at the heart of the political controversy over multiculturalism and recognition—a debate that has raged across academic departments, university campuses, ethnic and feminist associations, and governments throughout the world.

In this book Charles Taylor offers a historically informed, philosophical perspective on what is at stake in the demand for recognition of particular group identities. His thoughts serve as a point of departure for commentaries by other leading thinkers, who further relate the demand for recognition to issues of multicultural education, feminism, and cultural separatism.

Cloth: $14.95 ISBN 0-691-08786-5

Political Questions, Judicial Answers

Does the Rule of Law Apply to Foreign Affairs?

Thomas M. Franck

Almost since its beginning, America's rigorous separation of powers among Executive, Legislative, and Judicial Branches has been umpired by the federal judiciary. However, many otherwise ordinary cases are not decided in court when they include allegations that the President, or Congress, has violated a law or the Constitution itself. Most of these cases are shunned by the judiciary simply because they have foreign policy aspects.

Thomas Franck maintains that when courts invoke the "political question" doctrine to justify such reticence, they evade a constitutional duty. In this revisionist work, Franck proposes ways to subject the conduct of foreign policy to the rule of law without compromising either judicial integrity or the national interest.

"...will stand out as the most widely read and most important work on this subject for many years to come."—*David J. Scheffer, Senior Associate, Carnegie Endowment for International Peace*

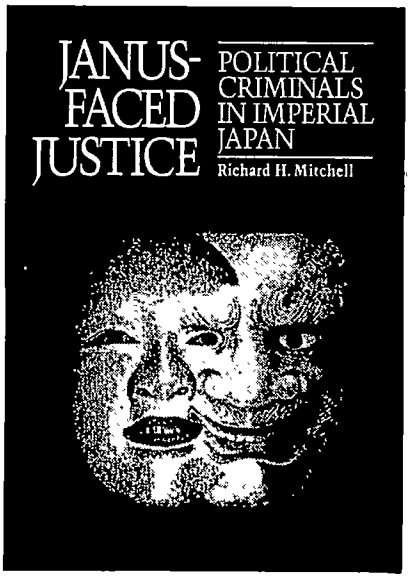
Cloth: $24.95 ISBN 0-691-09241-9

NEW IN PAPERBACK

Debt, Development, and Democracy

Modern Political Economy and Latin America, 1965-1985

Jeffry A. Frieden



In the 1970s and 1980s the countries of Latin America dealt with their similar debt problems in very different ways—ranging from militantly market-oriented approaches to massive state intervention in their economies—while their political systems headed toward either democracy or authoritarianism. Applying the tools of modern political economy to a developing-country context, Jeffry Frieden analyzes the different patterns of national economic and political behavior that arose in Argentina, Brazil, Chile, Mexico, and Venezuela. This book will be useful to those interested in comparative politics, international studies, development studies, and political economy generally.

New and Recommended Books from Hawaii

Janus-Faced Justice
Political Criminals in Imperial Japan
Richard H. Mitchell
Mitchell makes a major contribution to our knowledge of Japan's criminal justice system at a critical juncture in the country's history. He identifies two contrasting themes — a high degree of state repression and a concern for human rights — in the treatment of political criminal suspects and prisoners.

Law and Legality in China
The Testament of a China-Watcher
Laszlo Ladany
Edited by Marie-Luise Näth
Preface by Jürgen Domes
Laszlo Ladany, widely respected as a "China watcher," illustrates how Mao's antipathy towards law and age-old Chinese concepts of acceptable behavior created a mental and spiritual void in a whole generation of Chinese. Published posthumously and edited by two distinguished sinologists, this survey presents a thought-provoking study of modern Chinese culture and politics.
$36.00, cloth

Fragmented Vision
Culture and Politics in Contemporary Malaysia
Edited by Joel S. Kahn and Francis Loh Kok Wah
Leading social scientists describe the current social and political structure of Malaysia and its relationship to the sweeping economic changes that have been taking place there in the last two decades.

Insight Into the World Economy

World Economic Survey 1992

This 1992 survey gives a clear understanding of why the world economy stepped into recession in 1991. It examines the slowdown in U.S. growth, and provides an economic analysis of the Soviet Union's collapse. The predictions are for modest growth through 1993, but it cautions that over-reliance on market forces could be self-defeating and that too much emphasis on reducing government budget deficits was hindering economic growth. Economists, journalists, researchers, corporate and government officials will find this survey the most comprehensive, accurate and impartial view of worldwide economic events and information.

World Investment Report 1992: Transnational Corporations as Engines of Growth

Set against a background of increasing international competition Transnational Corporations (TNC's) are playing an increasingly significant role in the world economy. This timely study examines the role of TNC's as engines of international growth. The evidence provided in this analytical report shows ample cause for optimism and it is hoped that the lessons learned from the analysis will assist in policy formulation and the design of technical assistance in an increasing number of countries and thereby help make the 1990s a decade of renewed economic development.

Economic Survey of Europe, 1991-1992

'Painting the picture and forecasting the recovery of Europe.'

This Survey gives a fresh overview of the recent developments and selected policy issues in the ECE region, with special emphasis on the economies in transition. It reviews the macro-economic developments and provides an overall outlook first, on Western Europe and North America, and then on Eastern Europe. It details the economic developments in and the political disintegration and economic fragmentation of the former Soviet Union to include the Russian Federation, Belarus, Ukraine and the Baltic States. It reviews international support for eastern transformation and discusses property rights and privatization in the transition economies. Finally, it analyses and assesses prospects and policy choices for east-west migration, and pictures the economic situation with extensive tables and up-to-date statistics.

World Investment Directory 1992: Vol.1 - Asia and The Pacific

This directory provides data on foreign direct investment and related variables, basic data on firms, the legal framework within which investments take place and bibliographic information pertaining to the role of transnational corporations in individual countries. The issuance of this publication changes the fact that there is no comprehensive published source of such information which provides homogeneous data for all countries. This directory would facilitate interested users to embark on a more thorough analysis of foreign direct investment trends and their impact.

THE EFFECTIVENESS OF INTERNATIONAL ENVIRONMENTAL AGREEMENTS

A CO-PUBLICATION WITH THE UNITED NATIONS CONFERENCE ON ENVIRONMENT AND DEVELOPMENT – EARTH SUMMIT '92 –

This work will bring together thirteen major research papers, commissioned as background documentation for the Earth Summit, providing a detailed survey and analysis of the effectiveness of 124 existing international agreements and instruments to protect the environment. The material is presented in a clear open style and will prove a fundamental resource to all interested in the environment.

In addition the book will contain the report by the Secretary-General of the Conference which sets the entire survey in context and summarizes the findings of the individual research papers. This section will also contain the recommendations for future action to be agreed at the Conference.

The book will conclude with a reference section containing an annotated list of existing environmental agreements and instruments within each area of research, including current membership, source references and secretariat addresses.

Approx. 500 pp
Price: Paperback £40 (US$80): Hardback £65 (US$130)

POLITICAL SCIENTISTS

The American Political Science Association announces the 1993-94

Congressional Fellowship Program

WHO: Early and mid-career political scientists.

WHY: To learn more about the legislative process through direct participation.

HOW: A comprehensive three-week orientation period; full-time assignments as legislative aides in the House of Representatives and Senate; seminar program with leading congressional, governmental and academic figures.

QUALIFICATIONS: A scholarly interest in Congress and the policymaking process; a Ph.D. completed within the last fifteen years (or near completion).

THE FELLOWSHIP YEAR: Orientation begins November 1993; office assignments run December 1993 through August 15, 1994.

STIPEND: $26,000, plus travel allowance.

APPLICATION PROCEDURE: Submit eight copies each of:

- a detailed curriculum vitae;
- a personal statement (about 500 words) explaining how the Congressional Fellowship Program relates to your professional goals;
- a sample of your best writing (one published or unpublished manuscript).

Submit, also, the names of three professional references who have agreed to write letters of recommendation.

REFERENCES: Candidates are responsible for arranging that the letters of recommendation arrive in our offices by December 15, 1992.

APPLICATION DEADLINE: December 1, 1992; mail to Director, Congressional Fellowship Program, American Political Science Association, 1527 New Hampshire Avenue, NW, Washington, DC 20036.

Awards will be announced by March 15, 1993.

CONGRESSIONAL FELLOWSHIP PROGRAM ADVISORY COMMITTEE

AMERICAN POLITICAL SCIENCE ASSOCIATION
CONGRESSIONAL FELLOWSHIP PROGRAM

The American Political Science Association announces the second annual

APSA-MCI COMMUNICATIONS FELLOWSHIPS

CONGRESSIONAL FELLOWSHIPS FOR SCHOLARS AND JOURNALISTS with a demonstrated, professional interest in telecommunications and who show promise of making a significant contribution to the public's understanding of the political process.

THE FELLOWSHIP YEAR: A comprehensive three-week orientation period, followed by full time assignments as legislative aides in the House of Representatives and Senate, combined with a seminar program with leading congressional, governmental and academic figures. Orientation begins November 1993; legislative office assignments run December 1993 through August 15, 1994.

QUALIFICATIONS FOR SCHOLARS: Applications are welcome from scholars in all disciplines who have completed a Ph.D. in the last 15 years or are near completion of their dissertations.

QUALIFICATIONS FOR JOURNALISTS: A Bachelor's degree and a minimum of two years' full-time experience in newspaper, magazine, radio or television reporting at time of application. (Broadcast journalists' background may be on the air or as producers, directors, writers or researchers).

FOR ALL CANDIDATES, preference given to those who have not had extensive Washington experience. Applicants who are not current residents of the United States must be able to fund their own transportation to Washington to be interviewed should they be selected as finalists.

STIPEND: $26,000, plus a small travel allowance.

TO APPLY: Between October 1 and December 1, 1992, submit:

- a detailed resume (8 copies);
- a 500-word explanation of how the Congressional Fellowship Program relates to your career goals and interest in telecommunications and public policy (8 copies);
- for scholars: one published article constituting your best professional writing (8 copies) or, for journalists: a sample of your best professional writing (8 copies of clips or radio/television scripts or single copies of cassette or VHS tapes).

REFERENCES: All candidates must submit the names of three professional references who will send letters of recommendation to the APSA office by December 15, 1992. (Applicants are responsible for seeing that these letters are sent.)

MAIL TO: APSA-MCI Communications Fellowships, American Political Science Association, 1527 New Hampshire Avenue, NW, Washington, DC 20036.

Awards will be announced by March 15, 1993

ALTERNATIVE VISIONS

THE MAKING OF CANADIAN FOOD AID POLICY

MARK W. CHARLTON

"Charlton has written a detailed, fascinating, and revealing study ... It is rich in new material and ... will be one of half a dozen essential books on Canadian aid policies both immediately and for a long time to come." *Cranford Pratt, Department of Political Science, University of Toronto.*

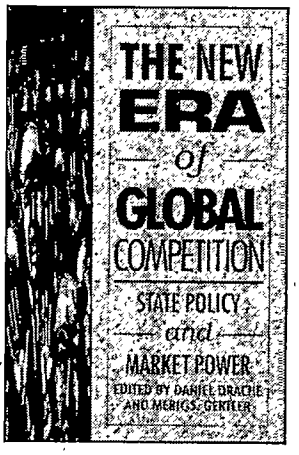
256 pp	6 x 9	
Cloth	ISBN 0-7735-0937-2	$44.95
Paper	ISBN 0-7735-0938-0	$19.95

CHARTER VERSUS FEDERALISM

The Dilemmas of Constitutional Reform

ALAN C. CAIRNS

In *Charter Versus Federalism*, Alan Cairns provides an insightful analysis of the consequences — for citizen and government alike — of the changes undergone by the Canadian constitution, especially since 1982. He also illuminates the difficulties of resolving the constitutional tensions between Quebec and The Rest of Canada.



160 pp	6 x 9	
Cloth	ISBN 0-7735-0891-0	$34.95
Paper	ISBN 0-7735-0892-9	$12.95

THE NEW ERA OF GLOBAL COMPETITION

State Policy and Market Power

Edited by DANIEL DRACHE and MERIC S. GERTLER

"an empirical and analytical critique of the Conservative government's policy of trade-led growth through trade liberalization and the economies of scale that follow from increased exports ... The book is absorbing and challenging reading for Americans interested in exploring alternative explanations of and responses to the new era of global competition." *Charles Craypo,* Industrial and Labor Relations Review.

480 pp	6 x 9	
Cloth	ISBN 0-7735-0817-1	$49.95
Paper	ISBN 0-7735-0818-X	$24.95

A DIPLOMACY OF HOPE

Canada and Disarmament, 1945-1988

ALBERT LEGAULT and MICHEL FORTMANN

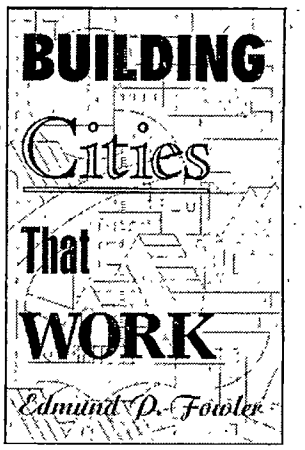
"The book ... has the virtue of being the most comprehensive treatment of this subject available. The archival and interview research on Canadian policy that is the main strength of the book is unlikely to be duplicated in the near future." *Keith Krause, Centre for International and Strategic Studies, York University.*

632 pp	6 x 9	
Cloth	ISBN 0-7735-0920-8	$75.00
Paper	ISBN 0-7735-0955-0	$29.95

A SOVEREIGN IDEA

Essays on Canada as a Democratic Community

REG WHITAKER



Bringing together the best of Reg Whitaker's essays on democracy, federalism, and the state, *A Sovereign Idea* will be essential reading for anyone interested in the rise of the idea of democracy in Canada. The essays, each in its own way, are an attempt to discover how a more democratic Canada can be achieved.

296 pp	6 x 9	
Cloth	ISBN 0-7735-0841-4	$44.95
Paper	ISBN 0-7735-0878-3	$19.95

BUILDING CITIES THAT WORK

EDMUND P. FOWLER

"Strongly influenced by the classic works of Jane Jacobs, this book explains why the built environment of metropolitan areas in North America is both socially destructive and economically wasteful. Through an analysis that is provocative, wide-ranging, and enlightened by a deep commitment to human values, Fowler calls for reestablishing urban community life from the ground up." *David Popenoe, Associate Dean for Social and Behavioral Sciences, Rutgers University.*

Teaching Positions in Eastern Europe

The Civic Education Project is an international educational program jointly sponsored by Yale University and the Central European University. CEP assists reform efforts in the social science departments of Central and Eastern European universities by providing Western-trained scholars for a year's tenure. Currently CEP has lecturers in Bulgaria, Romania, Hungary, Czechoslovakia, the Baltic states and Ukraine. CEP is also planning to expand the project to Russia next year. Lecturers teach courses in economics, political science, sociology, or law and assist host faculty with their professional development needs. Professors, post-docs and advanced graduate or professional students are invited to apply. To receive a brochure and application contact: CEP, P.O. Box 5445 Yale Station, New Haven, CT 06520; Telephone and Fax: (203) 432-3218.

CULTURAL **Activism** CULTURAL

Analysis

BETWEEN TOTALITARIANISM AND POSTMODERNITY
A *Thesis Eleven* Reader
edited by Peter Beilharz, Gillian Robinson, and John Rundell
Original in Paperback
These thirteen articles provide theoretical and historically informed analyses of the powerful currents that are shaping the late twentieth-century political and cultural landscape. They offer insights into the political and philosophical issues stemming from the fall of communism, the troubles of social democracy, and the rise of postmodernism.
276 pp. $14.95 paper

CULTURAL-POLITICAL INTERVENTIONS IN THE UNFINISHED PROJECT OF ENLIGHTENMENT
edited by Axel Honneth, Thomas McCarthy, Claus Offe, and Albrecht Wellmer
Original in Paperback
Focusing on the cultural and political aspects, these essays take up critical theory and political practice, the sociology of political practice, historical-philosophical reflections on culture, and the foundations of critical social theory.
300 pp. $16 95 paper (October)

CIVIL SOCIETY AND POLITICAL THEORY
Jean L. Cohen and Andrew Arato
The authors contend that the concept of civil society articulates a contested terrain in the *West* that could become the primary locus for the expansion of democracy and rights.
771 pp. $45.00

THE COLD WAR AND AFTER
Prospects for Peace
edited by Sean M. Lynn-Jones
Original in Paperback
"*The Cold War and After* is the best guide to the crucial debate on the post-cold war security environment. The book is a must for scholars and will be of great value to students and teachers of international relations."— Stephen M. Walt, University of Chicago
An *International Security* Reader 280 pp. $14.95 paper

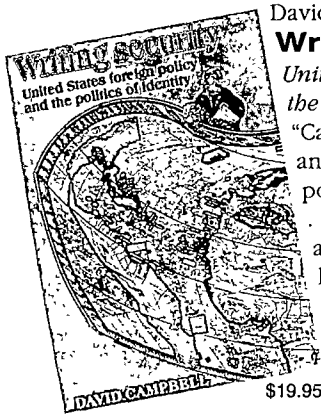
Brunswick Publishing Corporation

P.O. Box 555 • Lawrenceville, Virginia 23868 USA



TEL: 1-800-336-7154 • FAX: 804-848-0607

Encyclopedic in its dimension, the dictionary stimulates the reader with the author's own original comments on the more than 7,000 items included in this work. It contains an extensive array of precise definitions on American and Foreign political systems, processes, and institutions, as well as topics from business, management, international economics, trade, law, and military doctrines as they relate to government and politics, illustrated by numerous charts, graphs, tables, and historical documents.

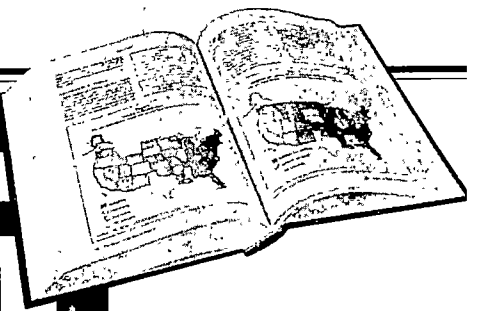
"It is at once complete and concise. A very handy reference work."
—*Richmond Times Dispatch*

"Contains easy to understand, factual information on American and foreign political and legal systems, processes, and institutions."
—*Journal of Social and Political Studies*

postmodern politics

David Campbell
Writing Security
United States Foreign Policy and the Politics of Identity
"Campbell writes with fluency and thinks in-depth about postwar U.S. foreign policy. . . . [He] effectively challenges an orthodoxy of thought that has delimited debate and forestalled change in international relations."–James Der Derian
$19.95 paper $44.95 cloth

Michael J. Shapiro
Reading the Postmodern Polity
Political Theory as Textual Practice
Offers the first demonstration by a political theorist of how textuality is inherent to political practice.
$15.95 paper $39.95 cloth



William Chaloupka
Knowing Nukes
The Politics and Culture of the Atom
This compelling analysis examines antinuclear politics through the lens of postmodern theories of language and society.
$14.95 paper $39 95 cloth

Harvey J. Kaye
The Powers of the Past
Reflections on the Crisis and the Promise of History
"At once scholarly and highly readable, learned and full of personal passion. It is also crucial, because what is at stake here is the unfinished struggle, not just the writing but the making of history." –Daniel Singer, *The Nation*
$14.95 paper $39.95 cloth

From the Concepts in Social Thought *series–*
Richard Scase
Class
A highly accessible introduction to the idea of social class. Against a background of the failure of Soviet and East European state socialism, Scase highlights the importance of social class in Western capitalist society.
$12.95 paper $34.95 cloth

John Davis
Exchange
An account of exchange that emphasizes moral and symbolic order, and the meanings people invest in their actions.

PRESIDENTIAL POPULARITY

Stephen Frantzich
Rodney Tomlinson
U.S. Naval Academy

PRESIDENTIAL POPULARITY uses an historical database to introduce the student to the causes and consequences of presidential popularity. Yearly data from all the post-war presidencies are included. The student is introduced to cross tabulation methodology.

The student develops and tests hypotheses "hands on" using economic, presidential activity, congressional voting, and presidential popularity data.

Requires an IBM PC with at least 128K memory, one diskette drive, DOS 2.1 or higher, and BASICA.

$39.95
$119.95 with a ten-copy site license

Order TASL software using Visa, MasterCard, American Express, check, or university purchase order. Shipping and handling is $2.75 for first item ($7.50 foreign) and $.75 for each additional item.

Causes and consequences of Presidential Popularity

A Guided Tour of PRESIDENTIAL POPULARITY

Start PRESIDENTIAL POPULARITY by:

Select PRESIDENTIAL POPULARITY from the DOS Shell menu and **press** [↵], or

Double click the PRESIDENTIAL POPULARITY Icon in the TASL group under Windows 3.0

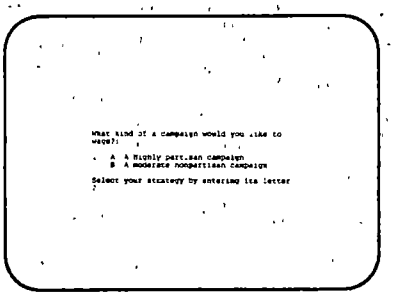
The PRESIDENTIAL POPULARITY title screen will appear.

Press [↵] to begin

PRESIDENTIAL POPULARITY is a programmed learning and data analysis exercise designed to teach a student the causes and the consequences of public evaluations of the president. It provides an introduction to the techniques of cross tabulation. It allows you to test your own hypotheses and learn about political research.

Choose Section 1 for an introduction into data analysis of political variables. You will be able to make conclusions from a cross tabulation table. The program will grade your conclusions and offer additional help if you are wrong.

Choose Section 2 to test which of two theories best fits the data with presidential popularity as the dependent variable and number of years since the last inauguration as the independent variable. This section also gives you cross tabulation tables for popularity as the independent variable and nine different choices as the dependent variable.



The user who has tried the first two sections is then ready for Section 3. Here the user conducts his own political research. He selects the dependent and independent variables, makes an hypothesis, sees the crosstabulation table, and makes a conclusion.

POLITICAL CAMPAIGNING

Stephen Frantzich
U.S. Naval Academy

POLITICAL CAMPAIGNING allows the student to manage a campaign for congressional office under different levels of resources. The resources for the campaign are determined by a combination of random factors and student choices.

During the campaign the student must make choices on issues, use of the media, and candidate effort. At the end, the student is told how the various choices affected the outcome.

Requires an IBM PC with at least 128K memory, one diskette drive, DOS 2.1 or higher, and BASICA.

$39.95
$119.95 with a ten-copy site license

LEGISLATIVE COALITION BUILDING

Stephen Frantzich
U.S. Naval Academy

LEGISLATIVE COALITION BUILDING places the student in the role of a congressional committee chairman trying to build a winning coalition on a piece of tax legislation. The chairman must make a series of choices as to the level of partisanship, strategy toward amendments, bargaining approaches and timing.

At the end, the student is appraised of the final vote and the amount of resources expended.

Requires an IBM PC with at least 128K memory, one diskette drive, DOS 2.1 or higher, and BASICA.

$39.95
$119.95 with a ten-copy site license

A Guided Tour of LEGISLATIVE COALITION BUILDING

Start LEGISLATIVE COALITION BUILDING by:

Select LEGISLATIVE COALITION BUILDING from the DOS Shell menu and **press** [↵], or

Double click the LEGISLATIVE COALITION BUILDING icon in the TASL group under Windows 3.0

The LEGISLATIVE COALITION BUILDING title screen will appear.

Press [↵] to begin

Play the role of a congressional committee chairman. Try to build a coalition of the majority of your ten-member committee that will vote with you on the proposed legislation. The legislation proposes to help balance the budget by taxing employee fringe benefits as if they were regular income.

You have "resource units" that you can spend on gathering information or "side payments" to members of the committee.

The simulation takes you through 4 stages in the legislative process:

1) Pre-hearing research
2) The hearing
3) The mark up session
4) Pre-vote bargaining

Read and **follow** the instructions on the screen

American Government:
An Introduction Through *MicroCase*®

by David Schultz, Trinity University

Now students in your introductory courses can do real political science analysis in a micro computer lab. This laboratory workbook includes a Student Version of the MicroCase Analysis System plus three real data bases. You will not have to teach your students how to use the software, nor will you need to teach them how to understand their results — the exercises are fully self-explanatory. Estimated retail price is $19.95 (sold only as a complete package).

Workbook

PART I - VOTERS AND ELECTIONS
- 1: Electoral & Popular Votes for President
- 2: Voter Participation
- 3: Who Votes?
- 4: Who Votes for Whom?

PART II - PARTIES AND ISSUES
- 5: Party Preference & Political Labels
- 6: The Tax Issue
- 7: The Welfare Issue
- 8: The Abortion Issue

PART III - INSTITUTIONS OF GOVERNMENT
- 9: Who's in Congress
- 10: Partisan Politics in Congress
- 11: Congressional Campaign Finances
- 12: A Woman for President
- 13: The Supreme Court

PART IV - FREEDOM
- 14: Civil Liberties
- 15: Civil Rights

PART V - FOREIGN RELATIONS
- 16: America's Role in the World
- 17: Foreign Aid

PART VI - INDEPENDENT PROJECTS

Included Software

Student MicroCase displays statistical results in effective color graphics. Options include:

- Frequency, percentage and cumulative distributions (including pie charts & bar graphs)
- The full range of univariate statistics
- Cross-tabulation
- Mapping
- Scatterplots (with regression line)

AGGREGATE AND SURVEY DATA

GSS1990
Contains 1,372 cases and more than 80 selected variables from the 1990 General Social Survey

States
Data based on the 50 States, with over 100 variables

Congress
Based on the 435 members of the 102nd Congress, with 45 variables

Hardware Requirements:
For IBM compatibles with color graphics capacity (or Hercules Monochrome) and 512K memory. One 3.5" or two 5.25" floppy drives required.

MicroCase Corporation

Complimentary examination copies are available for course adoption purposes only. To receive your copy, please complete all of the following information and mail to:

IS THE CURRICULUM BIASED?

A STATEMENT OF THE NATIONAL ASSOCIATION OF SCHOLARS

American higher education is facing widespread demands to eliminate the allegedly "Eurocentric" and "patriarchal" bias of the curriculum. While the details vary from campus to campus, these demands tend to focus on four objectives:

- that the "canon" be revised to include more works by blacks, other ethnic minorities, and women
- that the "issues of race, gender, and class" be introduced into a greater variety of courses
- that more courses in women's studies and minority studies be developed
- that courses in women's studies and/or minority studies be required of all undergraduates

Various justifications are commonly proffered for making these changes. It is alleged that:

- works by minorities, women, and Third World authors have been excluded from the curriculum
- minority and female students feel alienated and their educational progress is retarded by being asked to study works primarily by white males
- in order to overcome their own prejudices, white males must become acquainted with the cultures and problems of minorities and with the perspectives and problems of women
- the traditional curriculum represents the hegemony of Western culture, covertly supports a status quo inherently oppressive of women and minorities, and is unfairly imposed on students from different cultures
- the traditional desiderata of truth, objectivity, and critical intelligence can be met only by adding the perspectives of women and minorities and by facing up to the new questions they raise
- an increasingly diverse society and interdependent world require that our citizens gain greater understanding of different cultures

The National Association of Scholars disputes the first five of these arguments and believes that the last entails something other than the changes being proposed.

First, any work, whether formerly neglected or widely known, should be added, retained, or removed from the curriculum on the basis of its conformance to generally applicable intellectual and aesthetic standards. A sound curriculum cannot be built by replacing those standards with the principle of proportional representation of authors, classified ethnically, biologically, or geographically.

Second, the idea that students will be discouraged by not encountering more works by members of their own race, sex, or ethnic group, even were it substantiated, would not justify adding inferior works. Such paternalism conveys a message opposite to the one desired.

Third, other cultures, minority subcultures, and social problems have long been studied in the liberal arts curriculum in such established disciplines as history, literature, comparative religion, economics, political science, anthropology, and sociology. But more important, mere acquaintance with differences does not guarantee tolerance, an ideal Western in origin and fostered by knowledge of what is common to us all.

Fourth, the idea that the traditional curriculum "excludes" the contributions of all but males of European descent is patently false. From their beginnings, Western art and science have drawn upon the achievements of non-Western societies and since have been absorbed and further enriched by peoples around the globe. That the liberal arts oppress minorities and women is yet more ludicrous. Even if the curriculum were confined to thought strictly European in origin, it would still present a rich variety of conflicting ideas, including the very concepts of equality and freedom from oppression invoked by those who would reorient the curriculum.

Fifth, while diversity of background is valuable to the discussion of issues to which those differences are germane, objectivity is in general not enhanced but subverted by the idea that people of different sexes, races, or ethnic backgrounds necessarily see things differently. The assertion that cognition is determined by group membership is itself an example of stereotypic thinking which undermines the possibility of a true community of discourse.

Sixth, the study of the traditions and achievements of other nations and of ethnic subcultures is important and should be encouraged. But this must proceed in a manner that is intellectually honest and does not serve as a pretext for inserting polemics into the curriculum. Furthermore, "multicultural education" should not take place at the expense of studies that transcend cultural differences: the truths of mathematics, the sciences, history, and so on, are not different for people of different races, sexes, or cultures, and for that reason alone their study is liberating. Nor should we further attenuate the study of the traditions of the West. Not only is knowledge of those traditions essential for any evaluation of our own institutions, it is increasingly relevant to our understanding of other nations, which, in striking testament to the universality of the values they embody, are rapidly adapting Western practices to their own situations.

The **National Association of Scholars** is in favor of ethnic studies, the study of non-Western cultures, and the study of the special problems of women and minorities in our society, but it opposes subordinating entire humanities and social science curricula to such studies and it views with alarm their growing politicization. Efforts purportedly made to introduce "other points of view" and "pluralism" often seem in fact designed to restrict attention to a narrow set of issues, tendentiously defined. An examination of many women's studies and minority studies courses and programs discloses little study of other cultures and much excoriation of our society for its alleged oppression of women, blacks, and others. The banner of "cultural diversity" is apparently being raised by some whose paramount interest actually lies in attacking the West and its institutions.

We urge our colleagues to demand clear explanations and cogent arguments in support of the proposals being so rapidly brought before them, and to reject any that cannot be justified. The curriculum is and should be open to change, but we must rebut the false charges being made against existing disciplines. We must also reject the allegations of "racism" and "sexism" that are frequently leveled against honest critics of the new proposals, and which only have the effect of stifling much-needed debate.

For copies of this or other NAS statements, or for additional information about the **National Association of Scholars** and its activities, including its fellows program, research center, speakers bureau, search service, newsletter, state and regional affiliates, conferences, local events, and the quarterly *Academic Questions*, write to the National Association of Scholars, **575 Ewing Street, Princeton, NJ 08540**, or call **609-683-7878**.

Politics in Western Europe

An Introduction to the Politics of the United Kingdom, France, German, Italy, Sweden and the European Community

M. Donald Hancock, *Vanderbilt University,* **David P. Conradt,** *University of Florida, Gainesville,* **B. Guy Peters,** *University of Pittsburgh,* **William Safran,** *University of Colorado, Boulder,* and **Raphael Zariski,** *University of Nebraska, Lincoln*

"The genius of British politics in maintaining a stable political system over several centuries is not the good fortune of operating in a homogeneous society but the development of a set of institutions, values, and customs that permit the pragmatic acceptance of diversity and accommodation to gradual change."

B. Guy Peters, *University of Pittsburgh*

"Traditionally, the French have been sharply critical of the regime, but they have had a highly developed sense of belonging to the nation, and great expectations from the 'state' in terms of what it should do for them."

William Safran, *University of Colorado, Boulder*

"Not only is the Federal Republic a stable democracy; in recent years it has emerged out of the shadows of the Third Reich to become an increasingly important and assertive actor in European and international politics. The collapse of communism in Eastern Europe and the Soviet Union together with the breakup of the Soviet empire means that the Federal Republic will assume a greater leadership role in Central and Eastern Europe."

David P. Conradt, *University of Florida, Gainesville*

"On the surface, Italian decision making appears cumbersome, rather chaotic, and grossly inefficient. Yet, as some observers have pointed out, behind this disorderly façade of conflict and resulting sclerosis is an underlying process of compromise and collaboration among leaders of the various parties. Thus, while policy procedures and outputs leave very much to be desired, Italy is unquestionably a going concern and has yet to encounter the system breakdown that so many prophets of doom have predicted."

Raphael Zariski, *University of Nebraska, Lincoln*

"Sweden has undeniably attained one of the world's highest standards of living and most fully developed welfare systems. At the same time, twentieth-century economic and social reforms have resulted in an extraordinarily high rate of taxation and pervasive tendencies toward bureaucratization. The result is an ongoing struggle to redefine fundamental tenets of the 'Swedish model' of advanced industrial society."

M. Donald Hancock, *Vanderbilt University*

"The significance of the European Community lies not only in its economic status as the world's largest trading bloc but also in the declared intentions of political leaders in both the EC and its member countries to achieve economic, monetary, and political union by the end of the decade."

M. Donald Hancock and B. Guy Peters

INSTRUCTIONS TO CONTRIBUTORS

The *American Political Science Review* aims to publish scholarly research and writing of exceptional merit. Contributions must demonstrate the highest standards of excellence in conceptualization, exposition, methodology, and craftsmanship. Because the *Review* reaches a diverse audience of scholars and practitioners, contributors must demonstrate how their analysis or exposition illuminates a significant research problem, or answers an important research question, of general interest in political science.

Article Manuscripts

Article manuscripts should be submitted to the Managing Editor, Professor G. Bingham Powell, Jr., *American Political Science Review*, Department of Political Science, University of Rochester, Rochester, New York 14627-0148. Four copies must be submitted, and none can be returned. Manuscripts must be typed double-spaced, on one side of the paper only, and include an abstract of no more than 150 words. The author's name and affiliation should not appear on the copies submitted, but only on a separate covering sheet. In general, the *Review* considers manuscripts of up to 30 pages in length. Moreover, the *Review* does not consider manuscripts submitted to other publications.

Manuscripts should be prepared following the guidelines of the *Style Manual for Political Science*, a publication of the American Political Science Association's Committee on Publications. It is available from the Association's office. Otherwise, authors should follow the *Chicago Style Manual* and the example of recent issues of the *Review*. Graphs and tables should be presented on separate pages, with their location in the manuscript indicated, e.g., the notification "Table 1 about here," at the proper places.

Book Reviews

Books intended for review and all book review correspondence should be sent to the Book Review Editor, Professor Melissa P. Collie, *American Political Science Review*, Department of Government, Burdine Hall 536, University of Texas at Austin, Austin, Texas 78712-1087.

Other Correspondence

Information, including news and notes, for the Association's news journal *PS*, should be sent to Dr. Robert J-P. Hauck, Editor, American Political Science Association, 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036. Advertising, reprint, and circulation correspondence should be sent to the Executive Director at the Washington office. Domestic claims for nonreceipt of issues must be made within four months of the month of publication; overseas claims, eight months. Advertising information and rates are available from Terry Jacobson, Advertising Manager, APSA, 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036.

Indexing

Articles and notes appearing in the *Review* before the June 1953 issue were indexed in *The Reader's Guide to Periodical Literature*. Current issues are indexed by *International Political Science Abstracts*, *United States Political Science Documents*, and *Social Sciences Index*. Microfilm of the *Review*, beginning with Volume 1, may be obtained from University Microfilms, 300 North Zeeb Road, Ann Arbor, Michigan 48106. A *Cumulative Index of the Review*, Volumes 1–62, 1906–1968, also may be obtained from University Microfilms. Articles appearing in the *Review* are listed in *ABC Pol Sci* and *Current Contents: Behavioral, Social & Management Sciences*. Book Reviews are indexed in *Book Review Index*.

REDEFINING THE POLITICAL SYSTEM OF THE USSR: MASS SUPPORT FOR POLITICAL CHANGE

ADA W. FINIFTER *Michigan State University*
ELLEN MICKIEWICZ *Emory University and The Carter Center*

Using data from a national public opinion survey carried out in the Soviet Union during November and December 1989, we explore two attitudes relevant to the revolutionary changes there: (1) attitudes toward change and political democracy and (2) attitudes toward a core component of socialist ideology, the locus of responsibility for social well-being (the state or individuals?). These variables are unrelated, with the sample relatively evenly divided among the intersecting cells of a cross tabulation. While social conflict may be mitigated by the small sizes of absolutely opposing groups, consensus may also be hard to reach. Ethnicity, education, income, age, party membership, and life satisfaction have important effects on these attitudes. We discuss how attitude patterns in our data may be related to the disintegration of the Soviet Union and to problems faced by the independent successor states as they develop new institutions and foster new values.

In December 1991, the Soviet Union ceased to exist. A loose association, the Commonwealth of Independent States, represented the efforts of leaders of 11 newly independent states to retain a measure of continuity and to cushion the shock, both economic and political, of the sudden severing of ties. To many observers, the viability of the Commonwealth, without a decision-making body or regulatory and enforcement powers, appeared highly problematic even at its creation.

We report data on public attitudes toward change and political democracy, collected in seven of the former Soviet republics before the breakup of the Union. However, the questions we asked and the responses to them are not only closely related to the collapse of the former Soviet Union but are also very much a part of the post-Soviet future. All the newly independent states will have to address the attitudes of their populations to fledgling institutions and restructured values. All other things being equal, institutions and values that are supported by appropriate public attitudes will have higher prospects of survival. Difficulties in institutional development in areas where public support is low will be magnified. Each of the new states will, in short, have to confront the continuing public attitudes and beliefs with which they are beginning their political lives.

Further, our survey of attitudes toward the end of the life of the Soviet Union illuminates the profound impact of ethnicity on all the aspects of political change we studied. This variable is particularly important in the analysis that follows and underscores and prefigures the divisions that were later ratified. The depth of these divisions suggests not only a precarious outlook for integrative institutions, but also suggests difficulties for the large number of ethnic Russians living outside their home republic.

SUPPORT FOR CHANGE AND REFORM IN THE SOVIET UNION

In the historical experience of the last two centuries, movements toward democratization have often been accompanied by an enlarged role for the state as the protector of individual liberties and economic well-being. In these new democratic systems, the mass public was protected from arbitrary uses of power by institutionalized systems of state control that included both means for political responsibility and accountability to the public and the protection of social welfare; the latter typically involved governmental control over the provision of many social services. Many of the Western European democratic socialist movements stem from this sort of historical experience. In established democratic systems, as well, increasing political democracy has frequently meant an enlarged role for the state in the provision of social welfare; the historical experience of the United States since the New Deal period in increasing economic welfare and civil rights follows this pattern.

At present, there are important movements toward decreased state activity in many democratic nations. While these are frequently cited as part of a worldwide movement toward "privatization" that includes the democratic revolutions in the former Soviet Union and the nations of Eastern Europe, the differences between these political contexts are far more important than the similarities. The historical experience of the Soviet Union and the Soviet-type states of Eastern Europe is different in a fundamentally important way: the increased state control that occurred as the political regimes of these nations were formed was not part of a movement toward increased democracy but, rather, of a system of centralized control and repression.

In the Soviet Union (though the record of Gorbachev's perestroika is mixed), an important compo-

nent was a *smaller* role for the state. Shortly after his accession to power, Gorbachev took such steps as increasing centralization in the agriculture and food industry, restricting unearned income, and instituting the antialcohol campaign, all of which tended toward a greater role for the state. The course was then reversed, and the drive for pluralism began. "Informal" organizations increasingly entered the political arena, breaking state- and Party-run monopolies. The electoral process became, in 1989, genuinely (even if not fully) democratic. Media outlets were rapidly shorn of the tight constraints of censorship and uniformity, though tensions between editors and politicians increased markedly between late 1990 and the August 1991 putsch.

In the economic sphere, official rhetoric included support at the highest level for a market economy. Gorbachev's chief advisor, Alexander Yakovlev, considered the market as necessary for both socialist and capitalist outcomes. The ability to contract directly with foreign businesses was no longer the monopoly of the Moscow ministry; and the ministries were, in any case, in the process of downsizing. The notion of the joint venture, an arrangement to introduce foreign capital and techniques at all levels of the economy, became part of the message of perestroika. If the economy was not revolutionized until after the failure of the August 1991 coup, the policy pronouncements were, nevertheless, much in evidence earlier. Both political and economic reforms (with the political gaining much greater ground than the economic) chipped away at the power of the centralized state and the Party. The attempt of the opponents to regroup and reverse the course of reform may have convinced Gorbachev in 1990, but they ultimately failed in their bolder move the next August.

As noted, Gorbachev's pronouncements, particularly in the early stages of perestroika, were indeed ambiguous; and the tensions surrounding a move to a radically individualist political economy remained unresolved throughout his period of leadership. However, there can be no doubt that a major thrust of reform in the Gorbachev era was, *as compared to what went before,* toward decentralized government, more individual initiative, and greater individual responsibility. These ideas were frequently implied in discussions of "marketization" and greater individual "initiative" and "productivity." These are the ideas that we intended to capture in our survey with our question on state versus individual responsibility.

Because of Soviet history, our measures and our discussion of support for political change take the form of a focus on support for increasing political democracy (which is unexceptional) but also of support for greater responsibility for *individuals* in social welfare as opposed to the continuation of the state's playing the major role in this area. In this respect, our discussion is different from discussions of democratization that assume that this process will involve a larger role for the state. Given the historical and political context, this is a specification that seems to be necessary for theories of democratic development.

Who Supports Political Change and Reform?

Beliefs about the role of the state, group identifications, and personal self-interest are among the most prominent bases of political attitudes. In particular, the understandings held by a nation's citizenry about what role the state should play in the political and economic life of the nation, how far political dissent may be expressed publicly, how important order and stability are when these come into conflict with freedom, and other such basic aspects of the relationship between the public and its political leadership are major parts of the political culture of a nation. Typically, attitudes based on the prevailing political culture tend to remain stable unless cultural upheaval and discontinuity force people to take account of change (Eckstein 1988). Depending on the sort of change that is occurring and the fundamental motives that one believes drive political attitude formation, different hypotheses follow about the social sectors in which one expects support for change to develop most rapidly.

In change oriented from an authoritarian to a democratic form of government or a command to a market economy, attitudes toward change might be driven by beliefs about the role of the state and by personal self-interest. The nature of the change being undertaken is germane to the types of relationships that should be expected, as are the political and social contexts in which change occurs. In general, cultural theories of attitude formation suggest that attitudes supportive of democratization will develop most rapidly in the nontraditional sectors of the nation—that is, among the young and better-educated; in the cities, rather than in the rural areas; in the service, rather than the agricultural, sectors of the economy; and probably among men, as compared to women.

Other theories of attitude formation occasionally suggest contrary—or at least supplemental—hypotheses. For example, to support a market economy in the Soviet Union and its successor states represents a reversal of seventy years of ideological indoctrination. We would not expect people who were ideologically invested in the current system to be very supportive of this type of change, regardless of any "modern" demographic characteristics they might possess; at the least, their support would be tempered by the conflict. Similarly, the market economy and the economic dislocations unleashed by perestroika threaten the self-interest of some groups. Low-income people may be expected to want to retain the support and material benefits provided by the socialist state, regardless of any other "modern" characteristics they may possess, such as residence in large urban areas.

Our analysis takes into account the various theoretical problems and considerations we have discussed. First, we think attitudes toward economic and political change themselves must be clarified because the complexity of change suggests that these may not be unidimensional. Second, to the extent that we can identify a cluster of attitudes that are

TABLE 1

Attitudes on Various Aspects of Change and Reform (%)

QUESTION	REFORM POSITION	"IT DEPENDS"	TRADITIONAL POSITION	TOTAL	WEIGHTED N
Competitive elections (Q29)	95	—	5	100	(1,883)
Income differences (Q22b)	87	—	13	100	(1,910)
Free speech vs. order (Q22d)	58	—	42	100	(1,841)
Individual vs. state responsibility (Q22a)	49	—	51	100	(1,822)
Rapid vs. slow change (Q18)	45	17	38	100	(1,885)
Protest vs. traditional methods (Q22c)	36	—	64	100	(1,826)

Note: Ns are in parentheses. The total weighted N for the sample is 2,006. Missing data ranged from 5% to 9% in these questions. A middle position was available only in Q18.

oriented toward reform, we would expect greater agreement with such values in groups which belong to the "modern" sectors of society. Third, however, we do not believe support for democracy is based only in ideas or ideology; we also take into account how far groups can be expected to benefit from political and economic change. In groups that are part of the more traditional sectors, uniquely disadvantaged by change, or ideologically invested in the present system, we expect to find more resistance to modernizing and democratizing social, political, and economic change. Indeed, it is in such sectors that we expect to observe real resistance to reformist values. Thus, our analysis proceeds from assumptions rooted in both political culture theory and considerations of material and organizational self-interest.

The Political Context of the Survey

Largely unintended and unforeseen, what began in 1985 as perestroika resulted in revolutionary change. Glasnost, most observers concur, despite the tension and conflict over its scope, irreversibly altered the boundaries for the expression of opinions, although in the post-Soviet politics of the successor states (as before), there are wide differences from west to east. The political reforms (in which the monopoly of Communist Party power gave way first to splits in the Party itself and then to the presidential/parliamentary system amalgams in the now independent republics) continue to be implemented with varying degrees of rapidity and commitment. The Gorbachev administration's rhetoric of economic reform, first couched in conservative and ineffectual proposals, approached market principles, then reversed direction before the attempted coup. In some areas, such as the largest cities and the Baltic republics, reform proceeded far more rapidly than in the provincial heartland; and the increasing de facto decentralization of the country's political and economic systems has also been accompanied by severe economic deterioration and interethnic conflict. The main beneficiaries of the older system—the armed forces, the security organs, and the professional bureaucrats (the apparat) of the Communist Party and its remnants—have been least willing to see their power and resources eroded.

It is in the context of rapid and radical change that our survey of Soviet public opinion was designed and conducted. One of our aims was to explore the attitudes of our respondents to the tempo and components of political change. Our analysis is based on a national sample of interviews collected during late November and early December of 1989. These were true personal interviews and not the "drop off, pick up" questionnaires sometimes referred to as "face-to-face interviews" in the Soviet Union; this is the first large-scale true personal interview survey in that nation. The data were collected by the All-Union Center for Public Opinion Research, directed by T. I. Zaslavskaya. Further details on the sample and field procedures are given in Appendix A.

ATTITUDES TOWARD CHANGE: DIVISION AND IDEOLOGICAL COHESION

We focus here on six questions designed to measure attitudes about changes taking place in the Soviet Union at the time of our study. One question (Q18) is about the pace of change itself, and five more specific questions ask about change in the political and economic arenas: the perceived locus of responsibility (individual or collective) for individuals' social well-being (Q22a), the acceptability of differences in individual incomes and standards of living (Q22b), the acceptability of nonconventional forms of political expression like strikes and demonstrations (Q22c), the priority of free speech over public order (Q22d), and support for a competitive electoral system (Q29). The back-translation from Russian for these questions is given as Appendix B. (R) next to a response indicates that it was scored as "reformist" or "change-oriented." Except for Q18, which had a middle position ("In different situations, act differently"), all questions were dichotomies. The distributions on these questions highlight the substantial

disagreement that existed in the public on some issues that were important aspects of glasnost and perestroika (see Table 1).

As Table 1 makes clear, depending on which particular question one looks at, one can come to quite different conclusions about the level of support for change that existed prior to the dissolution of the USSR. To begin with, there was substantial disagreement on how fast change should be carried out. In the realm of political expression, practically no one objected to competitive elections. Nevertheless, apart from this very simple—albeit basic—measure of democratization, it was clear that old ideas were dying slowly; more subtle concepts about political rights were not universally approved. Two-fifths of our sample believed that public order was more important than free speech, and only slightly more than a third were willing to accept unconventional forms of political participation as a legitimate part of the political process.[1] Still, while a clear majority preferred to solve problems using conventional means, considering the strength of the wording of the question about protest, the amount of support for strikes, protests, and demonstrations was remarkable.[2] Nevertheless, the ambiguity and conflict over the extent of permissible political conflict signals the fragility of the current order.

Relatively few people were hard-core believers in strict income equality (about an eighth of our sample). Note that strict income equality has really not been a feature of official political doctrine. Stalin and all subsequent leaders asserted the rationale for wage differentials and there was a brief period of loosened reins on entrepreneurial activity during Lenin's New Economic Policy (NEP). However, as David Lane notes, "until the advent of Gorbachev's leadership, differentials were relatively low" (1990, 32); and there has been an official bias against too large a spread of income differences and against unearned income. Indeed, directives relating to the latter, even under Gorbachev, seriously impeded the development of individual economic initiative. It is also possible that the relatively low popularity of income equality in our sample may have been encouraged by the wording of our question, which accorded the *state* the function of providing opportunities for individuals to earn as much as possible. In retrospect, the question probably should have emphasized the exercise of individual initiative for making as much money as possible, rather than state sponsorship of these opportunities.

Other aspects of the economic "old order" are clearly more durable. Most striking, there was virtually an even division in the sample between individual and state responsibility for individual well-being. Since this is a central aspect of what change in the political and economic systems of the former republics is all about, the lack of consensus on this item suggests the potential for serious divisions in the former Soviet states.

It is also evident that there is not one cohesive ideology that ties together all of these ideas about political and economic reform, although we do find a cluster encompassing five of the six items. Correlations involving the question about state or individual responsibility for social well-being are particularly interesting. Table 2 presents the relationships among all six questions used as dependent variables. Many of these correlations are consistent with our expectations. For example, those who support free speech are also likely to approve of unconventional forms of political participation. However, being a "political democrat" or wanting rapid change does *not* necessarily mean that one is eager to abandon the socialist system by opposing a major role for government in caring for individuals. In fact, the reverse tends to be true. For example, people who approve of protest are *more* likely than those who disapprove to see individual well-being as a state, rather than an individual, responsibility. Moreover, those who want rapid change are *more* likely than those who want slow change to see individual well-being as a state responsibility. Indeed, the question on individual versus state responsibility, considering the "individual" response as the more change- or reform-oriented attitude, is negatively related to each of the other items under consideration. Although these correlations are modest, the data suggest that support for many aspects of change and political democracy is unrelated to the posture toward collective versus individual responsibility for the social welfare of citizens.

TABLE 2

Relationships among Attitudes toward Political Change

QUESTION	Q22A	Q22B	Q22C	Q22D	Q29
Rapid vs. slow change (Q18)	−.19	.18	.29	.25	.55
Individual vs. state responsibility (Q22a)	—	−.03	−.14	−.05	−.13
Income differences (Q22b)	—	—	.60	.55	.41
Protest vs. traditional methods (Q22c)	—	—	—	.76	.60
Free speech vs. order (Q22d)	—	—	—	—	.59
Competitive elections (Q29)	—	—	—	—	—

Note: Values are gammas.

At a theoretical level, these unexpected negative relationships demonstrate that the ideology of change must be understood in its specific political context. A 1980s American perspective that equates political democratization with a limited role for central governments (whether all-Union as in the former USSR or in the newly independent states) may be considerably off the mark from another geographic or temporal perspective. Nevertheless, it remains true that even in the specific case of "perestroika," our results are unexpected. Since perestroika was generally understood to include *both* political democracy and a move toward marketization and smaller cen-

tralized government, responses to the questions we used might have been expected to be unidimensional. It is clear that they are not. Perestroika was a complex, often contradictory cluster of ideas; and some aspects were clearly more popular than others. Furthermore, while there was strong support for political reform in the Soviet Union, this did not mean that all the ideas to which people had been socialized since the Russian Revolution would be equally changeable in the short term, even when new ideas that may appear inconsistent with some of them are introduced. The Soviet population had been exposed—subjected—to 70 years of official doctrine about the primacy of the state and collective approaches to problems. As Table 1 makes clear, this socialization was far from uniformly effective. But such ideas as people had developed about this subject were clearly not immediately changed into wholesale support for individualism and free enterprise even though there was a common recognition that the system had not worked efficiently and institutions supporting increased political and economic democracy had begun to develop. Clearly, political culture and socialization will inevitably provide a drag on attitudinal change.

That many advocates of change continue to support the socialist view that the state, rather than individuals themselves, is responsible for the well-being of the citizenry, suggests that contrary to much popular belief in the West, there has not been a wholesale abandonment of socialist principles. On the contrary, there may even be somewhat more support for these ideas among those who are the strongest believers in individual free expression and rapid change. What many Soviet citizens pressing for change may want is a more efficient and productive state, rather than a state shorn of social obligations. The Communist Party, as the engine of that obligated state, was rejected, but not the obligation itself; the institution failed, but not the norm. Indeed, the institution's failure may have been due largely to its unwillingness or inability to service the norm; and an important part of Gorbachev's failure as a leader was in his failure to distinguish the two.

The differential support for the various components of perestroika and the negative relationship between locus of responsibility and the other items suggest that a one-item measure of "support for perestroika" (such as appears in some reports of Soviet public opinion) would be quite difficult to interpret meaningfully. Further analysis confirms that Q22a, state versus individual responsibility for social welfare, should not be combined with the other items in a general measure of attitudes toward reform. As the negative relationships presaged, factor analysis suggests that Q22a is orthogonal to the other items; on the factor it dominates, all other items have negative loadings. Therefore, we combine items 18, 22b, 22c, 22d, and 29 into a scale of "support for political change." The alpha-reliability of this measure is .51. In addition, we analyze Q22a separately as a measure of "individual versus collective responsibility." While single items are generally less valid than multiitem indicators, in this case the idea we are measuring—attitudes toward individual versus state responsibility—is quite clear; and the single item has obvious content validity as a measure of that idea. We feel that the content validity and the inherent importance of the idea measured by this particular item warrant its use in our analysis.

For the scale of attitudes toward political change, we scored individuals +1 for each of the five items answered in the "reform," or change, direction, and −1 for each item answered in the "status quo," or traditional, direction. Thus, the scale ranged from −5 to +5. The distribution was heavily skewed toward approval for political reform. Almost 70% of the sample had net positive scores, almost 40% chose the reform-oriented response on three of the five items, and 14% were supportive of reform on all five items. In contrast, fewer than 1% opposed reform on four or five of the items, and fewer than 6% chose the traditional response on three items. Clearly, the battle over reform in the former Soviet Union was not between the reformers and those opposing all change but, rather, among those prepared to accept varying degrees of change.

For cross tabulation, the scale was divided into five categories: −2 through −5, −1 and 0, 1, 2–3, and 4–5. As expected from our individual item results, the relationship between the composite index of attitudes toward political change and the single-item measure of preference for state or individual responsibility for social well-being is negative, although rather weak. The statistics and the cross tabulation of the two variables are presented in Table 3. As we have already discussed, given that reform and restructuring in the Soviet Union were defined to include *both* political democracy and a move toward increased individual initiative, had public attitudes on these issues been similarly formulated, the relationship would have been positive, rather than negative. Instead, the negative correlation indicates that those who are more supportive of political change tend to favor state responsibility more than the opponents of change do and that those favoring individual responsibility tend to be less supportive of political change than those favoring continued state responsibility.

In order to clarify the degree of social and political conflict about these issues, it is instructive to consider the percentages of the total sample falling into each of the cells; and these are the figures shown in the body of Table 3 (the reader can calculate row or column percentages from the information given). Of the total sample, 29% are in the corner cells, representing the greatest degree of disagreement; 4% favor continuation of the socialist ideology of state responsibility *and* wants little or no political change (representing the extreme of those supporting the status quo); an additional 5% also favor little or no political change yet prefers a system favoring individual initiative. On the other hand, 12% favor a great deal of political change but prefer the socialist system of state responsibility, while 8% oppose state responsibility in favor

TABLE 3

Relationship between Support for Political Change and Locus of Responsibility for Social Well-Being (%)

SUPPORT FOR POLITICAL CHANGE	LOCUS OF RESPONSIBILITY FOR SOCIAL WELL-BEING	
	STATE	INDIVIDUALS
−5 to −2	4	5
−1, 0	11	11
1	10	12
2, 3	14	13
4, 5	12	8

Note: Weighted N = 1,785 (100%). Entries are percentages of the total sample in each cell. For the full table (with support for political change not collapsed), Kendall's tau $c = -.10$; gamma = $-.12$; $p \leq .02$.

of individual initiative and also want a great deal of political change. Only the last group really advocates a completely new system, and only the 4% mentioned earlier favor holding on to the status quo. While these totally conflicting groups are small, note that the remaining total cell percentages are relatively uniform, so that any group can substantially increase its size by including the group in the next closest cell. Thus, relatively evenly balanced coalitions of many different political complexions are possible.

As in most complex social processes, our data show that attitude change is uneven. New ideas are differentially accepted, and while a majority appear to favor rapid change, there is also significant conflict over the shape that change should take. Thus, some of the political difficulties and pressures from both right and left that ultimately brought down President Gorbachev—and continue to beset the newer leaders—are clearly illustrated in these data. We would suggest that in a society actively constructing new political and social institutions, with a mobilized public whose attitude structure supports division into relatively equally sized ideological groups, any political or economic institutional developments are liable to be uncertain until attitudes coalesce to a greater extent around both acceptable degrees of change and defining political and economic values.

SOCIAL CLEAVAGES

Up to now, we have discussed divisions in the total population of the former Soviet Union. Now, we move to a discussion of the major social cleavages attributable to a variety of social and demographic factors. Our analysis focuses separately on several major variables because we think it important to understand how particular variables operate to cause social cleavage in the process of change; at the end, we discuss regression equations that combine the most important of these variables.

Ethnicity

As the break-up of the Soviet Union and its reemergence as a number of individual states suggests, ethnicity was among the most important factors in considering support for the kinds of changes initiated by the Gorbachev administration. Our analysis includes the principal ethnicities that fell with sufficient frequency into our sample: Georgians, people from the Baltic states (in our case virtually all are Estonians), Central Asians (principally Uzbeks and Kazakhs),[3] Ukrainians, Belorussians, and Russians.

The differences among the nationalities in support for political change are shown in Table 4. While Russians, Ukrainians, Belorussians, and Balts did not differ very much from each other in the degree of support for political change, Georgians appear to be somewhat more favorable to change than the others, and Central Asians were considerably more resistant to change. In the post-Soviet configuration, the Georgians under Gamsakhurdia became outliers rejecting the notion of even weak Commonwealth ties, while many of the Central Asians have been able to prolong the previous system under new political labels.

The pattern of ethnic responses on the question of state versus individual responsibility for an individual's well-being (see Table 5) reflects the same contradictions that we have just discussed. For example, Georgians very strongly favored the socialist ideology of the state's taking responsibility for the individual; yet, of all ethnic groups, they were the most supportive of political change. The Georgians' response to the question of state versus individual responsibility

TABLE 4

may well have reflected their attitudes toward an independent Georgian republic, rather than a centralized Soviet state. Ronald Suny (1988), in discussing components of Georgian nationalism, emphasizes the ability of Georgian republic leaders to staff Party and state institutions with Georgians to the exclusion of other nationalities. Well before the Brezhnev policy of *korenizatsia* (nativization), the Georgians had consolidated their hold on the institutions of power and influence in their republic. Suny argues that even though an independent Menshevik state had existed briefly, the most "complete consolidation of the Georgians as a nation came in the first seven decades of Soviet power. . . . [and] the actual evolution of Soviet Georgia resulted in the emergence of a compact and conscious nation" (1988, 318). It is likely that this association of nationalism and the Georgian republic helped to produce the response that people would be better off if one's own (i.e., the Georgian) state provided leadership.

The second anomaly in attitudes toward individual versus state responsibility is exhibited by Central Asians. On the political change scale, they provide by far the strongest support for the status quo, consistent with their more traditional value structure and geographic and psychological distance from the centers of political change. Yet on this question, they differ much less from other ethnic groups (except the Georgians) and display a much greater willingness to place responsibility on the individual than their conservative posture on the political change scale would suggest. It is our view that although Central Asians may be as divided on this variable as the other ethnic groups, an alternative interpretation is more plausible. For some of the most traditional Central Asians the understanding of "individual" in this context may differ from that of other ethnicities. Specifically, it is the case that "individual" for the traditional ethnicities carries with it the sense not of the atomized individual, standing alone, but, rather, the individual "unit," which is, in fact, the traditional family. As Nancy Lubin wrote about Central Asia: "The extended family in pre-Revolutionary Turkestan was both a unit of consumption and production, an independent world unto itself" (1984, 209). Therefore, a response favoring the individual on this question may actually be a response favoring the continuation of the traditional patterns of social organization that have endured in Central Asia (even if in attenuated form on some dimensions) throughout the Soviet period, rather than an indication of support for a change in the current system.

As is well known, the moves for sovereignty, independence, or autonomy on the part of the constituent republics of the former Soviet Union put pressure on the substantial Russian "minorities" (who are often disproportionately found in positions of power and influence) in the non-Russian republics. Some are returning to the Russian Federation; but it is an unlikely solution, considering that at the time of our survey, some 24 million Russians lived outside this republic (Guboglo 1990). This potentially creates situations in which these individuals are exposed to a variety of experiences and peoples that may affect their attitudes in ways not likely for Russians in Russia. Indeed, our data show that the context of the republics strongly affects attitudes toward political change. Thus, we have also explored the impact of republic-of-residence for Russians living outside Russia.

Russians in Central Asia—both Uzbekistan and Kazakhstan—are much less likely to favor political change than are their counterparts in the Russian Federation. Of Russians resident in Russia, 52% score between 2 and 5 on our political change scale. However, only 38% of Russians resident in Kazakhstan and 36% in Uzbekistan were this supportive of change—closer to the 30% of Kazakhs and 23% of Uzbeks (in their native republics) than to their ethnic compatriots, Russians in Russia.

Ukraine is the only other non-Russian republic in which we have a sufficient number of Russians for analysis. Russians living here were *more* supportive of change than those at home: 66% score between 2 and 5 on the scale. Interestingly, while Ukrainians were more supportive of change than the general norm for the sample (51% of those living in Ukraine score from 2 to 5), they were not as supportive as Russians living in their republic. However, our respondents in Ukraine were drawn entirely from the more Russified area of that republic. There were no sampling sites in the western part of Ukraine, where Ukrainian nationalism is most pronounced. Hence, while our sample in Ukraine does not reflect well that much more volatile context among Ukrainians themselves, the attitudes of minority Russians in Ukraine on issues of political change might be less affected by such intrarepublic regional differences. Indeed, in the 1991 vote in the Ukraine on the subject of independence, though there were differences between Rus-

sians and Ukrainians, the divisions were far less than had been anticipated.

We find similar results on the influence of the local context for our question on individual versus state responsibility for social well-being. Among Russians in Russia, 50% choose *individual*. However, in Kazakhstan, where 66% of the titular nationality chooses this alternative, Russians choosing it increase to 58%. In Uzbekistan, where 55% of Uzbeks choose *individual*, relatively close to the Russian "norm" for this question, Russians are very slightly greater in their support for the individual, with 52% choosing this response. In Ukraine, where only 45% of the Ukrainians choose this alternative, only 37% of Russians do so.

In Central Asia, the Brezhnev policy of "affirmative action" (promoting people of the indigenous nationality and permitting preferential treatment) resulted in nepotism in which tribal loyalties and command over resources were expanded virtually into fiefdoms (Lubin 1984; Radio Liberty 1982). Russians in these and other republics perceived not only the erosion of their previously privileged status but also reverse discrimination (Karklins 1987). The resistance to change on the part of both the Central Asians and the Russians who live there may arise from values they share, even though the two communities tend to live separately and follow different career paths (Lubin 1984; Olcott 1987). On the other hand, the sources of resistance to change may have been different for the two ethnic communities, arising from the Central Asians' preference for the Brezhnev regime's complacent outlook on local arrangements, both legal and illegal, and, for the Russians, a general unease with what they perceived to be a continuing decline in their status, especially given the high birth-rate differentials and increasing proportions of the titular nationalities (Olcott 1990). Instances of discrimination against Russians in non-Russian republics broke into the press well before the current clamor about language, independence, and citizenship laws (Mikhailova 1989; Novikova, Ovsyannikov, and Rotman 1989). These issues, added to severe economic deprivation and conflict over status and scarce resources, have exacerbated the problem. For Russians in Central Asia, Moscow does not offer much solace: on political ideology, these respondents remained closer to the Uzbeks and Kazakhs than to their fellow Russians in Russia.

That Russians outside Russia often share a general propensity to accept or reject current political ideas in a fashion similar to that of the titular nationality in those republics (and different from Russians in Russia) is also subject to a more general theoretical explanation. The political attitudes of individuals who change their residential locations tend to be influenced by the political and social context into which they move; such individuals tend to change their attitudes in the direction of conformity with their new neighbors. This phenomenon has been found in diverse research, including studies of Americans moving within the United States (Brown 1981, 1988) and Americans moving to other countries (Finifter and Finifter 1989). The addition of this general contextual effect to the real and perceived grievances of Russians in Central Asia may sharpen even further the attitude differences between Russians in the home republic and Russians in the other republics. If, in the aftermath of the development of the Commonwealth of Independent States, pressures for the removal of Russians back to their home republic increase to intolerable levels, assimilation in Russia may be extremely problematic on political grounds, quite apart from the economic difficulties involved.

In the Baltic area, the situation of the Russian minority is different. The Baltic peoples, who took the lead in pressing for political change within the Soviet Union and were the first to declare independence, do not differ significantly from Russians in Estonia on support for political change. Perhaps surprisingly, on the item about strikes and demonstrations (Q22c), the posture of the Estonians hardly differs from the negative stance of the Central Asians in rejecting this form of political protest; and they are considerably more conservative than Russians living in their republic. Within Estonia, 45% of Russians, but only 18% of Estonians, think strikes and protests are acceptable methods of political participation ($p = <.001$, tau b = $-.26$, gamma = $-.57$).

We think this difference in the degree of approval of protest between Russians and Estonians living in Estonia occurs because of the particular socioeconomic location of Russians in that republic. Because the design of economic development in Estonia and Latvia during the Soviet period involved large inmigrations of blue-collar workers, Russians are now concentrated heavily in the industrial labor force of those more industrialized Baltic republics. There were substantial differences in social class between the ethnically Baltic Popular Fronts and Interfront, the Russian response. In Estonia (the Baltic site for our survey), the use of strikes was more likely to be a Russian, oppositionist, protest instrument than an expression of tolerance for political opposition within the ethnic Estonian community. Consequently, it is the Russians, rather than the ethnic Estonians, who account for most of the approval for protest that occurs in this republic.

Age

We expected age to be negatively related to support for reform efforts geared to social and political modernization and democratization. Virtually by definition, youth is part of the "modern" sector of society, and youth groups are frequently among those active in movements for social and political change; conversely, the relationship between aging and resistance to change is a phenomenon widely observed. In the case of the Soviet Union, the propensity of youth to accept change more readily than older people is probably accentuated by the effect of the Stalin period. A "generational effect" has been very widely discussed in terms of elite recruitment and mass

attitudes (Bahry 1987; Bialer 1986; Hough 1988). Analysts working with data from the Soviet Interview Project (SIP)[4] have drawn a distinction between the generation whose formative experiences occurred during the Stalin regime and the generation that might be termed *post-Stalin*. The latter—defined as those born in 1941 or later—is clearly deviant from the political conformity of previous generations, even when other relevant variables are held constant (Bahry 1987; Silver 1987). It is argued that this is a "generational" difference and not merely a reflection of the younger age of the post-Stalin generation.

A more recent discussion of the effects of age on propensity to accept change—in particular the reforms introduced by the Gorbachev administration—is that of T. I. Zaslavskaya (1990). In her discussion of the relationship between age and the likelihood of support for reform, she distinguishes two age groups in 1990 most likely to support reform: those over 55 and those under 35. Among the former, she finds those who, as she put it, had a "swallow of freedom" during the reformist Khrushchev years.

In our study, age does have a moderate effect on the support for political change (see Table 6). Since the definition of the post-Stalin generation used by the SIP study encompasses most of our sample—and, indeed, most of the population of the former Soviet Union—we cannot replicate all the generational categories used in the earlier work. However, the strong negative effects of membership in the 60-and-over age cohort do suggest that those who lived for a substantial period of time in the Stalinist Soviet Union are indeed resistant to liberal political reform. All our analyses show that people aged 60 and over are consistently and significantly more negative toward political reform than any other age group. Of those sixty or older, 53%, as compared with only 20% of those under age 60, have zero or negative scores on the scale of support for political change, confirming the political conformity of this group found in the SIP data. By 1991, however, this older group was retiring or being forced into retirement by the Gorbachev program of cuts in state and Party bureaucracies, thus limiting its political impact.

In addition to the marked effect in the oldest age group, our data also show that support for change declines rather consistently with increasing age. As Zaslavskaya observes, for those who were galvanized by the opening to liberalizing reform of the Khrushchev era (though the policies were often contradictory and unevenly implemented), the Brezhnev period represented a closing of that window and the ushering in of an increasingly dreary and immobile system. Thus, among respondents in their fifties or somewhat older, one finds both the initiators of the new Gorbachev reform movement and those who lived under the Stalinist dictatorship. The numbers of the group singled out by Zaslavskaya as favoring political reform, must, therefore, though their influence is very great at present, be offset by the greater part of the cohort. On the other hand, as noted, those who are over 60 are much more opposed to political change.

TABLE 6

Support for Political Change by Age (%)

SUPPORT FOR POLITICAL CHANGE	16–25	25–29	30–39	40–59	60 AND OVER

Weighted N	(375)	(257)	(385)	(641)	(289)

Note: Tau $b = -.18$; gamma $= -.23$.

Consistent with these findings, age is also negatively associated with support for individual responsibility for individual well-being, although this effect of age is not as strong as its dampening effect on support for political change (Table 7). However, the relationship is notable for its monotonicity. Clearly, a single cross-sectional survey cannot differentiate between generational and life-cycle effects: the data can be read to suggest either a very regular propensity for people to increase in their support for a collective approach as they age (possibly reflecting a wish to be protected from market forces as individual frailties or other personal difficulties associated with age increase) or a generational effect representing the quite steady erosion over time of the impact of socialization on the collectivist ethos. In regression analyses that we shall report, age is consistently the most or second most important of all variables.

Membership in the Communist Party

From the inception of the Soviet state, the Communist Party was accorded the "vanguard" role, leading and structuring policy options and setting policy direction. For over seven decades, all political discourse in all mass media repeated and reinforced this

TABLE 7

Locus of Responsibility for Social Well-Being by Age (%)

Note: Tau $c = -.11$; gamma $= -.14$.

notion. Part of the breakdown of the system was the repeal of Article 6 of the Soviet Constitution, which mandated the monopoly of political power by the Communist Party of the Soviet Union; however, this happened relatively late in the process, and our survey was conducted shortly before the event.

If the Party ideology about its vanguard role were valid, it would follow that Party members would differ from the non-Party population with respect to the critical issues of political reform. Given the movement toward glasnost and perestroika, if they were playing a "vanguard" role, Party members would be more supportive of political democratization. We find, instead, that Party membership is not at all related to support for political change. More importantly, of course, this means that Party membership did not predispose to *rejection* of political change. Overall, Party people are as divided about political reform as is the rest of the population. That they do not display a distinctive and coherent position on policies of such import, suggests that at least toward the end of the life of the Soviet Union, the Party was far from the monolithic instrument of Bolshevik tradition.

That Party members did not differ from nonmembers in attitudes toward political change suggests (as noted) that on these issues the vanguard role of the Party was to a large extent ephemeral. But it is also the case that at the time our survey was in the field, the Gorbachev reforms had not penetrated very deeply into the Party itself, that is, to the rank-and-file politically and geographically distant from the Moscow center. Gorbachev's advocacy of a reformed role for Party members (opening their operations to the scrutiny of glasnost, mobilizing non-Party people for greater participation in the workplace, and taking the lead in enlisting support for the complex of political reforms) did not reach very far below the higher echelons of power.

For example, in surveys carried out by the Academy of Social Sciences of the Party's Central Committee in 1986, 1987, and 1988, among the low-level Party officials who ran grassroots Party organizations, it was found that the reform process had "touched only the highest strata" of the Party. Very few had noticed any increase in the Party's attention to public opinion in the workplace, and an analysis of local Party summaries of operations showed little change from past practices (Toshchenko 1990). In fact, Party members failed actively to involve themselves or to change decisively—or even noticeably—their style and content of work, while the "informal organizations" and the competing political parties in process of formation increasingly structured the debate ("Pochemu otstaet Partia?" 1989).

Our findings on support for individual versus collective responsibility underline the conservative posture of Party members. Apart from age, education, and occupational prestige, Communist party membership is among the more influential variables in its association with the traditional collective ideology. Of Party members, 62% prefer the state to take responsibility for individual well-being, as compared to only 49% of non-Party people. Given this propensity for continuation of the ideological status quo, it is not surprising that Communist Party members as a whole are not in the forefront of those advocating more rapid change and greater political freedom to advocate change.

Education

A large literature indicates that more highly educated individuals are more tolerant of political deviance and more likely to engage in political participation. This suggests that the highly educated in the Soviet Union will favor reform, at least insofar as it concerns political democratization. Consistent with this, we find a positive relationship between education and support for political change (tau b = .17, gamma = .25). We also find that education has an equally strong impact on level of support for individual versus collective responsibility but that, interestingly, it also increases support for collectivism. Only 35% of those with higher education favor individual responsibility for social well-being, as compared to 51% of those with secondary education, and 58% of those with eight or fewer years of education (tau = −.15, gamma = −.26). Moreover, education is important: it lags behind only age and Central Asian ethnicity in its predictive power on support for political change and is the most important variable in predicting attitudes toward preference for state or individual responsibility for citizens' well-being. In regression analyses, the opposite signs for the relationships of education to our two dependent variables are maintained even after a large number of other variables are controlled. It is noteworthy that the relationship of education to support for collectivism is not consistent with the SIP data: among Soviet émigrés, Silver (1987) reports that the more highly educated are more likely to favor private/individual rights and solutions to problems than collective/state rights and solutions.[5]

Our interpretation of these differential relationships follows our theoretical discussion. Many observers have noted that the principal beneficiaries of the political changes instituted in the last few years were precisely the highly educated. Mobilizing this stratum for rapid political and economic change required the distribution to them of valued advantages. They were the recipients of both the material and the psychic gratification associated with glasnost: the foreign trips and goods and the ability to form new associations and acquire previously restricted information. What they apparently learned from this advantage in terms of their political attitudes was a strong propensity to favor the political freedoms represented in our scale of political change; but the changes they preferred were narrow and restricted to those that provided them with the benefits they sought—primarily the intellectual benefits that flow from political freedom.

Nevertheless, the issue should not be framed solely in terms of instrumental personal advantage. Many

of the most educated are precisely those who believe in a reasoned fashion that social justice requires the strong hand of the state. They are concerned that irrespective of the record of success of this particular system, the state does bear the onus for the social welfare of its citizens. In particular, as the provision of a safety net for the elderly, the young, the infirm, and returning veterans proves illusory, calls for a return to a greater role for the state in assisting the dependent population grow stronger. Many of those who search for models for the post-Soviet future look to countries where the role of the state is greater than it is in the United States. Thus, the well educated are favorably disposed to political change that benefits themselves but also resist certain changes that may be ideologically incompatible.

Income

Income plays a significant role in increasing support for political change, although its effect is considerably weaker than that of education. The reforms thus far are associated in the minds of many citizens of the former Soviet Union with a worsening economy, in which only a few groups have managed to derive material benefits (Levada and Sedov 1990). The few groups include those who run cooperatives and those who conduct illegal or partially illegal economic activity. In this context, it is not surprising that those with lower incomes are more likely to be fearful of, and opposed to, reform as compared to the wealthier, although the differences are not extremely large. In fact, the economic effects of the changes initiated by the Gorbachev leadership disproportionately burdened those with lower incomes.

Economic problems are compounded for older people on fixed incomes. A Soviet study shows that the majority of people who retired in the 1960s live on less than 50 rubles per month. This is considerably below even the unrealistically low poverty line of 70–75 rubles per month at the time of our survey. As the world now knows in great detail, many goods are in such short supply that only barter arrangements or radically inflated prices on unofficial or illegal markets can supply necessities. At the time of our survey, food purchases accounted for at least half of all expenditures of family income ("Prozhitochny minimum" 1990).

Issues of structural unemployment were already of concern to Soviet citizens well before explicit debates on a market economy broadened the scope of expected insecurity. The economies of the Central Asian republics were particularly affected: in the first six months of 1989, only some two hundred thousand people out of the three million unemployed in Central Asia were able to get work ("Bez raboty sredy morya raboty" 1989). The Gorbachev administration had indicated that the reforms on which it embarked would be accompanied by a "safety net" for the needy population. For example, all military demobilization was supposed to take place in synchronization with increased availability of housing and other necessities. However, the Soviet population saw little concrete preparation of such a safety net. Given widespread poverty, political and economic change may have represented a potential threat, rather than an opportunity. In this context, the higher the income, the more the individual would be able both to withstand the dislocations of change and to benefit from the increased freedom it represented.

Curiously, however, income had no impact on attitudes toward individual versus state responsibility for social well-being. While one might expect that those who are less able to care for themselves would favor a system in which the state took on this responsibility, we do not find this to be the case. This might well reflect an opinion held by the poor that the state has not been successful at this enterprise.

Gender

Men are significantly more likely than women to favor political change. This finding is consistent with much other research, in both the West and the Soviet Union, on the greater political conservatism of women, their lesser political interest and participation, and their stronger support for and trust of political authority (Jennings 1983; Jennings et al. 1990; Jennings and Niemi 1981; Shapiro and Mahajan 1986; and Carnaghan and Bahry 1990). However, gender is unrelated to position on state versus individual responsibility.[6]

In the former Soviet Union, the issue of gender is in part a cultural/ethnic one, in which aspirations and levels of mobilization of women differ radically from the Muslim East to the European West. We find that in its effect on support for political change, however, gender operates independently of the cultural factors associated with geographic region. Nevertheless, other factors create rather different environments for men and women. In spite of both roughly equal chances for educational attainment and high levels of work force participation (though by no means evenly distributed across occupations and disproportionately found in feminized occupations), women are less embedded in political life and more isolated than men. Leisure time is unequally distributed; and given the relatively low availability of appliances and other domestic aids, women, most of whom work in the national economy and also bear the burden of domestic obligations, have less free time than their male coworkers. Again, as elsewhere, our data show males as significantly more likely to express interest in politics than females, a major factor in receptivity to change. Forty-five percent of males, but only 32% of females, reported that they were "very interested" in politics (tau c = −.14, gamma = −.22).

Occupation

In discussions of support for political change in their country, Soviet analysts often referred to occupational sector and status. "Bureaucrats" or the "bureaucracy" were often cited as the principal sources

of obstruction to Gorbachev's reforms. Zaslavskaya (1990), for example, found the greatest resistance to change in the "directing apparat" (high-level bureaucrats), among people who work in the trade and communal services sector and among workers who are corrupt or severely downwardly mobile (*déclassé* is her term). She finds that certain others, whom she calls "quasi supporters," adopt an outward posture of support while disguising their real (negative) views toward political change; among these are people who work in the Communist Party apparatus, the state apparatus, and economic leaders.

On the distinctly supportive side, she finds those who have begun to participate in the new structure, such as employees and directors of cooperatives, leaseholders and others exercising new rights for individual production, workers who participate on the more flexible and remunerative group contract system, and finally, people who work on successful collective farms. Except for the last, all of these groups have already voted with their choice of job to accept change and depend on its continued expansion for their success. They are risk takers in a rapidly changing system.

In our survey, only those who work in the agricultural sector distinguished themselves by being less inclined to support political change than workers in any other branch of the economy.[7] This is consistent with findings in studies in many countries of the generally stronger conservatism of farmers and agricultural workers as compared to industrial workers. In Soviet society, agricultural workers were, by and large, not the risk takers whom Zaslavskaya describes. Even the notion of a "successful collective farm" is more often than not oxymoronic. The traditionalism of the agricultural sector and of rural life in general (as our findings about urban–rural differences in support for political change will show) was certainly a feature of Soviet political life, exacerbated by the isolation and disparities in development between that sector and others (Breslauer 1982; Hewett 1988).

The negative posture of the agricultural sector may reflect not only the traditional unwillingness of the least modern sector to change but also a certain skepticism about the reality and effects of reforms and of the ability of the agricultural sector to benefit from them as long as collective organizations survive and land is not fully privatized.

Urban or Rural Residence

We created a simple dichotomous measure in which cities of all sizes are classified as "urban," and rural and agricultural areas as "rural." Urban residents are greater supporters of political reform and democratization than are their rural counterparts (gamma = .28). This is consistent with numerous studies documenting the greater conservatism of those living in rural areas. Also (as we would expect), urban residents are more supportive of state responsibility for the social well-being of individuals, while rural residents are more likely to prefer a larger role for individuals (gamma = −.14).[8]

In terms of building support for the types of changes being undertaken in the former Soviet Union, these relationships reveal some of the difficulties when people do not see political reforms as unidimensional; that is, there is more support in the urban areas for political change in general, but this remains coupled with lingering support for state-oriented solutions to social and economic problems. In the rural areas, in contrast, there is less support for political change in general but more support for a movement toward greater individual responsibility.

Satisfaction with One's Life

Apart from education and age, life satisfaction is the only variable we have investigated whose effects survive simultaneous control for many other variables in multiple regressions for *both* of our dependent variables. For this reason—and because it plays an important role in some development literature—we included it in our analysis despite its different conceptual basis as compared to the social structural variables that constitute most of our independent variables.

Life satisfaction is often considered part of a cluster of cultural attitudes that are necessary for political democratization and economic change to take root (Inglehart 1990). At the aggregate national level, Inglehart demonstrates that life satisfaction is highly related to stability of democratic political institutions. In our Soviet data, however, higher satisfaction with one's own life resulted in *decreased* receptivity to change (tau b = −.12, gamma = −.17). That people who are satisfied with life want less change than the dissatisfied seems unremarkable. Reflecting on Inglehart's finding, however (which might be read to mean that the satisfied support democracy), we see that a different interpretation may be more appropriate: political change is less likely to come from the satisfied, whether they live in democratic or totalitarian systems.

On the other hand, we also find that individuals who were more satisfied with their own lives were more inclined to situate responsibility for social well-being with the *individual*, rather than the state (tau b = .10, gamma = .16). It is possible that people who were satisfied with their lives in the Soviet Union identified the source of their well-being in themselves or in their special abilities to exploit state programs, rather than more directly in any outputs they may have received from the state economy and social welfare programs that collectively represented the state-oriented ideology. The relationship between life satisfaction and preference for individualistic solutions is another (modest) indicator of the failure of state programs in the Soviet Union. Yet, interestingly, even in a state-run system, if one has found ways to cope and is therefore relatively satisfied, change is seen as less desirable.

TABLE 8

Regression Equations for Support for Political Change and Locus of Responsibility for Social Well-Being

	SUPPORT FOR POLITICAL CHANGE (POSITIVE = HIGH)			LOCUS OF RESPONSIBILITY (INDIVIDUAL = HIGH)

Note: All coefficients presented are significant at $p < .01$, except for income, which is significant at $p = .02$.

MULTIVARIATE ANALYSIS

A multiple regression equation (ordinary least squares) predicting support for political change confirmed that of the variables just considered, the most important were Central Asian ethnicity, age, gender, education, income, urban residence, and life satisfaction. (The multiple R is .40 and the adjusted R-squared is .15.) Table 8 gives the values for this equation. Working in the agricultural sector also has an impact but its coefficient is just short of significance, and the increase in the R-squared is insignificant.

For comparative purposes, Table 8 also presents an ordinary least squares regression for state versus individual responsibility for social well-being.[9] We are less successful with prediction of this variable (as would be expected with a one-item dichotomous measure). Including education, age, life satisfaction, and Georgian ethnicity (all of which make significant independent contributions to the equation), the multiple R is .23, and the adjusted R-squared is .05. Increasing age, higher education, and Georgian nationality increase the likelihood of preferring a state-oriented solution to social problems. Life satisfaction correlates positively with preference for an individualistic orientation. Occupational prestige and urban residence are other variables that are important to this measure but fall just shy of significance in the regression. A logistic regression of this question confirms education, age, Georgian ethnicity, and life satisfaction as the major influences.

As we have discussed, the regression coefficients show that both education and life satisfaction have opposite effects on our two dependent variables: education is associated with increased support for political change but decreased support for individualistic solutions, life satisfaction, with decreased support for political change but increased support for individualistic solutions. These changes of predictor variables' direction of influence on our two different measures of political reform demonstrate how the complexity of political change may lead the same people to react differently to its various aspects. Clearly, such issues need to be taken into account in developing measures of attitudes toward development, modernity, democratization, political change, and related complex concepts, and multi-item measures should be rigorously evaluated to be sure that all items are consistently related to each other.

CONCLUSION

Our findings about the multidimensionality of attitudes toward the complex of reforms introduced in the Gorbachev era have important political implications. That attitudes on these related subjects exist without significant associations with each other means that there is little systemic constraint on attitudinal lability. Major changes in support for particular aspects of political or economic reform can occur as change occurs in political or economic conditions.

Using our measure of support for modernizing political change, we find that its strongest proponents tend, though not without exception, to be the beneficiaries of those policies. Many of the supporters also fall into groups identified by cultural theory as "modernizing" groups. For example, the young have derived both psychic gratification from the policies and are looking at distinct career advantages. Most flexible in their outlook, and most able to change, they are the ones who are most likely to adapt successfully to a radically changed economic and political environment. They are better educated than their predecessors and better able to advance in

a situation of much greater uncertainty. The college-educated, however, may still support a strongly interventionist state when contrasted to wholly autonomous individual responsibility not only because of the relative advantages they might have derived from it but also because of an attachment to the notion that (an improved version of) the state might do better as a guarantor of social justice than would the unfettered operation of a market.

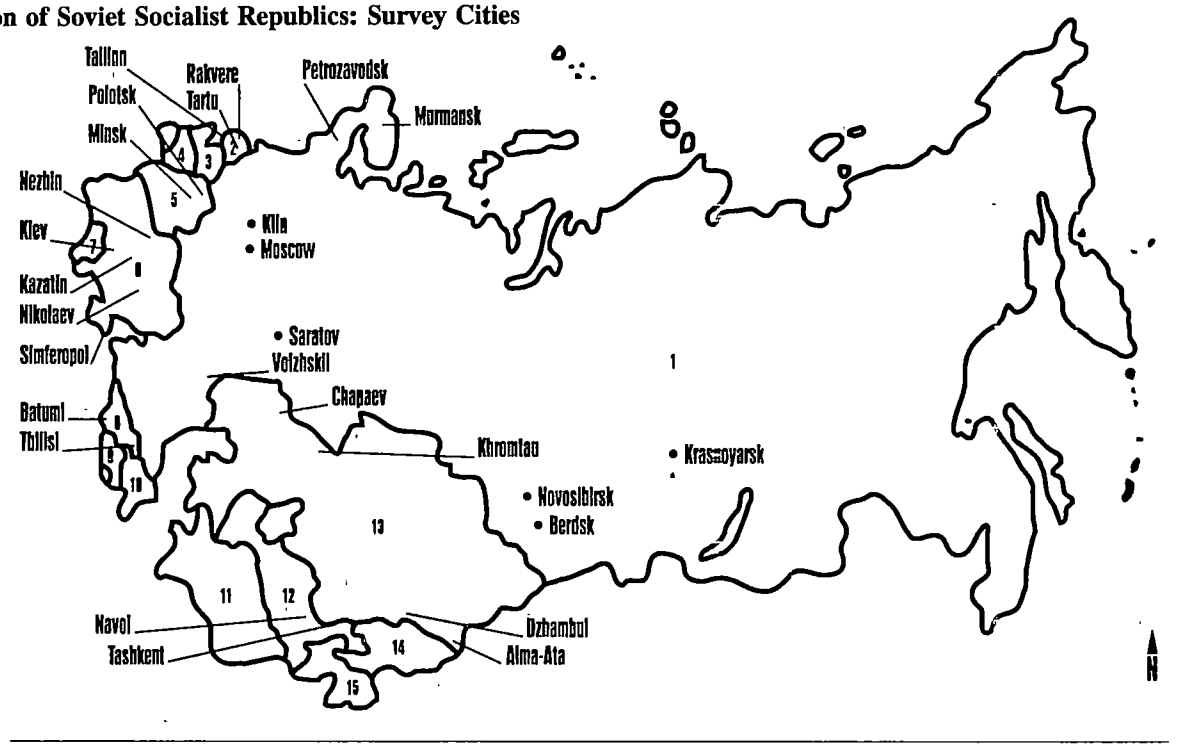
Those with higher income have greater insulation and can better withstand the sharp rise in prices. Those at the low end of the status scale (in terms of education and income) are unconvinced that the much-publicized projected safety net for the disadvantaged will offset increasingly burdensome dislocations. Males are also relatively more advantaged, empowered, mobilized, and able effectively to take advantage of political change and to benefit from it. All of these characteristics, as well as urban residence, are also associated with greater participation and mobilization.

Ethnicity remains a key factor in attitudes toward political change. But for the largest ethnic group, contextual factors are also important. There are substantial differences between Russians in their home republic, the Russian Federation, and the many millions of Russians who live, for the most part, as minorities in other republics.

Our research thus provides support for cultural theories of the role of mass attitudes in political change, insofar as this relates to the groups that will support modernizing social change; but our interpretations stress that support also arises out of particular material benefits realized by some groups from social change.

The ethnic and sociodemographic differences we observed as the Soviet Union was collapsing create serious problems for democratizing reform in the newly independent successor states. These divisions are an inevitable part of the legacy of the former Soviet republics and may well be magnified under conditions of extreme economic and political uncertainty. The traditional source of mobilization—and the source in control of many of the instruments of mobilization—had in the past been the Communist Party. But members of the Party were not performing that function as both their influence and cohesion dissipated. To mobilize and forge the coalitions necessary for developing the institutions (including effective political parties with an adequate base of popular support) and habits of change, the range of beneficiaries must be expanded. As our data show, support for both democratic change and change in the scope of state control is tentative. Unless there are timely outputs—both economic and political—that alleviate the serious material problems, legitimate the leadership, and confirm both the efficacy and utility of procedural and normative change, the process of institutional development will be substantially impaired.

APPENDIX A: THE SAMPLE



The sample was designed to represent the entire Soviet population, as well as the major nationality groups. The design was therefore clustered in seven of the 15 republics: Estonia, Belorussia, Georgia, Kazakhstan, Uzbekistan, Ukraine, and the Russian republic (RSFSR), which together contained 88% of the Soviet population. For the smaller republics, the sample uses clusters of republics, grouped according to cultural similarity and/or geographic proximity, to represent various regions of the nation. Thus, interviewing for the Baltic region of Estonia, Latvia, and Lithuania took place entirely in Estonia; interviewing for the region including Ukraine and Moldavia took place in Ukraine; interviewing for Georgia and Armenia took place in Georgia; and interviewing for Azerbaijan, Uzbekistan, Kirgizia, Tajikistan, and Turkmenia took place in Uzbekistan. Because of either large size or cultural dissimilarity, the Russian republic, Kazakhstan, and Belorussia were not grouped with other regions. Sampling within the very large Russian republic was further stratified by region, and separate samples were drawn from its five regions: East Siberia, West Siberia, the Northwest, Volga, and Moscow.

In order to achieve larger samples of important nationalities, we sampled disproportionately in Belorussia, Estonia, Georgia, and Kazakhstan. At the same time, achieved samples were somewhat smaller than planned in Ukraine and Uzbekistan. The final sample of 2,520 cases was therefore weighted to correct for the disproportional stratification. The weighted sample size is 2,006 and the number of cases in each regional area in the weighted sample accurately reflects the size of the population in each corresponding territorial region. All reported numbers of cases are based on the weighted sample size. The downsizing of the sample occurs because a weight of 1 was assigned to respondents in regions sampled with probability proportionate to size and oversampled groups were then downweighted against this standard. This procedure is preferable to upweighting the former group, because it does not bias tests of significance, based on the number of cases in the sample.

In each republic, interviewing took place in the capital, in one or more other midsized cities, and in some smaller rural and semirural areas. Given the lack of infrastructure for survey interviewing and difficulties of transportation, some interviewing sites were selected on the basis of geographic proximity to the twenty-six regional centers of the survey organization, availability of field supervisors and interviewers, and so on. Within these major sites, the design specified random selection within strata defined by age and sex, based on census information about the distributions of these characteristics within each regional cluster. In each sample location, names were chosen randomly from lists maintained in the government's population registration office. Name, sex, and age are noted on each individual's registration

FIGURE A-1

Union of Soviet Socialist Republics: Survey Cities

Note: Rural areas are not shown.

card, and interviewers sampled systematically to achieve the required numbers of cases in each stratum. The map presented as Figure A-1 shows the urban locations of the survey; the survey also included a large number of rural sites not shown on the map. This was the first Soviet survey to include such large numbers of rural and ethnic minority respondents. Since 34% of the Soviet population lives in rural areas, this is an important component of a representative sample. The interview was translated into several of the national languages (Estonian, Kazakh, etc.) and conducted, when appropriate, by conationals who were native speakers of those languages.

Since the sites themselves were not selected by strict probability methods, an exact estimate of sampling error is precluded; however, an educated guess is that it might be about 6%–7% for estimates based on the entire sample (basically doubling the sampling error for a random sample of this size). Given current practice even for samples that do not meet all the criteria for probability samples, we do occasionally report significance tests. We intend these as a general guide to the reliability of the data, rather than as rigorous tests of significance.

Even though we do not adjust the sample for any characteristics other than geographic region, it matches the Soviet population reasonably well on a variety of demographic characteristics (see Table A-1). We have the usual overrepresentation of well-educated people. It is therefore not surprising that the sample somewhat underrepresents the manufacturing sector and somewhat overrepresents people in education and science.

Prior to fieldwork, regional survey center directors came to Moscow for training on our instrument and procedures; and they, in turn, recruited and trained interviewers in their regions. Interviewers were paid almost twice the usual rate, so that the most experienced and best-trained could be hired. Armed with the names and addresses of sampled persons, interviewers returned up to three times to locate designated respondents. Virtually no interviewers had access to cars; and given the large size of the cities and apartment blocks and the usual difficulties of urban transportation, three callbacks in many cases represented a genuinely heroic effort. Following three unsuccessful callbacks, local procedure entailed substitution of a new name, a procedure also used in the United States by many commercial polls. Thus, the concept of a "response rate" does not seem to exist; nor, unfortunately, are systematic records kept of which respondents were substitutes.

Interviews lasted, on the average, about one-and-a-half hours. Each respondent was assured of confidentiality and anonymity; and, following the interviews, the names of respondents were separated

TABLE A-1

Population and Survey Sample Comparisons (%)

	POPULATION	SAMPLE
Age		
16–19	8.4	10.0
20–29	21.5	22.3
30–39	21.3	19.5

Housing, service	4.0	6.6
Health care	5.9	5.3
Agriculture	18.3	18.7

Note: The sample data are weighted only by geographic region. Population data include persons aged 16 and over, except for education, for which the data given are for ages 15 and over. For the age distribution of the population, the size of the group aged 16–19 is estimated as 40% of population aged 10–19, which is the category used in the source document.

Sources: Population data are from *Narodnoe khozyaistvo SSSR v 1989g* [The economy of the USSR in 1989] (Moscow, 1990) and a USSR State Committee on Statistics press release of January 1990. We should like to thank Vladimir Treml for his assistance.

[a]Includes both secondary special and secondary professional–technical.

[b]Soviet sources cite 127.033 million persons employed in the officially defined national economy. To that we add an additional 1.5 million estimated to be employed in the private sector. Excluding the military, then, we estimate 61.9% of the population of 207.729 million (as of 1989) to be in the civilian labor force.

from their interviews. Validity tests included post card verification of interviews, callbacks on a small percentage of respondents, and name recognition questions that included a nonexistent television personality. Carbonless copy paper enabled both the Soviets and Americans to have an "original" of all interviews, and both sides conducted independent coding operations. The data used in this report are all based on the American coding operation and weighting procedures.

During the data collection, we visited a number of survey sites. In general, the dedication of the staff was extremely high, stimulated by a sense of the importance of the scientific enterprise and the conviction that representative public opinion data was an important political input in the democratization of the nation. It was our impression from informal conversations with many interviewers that there were very few outright refusals, so that any bias in the sample is introduced almost entirely by the sampling frame per se and the not-at-home factor. Although the sample does not in all important respects measure up to the highest Western standards, it is probably one of the best national samples achieved to date in the Soviet Union.

APPENDIX B: QUESTIONS USED FOR DEPENDENT VARIABLES

Q18. Some people think that to solve our most pressing problems it is necessary to make decisive and rapid changes, since any delay threatens to make things worse. (R)

Others, on the other hand, think that changes should be cautious and slow, since you can never be sure that they won't cause more harm than good. Which of these points of view are you more likely to agree with?

Q22. Below are some widespread but contradictory statements relating to problems of the development of our society. Which would you be most likely to agree with?

a. The state and government should be mainly responsible for the success and well-being of people.

   People should look out for themselves, decide for themselves what to do for success in life. (R)

b. The state should provide an opportunity for everyone to earn as much as he can, even if it leads to essential differences in people's standard of living and income. (R)

   The state should do everything to reduce differences in people's standard of living and income, even if they won't try to work harder and earn more.

c. Strikes, spontaneous demonstrations, political meetings and other forms of social protest are completely acceptable methods of mass conduct and an effective means for solving social problems. (R)

   These forms of protest are undesirable for society, they should be avoided in favor of more peaceful, traditional and organized methods of solving social conflicts.

d. To improve things in our country people should be given the opportunity to say what they want, even if it can lead to public disorder. (R)

Keeping the peace in society should be the main effort, even if it requires limiting freedom of expression.

Q29. In the coming elections for local soviets, should we elect deputies from among several candidates, as we mostly did in the spring elections? (R)
Or is it better to avoid the conflicts these elections generated and go back to the old system of voting?

Notes

The design of this study was a joint product of the authors, together with George Gerbner, of the University of Pennsylvania, and Boris Grushin and Nikolai Popov, both of whom were at the time affiliated with the All-Union Center for Public Opinion Research. Grushin is currently the director of Vox Populi, a private public opinion polling organization based in Moscow. We wish to express our gratitude for the cooperation and contributions of these individuals to the study design, as well as to T. I. Zaslavskaya, director of the All-Union Center, which carried out the field work. Funding for this project was provided by the John and Mary R. Markle Foundation, Rockefeller Family and Associates, International Research and Exchanges Board, Coca Cola Corporation, and American Express. We also wish to thank Michael Sweat for his capable assistance with data management and computer support and Paul R. Abramson of Michigan State University for his helpful comments on an earlier version of this paper. The two of us share equal responsibility for the work.

1. "Maintaining order in the nation" and "protecting free speech" are components of Inglehart's well-known measure of "materialist versus postmaterialist values" (see, e.g., Inglehart, 1990). Unfortunately for comparative purposes, that measure asks people to rank these and other values, so that direct comparisons with our measure are not generally possible. In addition, most of the published accounts using Inglehart's measure report only composite results for the overall scale, which includes many values not germane to our analysis.

2. Recent relevant European experience is worth noting. Support for unconventional means of political participation declined in both West Germany and the Netherlands between 1974 and 1979–81 (Jennings, et al. 1990).

3. For purposes of this discussion we include Kazakhstan in Central Asia. Rumer (1989) summarizes the distinctions between the four- and five-republic definitions of Central Asia.

4. Investigators working on this project collected data from 1970s émigrés from the USSR and generalize it to the western urban population of the Soviet Union.

5. While Silver used a three-item measure of state versus private control of medical care, heavy industry, and agriculture and our own measure is a single question about state versus individual responsibility for the "success and well-being of people," the core concepts involved in both measures seem similar. An intriguing possibility to explain the discrepancy in results is that the émigrés may be an ideologically self-selected group in which background characteristics relate differently to basic social and political attitudes. Since emigrants are generally thought to be less risk-averse than nonmobile individuals, it makes sense that the most advantaged among them would favor individualistic solutions to social problems. Among the nonmobile, on the other hand, socialization might increase support for regime norms (in this case, state-oriented solutions to social and political problems) among the best-educated.

6. Our finding is again at odds with the Soviet émigré project, since Carnaghan and Bahry report that women emigrants were considerably less supportive than men of state control. Again, it is possible that the difference is caused by emigrant versus resident status. Possibly, female emigrants are more resentful about the practical difficulties of life for women in the Soviet Union.

7. In our sample, the agricultural sector includes not only farmers but also animal husbandry and other technical and scientific specialists, machine operators, administrative and clerical personnel, and all others who support the farm sector, whether in state or collectivized agriculture.

8. We also used more refined measures of city size with no noticeable improvement in prediction. Very large cities in the more conservative central and eastern areas of the country are not as supportive of change as are smaller cities in the west, creating some curvilinearities in the relationships. Overall, therefore, because the largest differences are between the rural areas and cities of any size, the simple urban–rural dichotomy is more successful than ungrouped city size or any more refined grouped measure. For example, for political change, the gamma is .18 with unrecoded city size and .20 with a collapsed measure with six values. For Q22a, the analogous values are −.09 and −.10.

9. While logistic regression is preferred for dichotomous dependent variables, with very even distributions, such as the 49–51 split we have in this case, ordinary least squares generally yields the same results.

ECONOMIC TRENDS AND GOVERNMENT SURVIVAL IN WEST EUROPEAN PARLIAMENTARY DEMOCRACIES

PAUL WARWICK *Simon Fraser University*

In this study, I investigate the linkage between trends in key economic indicators (inflation, unemployment, and growth in gross domestic product) and government survival in 16 postwar European parliamentary democracies. The partial likelihood method, which allows for variation in indicator values over the lifetimes of individual governments, constitutes the basic analytic tool. The findings reveal overall causal roles for both inflation and unemployment, as well as important differences in these roles between socialist and bourgeois governments and between pre-oil crisis and post-oil crisis eras. Most significant, the introduction of these indicators to the analysis helps to resolve the debate between two rival explanations of governmental stability, the bargaining complexity hypothesis and the ideological diversity hypothesis, in favor of the latter.

The study of government stability in parliamentary regimes has been enlivened within the last decade by a debate over the fundamental nature of the phenomenon and how it should be investigated empirically. The standard approach, as in much of the social sciences, is the causal one; it relates the durations of governments to a variety of properties of those governments or their parliamentary environments, usually by means of regression analysis. Critics of the causal approach have argued, however, that it mischaracterizes the underlying process: governments do not fall because they lack properties normally associated with longevity, they fall when challenged too severely by events or developments occurring in the outside political, social, or economic environments (Browne, Frendreis, and Gleiber 1984, 1986, 1988). Since events of this sort are essentially random with respect to individual governments, they maintain that the task at hand is not to associate characteristics with government durability but to model the randomness of government durations.

The "events" theorists clearly have a point: to treat a government's duration solely as a function of a set of characteristics most or all of which are fixed by the time the government assumes office is excessively deterministic. Some allowance must be made for developments that occur during the government's lifetime. Yet to expunge causal factors from the analysis totally—to treat durations as purely a function of random outside events—seems even more unrealistic. If British governments normally remain in power longer than their Italian counterparts, for example, it is surely due in part to systematic differences between the two systems (less party-system fragmentation, more single-party majority governments, etc.), not simply because British governments face fewer or less difficult events.

These observations suggest that an optimal strategy for advancing research on this topic would be to combine the insights of both perspectives in some fashion. Since the events thesis of random collapses implies that government durations are distributed according to a negative exponential distribution (Browne, Frendreis, and Gleiber 1986), King and his colleagues (1990) recently proposed a sensible unification: a model that treats government durations as a function of a set of independent variables and an underlying exponential distribution. In their "unified" model, the systematic element in government durations is taken up by the independent variables; anything that cannot be explained by those variables is relegated to the exponential distribution. Estimated by the maximum likelihood method, the model possesses the important property of accounting for all significant intercountry differences in durations, thereby resurrecting comparative or cross-national analysis from the limbo to which the system-specific approach of the events theorists had banished it.

Although the unified model shifts the focus back onto the systematic factors (events become, in effect, part of the error term), it could be argued that it adheres too closely to the events approach in two respects. First, it accepts rather uncritically the appropriateness of an exponential specification, an assumption that Easton and I (Warwick and Easton 1992) found to be unwarranted.[1] Second (and more important for the purpose at hand), it implicitly endorses the events theorists' dichotomization of relevant factors into fixed characteristics and totally random events. The weakness with this categorization is that it omits a third major alternative: factors which vary in a nonrandom fashion over the lifetimes of governments. Foremost among these factors in democratic regimes is the changing state of the economy.

I shall attempt to relate evolving economic conditions—as measured by inflation, unemployment, and economic growth indicators—to government survival in West European parliamentary systems in a systematic empirical fashion. Although there have been numerous efforts to associate economic indicators with opinion poll standings or with electoral outcomes, attempts to establish a linkage with the sur-

vival of governments are relatively rare. A standard property of these attempts, moreover, is the characterization of economic conditions during each government by means of average indicator values (e.g. Budge and Keman 1990, 176–82; Robertson 1983b, 1983c), thereby rendering static an analysis that is intrinsically dynamic in nature.[2] There is no need for this compromise. Event history analysis—the broad class of techniques of which King and his colleagues' exponential model is an exemplification—provides ways to incorporate variables whose values change over the duration of individual cases directly into the analysis. I shall exploit this facility in order to determine whether—and under what conditions—changing economic circumstances bring about government terminations in parliamentary regimes, particularly when other relevant factors are taken into account. In so doing, I aim to fill a major gap in the empirical explanation of government stability in West European parliamentary contexts.

METHODS AND DATA

All event history models have in common the objective of explaining the "hazard rate" or rate of termination inherent in some phenomenon. Thus, a concern with durations may frame the theoretical issue; but it is typically the hazard rate that focuses the empirical analysis. (The two concepts are intimately linked, for high hazard rates mean short durations, and vice versa.) The hazard rate is generally taken to be a function of two components: (1) a set of independent variables or "covariates," which are related to the hazard rate in a log-linear fashion, and (2) a "baseline" hazard rate, which represents its underlying behavior. In mathematical form,

$$\lambda(t) = \exp(\mathbf{x}'\boldsymbol{\beta})\lambda_0(t),$$

where λ is the overall hazard rate, λ_0 is the baseline hazard rate, and x is a vector of covariates with associated coefficients $\boldsymbol{\beta}$.[3]

An important feature of this expression is that it allows the hazard rate to vary with duration time t. In fact, the assumptions one is willing to make concerning time dependency determine the type of model to be employed. An exponential model such as King and his colleagues' is defined by the relatively simple assumption that the baseline hazard is constant over the course of a case's existence; but a wide variety of more complex specifications are possible. Since there is evidence that complexity of this sort (known as "duration dependency") may characterize government termination rates (Warwick and Easton 1992), the data analysis undertaken here will employ Cox's (1972) partial likelihood (PL) technique, which, alone among event history methods, requires no specification of the baseline hazard function.[4]

Although the PL technique is itself complex, its essence can be conveyed in a relatively straightforward fashion. The basic idea is that the durations of all cases are ordered from shortest to longest, and then the covariate values for each case are compared with those for all cases that outlived it. If, say, the presence of covariate X leads to government terminations, one would expect that a case that collapsed after T days in office would have, in general, a higher X-value than the governments that survived beyond T days. When time-dependent covariates (i.e., covariates that take on different values over the lifetimes of individual cases) are involved, the PL technique compares, for the case that terminated at T, its X-value at that time with the X-values at the same point in the durations of all surviving cases. The amount of data involved in these comparisons is potentially very large; but the data collection task can be made easier if the values of time-dependent covariates are recorded for a limited number of time points, and intermediate values estimated, where appropriate, by means of linear interpolation. This is the strategy I shall follow.[5]

Apart from its capacity to handle time-dependent covariates, event history analysis provides a felicitous solution to a problem that has bedeviled previous work on government stability, namely, what to do with cases that end in a theoretically uninteresting way—especially governments that end with regular elections. These cases fit neither the events framework (since regular elections are not random events) nor the causal framework (since no properties of governments or their supporting parliamentary milieux are involved). Event history analysis simply "censors" these cases, that is, treats the true durations of these governments statistically as at least as long as the recorded durations. For the case of a government that ended with the expiration of its four-year legal mandate, this amounts to assuming that its duration, in the absence of this legal impediment, would have been not less than four years but may well have been longer.[6]

The censoring procedure may also be applied to other extraneous terminations, such as the death of a prime minister or a pro forma resignation required for technical reasons. Unfortunately, there are no statistical criteria for determining which circumstances merit this treatment, so the choice falls to the judgment of the researcher (Warwick and Easton 1992). In this study, cases are censored if their terminations (1) resulted from the death or illness of a prime minister, (2) were necessitated by legal or constitutional requirements, (3) had not occurred by the end of the observation period (31 December 1989), or (4) were brought about voluntarily within one year of elections scheduled before they took office. The last category is constructed, following King and his colleagues (1990), to allow for the possibility that governments might voluntarily dissolve themselves in advance of approaching elections in order to maximize their electoral advantage. As with the other categories, it is designed to capture situations where a government termination occurs even though its viability was not under challenge at the time.

One of the advantages of the censoring solution is

that it accommodates the common practice among researchers of treating governments that survive elections and continue on in office as having been "terminated" by those elections. This convention has been widely adopted because elections change the parliamentary party configuration and because they involve a different criterion for survival—popular success, rather than the maintenance of parliamentary support or coalitional unity. With censoring, no artificial truncation of durations is entailed in adopting this sensible rule. Other events defined in this study as marking the end of a government include parliamentary defeats, changes in the prime minister or the party composition of the government, and government resignations (regardless of the composition of the succeeding government).[7] As in the case of regular elections, the censoring mechanism is used to adjust for situations where the termination seems more formal or technical than real.

One area in which the design of this study differs from many of its predecessors is in the conceptualization of a government. A government is here deemed to be composed not only of the parties who assume cabinet portfolios but also of the parties who formally or openly declare their support for the cabinet as well. The motivation for the expansion in the definition of a government to include supporting parties is to capture the true, or effective, governing coalition. It is noteworthy in this regard that in two-thirds of the cases where such parties can be identified, their support is necessary to create a parliamentary majority. Nevertheless, any relationships that emerge using this definition will also be tested on other government definitions, including the cabinet-only version, to determine whether it affects the empirical findings to any significant degree.

In order to facilitate the sequencing of durations that underlies the PL method, duration has been recorded in days, rather than the more usual months. The values of the time-dependent covariates are, accordingly, also estimated to the nearest day. With respect to the rate of increase in gross domestic product, which measures overall economic growth, this estimation process simply involves attributing an annual value to each day of the year in question. For inflation and unemployment, however, better estimates can be obtained from monthly figures than from annual averages.[8] The method used here derives daily values of these indicators from linear interpolations of their December monthly values, which raises two basic questions: Why choose December values? and Are interpolated values based upon one month per year sufficiently accurate?

Although, in principle, any month could have been chosen as the basis for the interpolations, December values possess the important property of being very close to annual values. The coefficients of .92 and .97 generated when annual values of inflation and unemployment, respectively, are correlated across all countries with their corresponding December values suggest that the December values are rarely idiosyncratic. In addition, the slope coefficients of .93 and .92 produced when the annual values are regressed on the December values indicate that December is broadly representative of the year as a whole (a perfect match would be reflected in a coefficient of unity). The effect of interpolating December values is therefore to register the trends in the data at a level that is representative of the entire year, eliminating in the process any distortions due to seasonal fluctuations (which are especially likely to afflict unemployment rates).

The smoothening effect of interpolation also removes a certain degree of month-to-month fluctuation that is normally present in economic data. If these fluctuations represent random "noise," this smoothening confers a significant added benefit (especially since the PL model does not incorporate a random disturbance term). It is possible, however, that the erratic high values that may occur in any month are what induce government collapses. If so, the data would underestimate the phenomenon. To test for this possibility, inflation was coded in two versions: the actual monthly rate and a pseudo–monthly rate constructed from the interpolated daily values. When the relationships of the two variables with the rate of government termination were tested by means of the PL method, the pseudo–monthly rate proved to have a noticeably stronger effect.[9] This finding suggests that politicians react not to the bad figures of a single month but to underlying trends extending over a period of several months—trends more clearly evident in the interpolated values.

The data collected for this study cover 16 West European parliamentary democracies from the resumption of normal politics after World War II until the end of 1989.[10] Parliamentary party strengths, the cabinet compositions of governments, the existence of support parties, and the termination categories used for censoring are all derived primarily from *Keesing's Contemporary Archives* (1944–90). With respect to the possible presence of support parties, other sources, (e.g., Browne and Dreijmanis 1982; Strom 1990; Swaan 1973; and various country-specific works) were also consulted. For maximum comprehensiveness, the data set incorporates all governments in the relevant time frames, including noninvested governments, caretaker governments, and single-party—as well as coalition—governments. Where exclusions occur, they principally involve the time-dependent covariates. Thus, unemployment rates are not available for the French Fourth Republic or Iceland and are scanty at best in the early years for most other countries. In addition, in several countries the method of calculating rates or index numbers is not consistent across the entire postwar period, producing values that are noncomparable. When changes in rates are the object of investigation, the loss of cases is not great (since only values spanning a transition in method have to be excluded); but when the rates themselves are being examined, the entire earlier series must be excluded, reducing the number of cases appreciably. The situation with respect to the other two indicators (the consumer

price inflation rate and the gross domestic product growth rate) is not nearly so severe; but the consumer price data are less precise before 1964, when index values were given in whole numbers only.[11] Details on the sources of these data are given in Appendix A.

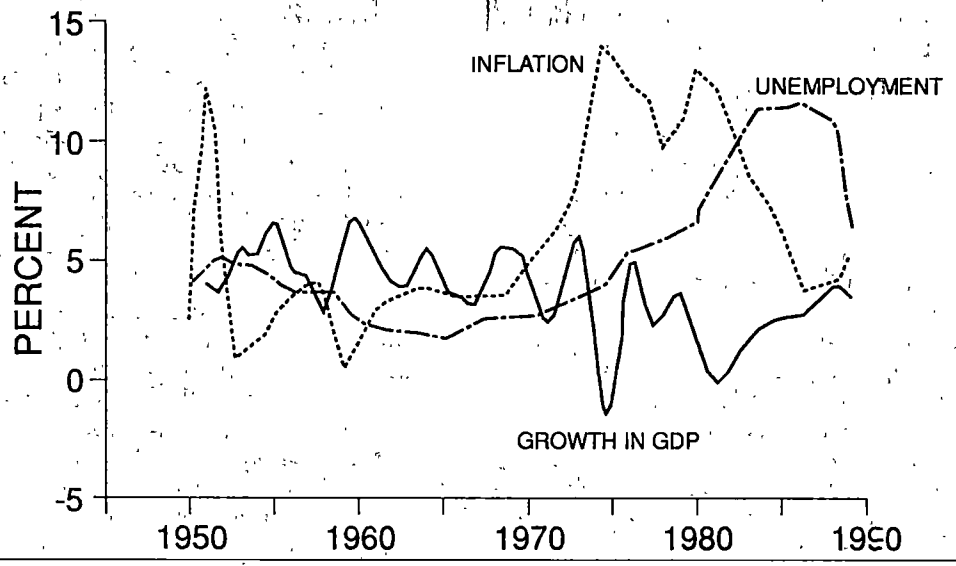
First, I shall examine the basic time trends in the economic indicators over the postwar era and test several versions of the indicators for their connection to rates of government termination, using the partial likelihood method. The analysis will then be broadened to incorporate the effects of other potential causal factors. As we shall see, economic indicators not only continue to demonstrate a causal role once other factors are brought into play but are instrumental in the evaluation of the relative merits of the bargaining environment and ideological diversity interpretations that have lately become major rivals in the explanation of government stability. Finally, I shall consider the success of governments of various ideological complexions (socialist, bourgeois, and mixed) in coping with inflation and unemployment; relate these records to their survival in office; and test the hypothesis that economic factors have had a greater impact on government stability in the more troubled economic climate prevalent in Europe since 1973.

ECONOMIC INDICATORS AND GOVERNMENT SURVIVAL

Before beginning the data analysis proper, it is useful to have in mind a general impression of the behavior over time of the three economic indicators: the consumer price inflation rate, the unemployment rate, and the rate of growth in the gross domestic product. In Figure 1, the time trends of these indicators are presented for the period 1950–89. These trend lines are based upon weighted averages of annual values of the indicators for the 16 countries of the sample, with the populations of the countries comprising the weights. The starting point chosen was 1950, because of the paucity of data before that time.

The trend lines pictured in Figure 1 indicate that after an initial bout of high inflation, both inflation and unemployment established and maintained relatively low levels throughout the 1950s and 1960s. In the 1970s, inflation rose to much higher levels and experienced two peaks (corresponding to the oil "shocks" of 1973–74 and 1979), then declined dramatically in the 1980s. The rise in unemployment in the 1970s was much more gradual, reaching an apex only in the mid-1980s before beginning a substantial decline. As for economic growth as measured by real increases in gross domestic product, it oscillates much more frequently and regularly than do either of these indicators but nonetheless reveals an overall tendency to decline over the period covered by the graph.

Although these trends contain few surprises, they do suggest that there is no simple trade-off between inflation and unemployment: both may be high or low at the same time. It is possible, therefore, that the two indicators have effects on government survival that are independent of each other. Conversely, there appears to be a tendency for higher levels of inflation and unemployment to be associated with lower gross domestic product growth rates and vice versa, suggesting that the latter may not convey new information about economic performance.



The hypothesis that economic trends are related to government survival receives a preliminary PL examination in Table 1. In interpreting the results listed in the table, it is important to bear in mind that since the model specification is log-linear, the effect of a one-unit change in a covariate on the rate of government termination is obtained by exponentiating its PL coefficient. For example, the coefficient of .06 attributed to the unemployment rate indicates that a 1% increase in unemployment is associated with an increase in the hazard rate of 6.2%, since exp(.06) = 1.062. It should also be noted that the procedures reported in Table 1 were performed with majority status (a dichotomous variable separating majority and minority governments) included as a control. This was done to prevent the possession of a parliamentary majority (or the lack of it) from masking the roles of economic covariates.[12]

The top of Table 1 explores the impact on government survival of four different measures of inflation: (1) the inflation rate, or percent increase in the consumer price index over the preceding year; (2) the change in the inflation rate over the preceding year; (3) the proportional change in the rate over the preceding year; and (4) the absolute value of the change over the preceding year. The last-mentioned category is included as a test of the hypothesis that economic change per se (regardless of whether favorable or unfavorable) brings about government instability. The results presented in Table 1 indicate that neither this nor any of the other proposed linkages finds support at the .05 level of significance (two-tailed tests), although that involving the inflation rate itself is sufficiently close that it should not be rejected out of hand. The direction of these relationships is as one would expect: high or increasing inflation rates are associated with higher hazard rates and thus a greater probability of government termination.

A very different picture emerges from the middle of the table, which contains results for the corresponding measures of unemployment. Because of the aforementioned noncomparability of data series, the unemployment rate itself is taken only from the most recent data series. The measures involving changes in unemployment rates may appropriately include earlier series based upon different counting methods, provided appropriate transitional situations are removed; this has the effect of increasing the number of cases modestly. The results indicate that the change in unemployment over the preceding twelve months is the most closely related to government survival, although all versions reveal relationships that are statistically significant or nearly so. Unemployment,

FIGURE 1

Average Annual Inflation, Unemployment, and GDP Growth Rates in 16 European Countries

Sources: Consumer prices from IMF; unemployment from UN; gross domestic product from OECD.

no matter how it is conceived, seems to be associated with higher rates of government termination.[13]

The final section of Table 1 shows the relationships with government termination of the analogous versions of growth in gross domestic product. Of the four versions, only the change in the growth rate from the preceding year shows any noteworthy effect. The negative sign associated with this effect indicates that increases in the growth rate of the economy are associated with a lowering in the rate of government termination, that is, with greater governmental stability. However, even this relationship falls well below the .05 level of significance.

The results reported in Table 1 provide some indication that economic trends (especially unemployment) are indeed associated with government survival in West European parliamentary democracies. This assessment accords with Robertson's (1983b, 1983c) earlier findings that the duration of governments is significantly related to average levels of

TABLE 1

Partial Likelihood Analyses of the Effects of Various Economic Indicators on Government Survival

COVARIATES	PARTIAL LIKELIHOOD COEFF.	T-VALUE	NUMBER OF CASES
Inflation			
Inflation rate (%)	.013 (.008)	1.73	305
Change in rate over prec. year	.024 (.018)	1.31	292
Prop. change over prec. year	−.003 (.006)	−.61	292
Abs. change over prec. year	.015 (.016)	.91	292
Unemployment			
Rate (%) (recent series)	.060 (.018)	3.35	193
Change in rate over prec. year (all series)	.235 (.055)	4.26	232
Prop. change over prec. year (all series)	.414 (.166)	2.50	232
Abs. change over prec. year (all series)	.124 (.065)	1.91	232
Gross domestic product			
GDP growth rate	−.021 (.028)	−.77	305
Change in rate over prec. year	−.036 (.024)	−1.48	296
Prop. change over prec. year	.001 (.001)	.77	296
Abs. change over prec. year	.011 (.035)	.32	296

Note: All coefficients are derived from partial likelihood analyses that include majority status as a control variable. Standard errors are in parentheses. Daily values for the inflation and unemployment covariates are interpolated from December monthly data; gross domestic product daily values are taken from annual figures.

unemployment—but not to inflation—in a more limited set of countries. The conclusion, of course, assumes all other factors equal; we cannot place confidence in it until the linkages have been shown to persist even after other relevant causal factors have been taken into account.

The analyses to follow will utilize the two indicators that showed the most promising results in Table 1: the inflation rate and the change in the unemployment rate. Not only is each of these measures more closely related to government survival than are the alternative measures of the same economic trait (controlling for majority status), but further analysis reveals that the presence of either of these measures in a PL model precludes a significant role for any of its alternatives. This suggests that the alternative indicators have relatively little to add to the statistical explanation of government survival.[14] This selection criterion is not foolproof; but in the absence of any political theory linking specific indicators to government survival, it is probably the most appropriate way to proceed at this stage.[15]

BARGAINING COMPLEXITY, IDEOLOGICAL DIVERSITY, AND THE ECONOMY

The goal of assessing the relative importance of economic conditions vis-à-vis other possible causes of government stability is complicated by the bifurcation of the latter along two very different interpretative lines: the *bargaining environment* thesis (King et al. 1990; Laver and Schofield 1990) and the *ideological diversity* thesis (Budge and Keman 1990; see also my earlier work, Warwick 1979). The bargaining environment interpretation views instability as the result of the absence of a stable core in a Euclidean ideological space—which, expressed less technically, means that coalition governments fall apart when at least one member believes that it can realize its policy goals more readily in a (viable) alternative coalition. A complex bargaining environment (one with many parties scattered throughout a large, multidimensional ideological space) increases the likelihood that these alternatives will exist. The ideological diversity interpretation, in contrast, sees government terminations as emanating principally from ideological or policy differences within governments, regardless of the availability of alternatives. The test of whether economic conditions matter for government survival therefore involves determining whether they continue to play a significant role once variables representing these two perspectives are introduced into the analysis; in the most optimistic scenario, this test will help to determine which perspective better fits the available evidence.

The main empirical support for the bargaining environment thesis comes from King and his colleagues' seven-covariate unified model. The four dichotomous covariates in that model indicate whether or not each government commanded a legislative majority, exercised its functions in a caretaker (nonpartisan) capacity, was the first to be formed after an election, and was obliged to undergo a formal vote of investiture. Bargaining complexity is conveyed by the model's three nondichotomous covariates: the number of failed formation attempts preceding the government's formation, the fractionalization (fragmentation) of the legislative party system, and its polarization as indicated by the proportion of seats held by "extremist" (antisystem) parties.

The theoretical role of these bargaining environment indicators varies considerably. A high number of formation attempts suggests a legislative situation rich in coalitional alternatives but gives no indication of the source of this condition. That source is more clearly identified with the system's fragmentation: other things being equal, more parties of significant size mean more viable alternative governments. Whether the presence of antisystem parties augments bargaining complexity is not so evident, however, given that these parties are typically excluded (by the prosystem parties, if not by themselves) from the business of bargaining over coalitions or participating in governments.

The ideological diversity thesis engages the debate precisely on this point. If antisystem parties are "noncoalitionable," as Laver and Schofield admit (1990, 200–201), their presence in force in a legislature should be associated with a lessening of coalitional alternatives and hence with greater government stability—the very opposite to what King and his colleagues found. Granted, a strong antisystem presence may be indicative of an ideologically divided and hence more complex party system. But the principal consequence of that polarization may be not a greater likelihood of attractive alternative coalitions, but rather the formation of governments from among prosystem parties that are themselves highly divided ideologically. These divisions may in turn predispose governments to early collapse. On this reasoning, one would expect ideological diversity within governments (provided it can be measured adequately) to displace the bargaining environment indicators in the explanation of government stability.

My previous research on government stability has concentrated on this measurement task (Warwick 1992[a]). The results of these efforts are three measures of ideological diversity, each significantly related to government stability. The first measure, which assesses the range of each government in a left–right dimension, is constructed from three "expert" assessments of party positions plus the European Manifestos Project's coding of postwar party platforms.[16] The other two measures assess the ideological range of governments along clerical–secular and regime support dimensions on the basis of Dodd's (1976) party scales. The question is, How well do these measures perform against the bargaining environment factors that constituted the core of the unified model, particularly when economic conditions are brought under consideration?

TABLE 2

Effects of Bargaining Complexity, Ideological Diversity, and the Economy on Government Survival

COVARIATES	MODEL 1	2	3	4	5	6
Majority status	−.69	−.65	−1.76	−1.43	−1.61	−1.90

Note: Entries are partial likelihood coefficients. Standard errors are in parentheses.

The analysis of the interplay of these factors begins with a reestimation of the unified model on the present data set, using the PL method. The results are given in Table 2, Model 1, which follows Laver and Schofield's (1990) lead in measuring party system fragmentation with the more easily interpreted "effective number of parties" index (Laakso and Taagepera 1979), rather than with the fractionalization measure. In other respects, the covariate specification is the same. Given that the two models differ in all other significant features (the type of model, the countries sampled, the definition of key concepts), Model 1 mirrors the results reported by King and his colleagues remarkably well. Among bargaining environment indicators, the number of formation attempts shows about the same effect on government survival as in the earlier model and the polarization effect has become stronger. In light of the preceding discussion, it may seem surprising that the effective number of parties is not significantly related to government survival at the .05 level, but this is also true of the fractionalization measure in the unified model.

We have seen that the inflation and unemployment indicators are not available for all countries and years covered in the sample; the same holds for the European Manifestos Project data.[17] Accordingly, Model 2 reassesses the unified model on the smaller set of cases for which complete data can be obtained. Although coefficient values are affected to some extent by the reduction in cases, the key finding is that all covariates significantly related to government survival in Model 1 remain significant in Model 2. This result greatly facilitates the task of evaluating the two rival hypotheses.

The second of these hypotheses is given a preliminary test in Model 3, using the same subset of cases; the test shows that all three ideological diversity measures described earlier (together with majority status) are related to government survival significantly and in the expected direction.[18] The full effect of the concept will be assessed in subsequent models by summing these measures to form an "ideological diversity index," using the coefficients listed in Model 3 as weights. When substituted for its component measures in Model 3, this index receives a coefficient of 1.00.[19] What happens to this coefficient when the bargaining environment indicators are brought into the picture is, of course, another matter.

Before turning to that issue, there is a second aspect of the ideological diversity interpretation to be

considered. To the extent that the antisystem presence in a legislature reduces the range of possible governmental coalitions, the probability that any member of an outgoing government will participate in the government that replaces it is likely to increase. Where the antisystem presence is substantial, therefore, parties may be tempted to defect from an uncomfortably diverse coalition government in the expectation that they will probably have to be included in the government that replaces it. This propensity can be assessed for each system by determining its "returnability," that is, the proportion of government parties that return to power in the next government following a collapse or early termination.[20]

The two covariates reflective of the ideological diversity hypothesis—the ideological diversity index and returnability—are tested against the significant covariates of the unified model in Model 4. The results reported in this model indicate that ideological diversity and returnability do substantially reduce the roles of the bargaining environment indicators, with only polarization continuing to show a significant effect. The coefficient associated with the ideological diversity index, although still significant, is also lowered very noticeably from 1.00 to .42—a reflection of the variance it shares with polarization. Model 4 thus shows the extent to which the two sets of covariates overlap in their capacity to account for government survival but fails to eliminate either set decisively. The next step is to determine whether the two economic covariates—the inflation rate and the change in the unemployment rate—can achieve this end.

This issue is addressed in Model 5, which adds the inflation rate and the change in the unemployment rate to the significant covariates of Model 4.[21] The principal result engendered by the inclusion of the economic covariates is the reduction in the coefficient associated with polarization, which is now statistically insignificant. It is also notable that the effect produced by the inflation rate is also quite insignificant. These findings suggest that the two covariates overlap to some extent in their effects on government survival—in other words, that systems with a large antisystem presence also tend to have higher inflation rates and that both features correlate with government survival. The implication is that one of these covariates must be removed from the model specification.

From a theoretical standpoint, it is clear that polarization is the one to be discarded. As I have noted, polarization is a poor indicator of bargaining complexity because it registers the narrowing of coalitional alternatives conveyed by the presence of noncoalitionable parties—precisely the reverse of what was intended.[22] In terms of the ideological diversity hypothesis, polarization functions not as a direct cause but, rather, as a surrogate measure, standing in for the ideological diversity within governments and other features that lead to government instability. The results in Model 5 suggest what those other features are: the incentive to defect from governments engendered by high returnability rates and the higher inflation experienced by polarized systems in the present sample.

The effect of removing polarization from the specification is given in the final model of Table 2. The three ideological diversity measures are entered separately in Model 6 in order to demonstrate that each is related significantly to government survival. The model also shows a noticeably larger coefficient associated with the change in the unemployment rate than was evident previously (see Table 1), indicating that controlling for other relevant factors actually enhances the role of that factor. As for inflation, its coefficient has nearly tripled, although its statistical significance is not particularly high.

The PL analyses presented in Table 2 demonstrate that the two economic covariates identified earlier not only contribute to the statistical explanation of government survival but also decidedly tilt the balance in the contest between its two main theoretical interpretations. This conclusion, moreover, is not reached at a price in terms of statistical power: like King and his colleagues' model, Model 6 is capable of accounting for all intercountry differences in termination rates (see Appendix B for details). Nor is it dependent upon the inclusion of support parties in the definition of governments: the model emerges intact even when governments are defined to include cabinet members only; cabinet members plus formally allied parties; or cabinet members plus formal, declared, and undeclared supporting parties. Finally, it does not imply any dependency between the presence of ideological diversity and the impact of the economic covariates. In fact, tests performed to detect an interaction effect in Model 6 failed to turn up any significant tendency for economic conditions to have a greater effect at higher levels of ideological diversity.[23] Economic factors, it appears, affect homogeneous and diverse governments alike.

IDEOLOGIES AND ERAS

Although the role played by economic factors in government survival appears to be independent of the level of ideological diversity within governments, it need not follow that it is unrelated to their ideological *orientations*. It is a commonplace among political observers that left-wing governments concern themselves more with unemployment than inflation and that right-wing governments reverse that order of priorities. These preferences are often linked to the perceived economic interests of their supporters. High unemployment tends to be seen on the Left as a "human" cost of capitalism that disproportionately affects the worse-off and requires government intervention to rectify or at least alleviate; concerns expressed over inflation may appear, however, as a pretext for beating back union wage demands. The Right takes a less zero-sum view of the workings of capitalism; but it does find economic virtue in the creation and maintenance of a favorable business

climate, which typically involves price stability as well as moderation in tax and social spending levels. Thus, the expectation has been, at least until the rightward drift in economic policy of the 1980s, that left-wing governments will cater to their working-class base by pursuing high-employment policies even if it stimulates inflation, whereas right-wing governments will focus on their middle-class constituency's concern for price stability even if it risks jobs.

To what extent are these expectations justified? Table 3 addresses this question by presenting the records of socialist, bourgeois, and mixed governments on the two economic indicators most closely related to government survival: the inflation rate and the change in the unemployment rate. The three government types were created by defining a left–right ordering of parties for each system; dividing these orderings into socialist and nonsocialist components; and coding each government as composed wholly from the socialist component, wholly from the bourgeois component, or containing parties from both components. To assess the performance of the three types of government, mean values of the economic covariates were estimated for each government from interpolated daily values.[24] These means were then averaged across governments of each type.

Table 3 does, in fact, reveal broad tendencies that conform to my outlined expectations. Although inflation and changes in unemployment show considerable fluctuation over the lifespans of all types of governments (as indicated by the standard deviations), socialist governments clearly do experience higher mean levels of inflation than bourgeois governments. Conversely, bourgeois governments typically experience a greater tendency for unemployment rates to increase than do socialist governments. Mixed governments appear to represent the worst of both worlds: inflation rates rivaling those of socialist governments and unemployment growth matching that of bourgeois governments. Interestingly, these patterns hold up even for the final month of existence for each type of government, as the final row for each covariate reveals. This finding suggests that bourgeois governments do not fall when they lose their grip on inflation, nor socialist governments when unemployment escapes their control. Instead, both appear to terminate despite their continuing strong records in these domains.

This conclusion is reinforced by the results obtained when the full model is estimated separately for the three types of government. The estimated coefficients for the economic covariates in these analyses are given in Table 4. Models 7–9 present a pattern of findings that at first glance may appear surprising: changes in unemployment are significantly related to government survival among bourgeois and mixed governments only (Models 7–8), while inflation shows a significant effect solely among socialist governments (Model 9). These relationships cannot be due to the tendency for bourgeois governments to outperform socialist ones on inflation or to be outperformed by them on unemployment, because the models relate each government's economic record only to those of other governments of the same type. Thus, Model 7 associates higher termination rates with bourgeois governments that undergo greater increases in unemployment relative to other bourgeois governments—and the same goes for socialist governments with respect to inflation (Model 9). The most likely interpretation of these results is that bourgeois governments and socialist governments are perceived as being uniquely equipped to handle inflation and unemployment, respectively (a perception borne out by the evidence in Table 3) and are therefore vulnerable only to adverse developments in the other indicator. The finding that mixed governments are "punished" only for unemployment despite their poor records in both areas underscores the dominance of unemployment in the postwar era. It may be that inflation plays a significant role in socialist government terminations only because the socialists' credibility on unemployment is so high.[25]

A second dimension along which the effects of the economic factors on government survival may vary relates to the period during which governments held office. Few would dispute that the oil crisis of 1973 marked a critical watershed in Western economic history, the end of the long postwar economic boom. Certainly, both inflation and unemployment became much worse in the 1970s and 1980s, as Figure 1 indicates. This raises the question whether economic conditions have come to assume a more pronounced

TABLE 3

Inflation and Unemployment in Different Types of Governments

ECONOMIC INDICATOR	TYPE OF GOVERNMENT		
	BOURGEOIS	MIXED	SOCIALIST
Inflation			
Average monthly value	5.37 (95)	7.29 (92)	7.18 (40)
SD in monthly values	.95 (89)	.91 (89)	1.07 (40)
Final month value	5.37 (95)	7.18 (92)	7.39 (42)
Change in Unemployment			
Average monthly value	.24 (95)	.24 (92)	.03 (40)
SD in monthly values	.54 (89)	.36 (89)	.44 (40)
Final month value	.34 (95)	.22 (92)	−.02 (40)

Note: Main entries are mean values for each type of government, with the number of governments given in parentheses. Only governments with valid data for both economic covariates are included. Values for individual governments were derived by dividing government durations into 30-day intervals ("months") and estimating the annual rates of inflation and change in unemployment at the beginning of each interval (using December figures). Means and standard deviations were then calculated over the intervals and the values in the final interval noted.

TABLE 4

Economic Influences on Government Survival, by Type of Government

	MODEL (TYPE OF GOVERNMENT)		
COVARIATES	7 (BOURGEOIS)	8 (MIXED)	9 (SOCIALIST)
Inflation rate	.001 (.036)	.038 (.031)	.178 (.060)
Change in unemp. rate over prec. year	.248 (.098)	.760 (.167)	−.101 (.245)
N	91	78	41

Note: Entries are partial likelihood coefficients derived from reestimations of the full model (Model 6) for the appropriate subset of cases. Standard errors are given in parentheses.

role in government survival in the period since October 1973.

This issue is explored in Table 5, which shows the effects of the economic covariates when the full model is estimated separately for the two eras defined by the 1973 oil embargo. A comparison of Models 10 and 11 provides scant support for the hypothesis of a general increase in the impact of the economy on government survival: while the impact of changes in unemployment is much stronger after 1973, that of inflation shows a comparable decrease. This shift in emphasis, moreover, is not engendered by any increase in the proportion of bourgeois governments in the latter period.

The analyses reported in Table 5 indicate that the principal consequence of the altered economic conditions of the postboom period has been to bring the causal role of changes in unemployment to the fore. The relatively weak role played by inflation in the overall model (Model 6) may be attributed to this fact. This is not to say that inflation is irrelevant to government survival. If the analysis is confined to the 1960s and 1970s, when consumer prices showed the greater change, inflation displays a much more significant impact on survival than changes in unemployment.[26] But the stronger role in the postboom era clearly belongs to the rising rates of unemployment, the roller coaster ride in inflation rates notwithstanding.

TABLE 5

Economic Influences on Government Survival before and after 1973

	MODEL	
COVARIATES	10 (TERMINATIONS BEFORE NOVEMBER 1973)	11 (TERMINATIONS AFTER OCTOBER 1973)
Inflation rate	.146 (.072)	.039 (.029)
Change in unemp. rate from prec. year	.217 (.093)	.453 (.116)
N	105	103

Note: Entries are partial likelihood coefficients derived from reestimations of the full model (Model 6) for the appropriate period. Standard errors are given in parentheses.

DISCUSSION

A conceptualization of outside events and their impact on government survival very different from the events theorists' has guided my research. For one thing, the events under scrutiny are not the idiosyncratic occurrences—the forced landing of a terrorist controlled aircraft or the assassination of a prime minister—that occasionally topple governments but the more systematic and more fundamental economic trends that form a large part of their day-to-day concerns. For another, the interconnection between these trends and government survival is viewed as reciprocal, rather than one-way: governments affect economic conditions, as well as being affected by them.[27]

The influence governments have on their economies can be seen quite clearly in the pattern of relationships linking ideological orientation with success in containing inflation and unemployment. The evidence indicates that bourgeois governments, as expected, do experience lower inflation rates than socialist governments. Conversely, unemployment rates are relatively less likely to rise during socialist administrations. These associations do not establish a causal role for government policy, to be sure; but it is difficult to interpret them in any other terms. Less expected are the findings concerning the reverse link, which suggest that governments are vulnerable only on the economic indicator they are generally less adept at handling. Thus, socialist governments do not terminate when their unemployment records fall behind the norm for governments of that type (presumably because their bourgeois opponents do not provide a credible alternative on the issue); but they are at greater risk if their inflation performance is off the mark. For bourgeois and mixed governments, the immunity pertains to inflation and the vulnerability to unemployment.

The inflation rate and the change in the unemployment rate turn out not only to affect government survival but also to play a key role in the debate pitting bargaining environment and ideological diversity interpretations of the phenomenon against each other. Although the introduction of the ideological diversity within governments seriously undermines the causal role attributed to bargaining environment complexity, the economic covariates dispense a further blow by eliminating the significant effect of its one remaining indicator, the legislature's polarization, or antisystem party presence. In the ideological diversity interpretation, a strong representation for

antisystem parties in a legislature inhibits government survival both by necessitating the formation of ideologically diverse governments from among the prosystem parties and by increasing the likelihood that parties that defect from one government will have to be included in its successor. Model 6 provides evidence for both effects. In contrast, none of the three proposed bargaining environment measures is able to enter the model significantly; nor do they, taken individually or as a group, significantly improve its log-likelihood.

What perspective on government survival is suggested by the findings of this study? Perhaps the most basic feature of government survival uncovered here is the extent to which its immediate sources lie not with the larger parliamentary environment or with the outside world but with the governments themselves. This is indicated both by the importance of government characteristics such as ideological diversity and majority status as well as by the capacity governments have to influence the economic indicators that matter most for survival. The larger political and economic environments are not banished from the picture, however. Not only do parliamentary settings impose constraints on the composition of governments and global economic trends largely escaping their control, but the exact timing by which governments terminate under the pressure of ideological differences must depend, in part, on circumstances of an idiosyncratic nature. Whatever these circumstances may be, a heightened vulnerability to economic trends appears not to be involved. On the contrary, governments of all types, including the minimally diverse single-party governments, are at risk to adverse economic developments.

The mechanism by which these developments undermine government survival remains largely a matter of speculation at this point. Some idea of what might be involved can be gleaned, however, from the economic records associated with different types of termination. In particular, it is notable that governments that were defeated in parliament or resigned before the end of their mandate (excluding those that terminated in order to add a coalition member) had significantly higher mean levels of the two economic covariates than did other governments.[28] This suggests that impatience with government economic strategy or a desire not to be associated with economic failure encourages parties to defect from governing coalitions. A firmer verdict must await more detailed investigations.

Concerning the future, my findings contain both favorable and unfavorable signs for government stability in West Europe. On the favorable side is the finding that survival in office depends on changes in unemployment rates rather than on their actual levels. This result indicates that the higher overall levels of unemployment of the last 15 years may not be in themselves inimical to stability. Nevertheless, in view of the powerful impact of that factor (each 1% rise boosts the termination rate by about one-third in Model 6), any surge in unemployment consequent upon the restructuring of the European economy after 1992 could significantly undermine government durability. The days when the very survival of parliamentary regimes in West Europe was at issue may be long past, but the potential for future governmental instability should not be discounted.

APPENDIX A. DATA SOURCES FOR THE ECONOMIC COVARIATES

The December inflation values for the periods 1946–63, 1964–69, and 1970–89 are derived from consumer price data listed in the International Labor Organization (ILO) *International Labor Review* (1945–63) and *Bulletin of Labor Statistics* (1964–70) and the International Monetary Fund (IMF) *International Financial Statistics* (1970–90), respectively. For years in which only consumer price index values are given, the inflation rate was calculated from annual percentage changes in these values. Following the IMF practise, these rates are calculated only to the nearest whole number whenever the index values themselves are given in whole numbers. Annual values were taken from the IMF *International Financial Statistics Yearbook* (1979, 1983, 1989).

The primary source for the unemployment data is the *UN Monthly Bulletin of Statistics* (1947–90). For earlier years, this source was supplemented, where appropriate, by data from the *International Labor Review*. Because of gaps and inconsistencies in the UN data for Spain and the Netherlands (in the 1980s), data from the Organization for Economic Cooperation and Development (OECD) *Main Economic Indicators: Historical Statistics 1969–88* was substituted in those cases. An "earlier series" category is established whenever a serious discontinuity occurs in rates owing to changes in how they were calculated.

The gross domestic product figures are from the *OECD Economic Outlook* for the period from 1970 and the *OECD National Accounts*, vol. 1, *Main Aggregates, 1950–78* and *Main Aggregates, 1960–88* for the earlier years. An IMF version of this indicator was also coded, based upon the series reported in the *International Financial Statistics Yearbook* (1983–89); but it did not yield substantially different results and is not discussed in this study.

APPENDIX B. MODEL TESTS FOR INTERCOUNTRY DIFFERENCES

The tests involve determining whether the log likelihood improves significantly when a set of dummy variables representing individual countries is added to Model 6. If it does, the implication is that the original covariates are unable to account for all significant intercountry differences in survival rates. Because returnability is constant for individual systems, it is necessary to exclude two country dummies to avoid collinearity. Norway and Sweden were chosen because of their similarities in mean duration and other factors. For cabinet parties only, cabinet plus formally allied parties, and cabinet plus all supporting parties (three of the four definitions of a government) the increases in the log likelihoods generated by the addition of the country dummies are insignificant at the .05 level. (The χ^2 values for these increases are 12.3, 14.7, and 12.0, respectively, with $\chi^2 \geq 16.9$ required for significance at nine degrees of freedom.) The exception, the definition that includes support parties only when their support is openly declared ($\chi^2 = 18.9$), depends on one unusual circumstance: the obligation to treat the British Labour government of 1976–79 as three distinct governments because the Liberals agreed to support it for part of that period. The effect is to make Britain appear less stable than its covariate values and the model would indicate.

The country dummies can also be used to provide a test of the appropriateness of replacing polarization with ideological diversity. The test consists of adding the country dummies to Model 5, which includes both ideological diversity and polarization. The result is that the coefficients for both covariates increase modestly. However, the standard error for polarization increases very drastically; and the coefficient becomes even more insignificant. The t-value for ideological diversity, conversely, is not affected and the covariate remains highly significant. This suggests that polarization's role in government survival, unlike that of ideological diversity, may be an artifact of its high concentration in one or more countries.

Notes

Funding for this research was provided by the Social Sciences and Humanities Research Council of Canada (grant 89–0558).

1. The determination of an appropriate distribution for government duration data (which is equivalent to determining the nature of the underlying trend in government survival net of all measured causal factors) is taken up in Warwick 1992(b), a companion piece to the present paper.

2. Elsewhere, Robertson (1983a) does relate changes in the rate of government collapse in various countries to changes in their unemployment and inflation rates. Individual governments, however, do not constitute the unit of analysis.

3. The log-linear specification is not strictly necessary but has the advantage of precluding negative predicted hazard rates. (A rate of termination cannot be less than zero.)

4. The partial likelihood (PL) method is introduced in Allison 1984 and developed in more detail in Tuma and Hannan 1984 and Blossfeld, Hamerle, and Mayer 1989. The technique does require the assumption that the hazard rates of any two cases be proportional over time; but further testing indicates that this assumption is met in these data (Warwick 1992[b]). It also assumes that any random errors are identical across cases, so that differences among cases are accounted for solely by differences in their covariate values (Tuma and Hannan 1984, 253–54). This assumption is normally violated in practise, but apparently without serious consequences.

5. If X_1 and X_2 are the values of covariate X at times t_1 and t_2, respectively, the interpolated value of X at a time T that falls between them would be

$$X_T = X_1 + \{(T - t_1)(X_2 - X_1)\}/(t_2 - t_1),$$

where all times are measured in days from some fixed date, such as the date the government was formed. The BMDP program 2L, which provides a highly convenient facility for interpolating time-dependent covariate values, was used to estimate all the PL models I report.

6. This is achieved statistically by estimating the contribution of these cases to the overall likelihood by means of the survivor function, which represents the probability of surviving to or beyond any given duration value, rather than with the density function.

7. This follows the practice of Browne, Gleiber, and Mashoba (1984) and King and his colleagues (1990), except in the case of resignations that are not accepted by a head of state. Such resignations are regarded as terminations in this study (although not in the others).

8. This assumption was checked by comparing the relationships between the termination rate and the inflation and unemployment indicators based on annual data with those produced using daily interpolations from December data (to be discussed). The December-based versions generally yielded the stronger relationships.

9. The simple (bivariate) PL coefficient for the actual monthly inflation rate is .056 (t = 3.29), while that for the pseudo-monthly rate is .064 (t = 3.56). This pattern holds up when the other covariates (to be discussed) are included in the analysis. In these tests, the actual monthly data attribute a given monthly rate to each day of that month. The interpolated data attribute the estimated value for the first day of a month to each day of that month. Because of the enormity of the coding task this analysis entails, it was performed only on the 208 cases for which complete data are available. The test is inappropriate for unemployment because actual monthly unemployment rates are contaminated by seasonal effects.

10. They are Austria, Belgium, Denmark, Finland, France (the Fourth Republic), Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal (from 1976), Spain (from 1979), Sweden, the United Kingdom, and West Germany.

11. The relative lack of precision in consumer price index numbers before 1964 is translated here into a lesser degree of precision in inflation rates, which are calculated only to the nearest whole number for that period. A comparison of results produced with and without the pre-1964 data indicates that the lack of precision of the earlier data affects relationships with government survival only slightly.

12. This could happen, for example, if economic downturns tend to produce majority governments. Since majority governments typically last longer than minority ones, unfavorable economic indicators might appear (spuriously) to be associated with longevity in office. It should also be noted that other factors may also be affecting the relationships reported in the table. Although uncontrolled here, they are taken into account in the subsequent analyses.

13. Using covariates based only upon the most recent unemployment series does not change these results very much: the PL coefficients for the change, proportional change, and absolute change versions are .309 (t = 3.66), .277 (t = 1.29), and .130 (t = 1.38), respectively. In addition, subsequent analyses based on these versions yield the same basic findings as those I shall report for the "all series" versions.

14. The same conclusion holds for the growth in gross domestic product: further testing indicates that its effect on the rate of termination is almost entirely due to its association with inflation and unemployment.

15. The criterion is not foolproof because any of the relationships reported in Table 1 could be suppressed by other factors. For this reason, the final model (6) developed in the next section was reestimated using the various alternative indicators of the economic covariates in the model. In all cases, the signs of the estimated coefficients were the same—and the significance levels lower—when the alternatives were employed.

16. The three sets of scales are Dodd's (1976) economic conflict scales (five-point version); Browne, Gleiber, and Mashoba's (1984) refinement of the Dodd scales; and socialist–bourgeois dichotomous scales based upon my earlier work (Warwick 1979). Each set of scales was subjected to a discriminant analysis using the European Manifestos Project data (Budge, Robertson, and Hearl 1986). The new, or "predicted," scale positions produced from these analyses, together with the first principal component of the European Manifestos Project data, formed the basis for four assessments of the left–right range of each government. Because these assessments intercorrelate so highly, they were subjected to another principal components analysis. The first principal component from this analysis, which accounts for over 95% of their common variance, constitutes the final measure of left–right diversity. Various other formulations, including those based on other source scales and those based on standard deviations rather than ranges, were also tested; this one proved to be the most successful.

17. The European Manifestos Project data exclude Finland, Iceland, Portugal, and Spain. Given the limited period of democratic rule in Portugal and Spain and the gaps in the unemployment data for Iceland and Finland, the number of cases lost through the use of European Manifestos Project data amounts to just 20.

18. This is also true when the entire set of cases for which these measures are available (n = 284) is used.

19. Although other methods of index construction could be utilized, this method was chosen because it leaves all other estimated parameters of the model unaltered.

20. Each system receives a returnability value based on its

record over the entire postwar period. It is assumed that this value reflects an underlying likelihood that is known to parliamentary actors throughout the period.

21. The postelection covariate falls somewhat below significance at the .05 level in Model 4 but was left in the analysis because its weaker role is partly due to the narrowing of the sample, as a comparison of Models 1 and 2 reveals. Had the reduced sample been more representative of the entire data set, it is a reasonable assumption that this covariate would have displayed a stronger and more significant effect.

22. This conclusion is supported by a correlation of .366 ($p < .01$) between polarization and returnability, indicating that the chances for a government party to return to power following an early government termination increase with the size of the antisystem presence in the legislature.

23. The tests consisted of adding interaction terms composed of the product of each economic covariate and the ideological diversity index to the model. Neither of these interaction terms, whether entered singly or together, proved to be significantly related to the termination rate.

24. The ideological orderings were based largely on Castles and Mair's (1984) left–right political scales, supplemented by the Browne, Gleiber, and Mashoba (1984) socioeconomic scales and by country-specific sources where appropriate. Mean economic indicator values for each government were derived by dividing the government's lifespan into intervals of 30 days, calculating the interpolated value at the start of each interval, and averaging these values over the intervals of the government's life. Thirty-day intervals were used in order to facilitate computations and to approximate the monthly intervals for which economic data are usually reported.

25. The patterns shown in Table 4 hold up when only majority governments (to control for the possibility that homogeneous minority governments may actually be dependent on parties of a different ideological orientation) and when only coalition governments are examined.

26. A reestimation of Model 6 for the 1960–79 period ($n = 91$) results in a PL coefficient of .087 ($t = 3.17$) for inflation and .177 ($t = 1.93$) for changes in unemployment.

27. This does not make the economic covariates endogeneous in the full model (Model 6). While their effects on survival do depend on the government's ideological orientation, they are independent of ideological diversity or any of the other covariates entered in the model. (Ideological orientation itself is not a direct cause of survival.) This is indicated by the finding that the introduction of the economic covariates into a model containing only the fixed covariates scarcely changes the coefficients associated with the latter. Thus, the economic covariates occur later in the temporal ordering than the fixed covariates; but they do not play the role of intervening variables.

28. Of the 208 cases utilized in the full model, the 95 that terminated in these circumstances had mean rates of inflation and change in unemployment of 7.3% and .4%, respectively. The corresponding values for the other cases are 5.9% and .0%. T-tests indicate that the differences between the two groups are significant at the .01 level in both instances.

POLI: AN EXPERT SYSTEM MODEL OF U.S. FOREIGN POLICY BELIEF SYSTEMS

CHARLES S. TABER *State University of New York, Stony Brook*

One of the more fruitful systematic approaches to the study of foreign policy views nations as information processors and explains foreign policy as a function of information and processing thereon. Much of such processing depends on the prior beliefs of decision makers, but for a variety of reasons these systems of prior beliefs are very difficult to analyze using "standard" empirical and modeling techniques. Computational modeling, including expert system technology, provides an alternative methodology that allows such analysis. I present Policy Arguer (POLI), an expert system model of U.S. foreign policy making in Asia. POLI has been very successful in reproducing actual U.S. responses to events in Asia from the 1950s. More important, POLI recreates policy debate in the form of the arguments and counterarguments used to justify policy alternatives. The model explains foreign policy outputs in terms of a complete process from foreign policy beliefs, through debate, to choice.

Foreign policy decision making has been subject to formal analysis only in recent decades. Traditionally, scholars have taken a historical approach to the study of foreign policy, emphasizing descriptive detail and realism. Their investigations, often in the form of case studies, attempt to capture the rich complexity of actors and relations among actors. Formal studies, on the other hand, use different rules of argument and evidence, sacrificing the descriptive detail of the historical approach for much greater explanatory power. They represent the world with idealized models designed to capture in tight focus the important actors and relations among actors.

Despite important differences between formal and historical approaches, they also have similarities. Each attempts to understand the same set of real world processes of foreign policy decision making. Each constructs a representation of these processes according to organizing principles (theory or pretheory). Neither simply describes the world "as it is."

The Policy Arguer Project exploits the similarities between formal and traditional studies to build a bridge between them. Using the computational power of modern computers, formal models can achieve much of the rich complexity of historical representations, while maintaining analytic focus. Computational modeling techniques allow the analyst to raise the level of realism of formal models of foreign policy decision making. In the Policy Arguer (POLI), I apply computational modeling techniques to describe and explain particular foreign policy choices in response to world events, using U.S. decisions on policies toward Asia as my research domain. I shall focus on POLI I, which represents the U.S. foreign-policy-making system of the 1950s.

COGNITIVE APPROACHES TO FOREIGN POLICY ANALYSIS

The intellectual heritage of the POLI Project can be traced to the considerable work, both formal and traditional, on the role of *beliefs* in foreign policy decision making. Snyder, Bruck, and Sapin (1962) introduced the systematic study of foreign policy belief systems as an integral part of the decision-making frame of reference. They advocated the analysis of national behavior as a product of the *subjective* perception and interpretation of a situation by national decision makers, their expectations from various courses of action, and their choice processes. To use Holsti's classic description, a belief system is "a set of lenses through which information concerning the physical and social environment is received. It orients the individual to his environment, defining it for him and identifying for him its salient characteristics. . . . [And it] has the function of the establishment of goals and the ordering of preferences" (1962, 245). Belief systems, as cognitive structures that mediate experience for individuals, are central to the descriptively detailed analysis of decision making.

A number of foreign policy analysts have emphasized the importance of the *images*, embedded in larger belief structures, that policy makers have about the world and about other actors (Boulding 1956, 1959; Glad 1983; Glad and Taber 1991; Holsti 1962, 1967; Jervis 1970, 1976; Tetlock 1983). This work has primarily focused on the pathological impact of images on cognitive processing, particularly on perception and diagnosis. Through selective perception and distortion, decision makers bias incoming information about the world to conform with preconception. In addition, decision makers may develop rigid belief systems containing highly simplified images that

restrict flexibility in the diagnosis of world events and in the choice among perceived alternatives.

In contrast to the emphasis of most image research (that simplified belief structures degrade the quality of information processing), Nathan Leites (1951) and Alexander George (1969, 1979) focused on the necessity of relatively simple belief systems for cognitive functioning. They developed the *operational code* construct to describe these essential cognitive structures. Decision makers' operational codes consist of their fundamental beliefs about the dynamics of international relations and about the efficacy of human action, coupled with their simplifying images of salient international actors (as, e.g., friendly or unfriendly). These beliefs enable decision makers to process information and examine potential courses of action efficiently. Of course, a decision maker's operational code has a tremendous impact on the particular policies that will be advocated or opposed by that decision maker; and as such, it can be a useful analytic tool for the explanation of policy choice (Walker 1983).[1]

Belief structures of this sort may be formally modeled as *cognitive maps*, in which elements of belief and the relationships among these elements are graphically represented (Axelrod 1976). These structural representations of belief systems allow analysts to predict behavior from a decision maker's operational code. Unfortunately, unless they are highly simplified, cognitive maps quickly become too large and unwieldy to analyze using standard methods. Moreover, static representations of cognitive structures like operational codes or cognitive maps cannot deal effectively with important cognitive processes, including reasoning, counterarguing, and learning. For these and other reasons, the cognitive map approach has not been as productive as its early advocates anticipated. Indeed, many analysts of foreign policy decision making have moved away from static representations of cognitive structure toward models or descriptions of the *processes* involved (Bennett 1981; Cottam 1986; Hermann and Coate 1982; Holsti 1977; Janis and Mann 1977; Powell, Dyson, and Purkitt 1987; Purkitt and Dyson 1985).

COMPUTATIONAL MODELING IN INTERNATIONAL RELATIONS

For a formal modeler, the complexity inherent in the decision-making approach is daunting, requiring a modeling language capable of expressing its essential features.[2] Computational modeling, developed in *cognitive science* (roughly, the intersection of cognitive psychology, computer science, and the philosophy of mind) provides a set of tools designed for precisely this problem.[3] Unlike earlier formalisms, computational models can represent rich cognitive structures *and* the processes that link structure to decision. In the field of international politics, these techniques allow the formal analyst to return to the issues and theoretical approaches introduced by Snyder, Bruck, and Sapin (1962).

The application of computational modeling ideas in international relations has a sparse but surprisingly long history, beginning with work at the Massachusetts Institute of Technology in the late 1960s and through the 1970s (Alker, Bennett, and Mefford 1980; Alker and Christensen 1972; Alker and Greenberg 1971, 1976; Bennett and Alker 1977; Pool and Kessler 1969). Rather than attempting a comprehensive review (see Benfer, Brent, and Furbee 1991; Hudson 1991), I will briefly describe several projects in international relations that provided direct inspiration in the development of POLI.

Decision makers must generate meaningful representations of new information before that information can be used in reasoning, that is, they must interpret incoming information. Indeed, how they do this—and in particular the issue of perceptual bias in this process—is a major topic of belief system research, particularly for those who focus on images. Not surprisingly, it is also a central issue in most foreign policy computational modeling projects.

Building on the work of Schank and Abelson (1977), Carbonell (1978) developed a set of programs capable of quite complex interpretations of political events. The primary contribution of Carbonell's POLITICS for my purposes is the application of organized structures of prior beliefs in the interpretation of new events. In this approach, "understanding" is the process of relating external information to internally represented concepts and ideas. An object in the environment (say, North Korea) has meaning to a decision maker only if it can be mapped onto some set of internally represented (i.e., "known" or "believed") concepts (say, "communist" or "regional imperialist"). Decision makers with different internal belief representations will have different interpretations of an event involving North Korea. Although the particular cognitive organization used in POLITICS (ideologies, scripts, and context-dependent inference rules) differs somewhat from that used in POLI, the idea that complex representations of belief provide a fertile ground for event interpretation and the reasoning process is important in both models (see also Seitz 1987).

Thorson and Sylvan (1982) modeled the decision making of John F. Kennedy in the 1962 Cuban Missile Crisis. Kennedy's prior beliefs, on the basis of which he interprets and reacts to events during the crisis, are represented in JFK/CBA as a set of production rules, or IF→THEN statements. Though small by comparison with some other rule-based models, JFK/CBA contains a far more detailed theory of Kennedy's relevant beliefs than could be expressed intelligibly as a cognitive map. JFK/CBA recognizes 14 possible states of the world during the missile crisis, ranging from "Soviet missiles are removed from Cuba" to either the United States or the Soviet Union "initiates a war." U.S. and Soviet actions transform the current state into a new state. Kennedy's beliefs, embodied in the IF→THEN rules, are used to evaluate possible

courses of action, as well as the plausibility of possible Soviet reactions, eventually leading to a decision and a state transformation. A run of the model, beginning with the discovery of missile base construction in Cuba, produces a simulated trace that can be compared to the well-documented historical case. In this basic validity test, JFK/CBA fared very well. The simulation runs of the 1962 crisis, based on the computational representation of Kennedy's belief system, are remarkably similar to the actual historical trace.

JESSE, a computational model of Japanese energy policy making (Sylvan, Goel, and Chandrasekaran 1990) explicitly integrates cognitive and political factors. How, within political constraints, does the decision-making system interpret a situation and select a stored plan of action? These tasks—classification and plan selection—are accomplished in JESSE using a sophisticated combination of knowledge frames and rules. On the basis of prior knowledge, JESSE asks the user a series of pointed questions whose answers allow it to interpret an event according to its classification scheme. JESSE then chooses a plan of action from its repertoire of stored plans. For example, JESSE classified the energy situation following the 1979 Iranian revolution as (in simplified form) a serious threat to the availability of low-cost imported energy for Japan. From a large set of stored plans, JESSE then selected a number of policies to deal with this energy threat, including stockpiling energy and reducing demand.

JESSE and JFK/CBA demonstrate the usefulness of reducing the domain of analysis (see also Job and Johnson 1991). Knowledge-based, or *expert*, systems—a subset of computational models—gain considerable power by focusing on specific domains of knowledge, or belief. They process information on the basis of prior knowledge or beliefs about some problem domain, rather than relying on more general knowledge.[4] As we have seen, JESSE is designed to solve problems of Japanese energy security. It does very well in that domain but would be lost if presented with a problem from U.S. security policy. Like JESSE and JFK/CBA, POLI relies on knowledge and beliefs about a constrained domain, namely U.S. foreign policy making toward Asia. Following convention, I will call the specialized knowledge and beliefs of U.S. policymakers *expertise*—though this term does not necessarily connote accuracy or truth.

Anyone who takes seriously the role of prior beliefs in information processing must consider the question, Whence come prior beliefs? Thorsen and Sylvan (1982) and Carbonell (1978) emphasize the importance of *precedent* in the interpretation of new events (see also Alker and Christensen 1972; Bennett and Alker 1977; Tanaka 1984). Any decision maker's belief system will contain beliefs about "how the world works" in certain contexts; that is, beliefs about how the world worked in similar situations in the past. Considerable evidence from cognitive science suggests that analogies drawn from experience are key components in the interpretation process (Mefford 1985, 1987; Schrodt 1985). Case-based decision models rely heavily (often exclusively) on these stored examples for interpretation of and reasoning about new events. While POLI does not rely exclusively on historical analogies, some of its understanding of events does build on historical cases. For example, one interpretation of the 1950 North Korean invasion of South Korea, among several offered by POLI, rests on a perceived similarity to the behavior of Hitler after the 1938 Munich Conference. In this interpretation, the Korean invasion is understood by analogy with the 1938 case.

THE POLICY ARGUER

POLI is an expert system model of U.S. foreign policy decision making in which several competing views of the world drive the reasoning process.[5] POLI takes events, in the form "actor, verb, target, context" as input and recommends U.S. responses. For example, POLI I recommends 19 U.S. policies for the 1958 Taiwan Straits Crisis, including a direct military threat against China, an upgrade in military readiness, and a protest in the UN Security Council.

Following a typical expert system design, POLI has four components:

1. The *knowledge base* is POLI's representation of U.S. beliefs about policy toward Asia. It is composed of a set of paradigms, or shared belief systems, through time.
2. The *inference engine* controls the processing of information. In POLI, this is a forward chainer using fuzzy inferencing.[6]
3. *Working memory* is the space in which the inference engine compares input with the knowledge base, selects and uses pieces of knowledge to operate on the input, and produces output.
4. The *user interface* is the means of communication between the analyst and the model.

The key tasks in developing an expert system are the extraction and representation of the expert knowledge base that the model will use and the development of the inference engine, which controls how the expert knowledge is used.

Building POLI's Knowledge Base

Unlike experts in many other domains, U.S. foreign policy makers do not draw on a clear, consensual body of expert knowledge. Even in the 1950s, at the height of the Cold War, there was more than one way of thinking about the world. In general, multiple agents of different worldviews compete to affect policy outputs. These competing impulses arise from a set of quite different representations of the world. In fact, agents of different worldviews reason differently about the same input information and come to different conclusions.

For example, in the late 1940s there was a difference of opinion in the American policy making sys-

tem about policy toward China. Key beliefs of different worldviews led to quite different conclusions:

1. Communism is not an implacable enemy but only a temporary one due to mistaken U.S. policies (implying that the United States should change its policy so as not to tread on communist toes, including in China).
2. Soviet communism is fundamentally opposed to U.S. interests, but other brands of communism might not be (implying that the United States should encourage Titoism in emerging communist movements and not automatically oppose all communist movements, including Mao's agrarian movement in China).
3. Communism is monolithic and opposed to U.S. interests, but the communist menace is centered on Europe; if it is contained in Europe, communism will fall of its own dead weight (implying European containment, excluding China).
4. Communism is monolithic and opposed to U.S. interests, and its immediate goals are worldwide; the failure to contain communism anywhere will weaken resistance everywhere (implying global containment including in China).

POLI represents this type of situation with multiple competing worldviews.

Although U.S. foreign policy making is not consensual, neither is it completely idiosyncratic. Patterns, or clusters, of shared beliefs emerge in the system and gain varying degrees of acceptance among individual policymakers. Of course, at extreme discrimination these belief clusters dissolve into distinct idiosyncratic worldviews. But I do not take this approach here. Rather, I work at a level between the individual and the organization: the level of shared belief systems, or *paradigms*.

This project assumes that a limited number of paradigms drive U.S. foreign policy and that they provide a useful organizing device. In this view, the individual proponents of a particular shared belief system are less important than the position of their paradigm in the ongoing foreign policy debate.[7] Though the individuals make the decisions, they do so as agents of one or another paradigm. POLI is similar in this respect to Carbonell's (1978) POLITICS, in which ideologies and other shared belief structures govern the interpretation of political conflicts.

Focusing on the information-processing system at the level of competing paradigms avoids several problems associated with similar work at the individual level of analysis. Most important, since individual policymakers are often strategic political actors, their expressed beliefs change across audiences and political fortunes. Surely such "beliefs" are poor predictors of their actual positions.

This would be a particularly grave problem for the Policy Arguer Project, since POLI is largely built on the public statements of politicians. However, these statements are not used as indicators of an individual's beliefs; rather, I use them as indicators of important beliefs in the system of ongoing policy argument. Public statements are important in their own right, even if they are not sincere representations of the speaker's own view. If they are persuasive, public statements reflect important beliefs in the political system. Indeed, to the extent that leaders feel compelled to express disingenuous beliefs, they are responding to the pressure of strong paradigms in the political culture. Individuals who share important beliefs from the dominant paradigm will push the argument; opponents may be forced to go along. In this perspective, public statements are important indicators of the paradigms that are engaged in policy arguments, even though they may not represent the speaker's "true" beliefs.

Second, some individual-level projects in foreign policy decision making focus too heavily on one important leader. Except in relatively rare crisis situations, the decisions of one leader do not control U.S. policy. A model of U.S. foreign policy making needs to account for the disputes in the system, for the policy arguments. POLI focuses on these policy arguments, both between opposed paradigms and within a single paradigm. Indeed, the treatment of uncertainty and belief in POLI enables me to trace the amount of support within a paradigm and within the system for any given line of argument.

Data Collection. The paradigms used in POLI I are extracted from the *Congressional Record* for 1949–60, through a type of content analysis. The procedure was to (1) identify a set of potential paradigms described in several U.S. foreign policy texts (George and Smoke 1974; Harrison 1978; Jervis 1976; LaFeber 1972; Nathan and Oliver 1985); (2) distinguish a preliminary set of core beliefs for each paradigm, again using the texts; (3) do a pilot study in the *Congressional Record* for a two-year period; (4) modify the set of paradigms and their core propositions according to the findings of the pilot study; and (5) use the modified paradigm set as the basis for a complete content analysis through the decade.

The first four steps in this process identified the bare skeletons of three paradigms in the early 1950s: militant anticommunism (MAC), pragmatic anticommunism (PAC), and isolationism (ISO).[8] A coding plan for the content analysis through the decade was also developed on the basis of this experience. Briefly, this plan entails six steps:

5a. Identify all references in the *Congressional Record* index under the headings "Asia" and "the Far East."
5b. Find and classify each entry by type and date. They may be speeches, insertions of articles, or floor debates.
5c. Read each entry and convert the logic used onto a code sheet. A completed code sheet is essentially a propositional inventory for the entry.
5d. Determine whether each entry conforms to the core propositions of one of the paradigms and classify the entry accordingly. In the 1950s, the

current three-paradigm scheme was sufficient to classify all the entries.

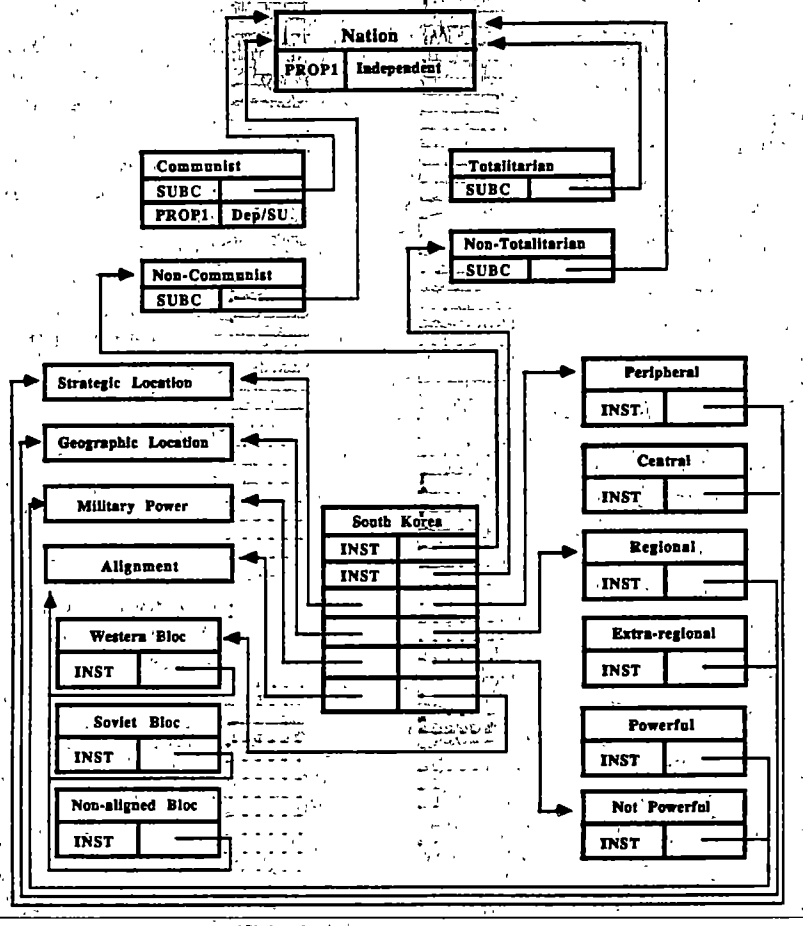
5e. Organize the logic found in the entries for each paradigm according to the structure I shall describe.

5f. Assign a certainty factor (CF), ranging from 0 (indeterminate) to 1.0 (true), to each datum in each paradigm and an overall CF to each paradigm. These CFs, based on the relative frequency of each proposition in the *Congressional Record*, indicate the level of confidence POLI will have in the truth value of the propositions. The certainty factor for a proposition is equal to the proportion of entries that invoked it in the given paradigm and time period. Core rules have the highest CFs because they represent common lines of reasoning in the paradigm. Peripheral propositions are invoked less frequently, are controversial, and have lower CFs. For example, the proposition that the United States should use atomic force in response to an indirect threat (through the domino principle) appears in three of the 37 MAC entries (speeches, articles, or debates) in the 1949–52 period; its CF = 3/37 or .08. Similarly, the CFs for the paradigms, which represent their relative dominance in the decision-making system for the time period, are based on simple frequency counts. For each time period, the proportion of entries supporting a paradigm is assigned as its default CF.

Following this plan, the paradigms for the 1950s, divided into three time periods (1949–52, 1953–56, and 1957–60), were compiled. Each paradigm is a large, complex, frequently inconsistent system of beliefs. I can briefly characterize them, however, by describing their core components.

Militant Anti-Communism. Proponents of MAC argue that communism is a unitary and implacable enemy of freedom and the West. All of the major ills in the world are attributed to international communism under Soviet leadership. There is no room, in this view, for long-term rapprochement with the enemy. In addition, divisions within communism are unlikely. Thus, there is no reason to court disgruntled communist leaders to weaken the Soviet hold on the Communist movement. There is also a clear image of a world divided strategically into a center and a periphery. Those nations that are strategically central must be defended "at all costs." But because the strongest version of the domino theory is core to the paradigm, even strategically peripheral locations must be defended if threatened. Otherwise there is great danger that a series of "dominoes" will fall and threaten some intrinsically central location. A third set of core beliefs for the MAC paradigm revolve around the "bully metaphor" and derive from a counterfactual reconstruction of the appeasement of Hitler by the Allies at Munich. According to this view, Hitler could have been stopped had the Allies stood up to him. International aggressors, like bullies, are basically cowardly; they will back down from firm opposition. Thus, MAC generally prescribes prompt, decisive, unambiguous, and firm actions.

Pragmatic Anti-Communism. Proponents of PAC believe that totalitarianism is the enemy. Communism is not necessarily monolithic; thus, individual communist leaders like Marshall Tito of Yugoslavia may be split off from Moscow's influence. In addition, PAC argues that the spread of communist/totalitarian movements primarily stems from basic social and economic inequalities rather than from military pressure. The PAC paradigm sees a more subtle form of domino theory rooted in the vulnerability of struggling nations that have been recently decolonized. It follows that the best defense against encroaching totalitarianism is a remedy for these social and economic ills. The PAC paradigm advocates economic and material solutions to most problems, but it is willing to use military power when allies and interests are directly and militarily threatened.



Isolationism. Isolationists argue that the United States should again withdraw from international politics. There are two basic components—one practical, the other moral. In practical terms, the ISO paradigm argues that the United States does not have the resources to maintain world leadership without degrading the quality of life at home. The concern of U.S. leaders should thus be internal. In addition, it would be imprudent to waste resources on a long struggle with communism. In moral terms, the United States can only maintain the ethical high ground by refusing to become involved in international adventures. Any appearance of complicity in colonialism, in particular, would damage U.S. integrity.

Paradigm Structure. Each paradigm in the knowledge base contains two types of knowledge. Procedural knowledge, in the form of IF→THEN production rules, codes how something is done ("IF communists invade South Korea, THEN send military forces"). Declarative knowledge describes important concepts and their relationships ("France is an ally"). These two types of knowledge in a paradigm serve distinct functions in the model: declarative knowledge is used to interpret input events, while procedural knowledge is used to reason from the interpreted events to conclusions.

The interpretive beliefs necessary to a paradigm (i.e., its declarative knowledge) are represented in POLI by a *frame system* with inheritance. One can think of frame systems of knowledge representation as hierarchical relational data bases. Each object in the system (in this case, each regional actor, class of actors, or property of actors) occupies a frame that may have any number of slots representing properties of the object. An object's properties can originate with itself or with other objects ("fillers") to which relational arrows point (i.e., objects "inherit" properties from classes to which they belong). In addition,

FIGURE 1

Militant Anticommunist (MAC) Frame System for South Korea

Note: PROP1 is the first in a list of properties of the object; SUBC means the object is a subclass of the category to which an arrow points; and INST means the object is an instance of the category to which an arrow points.

since this information is belief, rather than fact, each object's "degree of membership" in superclasses and the degree of confidence that the paradigm has in its assignment of characteristics must be considered. An empirically derived certainty factor is assigned to each element of belief in the frame.

Figure 1 gives an abbreviated example of interpretive beliefs as a frame system without CFs specified. Of course, this information is actually linked in a large frame system with all other regional actors, though it is difficult to present even two nations on one page clearly, let alone the entire system.

The *production rules* in a paradigm allow reasoning from an interpreted event to some policy output through inference chaining. These rules take the general form of IF→THEN propositions. Some take situations as their conditions ("IF an important enemy attacks an important friend"), while others take goals as their conditions ("IF you wish to oppose the attacker"). In addition, some give goals as their consequences ("THEN oppose the attacker"), while others give executable actions ("THEN attack the attacker"). The bulk of each paradigm consists of a long list of these propositions. Of course, like the declarative information in the frame system, procedural information is uncertain; each rule has an empirically derived CF that indexes the paradigm's confidence in the rule.

POLI'S INFERENCE ENGINE

The inference engine applies beliefs as represented in the knowledge base when POLI is confronted with an event. Processing begins when information about an event (e.g., North Korea attacks South Korea in 1950) is placed in working memory (through the user interface). The inference engine uses declarative beliefs to interpret the event, procedural beliefs to reason forward from its interpretation to a set of possible policies for responding to the event, and then selects a subset of these policies for implementation.

The Interpretation of Events

Suppose I present POLI with an event involving South Korea. The inference engine will search the paradigms in its knowledge base for declarative information about South Korea on which to base its interpretation. It will "understand" South Korea to be the collection of attributes assigned through the declarative information. Of course, like human experts, POLI is most efficient when it has a lot of interpretive information; but POLI does degrade gracefully, producing limited interpretations and inferences from partially understood events.

Consider POLI's interpretation of South Korea based on the abridged MAC frame system in Figure 1. Note first that South Korea is an instance of a noncommunist nation. Since noncommunist nations are a subclass of nations, South Korea will inherit the properties of nations (e.g., independence as an actor). South Korea is also listed as a nontotalitarian nation and has the properties Strategic Location = Peripheral, Geographic Location = Regional, Military Power = Not Powerful, and Alignment = West Bloc. In addition, each piece of declarative information has an associated CF, which the inference engine can use to gauge how much confidence it should place in an interpretive belief. The MAC paradigm might be very confident that South Korea is weak (CF high), but have little confidence in the inference that South Korea is strategically peripheral (CF low). Other information that the paradigm considers important is represented in the complete frame system (e.g., trade relations and the existence of an insurgency movement).

Similarly, each paradigm in POLI interprets the entire event, broken into its components: actor, target, verb, and context. When POLI is unable to interpret part of an event (say, the verb is unrecognized), it alerts the user to the problem and proceeds on the basis of the information it can interpret.

Inference Chaining and Fuzzy Reasoning

A paradigm recommends specific executable behaviors by reasoning through an inference chain from the interpreted event to the output policy recommendation. This inference process begins when the conditions of an IF→THEN rule match "facts" in working memory (initially, just the interpreted event). The rule "fires," and the consequences of the rule are added to the list of known facts. These inferred facts may enable other rules to fire; and, in a cascading effect, more beliefs may be inferred in response to the event, triggering still more rules.

Since I am interested in the diverse arguments that might emerge from these paradigms, there is little restraint in POLI on the growth of inference chains; I want all possible arguments to develop. To avoid infinite looping, no rules can appear twice in the same chain. Otherwise, inference chains grow as long as rules continue to fire. As you might imagine, POLI needs some mechanism for distinguishing among the hundreds of inference chains that can grow from a paradigm. In addition, the multiple paradigms in POLI produce competing outputs and arguments. POLI resolves conflicts of this sort through fuzzy reasoning based on CFs. The inference engine calculates a certainty factor for each of the competing conclusions, allowing POLI to distinguish strong from weak inference chains.

Reasoning in POLI is fuzzy in the technical sense of using fuzzy logic. Based on Zadeh's (1965) original theory of fuzzy sets, fuzzy logic provides a means of formally representing degrees of belief. The membership function of a fuzzy set maps to the [0, 1] segment of the real line, rather than to the two element set (0, 1), which allows a continuum of membership values (Cioffi-Revilla 1981; Negoita and Ralescu 1987; Seitz 1985; and my earlier work, Taber 1991). In fuzzy logic, this property is applied to capture the partial truth value of conditional statements and the natural vagueness of declarative concepts. The conditions in a production rule and the rule itself carry partial truth value. In Boolean logic, based on the theory of crisp sets, such conditions must be either true or false, leaving no room for degrees of truth. This would be a serious inflexibility in a belief system such as POLI. Decision makers clearly have uncertain—sometimes conflicting—beliefs; and they frequently use verbal hedges to qualify their beliefs. A descriptively accurate model of this process must allow reasoning from partial truth or vague meaning.

Surprisingly, given the importance of uncertainty in political beliefs, most of the major political computational models do not address the issue; the notable exceptions are JESSE (Sylvan, Goel, and Chandrasekaran 1990) and the Superpower Rivalry models (Seitz 1987). In the larger context of cognitive science, however, the manipulation of vague and subjective knowledge has been a major focus (Negoita and Ralescu 1987). Several formalisms exist for representing uncertainty, including probability theory and fuzzy set theory.

Where one wishes to express the vagueness of a natural language concept or belief, the approach based on fuzzy set theory enjoys an important advantage over a probabilistic approach (Cioffi-Revilla 1981; Seitz 1985). Consider the concept *powerful*. Its intuitive meaning concerns some vaguely defined quality that actors may have more or less of. But probability theory, based on the mathematics of crisp sets would force us to define some ideal or absolute meaning for the concept. To say, "China is quite powerful" would be to say that there is some fairly high probability that China has this ideal quality *in full*. This is quite different from the natural meaning of the phrase. Fuzzy set theory, on the other hand, focuses our attention on the relative *amounts* of this quality nations have. Now to say, "China is quite powerful" is to say that China, *relative to other actors* has a substantial amount of this quality. Indeed, we can assign a numerical value to the fuzzy variable *powerful* for China that will be understood in relation to the values assigned to other actors. In the POLI project these CFs

are empirically derived as part of the content analysis I have described. They are based upon the degree of support for a particular belief within the given paradigm.[9]

The production rules in POLI are fuzzy conditional statements in that certainty factors (CFs) are associated with the elements of the rules. Here I will simply illustrate the algorithm for fuzzy inferencing used in POLI (the derivation is presented in Taber 1991). Consider the rule "IF a nation has large oil reserves, THEN that nation is rich," which has a CF of .3. This rule means that the expert system has .3 confidence in the conclusion "That nation is rich" when it is certainly true that "that nation has large oil reserves" (i.e., when the CF for the premise is 1.0). When the system receives information that "Saudi Arabia has large oil reserves" with CF = .9, we can infer the information that "Saudi Arabia is rich" with a calculable degree of belief. Through an application of the compositional rule of inference, we compare the CF of the new information (.9) with the CF of the known relationship (.3), taking the smaller. The expert system would report the inference that Saudi Arabia is rich with CF = .3. Now if we input the information that "Bangladesh has large oil reserves" with CF = .01, the expert system would only have .01 confidence in the inference that Bangladesh is rich.

Taking a more complex example from POLI, the event "The Vietminh attack France at Dienbienphu in 1954" is interpreted (in part) by MAC as "unimportant enemy (.6) attacks (.9) important friend (.4)." In addition, the MAC paradigm includes the very uncertain production rule, "IF enemy attacks important friend, THEN drop an atomic bomb on the enemy (.08)."

Since in fuzzy logic, conjunctions of fuzzy elements carry the truth value of the minimum fuzzy element and disjunctions carry the truth value of the maximum fuzzy element, the condition of the rule in the example will have a global CF of .4, the minimum of the truth values for the three elements of the premise. But this rule has a very low CF (.08) associated with it, and this low CF must affect the conclusion. Using the compositional rule of fuzzy inference, the smaller of the rule CF and the premise CF is assigned to the inferred conclusion, resulting in a .08 level of confidence in the recommended action, "Drop an atomic bomb on the Vietminh."

These fuzzy algorithms make intuitive sense. *All* the elements must have some truth value for a conjunctive argument to hold; so a conjunctive argument is only as strong as its weakest link. Conversely, a disjunctive argument should be as strong as its strongest element, since *only one* of the elements need be true. Finally, in the context relevant to POLI, where rule CFs define the inferential relationship between premises and conclusions, one may view the compositional rule of fuzzy inference as a special case of conjunction. It is the logical conjunction "Premise is true (CF)" *and* "Rule is true (CF)." Both must have some truth value for the conclusion to have any truth value.

The processor must still select among the recommendations of all of the paradigms. Recall that POLI's inference engine produces three sets of uncertain recommendations—one for each paradigm. To the decision-making system, paradigms are more or less true descriptions of the world at any one time. They are informal theories about regional processes. One paradigm may dominate discussion among policymakers for a period because the decision-making system believes it to be a good representation of the world. Other paradigms still create arguments and inferences, but their individual arguments cannot be more persuasive than the paradigm as a whole. POLI limits the confidence it places in particular inferences of a paradigm to the confidence it places in the paradigm. Again, following the rule of fuzzy conjunction, POLI assigns to each recommendation of a paradigm the minimum of the paradigm's confidence in the recommendation and POLI's confidence in the paradigm itself.

Recall the Dienbienphu example that resulted in the inference "Drop an atomic bomb on the enemy" with CF = .08. Even if the paradigm that makes this recommendation is quite dominant (as MAC was in 1954), POLI would only accept this inference with .08 confidence—the CF of the inference *within* the MAC paradigm. Now consider the weaker isolationist paradigm (CF = .025). Even if it made an inference of which it was quite sure—"Remain neutral (.9)"—the inference would only be accepted by POLI (*outside* of the ISO paradigm) with a .025 CF.

An input event, then, produces several recommended policies from the paradigms, each with a CF attached, and each with supporting arguments. POLI selects a subset of these recommendations upon which to act, using the CFs as a guide. One selection mechanism in POLI generates a probability distribution over the CFs of all policies in the recommendation set and chooses policies stochastically. In the Dienbienphu example, though neither ISO's recommendation to remain neutral nor MAC's atomic policy would be very probable, there would still be a small chance of each. A second approach deterministically selects the recommendations with the highest CFs.

VALIDITY AND POLI AS AN ANALYTIC TOOL

Computational modeling techniques allow foreign policy analysts to increase the descriptive detail of their models without losing analytic focus. I shall demonstrate the descriptive complexity possible using the Policy Arguer as an analytic tool while also addressing the issue of validity.

In discussing an information-processing model like POLI, we must distinguish outcome from process validity, where outcome validity is the familiar notion of correspondence between the model's predictions and behavior from the real world system. Do the

outputs of the information-processing model—treated as a blackbox—match, to an acceptable level of statistical significance, the outputs of the empirical system? Process validity, on the other hand, concerns the correspondence between the mechanisms in the model and those in the real world system. If an important virtue of a computational model is that it is *not* a blackbox, we must demonstrate its reasonableness as a process model.

Outcome Validity

The outcome validity of POLI was checked using a chronology of Asian events in the 1950s, compiled by the Royal Institute of International Affairs, as a test data set ($N = 161$). For each event in the test data, the actor, target, and verb were identified, along with the U.S. responses. An average of slightly more than three responses per event were given in the test data. It was then straightforward to run each event through POLI and compare the recommended policies with the policies actually chosen by the United States. If the historically selected policy or policies were highly recommended by POLI, where a "high recommendation" was operationally defined as "having one of the top five CFs in the recommendation set," it was counted a success for the model.[10] If *all* of the actual U.S. responses identified in the test data set were not highly recommended by POLI, it was counted a failure for the model.

POLI did remarkably well in the decade of the 1950s, succeeding on 138 out of the 161 events. For just under 86% of the events in the test data set, POLI's highest recommendations included all of the policies chosen by the U.S. foreign-policy-making system. In addition, an analysis of the 23 failures shows that POLI came close for most of them. Either a chosen policy was just outside the highly recommended set and would still be a likely choice if the selection were stochastic or else the real world policy was too imperfect a match with POLI's recommendation. For example, POLI (based on MAC reasoning) highly recommends that the United States accuse China of imperialism in 1953 in response to China's attempt to increase trade with Great Britain. The actual policy chosen by the United States, as identified in the test data set, was "attempt to block increased trade." This is not a match, but one could argue that the intention is the same. In addition, an exact match in this example fell just outside the set of highly recommended policies. MAC pushes the policy "oppose increased trade between China and Great Britain," but only with .17 confidence; the cutoff for high recommendation was .282 in this case.

A potential problem exists with this analysis, however. The knowledge and beliefs that POLI uses to interpret events and reason to conclusions are extracted from speeches in Congress in the same time period as the events. Although the test data set is operationally independent of the *Congressional Record*, some of the speeches and articles respond directly to particular events that appear in the test data set. In other words, the logic and arguments on which POLI is based are, in part, the congressional responses to events in Asia. Because these events do appear in the test data set, there is a possibility of circularity.

To find out if this problem was serious, I used the knowledge base from the prior period to operate on events. Thus, I used the 1949–52 knowledge base for 1953–56 events, the 1953–56 knowledge base for 1957–60 events, and the 1957–60 knowledge base for 1961–63 events.[11] POLI remained very successful, even for this more stringent test. Fully 75% (84/112) of the actual U.S. responses to the events matched POLI's highest recommendations.

But how should we assess the success of POLI? Is 86% correspondence "good"? To gauge POLI's success, I will compare it with the performance of two null, or baseline, models: the *inertia model*, where existing policies are repeated in response to new events, and the *modal behavior model*, where frequently used policies are selected in response to new events. These null models are variants of the well-known organizational process model (Allison 1971), and we might expect them to do reasonably well. I will instantiate the two null models using the chronology of Asian events as described and compare POLI's performance with each.

But if I count successes and failures for the models at the descriptive level I have used for POLI, neither of the null models can approach POLI's performance. POLI matches actual U.S. responses to Asian events in the test data in much greater detail. In addition, neither of the null models can interpret events. The events must be categorized for them. POLI's task, which includes the interpretation of "raw" events and the detailed recommendation of policy responses, is considerably more comprehensive than either of the null models can attempt. Indeed, the fact that POLI does more theoretical work is already a powerful recommendation.

Table 1 presents the coding scheme used to reduce the level of description of the test data set. Quantifying event types and U.S. responses gives us a more typical events data set,[12] allowing a fairer test of the null models and a clearer comparison with POLI. Each of the 161 events in the test data set was placed in one of the eight categories, where plus signs denote a cooperative verb, minus signs, a conflictual verb. Thus, when Soviet leaders visited India in 1955, promising development assistance, it was a type 4 event: an enemy of the United States did something cooperative to a friend of the United States. Next, the U.S. response to each event was coded according to the ordinal scale in Table 1. Since this response is directed, we also code whether it is aimed at the actor in the event (1), the target in the event (2), or a third party (3). For example, the United States increased its development assistance to India to counter the 1955 Soviet offer. This response is coded a 2–2, the first digit indicating the position of the response on the scale, and the second, that it was directed at the target in the original event (India). In addition, the United States denounced the Soviet Union as impe-

TABLE 1

The Categories of Behavior

Event Types

1. Enemy + Enemy
2. Enemy − Enemy
3. Enemy + Friend
4. Enemy − Friend
5. Friend + Friend
6. Friend − Friend
7. Friend + Enemy
8. Friend − Enemy

U.S. Response Categories

1. Military Aid
2. Economic/Development Aid
3. Verbal Support
4. Positive Propaganda (e.g., symbolic support for nationalism)
5. Persuade, Negotiate
6. Negative Propaganda (e.g., name calling)
7. Verbal Condemnation (e.g., diplomatic protests)
8. Verbal Threat
9. Nonverbal Threat (e.g., movement of troops)
10. Direct Military Force

rialistic, which would be coded a 6–1: a 6 on the response scale and a 1 indicating that the response was directed at the actor in the event (the Soviet Union).

Since it gives POLI a major advantage in the test, I do not consider more than one U.S. response to each event in the test data set. Rather, I will only include the most extreme U.S. response. For each event, the U.S. response closest to an endpoint on the scale was coded. Note that this gives the null models their best chance of producing successful predictions in the data.

According to the inertia model, the United States will continue its existing policy given a particular type of event. For example, when the United States is confronted with a type 4 event, it searches history for the most recent occurence of a type 4 event and repeats the policy it used then.

The modal model says that the United States will apply its most frequently used policies in response to an event. A naive modal model might only consider the single most frequent response for each type of event. For example, the modal response for a type 4 event is a verbal condemnation of the actor (7–1). Every time a type 4 event occurs, the naive modal model selects 7–1. A more sophisticated modal model, on the other hand, would consider the two or three most common responses to each event. In this case, the model would propose, in response to a type 4 event, *either* a 7–1 or a 1–2 (military aid to the target). If either of these was the actual U.S. response, it would be a success for the sophisticated modal model.

We should expect the modal models to do very well in that they apply future information in selecting a response—they provide more hindsight than prediction. Of course, as I have noted, POLI also applies some beliefs developed on the basis of current events, though the circularity is not nearly as direct as in the modal model. POLI, of course, remained very successful even when this potential circularity was eliminated (75% success). As a final null model, we will use a version of the modal model that does not consider future information. The modal intertia model applies the most frequent responses to events of a given type from history at the time of the event. Instead of doing a frequency count across the decade for responses to each event, we now consider only the frequencies of responses that have occurred before the event. Thus, response 1–2 was the modal inertia response to a type 4 event in January of 1950; but by 1955, the modal inertia response was either 7–1 or 1–2.

TABLE 2

POLI's Predictive Accuracy Compared with Several Null Models

MODELS	CORRECT	INCORRECT	% CORRECT
POLI	143	18	88.8
Sophisticated modal	105	56	65.2
Naive modal	75	86	46.6
Modal inertia	66	87	43.1
Inertia	65	88	42.5

Note: Each of the five models makes predictions about the U.S. response to events in Asia in the 1950s, which are tested against the actual behavior of the United States as compiled by the Royal Institute of International Affairs (N = 161). The inertia models do not generate a prediction the first time an event type is encountered (N = 153).

Finally, POLI's responses to the events were coded using the same scale. Since POLI recommends multiple responses, only the one with the highest CF was coded. If several policies tied for the highest CF, the most extreme response was used.

Table 2 directly compares the four null models and POLI. Note first that POLI improves a little on its earlier performance, because the test is less stringent. Some of the 23 misses in the earlier test are matches at this level of description. The sophisticated modal model also does fairly well (65%), though POLI's proportion of successful matches is significantly better. Using the best null model (the sophisticated modal model) as a baseline for success in predicting the historical trace, the probability of achieving POLI's success if it were not in fact a better correspondence model is very small ($p < .00001$ using the binomial test). POLI clearly outperforms the null models.

Process Validity. It should be clear, of course, that POLI makes many recommendations for each event that are not close to the actual responses of the U.S. government. This is not a defect. The Policy Arguer is a process model of the decision-making system and not just of policy outcomes. It models the diverse arguments in the system, even the ones that are not

acted upon. The previous analysis demonstrated that most of the time, POLI's strongest recommendations are the things that the United States actually did. But a more compelling concern is the process by which those outcomes are reached.

In many respects, the most interesting feature of POLI is the detailed argumentation that supports its recommendations. This section recreates a case study of the U.S. response to the outbreak of the Korean War. Though we focus on this one case here, a similar case study emerges from every POLI run.

Unfortunately, detailed case studies can do no more than establish the process *plausibility* of POLI. As others have convincingly argued, correspondence tests of process generally are a species of face validity, requiring a different mode of analysis than the familiar statistical approach to outcome validity (Job and Johnson 1991; Schrodt 1991; Sylvan, Goel, and Chandrasekaran 1990; Whicker and Sigelman 1991). I will support the face validity of POLI as a process model by detailing POLI's response to the Korean case and comparing it to the reasoning and arguments attributed to the United States in historical case studies.

On June 25, 1950 troops of the North Korean army crossed the border between North and South Korea in a massive surprise attack. Over the next few days, U.S. leaders made three key decisions concerning this invasion: (1) that the United States had to intervene militarily, despite earlier assurances that South Korea (and even Taiwan) was outside of the U.S. defense perimeter in Asia; (2) that they would use the collective security mechanisms set up in the United Nations Charter; and (3) that the intervention must be limited in nature.

When POLI is confronted with the event "North Korea attacks South Korea in 1950," each of the three paradigms interprets the event and then reasons forward from the interpreted event to a set of policy options (Table 3). The trace of this process provides POLI's explanation of each policy.

The militant anticommunist paradigm (MAC) characterizes North and South Korea according to the attributes that the paradigm considers important. For example, MAC believes that both Koreas are strategically peripheral, that North Korea is East-aligned and South Korea West-aligned, and that both Koreas are militarily weak (though MAC is far more confident that South Korea is weak). The values of other attributes are also assigned from the MAC knowledge base. Several basic interpretive rules then operate on this declarative information to classify North and South Korea as unimportant expansionist enemy and unimportant friend, respectively. Finally, MAC interprets the verb *attack* to mean "physically threaten." Of course, MAC's real understanding of *attack* is found in the way its rules actually use the verb *physically threaten*.

Given MAC's interpretation of the actor, target, and verb, POLI can now apply its procedural knowledge to infer courses of action in response to the event. The following display provides the MAC reasoning behind the decision to intervene militarily:

TABLE 3

POLI's Policy Options for the 1950 North Korean Attack

PARADIGM[a]	POLICY OPTIONS	CERTAINTY FACTOR[b]
MAC	Communicate commitment to protect target	.560
	Increase military aid to target	.560
	Increase military support to regional non-communists	.500
	Military blockade on actor	.500
	Send military advisors to target	.500
	Act through the U.N.	.440
	Send U.S. troops to target	.440
	Investigate the event/problem	.440
	Trade embargo on actor	.440
	Reduce aid to actor	.400
	Communicate opposition to regional hegemony	.400
	Aid friends in region who oppose actor	.350
	Diplomatic sanctions against actor	.350
	Increase material support to regional non-communists	.330
	Increase trade with target	.280
	Increase economic aid to target	.280
	Increase industrial aid to target	.270
	Increase global military readiness	.220
	Communicate the containment line in Asia	.220
	Threaten use of atomic bomb	.210
	Directly attack communist actors in Asia	.170
	Subvert communist actors in Asia	.170
	Do nothing	.110
	Withdraw diplomatic recognition of actor	.110
	Withdraw envoys	.110
	Pressure allies to sanction actor	.110
	Consult allies about intended policy	.110
	Lodge protest in U.N.	.056
	Link economic aid to target compliance on other issues	.056
	Attack actor	.000
PAC	Avoid direct U.S. military involvement in Asia	.250
	Consult with Asian leaders before taking action	.250
	Sponsor conferences to gather input from Asian leaders	.250
	Restrict direct use of U.S. ground troops	.250
	Apprise Soviets of limited U.S. objectives	.250
	Do not directly attack Soviet territory	.250
	Raise problem in U.N. Security Council	.250
	Support only popular governments in Asia	.250
	Promote individual freedoms and human rights in Asia	.250
	Help Asian leaders address immediate welfare concerns	.250
	Help aspiring Asian democrats to write constitutions	.250
	Accuse Soviet communism of imperialism in Asia	.250
	If aid is given, do not attach strings to the aid	.250
	Encourage civil liberties in target	.250
	Monitor use of U.S. aid by target	.250
	If target is to be aided, give slowly so target can absorb it	.250
	Increase educational aid to target	.250
	Increase economic aid to target	.250
	Increase technical aid to target	.250
	Promote principles of majority rule, freedom, and equality	.250
	Publicly repudiate colonialism	.250
	Do not approach Soviet territory in military action	.240
	Apprise China of limited U.S. objectives	.230
	Do not directly attack Chinese territory	.230
	Do not approach Chinese territory in military action	.230
	Consider minimal use of air power first	.210
	Publicly support target	.140
	Encourage Asian nationalists to redistribute wealth	.140
	Tolerate independent foreign policies of Asian allies	.140
	Increase humanitarian aid to target	.140
	Freeze military aid to target	.110
ISO	Remain neutral about event	.125
	Offer to mediate dispute between actor and target	.125
	Reduce defense commitments in Asia	.125
	Rely on air and nuclear forces for defense of U.S.	.125
	Withdraw U.S. forces from Asia	.125
	Do not get involved in the internal affairs of Asian nations	.125
	Withdraw from U.N. Security Council	.125
	Reduce U.S. financial commitment to U.N.	.125
	Ask U.N. to leave New York	.125
	Do not join major U.N. peacekeeping efforts	.125

[a]The paradigms are militant anti-communism (MAC), pragmatic anti-communism (PAC), and isolationism (ISO).
[b]These certainty factors (CFs) represent the confidence POLI has that the given policy option would be a good choice. They are based on the empirically-derived CFs for the expert knowledge and the fuzzy inferencing techniques described above.

IF Actor physically threatens target
THEN Actor is important (.6)
AND Target is important (.6)

IF Political system of actor is communist
AND Political system of target is non-communist
AND Actor and target are contiguous
AND Actor physically threatens target
THEN Target is in danger of falling communist (.9)

IF Target is friend
AND Target is important
AND Target is in danger of falling communist
THEN Goal: Prevent target from falling communist (.6)

IF Goal: Prevent target from falling communist
THEN Goal: Reinforce military preparedness of target (.56)

IF Goal: Reinforce military preparedness of target
THEN Policy: Increase military aid to target (.56)
AND Policy: Send military advisors to target (.5)
AND Policy: Send U.S. troops to target (.44)

One of the features of the MAC paradigm is that targets and actors take on new importance when they are active. This comes from the belief that all parts of the world are linked together, so that peripheral nations become the front line when they are threatened (or when they threaten). This was one reason that U.S. leaders explicitly led North Korea and the Soviet Union to believe that South Korea was outside the defensive perimeter of the United States yet responded vigorously to the attack when it happened (Paige 1968, 66–7). Until the attack occurred, Korea *was* outside the U.S. defense perimeter. The belief that peripheral nations take on new importance when militarily active—an essential component of the domino theory—is represented in MAC by the first rule in the display.

The second rule represents another key part of the domino theory: noncommunist nations that border communist nations are in great danger of falling whenever they are the target of communist aggression. Thus, a cascade of collapses can be expected if any nation is allowed to fall. United States leaders used this line of reasoning as their major argument for intervention (George and Smoke 1974, 162–72; Glad and Taber 1991; Nathan and Oliver 1985, 120; Paige 1968). In his *Memoirs*, for example, Harry Truman wrote: "I felt certain that if South Korea was allowed to fall Communist, leaders would be emboldened to override nations closer to our own shores. If the communists were permitted to force their way into the Republic of Korea without opposition from the free world, *no small nation would have the courage to resist threats and aggression by stronger Communist neighbors*" (1956, 333, emphasis mine).

The third rule in the display sets up the goal "Prevent target from falling communist" in response to the facts in working memory: "Target is friend," "Target is important," and "Target is in danger of falling communist." In order to achieve this goal, several subgoals are set up, including the one given in rule 4. Finally, rule 5 operates on this subgoal by proposing three policies: "Increase military aid to target," "Send military advisors to target," and "Send U.S. troops to target." All three of these specific forms of military intervention, recommended by MAC, were actually taken by the United States in response to the North Korean invasion of South Korea in 1950. More importantly, the reasoning found in the display corresponds to the reasoning in the system—or at least to public justifications (Paige 1968; M. Truman 1973, 504–10).

MAC follows several other lines of reasoning to arrive at the policy recommendation "Act through the UN." One is related to the costliness of sending U.S. troops into action. By acting under UN auspices, the United States could keep economic and psychological costs down. This, of course, was part of the concern for limiting the war. Public opinion was strongly opposed to any long-term and bloody intervention (Nathan and Oliver 1985, 121–27; M. Truman 1973, 508–16). Thus, part of the reason for acting under UN auspices was reducing the potential cost to the United States.

A second reason offered by POLI (MAC) for acting through the UN is the principle of collective security. Policymakers of this period, both from the MAC and the PAC paradigms, believed that the proper response to any international aggression which violates international law, is collective. This was one of the primary reasons for the existence of the UN and its Security Council. MAC develops this argument in full—though in MAC it applies only to friends. It would not be triggered if the target of aggression was communist.

The collective security argument was prevalent among the U.S. decision makers reacting to the North Korean invasion (Paige 1968; M. Truman 1973, 498–510). One of the earliest communications from General MacArthur in Japan (Commander of U.S. Pacific Forces) on the morning of 25 June set the tone by calling the North Korean attack an "undisguised act of war *subject to United Nations censure*" (M. Truman 1973, 496, my emphasis). Indeed, Secretary of State Dean Acheson moved to bring the case before the UN Security Council even before notifying President Truman, who was in Missouri on family business (Nathan and Oliver 1985, 120).

Similar sets of arguments can be made about the other MAC recommendations found in Table 3. For example, the strong inference "Communicate commitment to protect target" follows from the belief "Target is friend" and from the domino theory conclusion "Target is in danger of falling communist." Whenever friends are in danger of toppling, according to strong elements of MAC, the commitment to protect them should be expressed publicly.

Although the confidence POLI has in the pragmatic anticommunist paradigm (PAC) is only slightly more than half as great as the confidence it has in MAC,

PAC does make important contributions to the policy debate. The PAC interpretation of the event is very similar to the MAC interpretation. North and South Korea have the same basic characteristics, but PAC attaches different CFs. For example, PAC is less confident that North and South Korea are strategically peripheral. Given this interpretation of the event, POLI now uses the PAC rule base to produce another, and competing, set of policy recommendations (see Table 3).

One line of argument supports the MAC view that action should be taken in the UN. This reasoning parallels the collective security argument just discussed. It is found in the rule,

IF Actor physically threatens target
AND Actor is not US
THEN Policy: raise problem in UN Security Council (.44).[13]

According to this rule, whenever there is international aggression that the United States did not initiate, the issue should be taken to the UN Security Council and dealt with as a collective security problem.

The third major decision made by U.S. leaders in response to the North Korean attack was to limit the U.S. intervention. The MAC paradigm provides a good "replication" of the first two real world decisions—to intervene and to act through the UN. But the only line of reasoning MAC offers relevant to this third decision is more directly applicable to the decision to act through the UN. The following display presents two inference chains from PAC for this third broad decision:

Chain 1

IF Goal: Contain Soviet communism in region
THEN Goal: Promote Asian nationalism (.44)

IF Goal: Promote Asian nationalism
THEN Policy: Avoid direct U.S. military involvement in Asia (.44)
AND Policy: Consult with Asian leaders before taking action (.44)
AND Policy: Sponsor conferences to gather input from Asian leaders (.44)

Chain 2

IF Actor physically threatens target
AND Borders of actor or target is USSR
AND Goal: Avoid World War III
THEN Goal: Limit U.S. military involvement (.49)
AND Goal: Avoid taking action that threatens Soviet security (.4)

IF Goal: Limit U.S. military involvement
THEN Policy: Restrict direct use of U.S. ground troops (.34)
AND Policy: Consider minimal use of air power first (.21)

IF Goal: Avoid taking action that threatens Soviet security
THEN Policy: Apprise Soviets of limited U.S. objectives (.3)
AND Policy: Do not directly attack Soviet territory (.4)
AND Policy: Do not approach Soviet territory in military action (.24)

PAC argues in Chain 1 that one of the best ways to contain Soviet communism in Asia is to strengthen the indigenous support for Asian leaders. This general goal of containment is one of the paradigm goals for PAC that applies in any situation. PAC adopts several subgoals designed to achieve containment, including the goal "Promote Asian nationalism," which in turn causes the last rule to fire, producing three policy recommendations to limit direct U.S. involvement. These recommendations exemplify the belief that Asian nationalism as an anticommunist force will strengthen if allowed independence. This line of reasoning also recognizes that Asian leaders are an important source of information and understanding about events in Asia.

Several congressional leaders used these arguments as part of their attack on the Truman administration's quick decision to intervene. In the early days of the war, the United States did not consult Asian allies about the proper response to the invasion. This failure to consider Asian sensibilities and expertise was severely criticized in the United States (and abroad) along the lines argued in PAC (LaFeber 1972, 100–121).

Chain 2 represents a different line of argument for limited intervention. Whenever international aggression occurs in the geographic vicinity of the USSR (a similar chain fires for China), PAC becomes very concerned about avoiding a direct confrontation. Special care must be taken not to provoke security concerns for either China or the Soviet Union in these cases.

The specific policy recommendations from Chain 2 were clearly followed by the United States in the first few days after the North Korean attack. A chronology of the decision process presented by Snyder and Paige (1962) demonstrates the accuracy of POLI's reasoning. It includes the choices on June 26 "to commit American air and naval units in direct combat support" of the South Koreans and "not to use ground forces in direct combat at this time"; on June 28 "to extend American air and naval action north of the 38th parallel"; and on June 29 "to restrict use of ground troops to protection of supply lines and evacuation of citizens," "to restrict American air and naval action to purely military targets north of the 38th parallel," and "to order air and naval units to stay clear of the Soviet and Chinese borders" (pp. 237–38). United States leaders also explicitly informed Moscow on June 27 that American objectives in Korea were limited (LaFeber 1972, 99). In addition, the arguments used in the actual decision making system to support these policies were precisely the ones used

by PAC (outlined in the text and in the display) to infer them (Paige 1968).

Because POLI has little confidence in the isolationist paradigm, its policy recommendations have significantly lower CFs. The ISO dominance of .125 is assigned to all of its inferences to reflect this skepticism. I will trace two lines of reasoning from ISO, one resulting in the recommendation to "remain neutral" and the other in the recommendation to avoid involvement in "internal affairs of Asian nations."

Unlike MAC, the isolationist paradigm does not invest added importance in militarily active nations. The Koreas were strategically peripheral before the attack, and they remain so after the attack. So the first chain consists of the single rule,

IF Strategic location of actor/target is peripheral.
THEN Policy: remain neutral about event (.7).

The second inference chain responds to the general ISO goal, "Never violate sovereignty." To achieve this goal, ISO recommends the policy, "Do not get involved in the internal affairs of Asian nations."

In fact, only a fraction of American elites objected to the U.S. intervention, and only part of this dissent was motivated by isolationist arguments like these. Senator Taft, one outspoken isolationist critic in 1950, accused the Truman Administration of overstepping its authority by intervening without consulting Congress. In some of his criticisms, Taft used both of the arguments just sketched for ISO (Foster 1983, 103–4). At other times, however, Taft seemed to support the intervention, merely disagreeing with Truman's failure to consult Congress (LaFeber 1972, 99).

Though I certainly cannot claim to have proven POLI's process validity, I do believe the reasonableness, or face validity, of the model to be well supported by this detailed comparison of POLI's reasoning with that of the U.S. policy-making system. In addition, two other case studies generated by POLI (attempts to settle Japan's disputes with South Korea in 1953 and the 1958 Taiwan Straits crisis) have been successfully compared to historical descriptions (Taber 1991).

Sensitivity Analysis. Like many computational models, POLI is very complex, containing three sets of production rules and three large frame systems for declarative information in each time period. An important question in models of this sort is, How sensitive performance is to changes in the knowledge base? (Benfer, Brent, and Furbee 1991). Do the model's reasoning and outcomes change with minor modifications of CFs or when we eliminate some of the rules? A reasonable model should eventually degenerate with the elimination of model components (Whicker and Sigelman 1991); but it should also be robust in the face of minor changes of features of the model about which we are relatively unsure. In other words, we want a model that is sensitive to modifications of central components but less sensitive to changes of peripheral components.

I will test sensitivity in POLI on three levels. First, the model should clearly be sensitive to substantial changes in paradigm dominance. If the relative dominance of the MAC and ISO paradigms flipped in 1950, I would expect a somewhat different response to the Korean invasion than the one we saw. In fact, I do find that systematic variations of the relative dominance of the three paradigms affect model performance. (It would be rather disingenuous of me to applaud this result, however, since it clearly follows from the model structure as described.)

Second, I identified the elements of belief that appear *never* to be used in a chain of reasoning. I ran the 161 events in the test data set through POLI, keeping a counter for the number of times each element of belief was used. Typically, large rule-based systems like POLI contain a significant amount of redundant information. So I was surprised to find that POLI was really quite lean. Only 108 of the 1,467 rules were never active in this test (though a somewhat larger number were rarely active). Note that in addition to estimating the amount of chaff in POLI, I can also use this sensitivity test to establish rigorously the core and periphery of the paradigm. Not surprisingly, there was a strong correspondence between a rule's activity counter and its CF. All 108 inactive rules had CFs too small ever to lead to a highly recommended policy.

Third, the model should be sensitive to major changes in the relative CFs of core and peripheral beliefs in a paradigm; but it should not be sensitive to minor changes in these CFs, especially when the relatively crude empirical basis of these CFs is considered. I checked this sensitivity by systematically varying the CFs in the MAC paradigm while monitoring the policy recommendation set. Because this procedure is computationally very intensive, I have not repeated it for the other two paradigms. The broad results for MAC should generalize, since the three paradigms were produced in the same way.

Each rule in MAC was tested by varying its CF while all other elements were held constant at their empirically derived confidence levels. Eight events, one of each type from Table 1, were run through the paradigm for each set of CF values. The purpose of this sensitivity test is to estimate the amount of change in CFs needed to alter the set of recommended policies. Three broad results emerged: (1) averaging across all rules, a fairly substantial change is needed in a single rule's CF to alter the policies in the recommendation set ($\pm.26$);[14] (2) the recommendation set is much more sensitive to core beliefs than to peripheral beliefs; and (3) the behavior of the model changes *completely* when the rule CFs are inverted (i.e., subtracted from 1.0). These results are a very nice fit with the general desiderata for sensitivity in a model like POLI. As we would wish, POLI is sensitive to major changes in the CFs without being highly sensitive to minor changes. In addition, the distinction between core and peripheral beliefs has a meaningful impact on output.

POLI on the New Frontier of Computational Modeling

The detail with which POLI is able to replicate traditional historical case studies of U.S. foreign policy decision making is a powerful argument for its validity as a descriptive model of the decision-making system. While maintaining analytic focus in the sense that all behavior within the model is fully understood, POLI achieves a very high level of descriptive realism. In particular, POLI represents foreign policy making as a complete process rooted in prior beliefs and controversy.

Perhaps the most important contribution of the Policy Arguer project is that it demonstrates the utility of the computational approach for foreign policy analysis. The computational modeling techniques described in this work (along with many others that were not appropriate for POLI) offer tremendous opportunities for political science analysts, who must frequently deal with large complex systems based on either natural language communication or symbolic processes generally. Computational modeling techniques allow the information-processing black box to be opened and modeled in great detail and in an intuitive way. Natural language systems resonate with our common notions of how the black box really works. In this way, formal analyses can approach the descriptive complexity of traditional analyses.

In addition, computational modeling provides a platform for controlled experimentation. To the extent that a model like POLI is a reasonable descriptive representation, it can be used to simulate the behavior of the real system. This allows a degree of manipulation and control impossible with real political systems. In particular, counterfactual simulation using computational models promises to become a useful mode of inquiry in foreign policy analysis (Taber 1991; Thorsen and Sylvan 1982). Sometimes the things that did not happen or the decisions that were not made become very important in understanding a historical case.

Finally, computational modeling techniques are now readily available to a large number of users at fairly low cost. One does not have to be an experienced programmer or have a mountain of equipment to use these techniques. (POLI I, for example, was developed on an IBM-compatible personal computer and runs easily within 640k, using less than 1.5 megabytes of disk storage space.)

The generality of the techniques used in POLI allows them to be widely used by nonprogrammers.[15] Perhaps the success of POLI and other recent computational models will inspire other political scientists to avail themselves of this new method.

Notes

For helpful comments at various stages of this project, I thank Stanley Feldman, Milton Lodge, Richard Merritt, Robert Muncaster, Steven Seitz, Richard Timpone, and Dina Zinnes. This material is based upon work supported by the National Science Foundation under Award No. SES-9102901.

1. The operational code approach has commonly been used to study particular leaders and how their belief systems influence their decision making. Ramsey MacDonald, Getulio Vargas, MacKenzie King, Dean Acheson, John Foster Dulles, Dean Rusk, Arthur Vandenburg, Lyndon B. Johnson, Mao Tse-tung, Liu Chao-chi, Willy Brandt, Kurt Schumacher, Lester Pearson, Pierre Trudeau, J. William Fulbright, and Henry Kissinger have all been subjects of such analyses (Holsti 1977).

2. Francis Crick recently wrote that "elegance and a deep simplicity . . . are useful guides in physics, but in biology such intellectual tools can be very misleading (1988, 6). The same might be said for many problems in the social sciences.

3. To avoid "the AI hype" and controversies over the meaning of *intelligence*, most practitioners prefer the label *computational modeling* to the better known *artificial intelligence*. For a general overview of computational modeling in international relations, including a discussion of this debate see Schrodt 1991. The work of Anderson, Minsky, Newell, Simon, and others in cognitive science will not be reviewed here (though their influence will be readily apparent to all familiar with their work). Several excellent reviews of the cognitive science literature exist, including Collins and Smith 1988, Sharples et al. 1989, and Shapiro 1990.

4. Successful expert systems exist for many domains, including geological exploration and medical diagnosis. See Benfer, Brent, and Furbee 1991 for a discussion of expert systems in the social sciences.

5. POLI was programmed in C on a Dell System 310 personal computer and compiled using Microsoft C 5.1.

6. In other words, POLI takes a situation as input and reasons forward to conclusions. A backward-chaining engine takes conclusions as input and reasons back to the conditions that may have caused the conclusions. I discuss fuzzy inferencing below.

7. Nathan Leites (1951) took a similar approach when he outlined the "operational code" of Bolshevik leaders. This shared belief system was a crucial element in explaining Soviet behavior. See also Majeski 1987, Boynton 1987 and 1991, and Hayward Alker's (1984, 1988) work on historical argumentation in which he formally analyzes the logics used in classical and contemporary political debates.

8. These paradigms are essentially equivalent to a three-part typology of "public attitudes" toward U.S. foreign policy identified by Bardes and Oldendick (1978), Holsti (1979), and Modigliani (1972): hawkish internationalism, dovish internationalism, and isolationism.

9. Actually, despite my strong endorsement of fuzzy inferencing (based on *process validity* concerns) it makes little *practical* difference which approach is taken. To satisfy my curiousity, I programmed POLI to use probabilistic and fuzzy inferencing in parallel and I compared the results (Taber 1991). The differences were minor. In general, fuzzy inferencing produced *slightly* more complex choices for POLI because the policy recommendations were less distinguishable—there were more ties. I report the fuzzy results here because I am convinced that it is a more appropriate representation of the real inferencing process.

10. To identify POLI's highly recommended policies (those with the top five CFs) I used the deterministic selection mechanism described above. POLI identified the five policies (more if there were ties for fifth place) with the highest CFs in the recommendation set.

11. On the other hand, since belief systems are the *cause* of policy output in this analysis, the use of belief systems from an earlier period may not be appropriate in predicting output. In essence, I am now testing the degree of change in belief systems (i.e., how well belief systems from an earlier period predict policies in a later period). It's not clear that we should expect much agreement.

12. These categories are similar to those developed in the

WEIS (Fitzsimmons et al. 1969) and COPDAB (Azar 1972) events data sets.

13. Note that this CF is PAC's confidence, not POLI's.

14. This figure represents the average amount of change in a single rule's CF that was needed to change the set of highly recommended policies *for at least one* of the eight event types.

15. Many of the inferencing techniques are general across problems. Inference engines and user interfaces (called shells) are readily available for the user who does not need special inferencing features. These shells are empty of content. They guide the user through the development of knowledge bases for the problem of interest and through the use of the knowledge bases once developed (Carrico, Girard, and Jones 1989; Martin and Oxman 1988). POLI's inference engine, for example, is a completely general forward-chaining engine. It could be used with any set of IF→THEN rules for many different research problems. The new user interface and inference engine for POLI will eventually be available as a stand-alone shell, which will be superior to commercially available shells for many analytic purposes. In particular, its inference engine employs fuzzy reasoning in a more sophisticated way than commercially available shells, which were designed for decision support, rather than research.

PUBLIC OPINION AND THE COMMON DEFENSE: WHO GOVERNS MILITARY SPENDING IN THE UNITED STATES?

THOMAS HARTLEY and BRUCE RUSSETT *Yale University*

We measure the extent to which military spending policy reflects public opinion, while controlling for other reasonable influences on policy. We use survey data as an indicator of aggregate public opinion on military spending and find evidence that changes in public opinion consistently exert an effect on changes in military spending. The influence of public opinion is less important than either Soviet military spending or the gap between U.S. and Soviet military spending and more important than the deficit and the balance of Soviet conflict/cooperation with the United States. We also examine the hypothesis that public opinion does not influence the government but that the government systematically manipulates public opinion. We find no evidence to support this hypothesis.

"Liberal" democracy, or polyarchy, is typically defined procedurally, in terms of the institutions that guarantee freedom of organization and expression, a wide franchise, and competitive and fair elections. These conditions are thought to make government policies depend on the vote, as well as on other expressions of the preferences of the public (Dahl 1971, 1989).

Some scholars have found evidence that democratic institutions in the United States may be decreasingly compatible with democratic norms. Mayhew (1974), for example, points out that congressional races are increasingly dominated by incumbents. Burnham (1982), among others, maps the decline in voter turnout; and Ginsberg (1990) argues that the influence of electoral mechanisms has declined.

Other scholars, however, have found that policy does reflect public opinion, evidence of the representativeness of American government. Ostrom and Marra (1986) find that policymakers seem to consider public support or opposition to increases in military spending (where *public opinion* is defined as a plurality favoring either an increase or decrease in military spending). Page and Shapiro (1983, 1992) find that change in public opinion tends to precede change in policy. They conclude that in a wide variety of issue areas "opinion changes are important causes of policy change" (Page and Shapiro 1983, 189). Other scholars including one of the present authors, Russett, have found similar results (e.g., Jacobson 1985; Risse-Kappen 1991; Russett 1990, chap. 4; Russett and Graham 1989; for a contrary view of West Germany, see Brooks 1990). On balance, this evidence supports the normative expectation, derived from democratic theory, that governments should respond to public opinion. Yet the findings of scholars who trace changes in the efficacy of representative institutions justify further research.

We explore the influence of public opinion on military spending, an issue that focuses attention on the question of whose will should predominate. Defense spending reflects a policy matter—national security—of supreme importance to all citizens, who should therefore decide how best to achieve it. Yet it also represents a realm of policy traditionally regarded as requiring some degree of expert judgment and access to privileged information. For many, it is a realm best left to those institutionally responsible for the common defense (Almond 1950; Lippmann 1955). If there were an external threat to national security that was not perceived by the public, those who govern could well be expected to act contrary to the common will. Yet policymakers might also act contrary to the common will in the absence of such a danger.

The issue of whose will should predominate is one of at least four questions that are important to democratic theory. The first question is whether the majority should rule.[1] Even in an area like defense spending, which is undeniably an issue of salience to the public, the mass public can have little influence under the strict standards of majoritarian democracy. After all, there have been absolute majorities (rather than mere pluralities) supporting changes in defense spending in only two of the past 25 years (1980 and 1981). Majoritarian democracy asserts that in the absence of a majority, the status quo should be maintained. But this would imply that over most of the past 25 years public opinion should have no effect on policy. Neither control of policy by policymakers nor control by groups with some particular interest in the size of the defense budget is a solution acceptable by the norms of democratic governance (McConnell 1966; Schattschneider 1960). We argue that due to the incremental nature of policymaking in military spending, *changes* in public opinion should influence policy.

The second question concerns the needs created by representative democracy—how to meet the need for stability and predictability of policy despite momentary shifts in popular sentiment, how to protect minority rights from majority tyranny, and how to give special weight to portions of the population who may be better informed or more intensely interested

in a particular policy.[2] These needs may modify the appropriateness of reflecting majority opinion in particular instances. Few observers, however, would deny that to deserve the label *democratic*, a state's institutions should, over time, produce policy outputs substantially consistent with some indication of public opinion. If public opinion influences decision makers in competition with considerations of special importance to the decision makers, then we must ask what will be the importance of public opinion relative to these other factors? To answer this question we estimate the magnitude of the influence of public opinion on defense spending and compare this with the magnitude of autonomous government influence.

Our third question concerns the degree to which public opinion *consistently* affects policy over time. Here, we are interested in systematic effects. Democratic theory's requirements are not satisfied by merely occasional compliance with the common will.

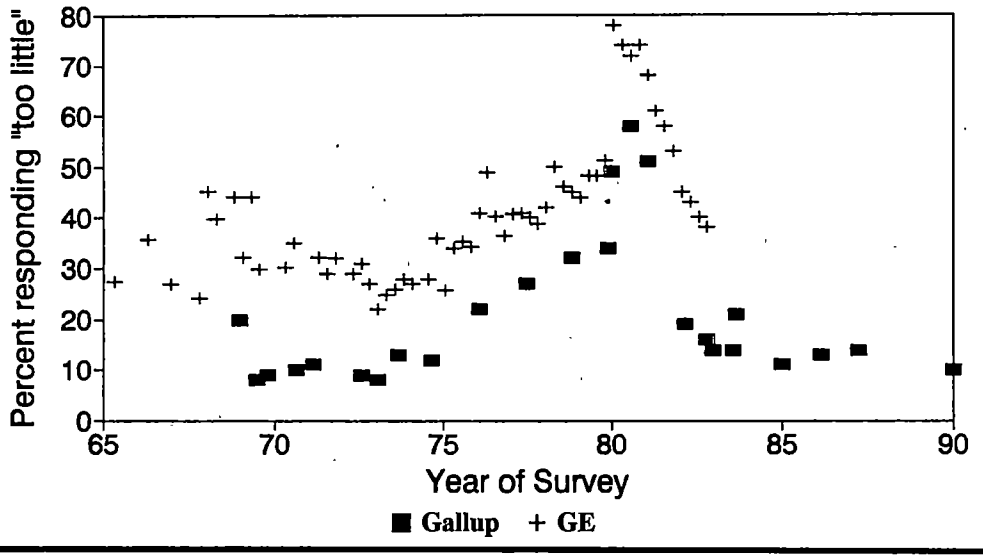
Finally, we ask whether consistency between public opinion and policy arises because public opinion influences government or because the government influences public opinion. Sometimes leaders adopt policies that are not initially preferred by the public, and approval develops subsequently. Scholars generally agree, however, that policy adoption should not consistently precede the emergence of popular approval in a democracy. Questions have been raised by a number of scholars (e.g., Edelman 1964; Lindblom 1977; Miliband 1969; Weissberg 1976). More recently, Ginsberg has asserted that by "using polling, media and public relations techniques, modern states have learned a good deal about the manipulation and management of public opinion" (1986, 224).[3] To answer this question, we empirically test how far public opinion has consistently *responded to* changes in U.S. military spending.

AN ALTERNATIVE TO THE MAJORITY RULE

In order to assess the relative influence of public opinion, and in order to model the decision-making process, we must define how change in a policy area (military spending) occurs. For budgetary issues like military spending, change must occur in an incremental manner. We argue that for such decisions the definition of individual interests in democratic theory can remain unchanged but that the majority rule must be replaced. In general, we suggest that with each budget cycle, the government should be expected to support incremental changes in the defense budget that reflect *changes* in the level of public support or opposition to increases in military spending.

Policy decisions regarding military spending and other budgetary items are made in increments (Wildavsky 1964). Making only incremental changes in the budget eliminated certain inefficiencies in the cost of prosecuting the Cold War. Annual budgets fund multiyear projects in which substantial investments are at stake; by changing military spending at the margin, many of the costs of stopping and restarting projects, or of abandoning investments only to reinvest, were avoided.

What implications do incremental decisions have for democratic theory? The incremental politics of the military-budget-making process pose no special problem for the definition of individual interests. We follow Dahl (1989), who uses a twofold argument to justify a particular definition of individual interests that gives a prominent place to the values of inclusiveness and equality. First, "the good or interests of each person must be given equal consideration." Dahl argues that "during a process of collective decision-making, the interests of every person who is subject to the decision must (within the limits of feasibility) be accurately interpreted and made known" (pp. 86–87). Second, Dahl defends a "presumption of personal autonomy" implying that "each adult person whose interests are involved in the outcome ought to have the right to specify what those interests are" (p. 99).



Random sample surveys satisfy both of Dahl's criteria and so can be thought to reflect the public interest accurately. In such a survey, each individual has an equal probability of voicing an opinion, and each individual's opinion is usually weighted equally.[4]

If incremental politics pose no problem for the definition of individual interests, they do pose some problems for the choice of a decision rule. When analyzing the effect of public opinion on policy in a representative democracy, democratic theorists have long used the principle of majority rule in order to justify the United States' democratic institutions of governance. Certain kinds of policies lend themselves to the majority rule—requiring a vote for enactment and a vote for repeal. The changes of incremental politics, in contrast, are small relative to the absolute size of the budget and do not constrain future action. It is reasonable to expect that in many years so many individuals whose interests are at stake might abstain from following the policy debate that no absolute majority would favor change in a particular direction.[5]

If the regular emergence of majorities is unlikely, then we must abandon the requirement of majority rule and search for a weaker rule that is consistent with the norms of democratic governance. In the United States, we often neither have nor need majority support in policy areas where decisions are characterized by incremental change. When there is no majority, we still expect the government to pay attention to changes in public opinion. When support for further increases in military spending drops, the government should respect this shifting preference in its incremental decisions by not increasing defense spending (barring temporary considerations such as a newly identified threat). Conversely, we might expect government to spend more on the military when support for increases in military spending rises. Consistent failure to do so would be to ignore the pref-

FIGURE 1

Gallup and General Electric Opinions on Change in Military Spending Compared

erences of the public most of the time. In policy areas where decisions recur periodically and change occurs incrementally, our rule satisfies the requirements of democracy better than the rule of the majority. Policymakers should be interested not only in whether a majority exists but also in the direction that public opinion is currently moving.

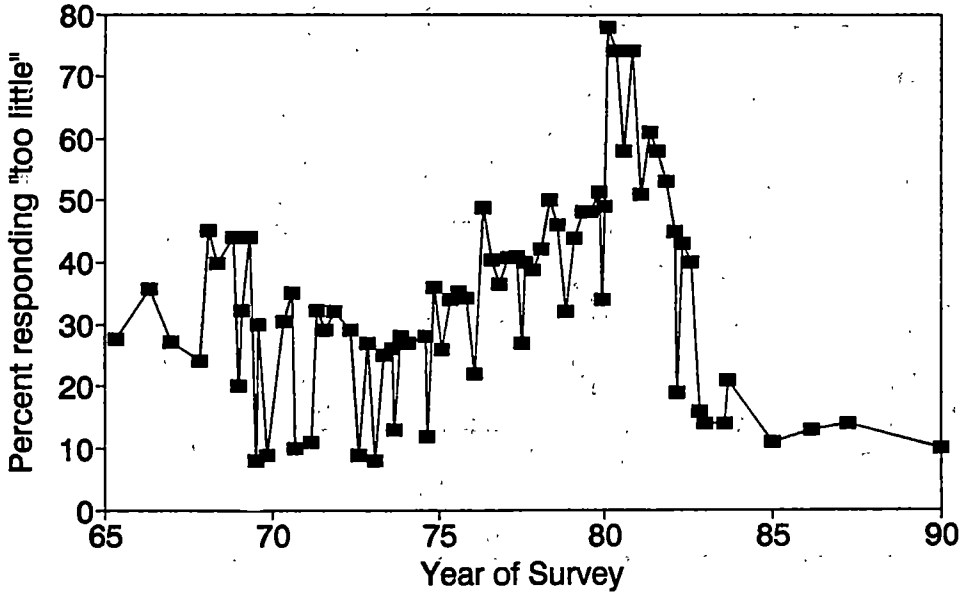
In short, testing governmental responsiveness in a policy area where change is incremental would involve examining change in public sentiment and change in government policy. We shall measure the importance of public opinion relative to other factors that might influence policy makers in the area of military spending, looking for a systematic influence of public opinion on policy. We will then see whether changes in public preferences for increased or decreased military spending precede governmental decisions to increase or decrease military spending. We now turn to the specification and estimation of our model.

MODELING MILITARY SPENDING

Changes in military spending are expected to be influenced by changes in public support for, and opposition to, changes in military spending. Before specifying our model, however, we must consider some issues of measurement.

We are concerned with actual expenditures rather than budgetary projections. Jacobson (1985) measures overall U.S. military spending with *total obligational authority* (TOA). We prefer total obligational authority to *budget authority* (BA) because spending is not completely determined by the final budget approved by Congress and the president. For example, some budget authority lapses before obligations are incurred, making TOA smaller than BA. An additional advantage of TOA over other indicators for military spending is that the military constructs a deflator specifically for TOA, and this deflator more accurately reflects changes in costs than does a deflator intended for use with the entire budget.[6]

Measuring public opinion also requires some discussion. One appropriate survey question used by several survey houses asks whether military spending should increase or decrease. With the problem conceptualized in terms of change, those with no current interest could either fail to express an opinion or simply support the status quo.



Public opinion is not measured at regular intervals, nor do any of the survey houses which measure support for changes in military spending produce enough estimates for us to be able to use a single survey house's estimates. We use a dataset compiled by one of the present authors and Thomas Graham (Graham and Hartley 1990). The dataset goes back to 1965, further than other available measures of public opinion; and it is carried forward to 1990. It allows us to avoid the methodological problems caused by a limited number of degrees of freedom and to check for the robustness of our results. Also, because we have data from a variety of sources (six different survey houses), we are able to ascertain the sensitivity of our results to the effect of house and question bias.

Using our comprehensive data set, we pooled the different public opinion series over a relatively long time series. Figure 1 illustrates that a single polling organization's measurements tend to move relatively smoothly over time. In contrast, Figure 2 shows that pooling the observations from different survey houses leads to great variance.

To ensure that survey house bias and variance do not affect our results, we construct three indicators of public opinion. The first is created by averaging

FIGURE 2

Gallup and General Electric Opinions on Change in Military Spending Combined

pooled public opinion measurements for all six survey organizations over annual periods that correspond with the budgetary cycle. Gallup, Roper and National Opinion Research Center tend to cluster together with less variance, and so were used to generate the second indicator. A third, less-dovish, indicator was obtained using data from General Electric; Columbia Broadcasting System; and Yankelovich, Skelly, and White.[7] Figures 3 and 4 illustrate how each group of three survey houses produces similar trends. Regressions were run using the indices derived from all three of these pooled indicators. Some results are not reported here, because the use of different groupings did not affect our findings. The coefficients from each of the three regressions were statistically significant and their slopes led to the same substantive conclusions. The series we use to generate the reported estimates is from all six survey houses averaged annually and can be found in Table 1.[8]

So far we have only discussed our dependent variable, U.S. military spending, and one independent variable, public opinion. Several other important factors are needed to specify the model. Policy might also be expected to reflect the concerns of officials and specialists faced with the conflicting

FIGURE 3

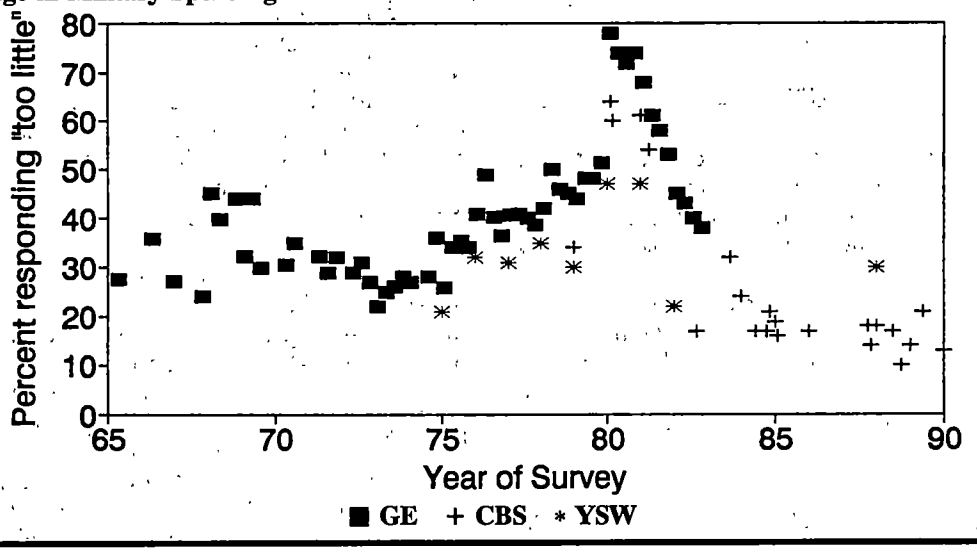

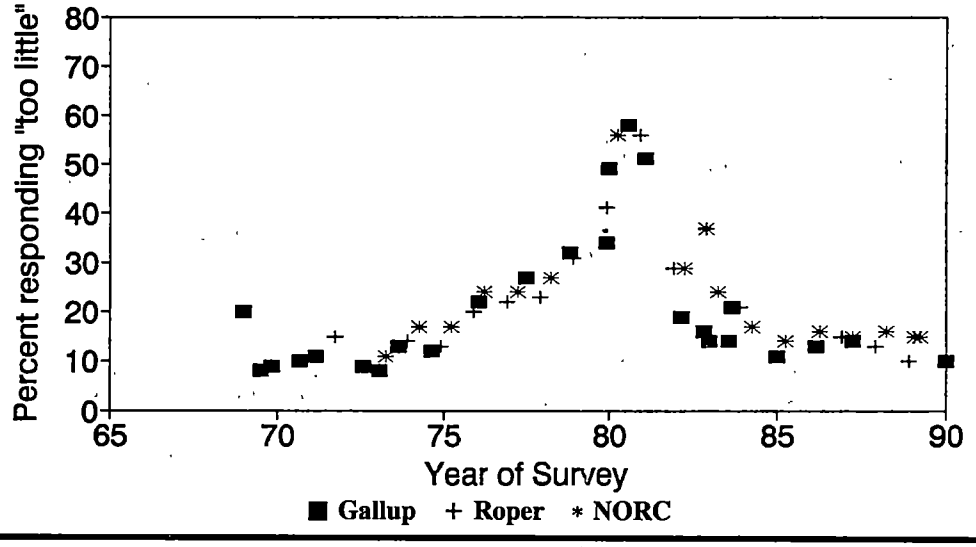

FIGURE 4

Dovish Bias: Gallup; Roper; Yankelovich, Skelly, and White Opinions on Change in Military Spending

imperatives of national security and domestic policy. A model explaining change in total military spending could draw on a variety of earlier models. (See Anderton 1989; Etcheson 1989; McGinnis 1991; Russett 1983 for reviews.) A reasonable model, that is, one in which omitted substantively significant variables are uncorrelated with our included independent variables, would include three other factors: changes in Soviet military spending, changes in the difference between U.S. and Soviet military spending, and changes in the U.S. federal budget deficit. Other variables might be added, such as bureaucratic inertia or the importance of stockpiles of armaments. However, given our goal of estimating the relative influence of the mass public on policy, these variables, plus a term for Soviet conflictual or cooperative behavior toward the U.S., should suffice.[9]

TABLE 1

Averaged Values of Survey Responses Concerning Military Spending, 1965–1990 (%)

YEAR	"TOO LITTLE"	"TOO MUCH"
1965	28	16

1990	12	43

Sources: See Appendix A.

Our first policy-related variable, Soviet military spending, reflects the assumption that if military spending could have been affected by public opinion, it could also have been spurred by an arms race. Arms race models have emphasized international causes—adversary's military spending or military strength, international tensions, and the like (Richardson 1960; Ward 1984). Most arms race models assume that military spending is an important measure of a nation's future military capabilities and therefore also intentions and commitment. Marra and Ostrom (n.d.) and Ward and Davis (1990) argue that the measure of aggregate Soviet military spending reflecting the information most likely used by U.S. policymakers *at the time their budgetary decisions were made* is generated from the "building block method" used by the Central Intelligence Agency, and published by the U.S. Arms Control and Disarmament Agency.[10] This method involves estimating the change in tangible assets of the Soviet military (e.g., tanks, aircraft) and then estimating what it would cost to duplicate this capability in the United States. Marra and Ostrom argue that the most relevant features of Soviet military spending for U.S. policymakers are the sign and size of annual changes. They also argue for the importance of the gap between U.S.

and Soviet military expenditures. We use the constant dollar estimate for U.S. and Soviet military spending because policymakers try to account for inflation. Inflation-adjusted budgetary outlays also reflect the real economic resources that would be required to produce, maintain, and use a given level of military resources and that are ultimately paid for by the public.[11]

If changes in U.S. military spending are the product of policymakers' national security considerations, they are also determined in part by the administration and Congress who must consider domestic political influences, the most important of which are fiscal constraints. Whereas the armed forces might be expected to support expenditures that increase military capability in response to the Soviet Union, the administration and Congress need to balance increased military expenditures with domestic priorities such as an increasing budget deficit (Huntington 1961, 125; Ostrom and Job 1986).[12]

We estimated two equations. Both of these equations are differenced, so the constant captures any linear trend in U.S. military spending. The first one includes the policy variables and an indicator of the extent to which public opinion feels the government is spending too little on defense:

change in total U.S. military spending = constant

+ change in Soviet military spending$_{t-2,\,t-3}$

+ change in (Soviet military spending

− U.S. military spending)$_{t-3}$

− change in deficit$_{t-1}$

+ change in percentage responding *too little*$_{t-1}$.

The second equation is the same as the first except that it reads *too much*, instead of *too little*. We expect a negative coefficient for this variable.

A note is in order regarding lag lengths. Marra and Ostrom (n.d.) and others have argued that a lag length of three years is required for measures that include Soviet military spending: one year because budgets are presented and debated in the year preceding the one they cover and two additional years to allow for the time required to turn evidence of Soviet military strength into Arms Control and Disarmament Agency (ACDA) estimates of Soviet military spending. Since information on Soviet military spending is not available in the first year after the Soviets make their budget, we do not include the earlier lag. A one-year lag for Soviet military spending would have no theoretically meaningful interpretation. However, we do include a lag length of just two years to test for the possibility that preliminary and confidential estimates are used in the budgetary process.

Note also that we did not include a lagged dependent variable, because we are dealing with differences in U.S. military spending. While last year's level might be expected to be a good predictor of this year's level, we would expect this year's changes to result from variables important to policymakers, such as the latest estimate of the Soviet threat and public opinion, not from last year's change.

TABLE 2

Explaining Changes in U.S. Military Spending, 1965–1990

INDEPENDENT VARIABLES	COEFF.	S.E.	*P*
Constant	−1.29	5.37	—
Change in			
Soviet military spending$_{t-2}$	.357	.257	.08
Soviet military spending$_{t-3}$	.503	.173	.01
Difference between Soviet and U.S. military spending$_{t-3}$	−.151	.173	.18
Deficit$_{t-1}$	−.064	.028	.02
"Too Little"$_{t-1}$	.261	.149	.05

Note: $\widehat{R}^2$ = .77; standard error for the equation = 5.44; degrees of freedom = 14. All monetary units are billions of constant (1982) dollars. P-values are for one-tailed t-tests.

FINDINGS

Table 2 shows our results.[13] The variable of interest here is the public opinion variable. We find evidence that increases in the percentage of the public that believes that the government is spending too little on the military result in increases in military spending ($b = .261, p < .05$). The statistical significance level for this independent variable is impressive, considering that the indicator is the average of values taken from different survey houses.[14] Substantively similar results hold if we use as our independent variable the percentage of the public responding that the government spends too much on military spending.

The greatest influence on change in U.S. military spending is change in Soviet military spending. Change in Soviet military spending as reported by the ACDA, lagged three years, is substantively and statistically significant ($b = .503, p < .04$). We find support for Ostrom and Marra's (1986) assertion that decision makers primarily use publicly available information regarding Soviet military spending. Change in Soviet military spending, lagged only two years, has a marginally statistically significant influence on change in U.S. military spending ($b = .357, p < .08$). Because these variables covary, it is likely that Soviet military spending is even more statistically significant than our results indicate.

We do not find statistically significant results for the gap between U.S. and Soviet spending ($p < .18$). It would seem that in the political debate the gap does not add much, but, rather, U.S. spending responds to Soviet spending. The sign of the coefficient for the deficit is in the expected direction, with increased

deficits exerting pressure against further increases in U.S. military spending ($b = -.064$, $p < .02$).

Two other variables that were not included in our model nevertheless merit special attention. Models of arms races and of Soviet–American relations suggest that military expenditures are affected by changes in the level of international political tensions, that is, by the behavior, as well as the expenditures, of the adversary. To account for the influence of international tension, we included the indicator of Soviet behavior toward the United States constructed by Joshua Goldstein from the World Event/Interaction Survey dataset aggregated to the annual level (Goldstein and Freeman 1990).[15] However, we found no significant effect.

We also might expect military spending to be greater during the Reagan years, all else being equal. Analysis (not reported in the table) using dummy variables for Reagan's first term, (1981–84), the years 1981–88, and the years 1981–90 did not produce stable and statistically significant coefficients. It appears that increases in military spending during those years are explained better by changes in the other variables, including public opinion.

Our results also suggest that the effect of public opinion on policy is consistent. In fact, regressions run with either earlier years or later years omitted from the sample resulted in the same conclusions.

In short, much of the influence on military spending stems from "objective" characteristics of the arms race, such as the change in Soviet military spending. Some of these influences on military spending other than public opinion can be considered normatively justifiable. One might argue with the wisdom of engaging in an arms race, but it would be difficult to refuse experts some autonomy to assess the external military threat and react to it. Other nondemocratic influences would have been more controversial; but there is no strong evidence that a significant part of the increase in military spending during the Reagan years was due to the particular perspectives of his administration, independent of other factors.

Even controlling for the effects of other factors that concern policymakers, we find that public opinion exerts an effect on military spending in a way that is substantively plausible as a cause. With other influences held constant, we find that if the percentage of public opinion favoring increases in military spending rises, then the level of military spending will increase. Conversely, if the percentage of public opinion opposing increases in military spending rises, then actual spending tends to come down. It is important to note that these effects were systematic over the time period that we studied, not occasional effects too erratic to result in a statistically significant regression coefficient.

More specifically, ceteris paribus, for every 1% change in support for (or opposition to) increased spending there is about a $.33 billion increase (or decrease) in defense spending. This is a small but not insignificant effect, especially considering that swings in public opinion were as large as 25% during the late 1970s and early 1980s (see Figure 1). Neither, however, does the public have an overwhelming impact on the nearly $300 billion military budget.

ASSESSING THE INFLUENCE OF GOVERNMENT ON PUBLIC OPINION

We shall test the hypothesis that consistency arises because the government influences public support for increases (or decreases) in military spending. When it changes the military budget, does the government create a change in public opinion supporting that action? To address this question partially, we use Granger's concept of causality to assess the directionality of influence. Granger causality—developed by Granger (1969) and used in vector autoregression (Freeman, Williams, and Lin 1989; Sims 1980)—is a method that relaxes assumptions about causal direction and lag length and so allows one to assess the directionality of influence. The technique involves regressing each variable on a reduced form equation that includes its own lagged values and the other variables' current and lagged values. We hypothesize that government does not influence public opinion. In the language of Granger causality, we hypothesize that changes in policy do not "Granger-cause" changes in public opinion, that is, that lagged values of public opinion would do just as well explaining current values of public opinion as would a model that also included lagged values of military spending.[16]

One potential criticism of our use of vector autoregression is discussed in Appendix B. It can be avoided by making the reasonable assumption that there is a first-order autoregressive process in U.S. military spending. The finding of autocorrelation in our regressions supports this assumption.

Our model includes three lags each of public opinion, U.S. military spending, and Soviet military spending. We tested the hypothesis that change in U.S. military spending Granger-causes subsequent change in public support for military spending in two ways—that $\pi_{12} = 0$ first for public support for increased, and then for decreased, military spending. The results were far too weak to be acceptable at any reasonable significance level (chi-squared [3] = 1.87, $p = .60$; chi-squared [3] = 2.66, $p = .44$).[17] The absence of significant results in either equation suggests that public opinion may in fact be exogenous to policy on military spending.[18]

CONCLUSIONS

We have assessed how far public opinion influences government policy in the realm of military spending. Despite other researchers' findings that institutions that maintain public control over government may be losing their efficacy, we found strong evidence consistent with the hypothesis that public opinion did in

fact influence government policy, although the exigencies of the arms race and the budget deficit were equally or more influential. The influence of public opinion was systematic over a period of years. One might regard this mixture of public and elite influence as acceptable, at least in an era when the Soviet Union was actively building up its military and a countervailing military buildup might be necessary. We also found some evidence supporting the contention that public opinion was not merely the result of overt government influence.

A great deal of research remains to be done in this area, however. For one thing, it is uncertain whether public opinion affects policy consistently in other areas of incremental politics, and it is uncertain to what degree public opinion will continue to influence military spending in the absence of a superpower arms race. Second, it is uncertain what influence the media has on the process. It is possible that network television (as documented in the Vanderbilt Archives) has an effect on public opinion but no direct influence on policy. Network media might thus be used as an instrument to specify a simultaneous equation model to test further the hypothesis that government influences the public (see Page, Shapiro, and Dempsey 1987). Third, arms race modelers might consider the effect of public opinion in models in which U.S. and Soviet budgets affect each other simultaneously and in which military strength is also a factor; that might provide a more accurate measure of the relative importance of public opinion and arms race coefficients. Fourth, the findings of Ostrom and Marra (1986) suggest the possibility that different branches of government are more responsive than others in this policy area. Analyzing each of these three questions would require several more years of data if results are to be subjected to sensitivity analysis. Fifth, it is uncertain what the structure of public opinion that underlies the changes in preferences on military spending is. Analyzing this would require panel data. Finally, all of these results are merely suggestive. To strengthen an assessment of causality, historical research is required, to show that policymakers actually sought out and used information regarding public opinion when making their decisions.

APPENDIX A: DATA SOURCES FOR PUBLIC OPINION INDEX

All of the public opinion data used in this analysis can be found in Graham and Hartley 1990. Question wording for the different survey houses is listed below.

Gallup, American Institute of Public Opinion, Gallup/*Newsweek*, Gallup/*Times Mirror*

Version 1. "There is much discussion as to the amount of money the government in Washington should spend for national defense and military purposes. How do you feel about this: Do you think we are spending too little, too much, or about the right amount?"

Version 2. "Do you think that we should expand our spending on national defense, keep it about the same, or cut back?"

The Roper Organization

"Turning now to the business of the country—we are faced with many problems in this country, none of which can be solved easily or inexpensively. I'm going to name some of these problems, and for each one I'd like you to tell me whether you think we're spending too much money on it, too little money, or about the right amount. Are we spending too much, too little, or about the right amount on . . . the military, armaments and defense?"

National Opinion Research Center

"We are faced with many problems in this country, none of which can be solved easily or inexpensively. I'm going to name some of these problems, and for each one I'd like you to tell me whether you think we're spending too much money, too little, or about the right amount: . . . military, armaments, defense."

General Electric/Trendex

Version 1. "I would like to get your opinion on several areas of important expenditures, first on the part of the government. As I read each one, please tell me if you would like to see the government spend more, spend less, or spend about the same amount as they have been . . . on defense."

Version 2. "I would like to get your opinion on several areas of important government activities. As I read each one, please tell me if you would like to see the government do more, do less, or do about the same amount as they have been: . . . defense."

CBS, CBS/*New York Times*, *New York Times*

Version 1. "Should federal spending on military and defense programs be increased, decreased, or kept about the same?"

Version 2. "Do you think government/federal spending on military and defense programs should be increased, decreased, or kept about the same?"

Yankelovich, Skelly, and White/*Time*; Yankelovich, Clancey, Shulman/*Time*

"Do you feel that government spending should be increased, decreased, or kept where it is now in the following areas? . . . the military."

APPENDIX B: CRITICISM OF VECTOR AUTOREGRESSION

One criticism of vector autoregression is important to our example (Cooley and LeRoy 1985). Note that our model is

$$\begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} = \begin{bmatrix} 0 & \alpha_{12} & \alpha_{13} \\ \alpha_{21} & 0 & \alpha_{23} \\ \alpha_{31} & \alpha_{32} & 0 \end{bmatrix} \begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} + \begin{bmatrix} A_{11}(L) & A_{12}(L) & A_{13}(L) \\ A_{21}(L) & A_{22}(L) & A_{23}(L) \\ A_{31}(L) & A_{32}(L) & A_{33}(L) \end{bmatrix} \begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} + \begin{bmatrix} u_1 \\ u_2 \\ u_3 \end{bmatrix},$$

where X_1 = public opinion, X_2 = U.S. military spending, X_3 = Soviet military spending, and L is the lag operator, so that $A_{11}(L^1)X_1 = A_{11}X_{1\ t-1}$ and $A_{11}(L^2)X_1 = A_{11}X_{1\ t-2}$. The reduced form of this model is

$$\begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} = \begin{bmatrix} \pi_{11}(L) & \pi_{12}(L) & \pi_{13}(L) \\ \pi_{21}(L) & \pi_{22}(L) & \pi_{23}(L) \\ \pi_{31}(L) & \pi_{32}(L) & \pi_{33}(L) \end{bmatrix} \begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} + \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix}.$$

We can accept the null hypothesis of no Granger causality if the parameter π_{12} does not differ significantly from 0. Military spending (or the influence of government) is said not to Granger-cause public opinion if $\pi_{12} = 0$. However, Cooley and LeRoy (1985) point out that Granger causality is distinct from strict exogeneity. Cooley and LeRoy would argue, in this case, that public opinion can be considered to be causally prior to military spending if and only if public opinion is strictly exogenous and military spending is endogenous. In this case, public opinion is strictly exogenous with respect to U.S. military spending if $\alpha_{12} = A_{12}(L) = 0$. Note that the reduced form equation is

$$\begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} = \frac{1}{|\alpha|} \begin{bmatrix} 1-\alpha_{23}\alpha_{32} & \alpha_{12}+\alpha_{13}\alpha_{32} & \alpha_{12}\alpha_{23}+\alpha_{13} \\ \alpha_{21}+\alpha_{23}\alpha_{31} & 1-\alpha_{13}\alpha_{31} & \alpha_{23}+\alpha_{13}\alpha_{21} \\ \alpha_{21}\alpha_{32}+\alpha_{31} & \alpha_{32}+\alpha_{12}\alpha_{31} & 1-\alpha_{12}\alpha_{21} \end{bmatrix} \begin{bmatrix} A_{11}(L) & A_{12}(L) & A_{13}(L) \\ A_{21}(L) & A_{22}(L) & A_{23}(L) \\ A_{31}(L) & A_{31}(L) & A_{33}(L) \end{bmatrix} \begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} + \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix},$$

where $|\alpha| = 1 - \alpha_{23}\alpha_{32} - \alpha_{12}\alpha_{21} - \alpha_{12}\alpha_{23}\alpha_{31} - \alpha_{13}\alpha_{21}\alpha_{32} - \alpha_{13}\alpha_{31}$, so that

$$\pi_{12} = \frac{(1-\alpha_{23}\alpha_{32})A_{12}(L) + (\alpha_{12}+\alpha_{13}\alpha_{32})A_{22}(L) + (\alpha_{12}\alpha_{23}+\alpha_{13})A_{32}(L)}{1-\alpha_{23}\alpha_{32}-\alpha_{12}\alpha_{21}-\alpha_{12}\alpha_{23}\alpha_{31}-\alpha_{31}\alpha_{21}\alpha_{32}-\alpha_{13}\alpha_{31}}.$$

There are several circumstances in which public opinion would not be strictly exogenous and yet π_{12} would equal 0, leading to a false finding of exogeneity. One of these circumstances is relatively unlikely, namely, that in which $1 = \alpha_{23}\alpha_{32}$, $\alpha_{12} = -\alpha_{13}\alpha_{32}$, and $\alpha_{13} = -\alpha_{12}\alpha_{23}$. However, π_{12} could equal zero and yet α_{12} not equal 0 if $A_{22}(L) = A_{32}(L) = 0$ and either $A_{12}(L) = 0$ or $1 = \alpha_{23}\alpha_{32}$. We can avoid this pitfall by assuming that $A_{22}(L)$ does not equal 0, that is, by assuming that there is a first-order autoregressive process in the military spending budget. This is a theoretically justifiable assumption and is empirically supported by our finding resulting from the correction of first-order autocorrelation reported in the results.

Notes

We are grateful for a grant from the John D. and Catherine T. MacArthur Foundation. For comments thanks are due to John Freeman, Robert Shapiro, Michael D. Ward, and David Lumsdaine.

1. Few observers in modern states would make the requirement for a simple majority absolute. For one thing, it is well known that if policy issues are distributed on multiple dimensions, various shifting majorities may form even under procedures widely regarded as democratic (Arrow 1963; Caplin and Nalebuff 1988, 1991).

2. See the *Federalist Papers* 10.

3. Some evidence indicates that crises and other factors are used to raise the popularity of leaders when the economy is weak or elections are near (Brody 1984; Kernell 1978; Mueller 1973; Ostrom and Job 1986; Russett 1990, chap. 2; Russett and Barzilai n.d.).

4. Actual sampling procedures may, of course, deviate from the assumptions without generating a biased sample.

5. An additional reason why a majority might not emerge in the realm of military spending is that issues of national defense are complex. They entail balancing the risk of international conflict with domestic priorities. It is never clear "how much defense is enough" or whether additional military spending serves as a deterrent or as an incentive to arms race or war. There is never an unambiguous answer to the question of whether to increase or decrease military spending. Many individuals select the answer *don't know*.

6. Data on U.S. military spending come from U.S. Department of Defense 1990.

7. For a more detailed discussion of house bias in aggregate survey data, see Cowden and Hartley 1991. Question wording is included in Appendix A, but it is important to note that question wording does not seem to be the only determinant of bias in aggregate public opinion measurements.

8. Note that we cannot include each survey house individually because no single house measured public opinion on military spending at regular intervals over the period. Surveys dating further back are available, but it is impossible to assess their comparability because there is no overlap in the early 1960s. We could have extended the analysis into 1991, on the basis of public opinion in 1990. But we preferred to restrict the analysis to the Cold War era, during which we would expect the coefficients to be reasonably stable. In both November 1989 and January 1990, when the public was asked, "In view of recent events in the Soviet Union and Eastern Europe, do you think the cold war is over?, only 37% said *yes* and 54% said *no*. But by October 1990, following German unification, 49% said *yes* and 43% *no* (CBS/*New York Times* press releases).

9. Marra and Ostrom (n.d.; Ostrom and Marra 1986) have discussed the specification of a model explaining what policymakers consider in determining levels of U.S. military spending. Since we are interested in assessing the overall responsiveness of American government to public opinion, we do not separately model the different institutions that participate in the budgetary process. Two variables that they considered and we excluded are change in war costs and change in revenues. The Vietnam War was primarily deficit-financed; thus, war spending should be primarily correlated with the deficit. Excluding war costs might be expected to attenuate the deficit coefficient, because its sign will be

negative, the coefficient for the war cost variable would be positive, and the two independent variables should be positively correlated. Change in revenue is probably not correlated with any of the independent variables, so that its exclusion should not bias any of the estimates.

10. This estimate is reported annually in the U.S. Arms Control and Disarmament Agency's *World Military Expenditures and Arms Transfers*. The Defense Intelligence Agency estimate was also very probably used by policymakers, but it is not in the public domain. It is less likely that alternative estimates, produced by Stockholm International Peace Research Institute and International Institute of Strategic Studies, were used by U.S. policymakers.

11. For additional arguments regarding the consideration of military spending in constant dollars, see Kinsella 1990. Kinsella also argues persuasively that there is no evidence that military spending has a negative effect on the economy at the macroeconomic level. Thus, other measures of fatigue (e.g., Richardson 1960) are not applicable in this context.

12. Data for our measure of the deficit was taken from U.S. Office of Management and Budget (1991) for fiscal year 1989.

13. First-order autocorrelation was corrected for using the Cochrane–Orcutt method; rho was .408; higher-order autocorrelation was not found.

14. It is important to be cautious regarding the interpretation of the magnitude of the coefficients for the public opinion variables. Separating out hawkish from dovish survey houses (as in Figure 2) changes the magnitude of this variable's coefficient, though not its sign or statistical significance. However, since this variable is almost certainly measured with random error, all coefficients obtained are conservative estimates.

15. Goldstein and Freeman's data end in June 1990; we have used the first six months of 1990 as an estimate for the entire year. They caution that the coder changed in 1986 and 1987.

16. It is worth noting at this point that to be exact, our theoretical question is not, To what does extent actual military spending influence public opinion? Rather, we are using U.S. military spending as a proxy and asking, Do the officials who influence the complex process of policymaking in military spending also influence public opinion?

17. Since there is no statistically significant finding, we do not discuss the magnitudes of the response here. Full results of our analysis, including impulse response functions and innovation accounting, are available on request.

18. Eichenberg and Stoll (1991) suggest that, if anything, a change in military spending subsequently produces an opposite change in public preferences, as the public reacts against perceived policy extremes. They do not, however, use vector autoregression or a simultaneous equation model.

PATTERNS AND SOURCES OF TICKET SPLITTING IN SUBPRESIDENTIAL VOTING

PAUL ALLEN BECK, LAWRENCE BAUM, AAGE R. CLAUSEN and CHARLES E. SMITH, JR. *Ohio State University*

The primary source of divided government in the United States is voters who split their ballots between the parties. Yet there has been little comprehensive examination of either patterns or sources of ticket splitting in recent years. Instead, divergent lines of research have emerged, emphasizing such things as voter partisanship, incumbency, and a "new" (young, well-educated, even partisan) kind of ticket splitter; and their focus has been too often restricted to the atypical president–Congress pair. We seek to unify these research traditions in a comprehensive model of split-ticket voting and to test this model across the partisan ballot in a typical election setting–here, the contests for five Ohio state-wide offices in 1990. The model incorporates partisan strength, candidate visibility, and the individual characteristics that distinguish the "new ticket splitters". The results support our partisan strength and candidate visibility explanations but provide little support for the emergence of a new type of ticket splitter.

Divided control of government, that uniquely American form of coalition government in which two different parties simultaneously control key governmental institutions, may be the most important political phenomenon of our time (Cox and Kernell 1991; Fiorina 1990; Jacobson 1991; Mayhew 1991; Sundquist 1988). In 20 of the last 24—and 32 of the last 48—years an American president has faced a Congress in which at least one of the houses was controlled by the opposition party. In the earlier years of American national politics, by contrast, divided control emerged from time to time, usually as a result of midterm election reversals for the presidential party; but it never dominated as it has in recent years.

Divided control is hardly exclusive to the banks of the Potomac. As V. O. Key (1956) noted 35 years ago, it has long been common in the state governments; and it has become increasingly widespread in recent years. The 1990 elections produced 32 states[1] with a governor of one party and a legislature in which the opposition party controlled at least one house—tying the historical high in 1988 but considerably higher than the average since 1967 or for the 1931–52 period (Fiorina 1990; Key 1956, 55).

The constitutions of almost all states provide a further possibility for divided government by separately electing different executive branch officials. In 1991, 35 states had top officeholders from both parties. This figure is well above the average over the last 20 years, and recent levels of executive splits greatly exceed those reported by Key for selected states during the 1900–1952 period (Key 1956, 197–216). When party control of the plural executive is combined with control of the legislature, only 12 states (most of them in the South) emerged from the 1990 elections as wholly dominated by a single party. Since 1967, in fact, there has never been a year when a majority of the states had single-party control of all executive offices and the state legislature. Divided control, in short, has become the *norm* for state governments just as it has for the government in Washington. Its causes, therefore, are a worthy topic of investigation.

Scholars have offered numerous structural reasons for divided government (Fiorina 1990; Jacobson 1991; Key 1956). Separate elections for different officials and the staggering of elections for various offices always have provided opportunities for divided party control in America that are not available in most democratic nations. The translation of popular votes into seats (or into electoral votes in the presidential contests), including the effects of gerrymandering, also may produce divergent results for different offices from the same vote totals. The office-block ballot form adopted in some of the states is conducive to divided government as well, with the arrangement of candidates by office (rather than party) and the correlative absence of a single-action party-vote choice making straight-party voting more difficult.

The principal roots of divided government are to be found in voter choice, however, not political structure. The direct election of multiple officials—a legacy of the powerful democratic tide in the Jacksonian era—*permitted* a voter to support different parties on the same ballot once the consolidated Australian ballot became widespread after the 1890s.[2] The office-block form, a legacy of the Progressive Era, virtually extends this permissiveness to license. But voters must be motivated to split a ticket in order for these possibilities to become realities.

More and more voters in recent decades have been seizing the opportunities to split their votes between the parties in the same elections. Based on reported votes for president and the U.S. House of Representatives in the American National Election Study surveys, split-ticket voting rose from 13% in 1952 to a historic high of 30% in 1972 and has settled into the

25%–28% range since then (Stanley and Niemi 1990, 132; Wattenberg 1986, 17–23). That ticket splitting has exhibited parallel gains in other office combinations can be inferred from the increasing frequency of split results. At the individual level, then, contemporary American voters are less motivated than before—probably than ever before—to vote only for the candidates from a single party.

Who are these ticket splitters? Past studies of ticket splitting have relied heavily upon vote divergence in a pair of contests—typically, the presidential and congressional races—to address this question. In an electoral system in which voters can vote for a multiplicity of offices, however, such a two-contest focus surely underestimates the extent of ticket splitting. Moreover, by restricting attention largely to the presidential and congressional contests, researchers have selected a pair that is quite unrepresentative of the situation individual voters typically face. The presidency is the most visible office in the land, and virtually all voters possess considerable information about both parties' candidates for it. Congressional contests, by contrast, typically involve a relatively visible incumbent running against an almost invisible challenger, if any. These visibility differences may accentuate ticket splitting. Furthermore, voters have very different expectations about candidates for the two offices—the one executive, the other legislative. This may translate into quite dissimilar criteria for choice (Fiorina 1990) and higher levels of ticket splitting for this pair than for offices that are similar in function. These considerations combine to make the presidential–congressional pair unique.

This study examines ticket splitting from a new and different vantage point. It focuses upon voter behavior across a five-office partisan ballot, rather than for a particular pair of offices. The case that we examine is the 1990 statewide election in Ohio. The five partisan races appearing on the ballot in that year provided a nice mix of the two characteristics—candidate visibility and the presence of an incumbent—that have proven important in earlier studies of ticket splitting. They also produced victories by candidates from each party and by both incumbents and challengers.[3]

Substantively, this focus moves us away from the current overdependence of research on ticket splitting that involves votes for president (an atypical office in terms of the information voters possess about its candidates) and toward the more commonplace low-information contests. It also examines this behavior in voting for offices at the state level. States are important policy actors in the American federal system, but they largely have been ignored in studies of voting behavior. To establish the generality of ticket splitting and its determinants requires a focus on the states.

There are good methodological reasons for this focus as well. First, we can examine electoral choices across contests for offices in the same electorate. Studies that mix the levels of contests and electorates, such as the familiar presidential–congressional comparisons, confound individual- and contest-specific factors because members of their samples face many different congressional contests. Second, by containing our comparisons within executive contests, we avoid the confounding effects of measuring ticket splitting across offices with vastly different functions and popular expectations. Consequently, results from a single state can greatly advance our understanding of ticket-splitting behavior and can also establish a baseline for replicative efforts in other states and other circumstances.

Voter behavior in the 1990 Ohio elections was tracked with a statewide panel study of Ohio voting-age adults conducted by telephone by professional interviewers in the Polimetrics Laboratory at Ohio State University. This analysis focuses on the 567 *voters* (out of 1,033 respondents) who completed both pre- and postelection interviews. Virtually all of the variables we analyze come from wave 3 of the study, but a few are drawn from wave 1.[4]

THE SOURCES OF TICKET SPLITTING

Split-ticket voting is hardly a new phenomenon in American electoral politics. Its trace markings in split election results have long intrigued scholars (Cummings 1966, chap. 2); and since the first individual-level data on voting appeared, considerable effort has been directed to explaining why voters would choose candidates from different parties. Nonetheless, for a variety of reasons, no comprehensive theory of ticket splitting has emerged that incorporates the different explanations provided for the phenomenon.

Previous explanations of ticket splitting have followed two divergent paths. Some scholars have emphasized the role of individual characteristics (particularly, partisan loyalties) in ticket splitting. Others, especially the most recent studies, have concentrated on the nature of the candidates, particularly the visibility edge enjoyed by incumbent officeholders. Our analysis draws upon each of these research traditions.

The earliest research on ticket splitting based on surveys emphasized, not surprisingly, the distinctive characteristics of the ticket splitters. In their seminal study of ticket splitting, using the 1952 and 1956 Michigan election studies,[5] Campbell and Miller (1957) attribute split-party votes for president/senator, president/representative, and state and local offices primarily to the absence of a strong party identification to motivate a straight-party vote, particularly in states that did not enable straight-ticket voting by a single action. Further analysis of multiple contests using the Michigan surveys through 1976 (by which time ticket splitting had grown to considerable proportions) corroborates the importance of strong party identification as an inhibitor of ticket splitting (Maddox and Nimmo 1981).

DeVries and Tarrance (1972) have dissented from the prevailing view that varying levels of partisanship are the dominant individual-level force behind split-

ticket voting. Their study of votes across several different offices based on national polls and state polls in Michigan and Texas concludes that the partisan-versus-independent distinction was overemphasized. Only about half of the ticket splitters they uncovered were self-identified independents, which left room for considerable ticket splitting among partisans. Two factors, however, weaken the force of their dissent. First, by ignoring the differences in intensity of partisanship among the large majority of the electorate who have party loyalties, they have understated the influence of partisanship on ticket splitting. Second, partisanship still emerges from their study as the most important correlate of ticket splitting.

The foregoing studies identified other voter characteristics that should be considered in any comprehensive explanation of ticket-splitting behavior. The lack of consistency in the correlates of these characteristics across studies suggests, however, that their exact role is questionable. Campbell and Miller (1957) found ticket splitting to be more widespread among men, the less educated, urban dwellers, and southerners. DeVries and Tarrance (1972) found it greater among those who are better educated, young, more affluent, of higher occupational status, and more dependent upon the media for their political information and touted these as the characteristics of the "new" ticket splitters. Maddox and Nimmo (1981) also showed ticket splitters to be more media-oriented and found that higher degrees of interest in the campaign induced more ticket splitting.

The three studies that examine the individual voter characteristics of ticket splitters share a focus on multiple offices in their operationalizations of ticket splitting, but their differences in other respects may account for the contrasts in their findings (Campbell and Miller 1957; DeVries and Tarrance 1972; Maddox and Nimmo 1981). The early Campbell and Miller (1957) study and the national survey results used as a part of the DeVries and Tarrance study measure ticket splitting by answers to a general question asking about the extent of ticket splitting, rather than by comparing reported votes for different offices. It is likely that these responses are skewed toward a more divided vote than actually occurred because of the social desirability of ticket splitting in American life (Feigert 1979). These studies also differ in the years they cover. Systematic explanation may have been confounded by a change in the patterns of ticket splitting as it became more prevalent after the mid-1960s.

An alternative stream of research has concentrated on the inducements to ticket splitting presented by popular and visible incumbents from the opposition party. This research has focused on presidential–congressional splits and has taken advantage of the different pairings of candidates across the various congressional districts contained in national surveys (e.g., well over 100 districts are covered in the Michigan surveys). The advantages of incumbency in a time of reduced partisan loyalties have been commonly cited as leading to the split results in presidential and congressional voting (Cover 1977). Gary Jacobson (1989, 1991) has demonstrated, however, that incumbency alone is not the key to a divided vote; rather, the failure of experienced challengers to emerge to face incumbents leaves voters with little real choice but to support the current officeholder. In short, he contends, candidate visibility, rather than incumbency per se, accounts for ticket splitting.

These alternative partisan and candidate theories of ticket splitting are not logically contradictory. The frequency of straight-ticket voting may increase generally with the strength of partisanship even while the presence of strong candidates from the opposing party may undermine party fidelity. The growth of ticket splitting in recent years may have resulted from the decline in the strength of partisan loyalties within the electorate (Wattenberg 1986), as well as from changes in the visibility of challengers. Any comprehensive theory of ticket splitting, consequently, should encompass the characteristics of voters as well as of contestants for office—especially the partisanship of the voter and the relative visibility of the candidates from whom they must choose. A comprehensive theory of this phenomenon requires the incorporation of other factors too; media habits, interest, attentiveness, education, and age may affect ticket splitting independently of partisanship and the nature of the candidates. Only by considering all of these factors together with partisanship and candidates can the divergent results of previous studies be reconciled.

TICKET SPLITTING ACROSS THE BALLOT

Data from the 1990 Ohio statewide election provide a highly appropriate test for this comprehensive model of ticket splitting. On the typical American long ballot, voters have multiple opportunities to split their votes between the parties. We focus our attention upon the five statewide partisan races in the 1990 Ohio election.

Our first task is to estimate the extent of ticket splitting in the election. The conventional way to measure it is to determine the percentage of voters who split their tickets in each pair of races. The range of this measure in the 1990 Ohio elections is from a low of 23% to a high of 38% (Table 1). At the high end of this range, ticket splitting was higher than for president–House pairs in the Michigan surveys in recent years (Fiorina 1990), so that this election already evinces higher rates of splitting than the usual contests of reference.

The level of ticket splitting increases substantially when one examines voting patterns across all five contests. A total of 54% of the voters in our sample cast at least one vote for each party—a number that is virtually twice the often-reported magnitudes when

TABLE 1

Ticket Splitters as Percentage of Voters in Each Pair of Contests

	GOVERNOR	SECRETARY OF STATE	ATTORNEY GENERAL	AUDITOR	TREASURER
Governor	—	23 (487)	23 (422)	34 (440)	38 (392)
Secretary of State	—	—	25 (409)	32 (430)	30 (378)
Attorney General	—	—	—	36 (390)	33 (347)
Auditor	—	—	—	—	25 (363)

Note: Entries are percentages voting for candidates of different parties among those who voted in both contests of the pair. Ns are in parentheses.

only pairs of races are considered. That this level is attained in a strong party state (Fenton 1966, chap. 5; Mayhew 1986; Baum and Patterson 1992) in which both parties provide party slate cards that can be carried into the voting booth is perhaps surprising, even though the Ohio ballot does not permit a straight-party vote by a single action. The 1990 Ohio results show how widespread ticket splitting has become in American elections, and they document the high incidence of such behavior outside of presidential elections.

The analysis that follows concentrates on the patterns and sources of the split party vote across all five contests. The variable in focus is a simple one—whether or not the vote was divided between the parties. This is a dichotomous variable, yielding 53.5% ticket splitters and 46.5% straight ticket voters within the entire sample of voters.[6]

Our objective is to explain why some voters cast a straight party vote whereas others were motivated to divide their vote among candidates from different parties. One approach in answering this question is to consider that voters viewed each contest independently and, after weighing all important considerations, decided to vote for a candidate that turned out to be of the same or the opposite party from the other candidates preferred. In this explanation, each contest is treated as an independent event, requiring a more or less unique accounting. Furthermore, it does not presume a normal behavior of partisan voting from which deviations are to be explained.[7]

While the urge to examine voting behavior contest by contest is strong, particularly given the normal orientation of voting behavior studies and the understandable desire to try to maximize the amount of variance one can explain, our interest is in an alternative "whole ballot" approach that can account for the patterning of votes across the ballot. Only with this focus can a comprehensive theory of ticket splitting be developed.

We shall pursue two lines of analysis to develop this theory. First, we focus intensively on the two most promising variables in explaining the voting patterns, namely, partisanship and candidate visibility. The former is a key voter characteristic, while the latter contains the most salient feature of each contest. Thus, we bring together in the same analysis the two perspectives on ticket splitting that have characterized past research. Second, after we have carefully explored the effects of partisanship and visibility, we turn to a multivariate analysis of the split vote incorporating these and a number of other theoretically promising variables. By estimating a more fully specified model of ticket splitting than earlier studies, we hope to be able to determine the effects of party and candidates, as well as to sort out the relevance of other individual characteristics, especially those thought to characterize the "new" ticket splitters.

THE ROLE OF PARTISANSHIP IN VOTER TICKET SPLITTING

An examination of patterned voting in the contemporary American electorate must begin with the partisan loyalties of individual voters. The most visible—and often the only—link among candidates for office is their political party. In Ohio, this link is clearly identified on the ballot, so that even voters coming into the voting booth with absolutely no prior information about candidates receive this valuable voting cue. For voters who possess party identifications, the party of the candidates should be an especially potent cue; the stronger the voter's party identification, the more we should expect it to influence the voting choice.

The results of Table 2 support the hypothesis that party identification is related to a partisan pattern of voting in a powerful fashion. Strong Democrats and strong Republicans least frequently split their votes in the 1990 Ohio contests. A majority of them supported only the candidates of their party. Those who did divide their votes between the parties did so only minimally. Nonetheless, a substantial minority of strong partisans defected at least once, which suggests that strong partisanship alone is not sufficient to produce a straight party vote.

The threshold of party regularity is crossed once we move to weaker party-identifiers. Majorities of

TABLE 2

Party Identification and Split Ticket Voting, Ohio 1990 (%)

PARTY IDENTIFICATION	ALL D	SPLIT TICKET D > R	SPLIT TICKET D = R	SPLIT TICKET R > D	SPLIT TICKET TOTAL	ALL REP.	N
Strong Democrats	72	24	3	3	30	0	(81)
Weak Democrats	34	41	8	17	66	0	(92)
Ind. Democrats	31	26	14	21	61	7	(42)
Independents	9	49	15	25	89	2	(53)
Ind. Republicans	2	17	7	46	70	28	(54)
Weak Republicans	2	12	1	50	63	34	(90)
Strong Republicans	0	4	4	32	40	60	(92)

Note: N = 504. Pearson's r = .75/Kendall's Tau B = .63. Entries are the percentages for each category of partisanship who vote for all Democrats, all Republicans, or split their tickets. Ticket splitters are divided into those who voted for more Democrats than Republicans, equal numbers of each, and more Republicans than Democrats. Entries were made for voters who cast ballots in two to five of the five contests. Single-contest voters were eliminated because it was impossible for them to split their tickets.

less-than-strong partisans in every category split their votes between the parties, and almost all pure independents were split-ticket voters. Weak partisans and independent-leaners, in fact, behave more like pure independents than strong partisans. These two kinds of partisans, moreover, exhibit such similar patterns of voting behavior that in the subsequent multivariate analysis they will be combined.[8]

One other feature of Table 2 bears mention. In this particular election, strong Republicans were more likely to split their tickets than were strong Democrats. As we shall see, this is entirely attributable to the disproportionate Democratic advantage in incumbency, which that party has enjoyed for the last several decades throughout the country. What we observe in the 1990 Ohio elections, therefore, is an illustration of a general pattern of subpresidential voting: Republicans are more likely to be ticket splitters.

The reasons why partisanship plays such an important role in inhibiting ticket splitting are familiar. Viewed from the perspective of *The American Voter*, partisanship is an indicator of identification with the party as a group (Campbell, Converse, Miller, and Stokes 1960). Support for candidates from that party is an expression of group loyalty and should become more complete as one's party identification strengthens. The same result emerges when partisanship is viewed, from the rational choice perspective, as a valuable voting cue in an environment of imperfect information (Downs 1957; Fiorina 1981). Without information to the contrary, partisans assume that the candidates of their party share their own outlooks and preferences. In the relatively low information context of subpresidential races, then, partisanship should be a particularly valuable guide to voting. While these two perspectives on the role of partisanship in voting behavior rely upon different cognitive processes for explanation, they predict the same result for ticket splitting. Consequently, it is not necessary to choose between these explanations; nor is it possible with the data at hand.

PARTY, CANDIDATE VISIBILITY, AND TICKET SPLITTING

Candidate characteristics, of course, can overwhelm partisanship. The first sign of this is the integral role of incumbency in ticket splitting in the 1990 Ohio races. Almost three-quarters (72%) of the split-ticket voters in our sample divided their votes between the two parties by deviating from a preponderantly Republican voting pattern to support Democratic officeholders seeking reelection. Nearly two-thirds (64%) of these incumbent-oriented ticket splitters voted Republican for governor, then voted for at least one of the Democratic incumbents for other executive offices. This incumbent-seeking behavior, however, does not tell us why incumbency is so potent a force. For a preliminary answer to this question, we move momentarily away from a focus on the whole ticket to examine individual contests and how candidates in them may be advantaged by the visibility they enjoy in the voters' minds.

Our treatment of the candidate factor focuses on candidate differentials in visibility as perceived by voters. Visibility differentials can have many sources, which are worthy of exploration; but in the end, all that matters is *how* (not why) the voters see the candidates. The measure of perceived candidate visibility we employ is based on a series of questions from the postelection survey asking the respondent to evaluate the candidates on a variety of policy issues, personal traits, and group attachments. (See the Appendix for the text of these and other questions we use.) Each evaluation was scored as an indication of visibility. A candidate's overall visibility to the respondent was the sum of these particular evaluations, and the candidate with the larger total in each race was credited with the visibility advantage for that respondent. Visibility advantage (or disadvantage) is the simple difference between the number of respondents who knew a candidate better and the number who found the opponent more visible.[9]

TABLE 3

The Visibility of Candidates in the Ohio 1990 Election (%)

	VISIBILITY			
OFFICE	REPUBLICAN MORE	EQUAL	DEMOCRAT MORE	N
Governor	21	67	12	428
Secretary of State	19	74	7	421
Attorney General	16	71	13	396
Auditor	4	64	32	412
Treasurer	3	70	27	377

Note: Includes only respondents who voted in each contest. The figures for incumbents are underlined.

The relative visibility advantages in each contest, presented in Table 3, describe a common pattern. The incumbents seeking reelection to the auditor's and treasurer's offices enjoyed substantial visibility advantages over their challengers. That the incumbent secretary of state did not enjoy a similar edge is explained by the fact that the Republican challenger, Robert Taft, was a scion of Ohio's most famous political family. Taft *began* the campaign with high visibility and ended up with a substantial net edge over his incumbent opponent. Thus, our Ohio data contain one case in which a challenger was able to overcome the natural incumbent advantage; and this case will play a crucial role in specifying the nature of the usual incumbency advantage.

Our hypothesis is that these visibility advantages gained extra votes for the candidates who enjoyed them. Testing this hypothesis is no simple matter, however, because the vote gains must be assessed against some kind of baseline. One way to demonstrate the effects of visibility is to examine the relationship between visibility and vote, *controlling for party identification* as the baseline. These relationships are presented in Table 4. If visibility has no independent effect over and above partisanship, then these correlations should be uniformly insignificant. Where visibility has an impact beyond partisanship, by contrast, the correlations should attain significance and should, if visibility has the advantage we expect, be positive in direction.

The results in Table 4 show that candidates gained votes from a visibility advantage that transcended the effects of party identification. Almost all of the correlations are positive, and 14 of the 25 attain statistical significance. The only negative relationships are registered for independents, but they fall far short of significance. The visibility advantage was most pronounced in the three races with the greatest visibility discrepancy between the two candidates. Some of the largest correlations between visibility and vote appear among Democrats in the secretary of state race and among Republicans in the auditor and treasurer contests, which demonstrates the power of visibility in overwhelming partisan attachments. That in one of these contests the challenger, rather than the incumbent, was benefited by visibility, however, suggests (with Jacobson 1989) that incumbency does not guarantee a visibility advantage.

Exactly how visibility influences the vote is so far left unspecified. Candidates' characteristics always have been important in American elections; and with the weakening of partisanship in recent years, their importance seems to have grown. In many subpresidential elections—in contrast to the more familiar presidential contests—the amount of information citizens possess about candidates is so low that virtually any information the voters have may be critical in their vote decision. Since this information is typically favorable, sheer visibility often produces an electoral advantage. Consequently, the difference in what voters know about candidates is an important variable in accounting for vote decisions, even without further refinement as to the exact content and direction of that knowledge (Jacobson 1987).

TABLE 4

Effects of Candidate Visibility Differences on Vote by Party Identification

OFFICE	STRONG DEM.	WEAK/IND. DEM.	PURE IND.	WEAK/IND. REP.	STRONG REP.
Governor	.11	.25*	.13*	.09	.04
	(72)	(111)	(38)	(106)	(83)
Secretary of State	.41*	.18*	.43*	.18*	.13

Attorney General	.23*	.30*	−.07	.08	.08
	(67)	(102)	(34)	(102)	(78)
Auditor	.07	.19*	−.06	.38*	.24*
	(70)	(111)	(36)	(101)	(79)
Treasurer	.08	.18*	−.08	.33*	.43*
	(68)	(100)	(36)	(91)	(70)

Note: Entries are Pearson correlations between candidate visibility differentials and vote within each partisan category for those who voted in four or five contests. To keep the number of cases in each cell relatively high, weak and leaning partisans, who behave similarly, are combined. Ns are in parentheses.
*$p \leq .05$ (two-tailed test).

This, surely, is the source of the well-known incumbency effect. Officeholders have been in the spotlight of usually favorable public attention in previous years and are able to marshal crucial vote-getting resources (e.g., money, media coverage, an already-established organization) during an election campaign. Few challengers can match—much less overcome—the visibility incumbents naturally enjoy. When challengers can erase the incumbent visibility advantage, however, they are likely to win the election (Jacobson 1989). Looking across the ballot, then, when there is variation in candidate visibility by party (as is typically the case), one would expect a divided party vote.

Any comprehensive analysis of split-ticket voting must take into account the nature of the candidates for office and how their public recognition can be an electoral asset or debit. On a case-by-case basis, we have shown that the sheer visibility of a candidate can overcome the normal partisan tendencies of voters. What remains to be done is to integrate this factor systematically into a comprehensive explanation of ticket splitting. To accomplish this task, we turn to multivariate analysis and to a more complicated measure of visibility.

A MULTIVARIATE ANALYSIS OF THE SOURCES OF TICKET SPLITTING

The analysis so far has identified partisanship and candidate visibility as key determinants of ticket splitting. As the representatives of the alternative theoretical foci on voter and candidate characteristics, they are the two leading candidates in an account of the division of the vote between parties across a long ballot. However, they are not the only promising explanations of ticket-splitting behavior. Previous studies have identified other reasons why voters may divide their votes between the parties, and we need to expand our analysis to include them. In order to assess these alternative explanations in conjunction with the partisanship and visibility accountings we have relied upon so far, a full multivariate analysis is required. The dependent variable in this analysis is the dichotomous measure of whether or not the respondent split his or her ticket.

The first variable added to partisanship and visibility in the multivariate analysis is age (measured in years). Some previous research has suggested that younger voters are more inclined than older voters to split their tickets. This behavior may lend itself to a life-cycle explanation. But the contention that the "new" ticket splitters are to be disproportionately found among the young suggests that there is something particular about this *generation* of young voters (DeVries and Tarrance 1972). One reason why the young may be more likely to cast divided party votes, of course, is that their partisan loyalties are weaker, for either life-cycle or generational reasons. By assessing the effects of age in a multivariate model that contains partisan intensity as a variable, we can examine this interpretation of the relationship of age to ticket splitting.

A second explanation for ticket splitting that merits representation in our multivariate model stems from the notion that cognitively sophisticated voters are less dependent on decision-making shortcuts. Their vote is more likely to be based on candidate-by-candidate evaluations, instead of relying on such heuristics as party or even the coattails of the top-of-the-ticket candidate (Chubb 1988; Shively 1979). Cognitive sophistication is captured in a crude but meaningful basis by education, measured in years of schooling. Education has been variously related to ticket splitting in previous research: better-educated voters were more likely to vote straight party in the Campbell and Miller (1957) study but more likely to *split* their votes in the DeVries and Tarrance (1972) analysis. By including education in our multivariate model, we can help to reconcile these divergent results.

Political sophistication is not simply a function of general cognitive ability (Converse 1964, 1980). Some people at each level of education pay inordinate attention to politics and, as a result, are able to bring considerable information to bear on their political decisions. This political specialization may be reflected in self-reports of political interest at the end of the campaign. Maddox and Nimmo (1981) found that ticket splitting was higher among those with the greatest political interest. There are good reasons to pursue this line of analysis here. To test the hypothesis that political interest induces a split ballot, we include the variable INTEREST, which varies from *not much interested* (scored 1) to *very much interested* (scored 3) in the campaign.

Third, ticket splitting may be a function of how people receive their information about politics. Television has become a key source of political information for almost all Americans. With its reliance on visual images, this medium is seen as fostering a personalization of politics, an emphasis on candidates over issues or party (Popkin 1991; Rubin 1981). Consequently, voters who derive their political information primarily from television may be expected to be more candidate-oriented, which leaves them more inclined to divide their votes between the parties across the ballot (Maddox and Nimmo 1981). By this logic, it is the increasing dominance of television as an information source in recent decades that accounts for the rise in ticket splitting.

This television-centered explanation for ticket splitting, too, warrants inclusion in our multivariate model. Because television use is universal, we represent it by determining whether respondents report a greater reliance on television as a source of their political information than either newspapers or personal discussants. The variable is TVDOM, scored 1 if television is favored and 0 if it is not. Those who rely upon television most, this hypothesis claims, should be more likely to split their tickets.

Fourth, some scholars have seen split-ticket voting

as strategic behavior, in which voters who lack confidence in, or support for, either party are rationally motivated to divide their votes so that they can prevent one party from gaining full control of government (Alesina and Rosenthal 1989; Fiorina 1990). A test of this explanation for ticket splitting can be fashioned by employing attitudes toward divided government. We employ an agree–disagree question about its desirability, SPLITCON—scored from *strongly disagree* (1), to *strongly agree* (4), with the ideal of one-party control—that can be thought of as a general orientation because it was asked at the beginning of the 1990 campaign. If votes are motivated by a conscious desire to divide executive positions between the two parties, then this variable should be significantly related to ticket splitting.

Finally, the party identification and visibility variables are each represented in our model. Party is measured in terms of strength (PTYSTR) by folding the seven-point party identification scale at its independent midpoint and combining the virtually indistinguishable categories of weak partisan and independent-leaner. (The result is 1 = independent, 2 = leaning partisan/weak partisan, 3 = strong partisan.) Based on the results of previous research, partisan strength is expected to be significantly related to ticket splitting (as Table 2 demonstrates clearly in the bivariate case).

Table 2 also exhibits a tendency for Republicans to split their tickets more than Democrats in the 1990 Ohio elections. We hypothesize that this tendency can be accounted for by the generally higher visibility of Democratic candidates in the election and perhaps some of the other factors we have identified. To test this hypothesis fully requires the inclusion of a Republican partisan direction variable (REP, scored 1 if weak or strong Republican, 0 if independent, independent-leaner, or Democrat) in our model, so that we can determine whether its relationship to ticket splitting vanishes once the effects of other variables are taken into account, as we expect.

The measurement of perceived candidate visibility across the subpresidential ballot is more complex. Earlier, the effects of visibility in individual contests were inferred from the relationship between a visibility difference between candidates and the vote with controls for party identification. The conceptualization of visibility as it operates across the ballot necessarily takes this logic one step further. It depends upon the notion that the pressures to split a ticket are increased when candidates from different parties enjoy the relative visibility advantages across the ticket. The variable that expresses these expectations, called VISSPLIT, is scored 1 when candidates from different parties are more visible to the voter and 0 when all of the more visible candidates come from the same party.

Analysis of Voters in at Least Two Races

Table 5 presents the results of a multivariate analysis of the split ticket vote dichotomy on the variables just identified (see the Appendix for the questions underlying these measures) for those who have voted in more than one race.[10] These results confirm the dominance of partisan strength (PTYSTR) in accounting for split-ticket voting. No other variable is as strongly associated with ticket splitting behavior. It is hardly surprising that departures from a single-party vote decrease as the voter becomes more strongly committed to the party and that this commitment is the primary predictor of party steadfastness in voting. This relationship also makes the contemporary increase in ticket splitting more comprehensible. As partisan intensity has declined in recent years, it surely has brought with it a parallel decline in party-ticket voting.

TABLE 5

Probit Analysis of Ticket Splitting

INDEPENDENT VARIABLE	*b*	S.E.	CHANGE IN PROB. OF SPLITTING
PTYSTR	−.79***	.112	.09
REPUBLICAN	−.02	.125	—
VISSPLIT	.62***	.160	.10
SPLITCON	.05	.128	—
TVDOM	−.22	.133	—
INTEREST	−.13	.099	—
EDUCATION	.07**	.028	.01
AGE	.01**	.004	.01
Constant	1.22	.670	—

Note: N = 463. McKelvey Pseudo R^2 = .29; Dhrymes Pseudo R^2 = .15; likelihood ratio = 83.18 (approx. chi-square with 9 d.f.); percentage of cases predicted accurately = 70%. The table excludes those who voted in only one contest. The dependent variable in this analysis is ticket splitting, scored 1 if vote was for candidates from two different parties and 0 if for candidates from only one party. Probabilities of splitting are the changes in the probability of split-ticket voting associated with a one-unit increase in that variable with every other variable held at its mean. Probabilities are not shown for variables whose impact on split-ticket voting fails to achieve statistical significance. In calculating the percentage of cases predicted accurately, the prediction is straight ticket if estimated *p* is less than .50 and split-ticket if estimated *p* is at least .50.

**$p \leq .01$ (one-tailed test).

***$p \leq .001$ (one-tailed test).

The greater tendency for Republicans to split their tickets that appeared earlier in the simple relationship between partisanship and ticket splitting vanishes in a multivariate context. Republicans are more likely to vote for candidates from both parties; but the results suggest that the reason lies in factors other than their partisanship—chiefly, we surmise, in the advantages Democratic incumbents enjoy in visibility.

Candidate visibility joins partisan strength in the multivariate analysis as a potent predictor of ticket splitting. Voters who saw at least one candidate from each party as more visible across the five races were significantly more likely to split their tickets than those for whom the visibility advantage always remained with the same party. Incumbency no doubt explains a substantial part of this effect, since incumbents are best able to overcome the natural advantage held by candidates of a voter's own party or to

monopolize the attention of independents. But—as the presence of a visible Republican challenger in Robert Taft makes it possible to show—it is differential visibility rather than incumbency per se that is conducive to a divided party ballot.

Only two other variables exhibited significant relationships to ticket splitting, and the strength of these relationships fell far short of those for visibility and partisan strength. One of these variables is education, in which a one-year increase in attainment was associated with a .01 increase in the probability of ticket splitting. Unlike the results for the 1950s (e.g., Campbell and Miller 1957) but consonant with more recent findings (e.g., DeVries and Tarrance 1972), more educated respondents were more likely to split their tickets in the 1990 Ohio elections. Because the education of the electorate has been growing in recent decades, the overall importance of this relationship probably transcends its coefficient. The case for a "new" ticket splitter finds some support in the reversal of the old voting patterns by those with higher levels of education.

Split-ticket voting is also more common among older voters. This is an unanticipated result from the standpoint of both earlier research and theoretical expectations. Younger voters are normally expected to be less firmly anchored in their voting behavior. They tend to be less partisan than their elders, although there has been a surge of the youngest age group into partisanship in more recent years. They also are better educated. Both of these factors should predispose them to split their tickets more; yet even the bivariate correlation between age and ticket splitting is positive, not negative. Moreover, the magnitude of this positive relationship increases once other variables, including partisanship and education, are taken into account. The image of the "new" ticket splitters as disproportionately young does not bear up under closer scrutiny in our data.[11]

The other hypotheses tendered to explain ticket splitting fail to survive our analysis. The image of ticket splitters as television-dependent is undermined, at least in Ohio for 1990, by the fact that respondents for whom television dominates newspapers and personal discussions as a source of political information *less* frequently divide their votes between the parties (although this relationship falls short of significance).

Nor does the hypothesis that ticket splitters are rationally dividing governmental powers between the parties (Fiorina 1990) receive support in our data. The attitude that government works better under conditions of divided control bears no relationship to ticket splitting, even after a host of other factors predisposing the voter toward dividing the vote are taken into account. This result accords with findings from another contemporary study (Alvarez and Schousen 1991), which makes it all the more likely that the divided-government-motivated-voter hypothesis lacks explanatory power.

Another hypothesis that emerged from earlier research is that voters with higher levels of interest in politics were more likely to split their ballots. This hypothesis, too, receives no support in our analysis. As interest increases, frequency of ticket splitting declines—rather than increasing, as previous research had led us to expect it would. But the relationship is so modest that it falls far short of achieving significance.

Demonstrating the Robustness of the Results

Ticket splitting has proven to be a more complicated phenomenon than it appeared to be at first blush. Additional analysis is needed to make certain that these complications have not produced anomalous results. One complication is created by widespread *roll-off* (the tendency not to vote for some contests—see Burnham 1965) in the 1990 Ohio elections. The failure to cast a vote in all races on the ballot lowers the probability of ticket splitting. By restricting analysis to those voters who cast ballots in two or more contests, Table 5 has eliminated the complication imposed by those for whom the probability of a split ballot was zero. But 115 voters (almost 20% of all the voters in our sample) cast ballots in only two or three contests, thereby severely restricting their opportunities to divide their votes between parties. We shall have more confidence if our results hold up after these voters, too, are removed.

Another complication is created by the possibility that idiosyncratic forces may play upon the vote. Deviations to vote for the other party by the erstwhile party voter can occur for a variety of reasons, such as a personal friendship, a local "favorite son or daughter," a key issue, or a personal scandal. While the resulting votes are appropriately counted as divided between the parties, a peculiar distribution of these idiosyncrasies in an election might give a distorted picture of the sources of ticket splitting. It is probably safe to assume that these reasons are randomly distributed across contests and years, so that they do not confound our results. To guard against the possibility of this kind of bias, however, we have used the more stringent comparison of those who voted for at least two candidates from each party, as opposed to straight-ticket voters.

Table 6 presents the results obtained from these two different lines of analysis. What is most striking about these results is that the coefficients for the partisan strength and visibility variables change hardly at all from those in Table 5. These two variables appear to be powerful sources of ticket splitting regardless of the circumstances. The same cannot be said, however, for age and education. While virtually unaffected by increases in the opportunities for ticket splitting, these coefficients decline and become insignificant among the most extensive ticket splitters, namely, those who have voted for at least two candidates from each of the parties. Only partisan strength and differential candidate visibility are related to this extreme form of ticket splitting.

All in all, this analysis increases confidence that our results are not an artifact of a measure that is overly

TABLE 6

Probit Analysis of Ticket Splitting for Voters in Four or Five Races

INDEPENDENT VARIABLE	ONE SPLIT b	ONE SPLIT S.E.	TWO SPLITS b	TWO SPLITS S.E.
PTYSTR	−.86***	.127	−1.01***	.165

INTEREST	−.13	.108	−.09	.150
EDUCATION	.08**	.032	.05	.038
AGE	.01*	.005	.00	.006
Constant	1.47*	.724	1.76*	.912
McKelvey Pseudo R^2	.31		.38	
Dhrymes Pseudo R^2	.16		.22	
Likelihood ratio (approx. chi-square with 8 d.f.)	83.18		71.44	
%Cases predicted accurately (%)	70.0		73.0	
N	385		249	

Note: Only voters in four or five races are included in this table. In column 1 the dependent ticket-splitting variable is scored 1 if the respondent voted for candidates from two different parties and 0 if for candidates from the same party. In column 2 it is scored 1 if the respondent voted for two candidates from each party and 0 if for candidates from the same party, with those who split their tickets only once eliminated. In calculating the percentage of cases predicted accurately, the prediction is straight-ticket if estimated p is less than .50 and split-ticket if estimated p is at least .50.

*$p \leq .05$ (one-tailed test).
**$p \leq .01$ (one-tailed test).
***$p \leq .001$ (one-tailed test).

sensitive to a sample that includes too many partial voters or to idiosyncratic behaviors. While other (albeit less theoretically justifiable) validity tests could be run, we are confident that they would yield similar support for the robustness of the results reported in Table 5.[12]

CONCLUSION

Divided control of government is as important a feature of the American states as it is of the national government. The results of the 1990 Ohio election could not have produced better evidence of this. When the dust had settled, the Republicans continued their control of the Ohio senate; the Democrats, their hold on the state House of Representatives. Furthermore, the Republican party broke the previous Democratic monopoly on executive positions by gaining the offices of governor and secretary of state, leaving the other three statewide executive positions in the hands of their Democratic rivals. Thus, the contests for executive office in Ohio in 1990 have provided us with an excellent vantage point from which to explore the electoral bases for divided government.

The traditional American long ballot, in a political structure and political culture that subvert party regularity, offers voters ample opportunity to support divided party control of government. A majority of the Ohio electorate in 1990 took advantage of this opportunity by casting ballots for candidates from each of the two major parties for the executive offices. The election's split outcomes are primarily (although not wholly, because of roll-off) attributable to this behavior.

Based on these results, it seems reasonable to suppose that split-ticket voting in American elections is far more common across the full ballot than previous studies focusing on pairs of contests or congressional–presidential divisions have implied. To adequately study ticket-splitting behavior, we believe that it is imperative to consider the full menu of contests placed before the voter in any single election, including both the rare high visibility contests and the commonplace races of low visibility. The heavy focus in previous research on splits in pairs of contests, especially the presidential–congressional set, risks both underestimation of the frequency of the behavior and misspecification of its sources.

Despite the fact that ticket splitting is often the result of independent decisions for the different contests on the ballot, clear sources of this behavior across the subpresidential ballot have been identified. The primary motivating factor for ticket splitting—contrary to the discovery of ticket splitters as a "new force" two decades ago (DeVries and Tarrance 1972)—is a long established and powerful force in American voting behavior, strength of party identification. Documented as the key determinant of the split-party vote as long ago as the 1950s (Campbell and Miller 1957), partisanship turns out to be the prime determinant of split-ticket voting in Ohio in 1990. This result would surely be replicated in elections at various levels of government across the nation.

A focus on multiple offices across the ballot enables us also to determine how different candidate pairings may affect ticket splitting. This analysis shows that *the same voters* react differently to candidates based solely on their relative visibility, without regard to the content of these candidate perceptions. Candidates who enjoy a visibility advantage are very successful in attracting votes beyond their own partisan camp and in solidifying the support of their fellow partisans. The major source of visibility is, of course, incumbency. Indeed, in the 1990 Ohio elections, the preponderance of split tickets were the result of the powerful pull of incumbency and the great advantages it conferred on two of the incumbent candidates. Nonetheless, because incumbency does not always ensure such an advantage (as our results have shown), the explanation should rest more generally upon candidate visibility.

Especially because these Ohio results parallel those from studies of congressional–presidential splits in important respects, we have little hesitation in generalizing beyond the confines of our specific data.

Incumbency is an important contributor to ticket splitting, but this is because of the visibility advantages it often confers and not some intrinsic quality of incumbency itself. The visibility edge induces opposite-party loyalists to defect from their party's candidates, pulls independents into the favored candidate's orbit, and reinforces the natural tendencies of fellow partisans. In Ohio in 1990, this phenomenon generally favored the election of Democrats; and it is likely that the same would hold true for other states and levels of government where the Democrats enjoy an incumbency advantage. If so, this "pull of incumbency" should be added to macro theories of electoral change.

Evidence in our results for the "new" ticket splitter described by DeVries and Tarrance (1972) is mixed. In accordance with the results of more recent studies, those who split their tickets in our sample were generally better educated than those who voted straight tickets, even after the effects of partisan intensity and visibility were taken into account. By contrast, the classic 1950s study of ticket splitting found it occurring disproportionately among the *least* educated voters (Campbell and Miller 1957). The effects of education, however, appear to apply only to single-contest deviations. Recurrent splitters (at least across the 1990 Ohio ballot) were not distinctive in their educational levels.

This "new" ticket splitter apparently does not include the youngest members of the electorate. The young in our study were more likely than older voters to vote *straight* tickets, rather than to divide their votes between candidates from different parties. We can hypothesize alternative reasons for this anomalous result. First, the relationship between ticket splitting and age is consonant with a situation in which realigning forces have produced a new generation of loyal partisans among the young without converting often-unfaithful older partisans from their established loyalties. Second, older voters may be more familiar with candidates who have been prominent on the political scene (but not just the Taft name, as we have shown); consequently, these voters are less dependent on the party cue. Whatever the explanation, the greater propensity of the young to divide their votes that appeared in previous studies was not replicated in the Ohio 1990 election.

Finally, the story of ticket splitting in Ohio during the 1990 elections can be told entirely without resort to some variables that have proven important in earlier studies. In particular, levels of interest in politics proved to have no significant relationship to voting for candidates from both parties. Neither did dominance of television as an information source or a motivation to produce divided government emerge as important. These results could be anomalies of our case, but we suspect that they are more likely to be typical results of the multivariate, multiple-vote approach that sheds more light on ticket splitting as patterned behavior.

A combination of motivation (partisanship) and opportunity (the visibility differentials of the candidates), with a pinch of education and age, then, accounts for a substantial portion of ticket splitting across the 1990 Ohio subpresidential ballot. To be sure, the nature of the ballot itself, by making it easier or harder to vote a straight ticket, can accentuate these effects. The Ohio office-block ballot, for example, makes it easier than in many states to split a vote between the parties. A cross-state study would have to take this structural feature into account. But in the end, any theory attempting to explain ticket splitting behavior would be wise to focus its attention on partisanship, candidate visibility, education, and age, paying special attention to the first two. To understand systematic patterns of ticket splitting, in short, requires a merging of the two separate research traditions that have characterized its study to this point.

APPENDIX: MEASUREMENT OF KEY VARIABLES

Votes. The measures of votes in the various contests are based on the questions, "Did you vote in the contest for ——— between ——— and ———?" and if *yes*, "Did you vote for ———, the Democrat, or ———, the Republican?"

Party Identification. The measures of party identification are based on the question, "Generally speaking, do you usually think of yourself as a Republican, a Democrat, an independent, or what?" and, if Republican or Democrat, "Would you call yourself a strong (Republican, Democrat) or not very strong (Republican, Democrat)?" or if independent or *no preference*, "Do you think of yourself as closer to the Republican party or to the Democratic party?"

Visibility. The measures of visibility are based on questions asking respondents to place each candidate on a five-point continuum for four issues that were important in the 1990 campaign (abortion, campaign fund-raising, taxes, and government regulation of business); on a five-point liberal–conservative continuum; on six traits (competent, honest, strong as a leader, caring about people, decent, hardworking); and on closeness to six groups (Catholics, business, Christian fundamentalists, unions, blacks, and feminists). The issue questions (too lengthy to list here) were similar in form to those used in the American National Election Study (ANES) with specific positions anchoring each pole. The trait questions were identical to the ANES questions. The group closeness questions were worded: "Now I want you to tell me if you see any of the candidates as *really close* to some groups in American society. The first candidate is ———. Do you see him as *really close* to ———?"

SPLITCON. This variable is based on responses to the statement "State government works best when one party controls all the statewide offices."

TVDOM. This variable is based on the combination of responses to three questions: "In an average week, how often do you read a daily newspaper?", "In an average week, how often do you watch the local television news?" and "Have you talked about the campaigns, the candidates, or the issues in the 1990 elections with anyone—such as a friend, neighbor, coworker, your spouse or other relative?" Where the respondent watched television regularly but did not regularly read newspapers or did not talk with anyone, television was coded as dominant.

Interest. This variable is based on the following question asked after the election: "Some people don't pay much attention to political campaigns. How about you? Would you say that you were very much interested, somewhat interested, or not much interested in following the campaigns this year?"

Notes

This research was funded by the National Science Foundation under Award SES–9010956. We are grateful to the foundation for its support, to the Ohio State University Polimetrics Laboratory for conducting the surveys, to Melissa Thomas (who was supported by the NSF's Research Opportunities for Undergraduates program) for her assistance, and to Michael Gant for his constructive comments on an earlier version of the paper.

1. This number includes Nebraska's nonpartisan unicameral legislature, which has long been controlled by Republicans. Nebraska currently has a Democratic governor.

2. Before the 1890s, each party prepared its own ballot in most of the states. Ticket splitting, consequently, required the taking of two party ballots in full public view and the combining of them in some fashion to register votes for each party. Given this requirement, it is understandable that ticket splitting was so rare prior to the turn of the century.

3. In the two open-seat contests, a Republican was elected governor, and a Democrat won as attorney general. Two of the three incumbents won reelection, with incumbent Democrats winning the races for treasurer and auditor and a Republican challenger being elected as secretary of state.

4. A total of 1,277 Ohio adults were interviewed in wave 1 of the panel, which was conducted in September and early-to-mid October. The response rate for this wave was 57%. (A wave 2 interview was conducted for 492 wave 1 respondents within two weeks of the election, but these data are not utilized in this analysis.) Of these wave 1 respondents, 1,033 completed wave 3 postelection interviews for a reinterview rate of 81%. Only 567 of the wave 3 respondents reported having voted in the election, however; and they are the major focus of analysis. This two-wave panel sample matches up well with the known characteristics of the Ohio adult population in gender, age, race, and county of residence (based on the 1990 census). Like most surveys, however, it overrepresents people with higher levels of education. This sample bias should be taken into account in generalizing from the results.

5. The studies were conducted by the Survey Research Center at the University of Michigan. Beginning in 1970, the Michigan surveys were conducted by the Center for Political Studies, which had devolved from the Survey Research Center. Since the mid-1970s, these studies also have been referred to as the American National Election Studies.

6. A total of 6% of the voters cast a ballot in only one race (usually for governor), while 6% and 12% voted in two and three contests, respectively. One-race voters could not split their tickets and the opportunities to split were low for two- and three-race voters as well, so it should not be surprising to find that the percentage of ticket splitters is considerably lower among these voters (36%) than among four- and five-race voters (59%). Roll-off could be construed as a form of ticket splitting, but we reserve this treatment for subsequent study.

7. In effect, our treatment assumes that a latent continuous variable (reflecting propensity to split the ticket) underlies the dichotomous split/straight categories. We did consider, however, a number of alternative functional forms for the dependent variable. Because our theoretical interest lay in allowing alternative foundations for ticket splitting to compete as explanations for a singular, across-the-ballot behavior, in the end we chose to focus more or less exclusively on a dichotomous dependent variable.

8. When the party identification measure is folded at its independent midpoint so that it ranges from strong partisans of either party to independents, the relationship (and the similarity between weak partisans and independent-leaners) becomes even clearer. The percentage of ticket splitters declines in step fashion (82%, 63%, 60%, 33%) from independent to leaners to weak partisans and finally to strong partisans; and the Pearson's $r = -.30$. All subsequent analyses were conducted by measuring partisan strength in alternative ways—with and without leaners and weak partisans combined. The results were virtually identical and yielded no differences of substantive importance. Because combining leaners and weak partisans produces a slightly greater impact for partisan strength and using dummy variables for each category (save one) produces the same result but is more complicated to explain, we report the estimates for the three-category variable.

9. Visibility is measured from the postelection surveys, because the preelection results (wave 1) yielded so many no-information ties between candidates that they had virtually no discriminatory power.

10. We exclude the 36 voters who cast ballots for only one contest so as not to confound our analysis with those for whom ticket splitting is a logical impossibility. Because the dependent variable is a dichotomy, these are probit estimates rather than ordinary least squares regression estimates. Probit has the further advantage of allowing us to translate the effects of each variable into probability terms. To accomplish this, we set all other predictors at their mean values and then compute the change in the predicted probability of a split ticket that would occur as a result of a one-unit increase in the explanatory variable of interest.

11. We have estimated a variety of different equations to try to eliminate this unexpected age effect, but it has proven to be robust throughout. In particular, we reestimated the equations in Tables 5 and 6 without the race including Bob Taft, to see if the attraction of the Taft name to older voters might have induced them to split their tickets in this one instance; but the results were unchanged.

12. It is important to keep in mind that the variations on the basic model reported here are only two of a number of alternative specifications, many of which may extend beyond simple restrictions on the sample or measurements of the dependent variable. Indeed, we hope that our work will stimulate future efforts at exploring alternative qualitative and quantitative representations of ticket splitting across the ballot.

ADAPTIVE PARTIES IN SPATIAL ELECTIONS

KEN KOLLMAN *Northwestern University*
JOHN H. MILLER *Carnegie Mellon University*
SCOTT E. PAGE *Northwestern University*

We develop a model of two-party spatial elections that departs from the standard model in three respects: parties' information about voters' preferences is limited to polls; parties can be either office-seeking or ideological; and parties are not perfect optimizers, that is, they are modelled as boundedly rational adaptive actors. We employ computer search algorithms to model the adaptive behavior of parties and show that three distinct search algorithms lead to similar results. Our findings suggest that convergence in spatial voting models is robust to variations in the intelligence of parties. We also find that an adaptive party in a complex issue space may not be able to defeat a well-positioned incumbent.

Since Anthony Downs's *Economic Theory of Democracy* (1957), a spatial theory of elections has occupied a prominent theoretical status within political science. Modelers use the intuitive notion of ideological distance to develop explanations for observable electoral trends. The most famous of these trends is the Downsian idea that in a two-party system, given certain assumptions, parties converge toward a median position on the continuum of possible voter positions. Although simple spatial models have produced this result, extensions to the models have questioned the robustness of this prediction. Following the voting paradox and the results of Plott (1967) and McKelvey (1976), some scholars have speculated that chaotic results are possible and, in some cases, likely. In two or more dimensions, the top cycle set consists of the entire space of issue positions.[1] Bates summarizes the more general result: "The principle lesson is that, in general, one cannot expect an equilibrium to exist; and, because any outcome can be defeated, political decisions represent arbitrary outcomes" (1990, 45). Whereas some scholars concede the predicted instability in multidimensional voting models (Riker 1982), others see the Downsian model's stability and convergence as more empirically accurate and (perhaps) more normatively desirable.

Some theorists, inclined to believe that electoral chaos is extremely unlikely, have incorporated various complexities to explain stable, often centrist, outcomes. Coughlin (1990a) divides these models into four general categories: (1) models that allow for mixed strategies by parties, (2) models that track dynamic trajectories of party locations, (3) models that search for uncovered or undominated sets, and (4) models that include candidate uncertainty over voters' behavior (probabilistic voting models). He writes, "It is hard to resist the alternative inference that the primary contribution of recent work on the majority rule relation is as a grand 'reductio ad absurdum' that tells us to go back to the basic model that has been used to see how it should be modified in order for theory and empirical observations to match up" (p. 164).

Two-party electoral outcomes appear more stable than the chaotic results predict, so the task of seeking alternative assumptions to get more realistic outcomes has a sound scientific basis. Nevertheless, both original spatial models and many contemporary revisions rely on unrealistic assumptions to produce equilibria. They often assume fully informed and optimizing voters and parties (Davis, Hinich, and Ordeshook 1970). Spatial modeling seems wedded to the defining assumptions of rational choice, namely, that people and organizations are self-interested, have complete information, and can locate optimal strategies regardless of complexity. Chaos results, for example, rely on unrealistic assumptions about the abilities of parties to locate winning platforms. Probabilistic voting models assume that parties position themselves optimally given complete knowledge of the probabilities of voters' actions (Coughlin 1990b). We find implausible even the restricted assumptions that parties have sufficient information and analytical abilities to locate optimally. Perhaps different assumptions about the abilities of parties or voters lead to stable outcomes.

We incorporate boundedly rational parties in a model of two-party competition. Instead of modeling parties as full-information global maximizers, we model them as incompletely informed and adaptive. They move incrementally toward better regions of the space through the use of search algorithms. Our model involves a dynamic interaction between parties who make decisions in an evolving environment. Much like Kramer (1977), we are interested in the trajectory of party platforms over a sequence of elections. Using our methodology, we are able to explore a variety of questions: Do imposed informational and computational constraints lead to arbitrary outcomes, with winning party platforms scattered throughout the space? Do boundedly rational parties converge toward centrist platforms? Do parties always defeat incumbents, as many models suggest? Does altering the preferences of parties from vote

maximizing to winning with ideals affect the behavior of parties? Our use of adaptive agents allows us to address these questions without wholly abandoning formal modeling.

We shall discuss the advantages of using artificial adaptive agents in the social sciences and present our basic model and a description of the two types of party preferences that we consider. We then present the three search procedures used by our parties and describe our results. We conclude with a discussion of the role of information in elections and possible directions for future research.

THE USE OF ARTIFICIAL ADAPTIVE AGENTS

Holland and Miller advocate a class of models using artificial adaptive agents (AAA), a technique in which "the unfolding behavior of the models can be observed step-by-step" (1991, 366). Based on computer languages, these models are flexible enough to capture a variety of situations yet they maintain precision and logical consistency.[2] Computational models allow the exploration of systems of well-defined agents in a perfectly controlled environment that can be easily and rapidly replicated under many conditions. Moreover, any conceivable analysis is feasible since the state of the system is fully recoverable. This allows the researcher to generate, develop, and test theoretical hypotheses quickly. Although optimization is the key benchmark in much social science theory, learning, adaptation, and bounded rationality are recognized as important processes. Through the use of AAA models, questions about the relationship between optimization and adaptation can be explicitly explored. We adopt the AAA technique because of these advantages and because of our belief that political parties are better characterized as partially informed, finite-memory information processors who rely on rules of thumb than as completely informed rational agents.

Underlying our methodology is the notion that there exist important classes of behavior that can be captured in models too complex for traditional mathematical analysis. Absence of equilibria in a model (or equilibria that human agents could locate only by chance) does not necessarily imply a lack of predictability. AAA allow us to search previously inaccessible models for patterns of generic behavior. Our choice of technique has costs. Restriction to any one type of algorithm can yield ad hoc results, and predictions are often less precise than those of rational actor models. To control for these possibilities, we compare three distinct types of AAA, and arrive at strikingly similar results for all three. The use of multiple algorithms to discover equivalence classes of adaptive behavior distinguishes our model from others and strengthens our results.

There are many precedents for the use of AAA and similar techniques in the social and behavioral sciences. For example, economists have applied AAA to evolve efficient bilateral trading rules (Marimon, McGrattan, and Sargent 1990) and to explore learning in varying economic environments (Arifovic 1989; Miller 1986). In political science, Cohen (1984) has used computer models to explore competing theories of organizational decision making, and Whicker and Strickland (1990) have used computer simulations to test the importance of opinion distribution and decision rules on the constitutional amendment process. Axelrod (1986) has simulated the evolution of norms and has also used a genetic algorithm to develop new strategies that were superior to Tit for Tat in his 1984 computer tournaments (Axelrod 1987). One of the present authors, Miller (1987), has analyzed the coevolution of strategies and the emergence of cooperation in noisy repeated prisoner's dilemma games using adaptive algorithms.

Thus, we agree with Coleman (1989) that simulation models with humans, computers, or both can be useful in the construction of social theory. We shall use computer models to trace the emergent behavior of boundedly rational parties in the context of spatial voting models. Since our parties are limited in both the information they possess and in how they process the information, there is no guarantee that in finite time they will find optimal locations in the policy space. We can, however, compare the general movements of the parties over time to the predictions of mathematical models of party competition. The model we put forth does not stretch the boundaries of our technique. Our present purposes—to address a central problem in positive political theory and show the strength of our approach—are best served by a simple model.

THE BASIC MODEL

Our model incorporates many of the assumptions of spatial voting models, including voters who are perfectly informed about candidate platforms. We follow more recent models and relax the assumption of identical voter preference intensities. We call a voter's preference intensity a *strength*, interpreted as the importance that the voter attaches to an issue. Strengths vary, so voters have noncircular indifference curves. Our model departs from standard spatial models in three respects. First, we consider both purely office-seeking parties and ideological parties. Second, our parties are not perfectly informed, and do not know individual voter utility functions. Rather, they obtain information through "test" elections (like opinion polls) that measure how well their current platform would do relative to their opponent's platform. During a campaign, parties test their platforms on voters, receive feedback in the form of vote totals, and alter their platforms to improve vote totals. Finally (as discussed), our parties do not optimize given their limited information. Instead, using the vote totals from test elections, they adap-

tively alter their platforms, trying to defeat their opponent.

Formally, there are two parties competing for V votes in an n-dimensional issue space. Each voter's preferences are represented by two vectors of n integers, which give the voter's ideal positions and strengths on the n issues. We assume that there are k possible positions on each issue $\{0, 1, \ldots, k-1\}$ and s possible strengths $\{0, 1, \ldots, s-1\}$. The utility to a voter from a party's platform, $y \in \{0, 1, \ldots, k-1\}^n$, is given by the negative of the squared weighted Euclidean distance, where the weight on the ith issue is the strength associated with that issue by the voter. If s_{ji} denotes the jth voter's strength on the ith issue and x_{ji} is the jth voter's ideal point, then a voter's utility is given by

$$u_j(y) = -\sum_{i=1}^{n} s_{ji} \cdot (x_{ji} - y_i)^2$$

In this model we assume that both strengths and ideal points are independently and uniformly distributed. The election results we present consider 251 voters, 15 issues, 7 positions per issue, and 3 possible strengths. Therefore, on average, each voter has five issues of major importance ($s_{ji} = 2$), five of minor importance ($s_{ji} = 1$), and five of no importance ($s_{ij} = 0$). The assumption that voter ideal points are uniformly distributed does not necessarily imply regularity. A relatively small number of voters are generated in a large space, so a spray of points is a more appropriate way to think of the distribution.[3] Each voter casts a ballot for the party giving the higher personal utility. To evaluate the trajectory of democratic outcomes, we introduce *centrality*, a measure of the goodness of each outcome. Without such a measure, we cannot compare our model analytically to any other model. We calculate centrality by computing both the sum of the utilities of the individual voters if the winning party were located at the median on all issues and the sum of utilities resulting from the winning party in the election, then divide the former by the latter.

$$c(y) = \left[\sum_{j=1}^{V} u_j(\text{median})\right] \Big/ \left[\sum_{j=1}^{V} u_j(y)\right]$$

It follows that $c(\text{median}) = 1$. This normalization has the interpretation that the higher the centrality, the closer the winning candidate is to the weighted center of voter preferences and therefore the more responsive the democratic outcome. We attach no normative significance to the median itself as an outcome. We merely exploit the fact that it is generally of high aggregate utility. There may exist platforms with centralities greater than 1. Ideally, we would find the platform of minimal average distance and use its utility as the numerator; but the costs in computer time outweigh any advantages. Regardless of the numerator, we have a measure of aggregate utility, or the average weighted distance to a voter.

Parties are initially represented by a randomly selected "ideal" platform. Since parties are aggregates of individuals, we assume they have uniform strengths across all issues. We consider two types of parties: *ambitious* and *ideological*. Ambitious parties care only about winning elections, and their ideal platform serves only as a starting point for the initial campaign. Ideological parties also want to win the elections, but they want to win with a platform that is spatially close to their ideal platform. Formally, if $v(\mathbf{y}:\mathbf{x})$ is the number of votes the challenger party receives if it takes platform $\mathbf{y}$ and the incumbent is at $\mathbf{x}$, and $\mathbf{Y}$ is the challenger party's ideal point, then the objective functions for the ambitious and ideological parties can be written as:

$$\text{Obj}_{\text{am}}(y) = v(\mathbf{y}:\mathbf{x})$$

$$\text{Obj}_{\text{id}}(y) = \begin{cases} v(\mathbf{y}:\mathbf{x}) & \text{if } v(\mathbf{y}, \mathbf{x}) \le V/2 \\ V/2 + n \cdot k^2 - \sum_{i=1}^{n} (y_i - Y_i)^2 & \text{if } v(\mathbf{y}:\mathbf{x}) > V/2. \end{cases}$$

Recall that V is the total number of voters, n the number of issues, and k the number of positions per issue. This implies that

$$n \cdot k^2 \ge \sum_{i=1}^{n} (y_i - Y_i)^2$$

for any y and $\mathbf{Y}$. Thus, ambitious parties attempt to maximize votes in the hopes that a larger margin of victory makes them more difficult to defeat in subsequent elections, while ideological parties have lexicographic preferences. Their primary goal is to win the election: $v(\mathbf{y}:\mathbf{x}) > V/2$. Once this is accomplished, they attempt to get as close to their ideal platform as possible.[4]

During each election, the incumbent party's platform is fixed, and the challenger party attempts to find a platform in the issue space that defeats the incumbent. In the first election the incumbent party (arbitrarily chosen) remains at its ideal platform. Thereafter, the incumbent remains at the platform where it won the previous election. The challenger party attempts to defeat the incumbent by choosing a new platform. The challenger party, during a finite campaign, tests new platforms on voters who are assumed to have perfect information about both platforms. These tests are accurate polls of political popularity.

Both ambitious and ideological parties are constrained in how they search the issue space for good platforms. First, the campaigns are of finite length, so parties are limited in the number of polls they can take. For example, a party may only be able to take 40 polls before the election. Second, during any platform adaptation, our parties are limited by the number of issues they can change and the degree of change on any such issue.[5] Even for ambitious par-

ties, the ideal platform functions as an ideological tether in early elections.

Positioning constraints and finite campaign length imply that our parties fail to fulfill their goals optimally. Ideological challengers should typically win elections because ideological incumbents attempt to stay near their ideal platforms, which generally lie in regions of average centrality. However, because of their limited ability and information, ideological challengers accept platforms further from their ideal platforms than necessary. With ambitious parties, after a few elections the incumbents' platforms are located in regions of high centrality, making them difficult to defeat. Therefore, ambitious challengers often lose.

HOW PARTIES FIND PLATFORMS

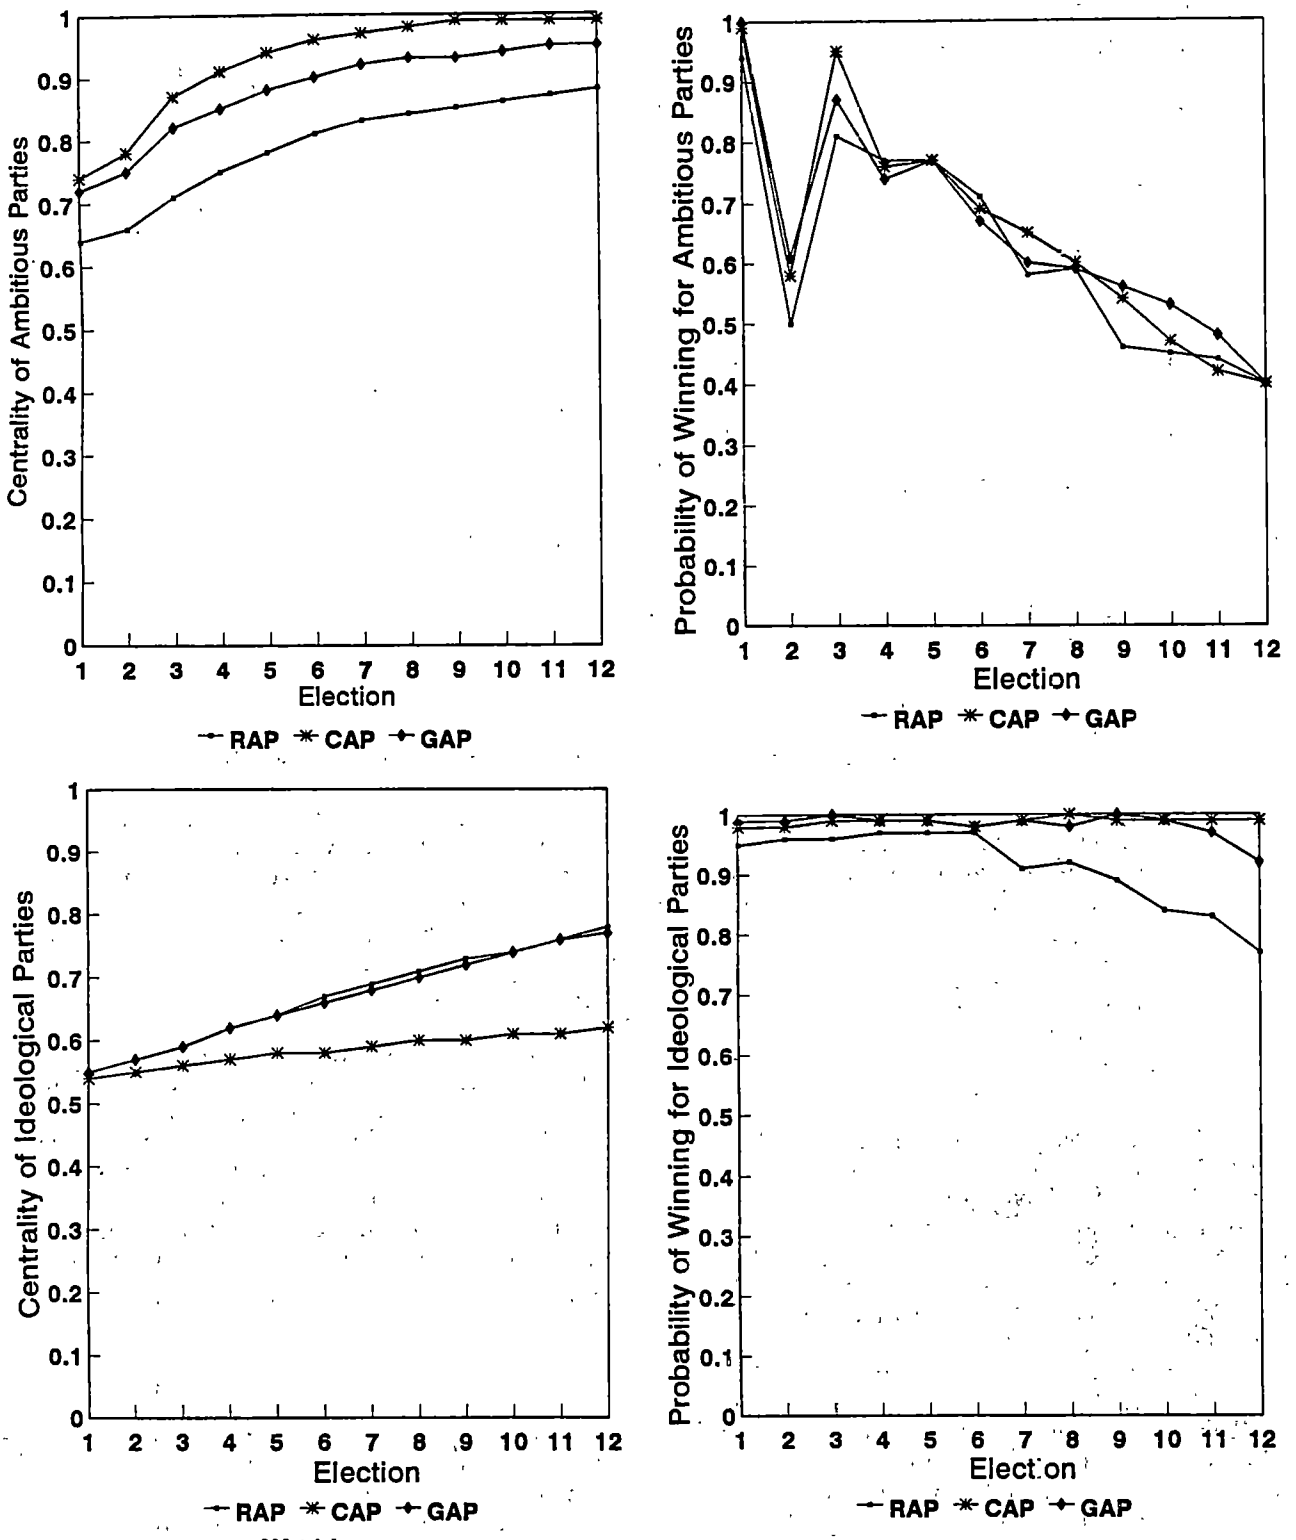
Once we relax the assumptions that parties have complete information and the ability to locate optimal platforms, we can model our parties in a variety of ways. There are many ways to not be perfectly rational. We chose three types of parties, each having a different platform search procedure: *random adaptive parties* (RAPs), *climbing adaptive parties* (CAPs), and *genetic adaptive parties* (GAPs). The search procedures were constructed to be crude approximations of actual procedures. More important, they provide reasonable bounds on the ability of parties to locate platforms. The procedures themselves are mechanisms for the party to choose the platform it presents to the voters against the incumbent. All three procedures will be discussed primarily within the context of ambitious parties. The extension to ideological parties is straightforward.

The RAPs are the least adaptive of our parties. Letting L represent the length of the campaign, RAPs randomly generate L platforms in the neighborhood of their previous platform and choose the platform that receives the most votes against the incumbent. The RAPs approximate a smoke-filled-room selection process. The party gathers immutable potential candidates and selects the highest vote-getter to represent the party in the election. We do not dispute the contention that this underestimates the ability of parties or candidates to adjust to public opinion. The RAPs are intended as lower bounds on the ability of parties to position themselves.

In contrast to the RAPs, both the CAPs and GAPs selectively refine their platforms to improve vote totals. The CAPs begin with their current platform and experiment, slightly changing positions on a few issues. If the new platform fares better against the incumbent than did the previous one, the party switches to the new platform. These platform tests are called hill-climbing iterations. Here, the campaign length L equals the number of hill-climbing iterations (including those resulting in no improvement) that a party performs before the actual election. The CAPs enter the election with their final—and therefore best-to-date—platform. The CAPs represent parties that select a candidate and then adapt the candidate's platform to the electorate's views by testing alterations with focus groups and speeches. After finitely many refinements, the improved challenger faces the incumbent.

The GAPs, the third type of parties we consider, employ a genetic algorithm to guide their search (see Goldberg 1989; Holland 1975). Instead of adapting a single position, genetic algorithms adapt a population of platforms, attempting to discover nonlinear (epistatic) interactions among variables. Genetic algorithms were designed to work well in "complex" environments—spaces with nonlinearities, discontinuities, noise, and high dimensionality. For our purposes, GAPs provide an indication vis-à-vis the other algorithms of the inherent difficulty of the spatial election problem.

The GAPs represent parties whose potential candidates shift positions both by borrowing from competitors and by testing their own alterations. The genetic algorithm generates new platforms using three procedures. It begins with the random creation of, say, 12 platforms. The first operator, reproduction, randomly selects (with replacement) 12 pairs of candidates from the list and reproduces only the preferred member of the pair. The resulting candidates are then randomly arranged in pairs to which the cross over operator is applied. During crossover, the candidates randomly decide (with probability 50%) whether or not to trade positions on a few issues. If they decide to switch, they exchange groups of positions. Finally, the mutation operator allows each candidate to alter positions randomly on an issue or two.



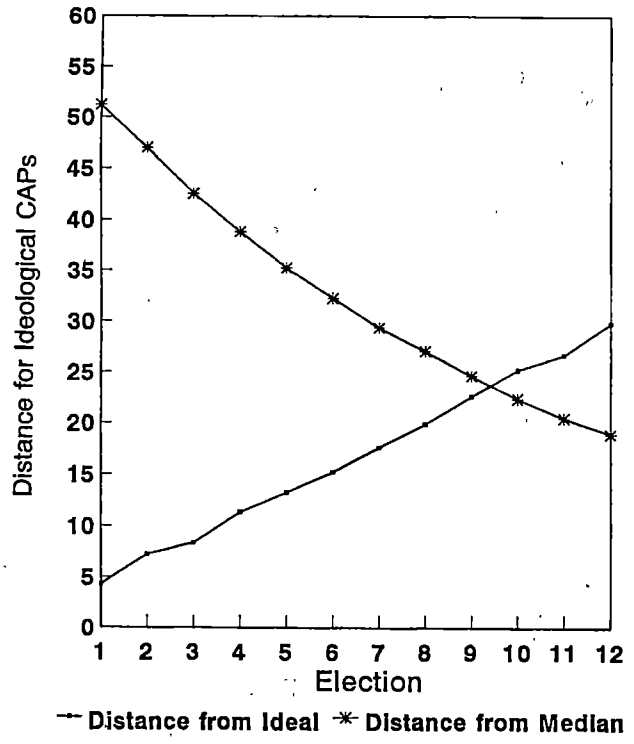
Following biological convention, each application of the reproduction, crossover, and mutation operators is called a *generation*. We count each generation of the genetic algorithm as two units of campaign length, since both crossover and mutation involve candidate platform alterations. At the completion of a campaign of length L, which consists of $L/2$ generations of the genetic algorithm, the party chooses the best-to-date platform.[6]

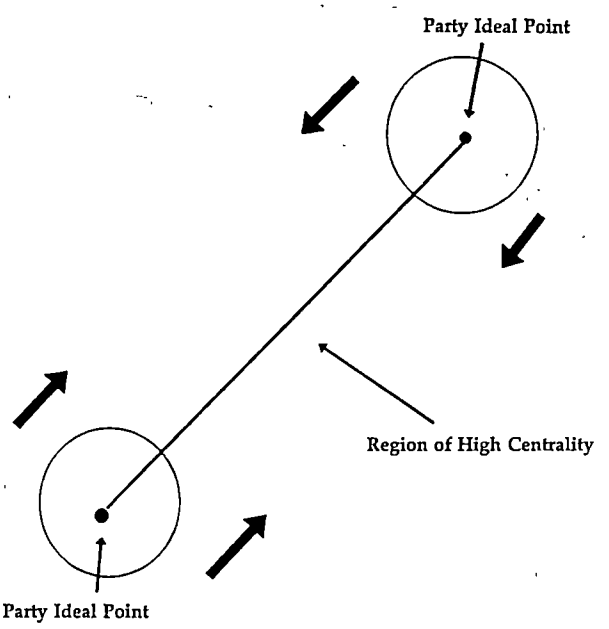
RESULTS

Several measures are of interest in comparing the different parties and search procedures. Given that our primary concern is the extent to which the distribution of winning party platforms is biased toward regions of high centrality, we record the centrality of winning platforms. We also want to measure the ability of ambitious and ideological parties to defeat the incumbent and to know how far ideological parties must stray from their ideal platforms to do so. Finally, we are concerned with the effect of varying the length of campaigns. The length of campaigns corresponds roughly to the amount of information parties have about voters before an election. Campaigns of length 40 ought to enable parties to compete more effectively against incumbents than campaigns of length 5.

FIGURE 1

Centrality and Success of Adaptive Parties





Data represent means over 200 trials

Before presenting our findings, we should note that the robustness of computer simulation results often is sensitive to parameter values. Our findings appear qualitatively invariant to reasonable changes in parameters. We chose parameter values that seem realistic in the study of democratic elections and for

FIGURE 2

Ideological Parties: The Dumbbell Waltz

which a wide range of surrounding values produced similar results. For example, we chose 12 elections because most interesting phenomena were manifest by that time. The following parameters were used:

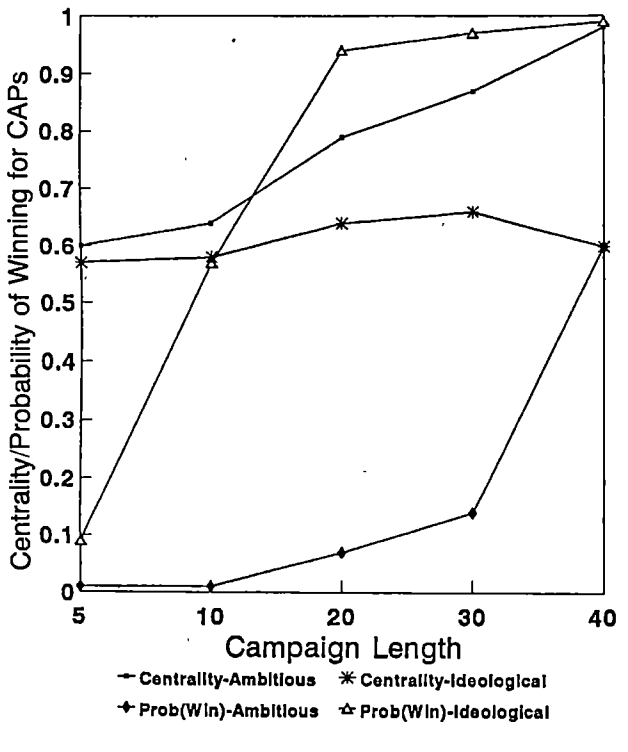
Voter types (V)	251
Number of issues (n)	15
Positions per issue (k)	7
Strengths (s_{ji})	3
Elections	12
Campaign length (L)	40

All of these fall safely within ranges for which we observed no significant changes in the conclusions.

Centrality values have greater significance when viewed with respect to the distribution of centrality. The Appendix shows numerically estimated distribution and density functions for the centrality of platforms. We compare election outcomes to the cumulative distribution function. Note that a winning party with a platform having a centrality of .55 lies in the upper 17% of the distribution. We ran two hundred trials of a 12-election sequence for each party and type of algorithm. We recorded the centrality of the winning party, the probability that the incumbent would be defeated, and (in the ideological case) the distance to the party's ideal platform.

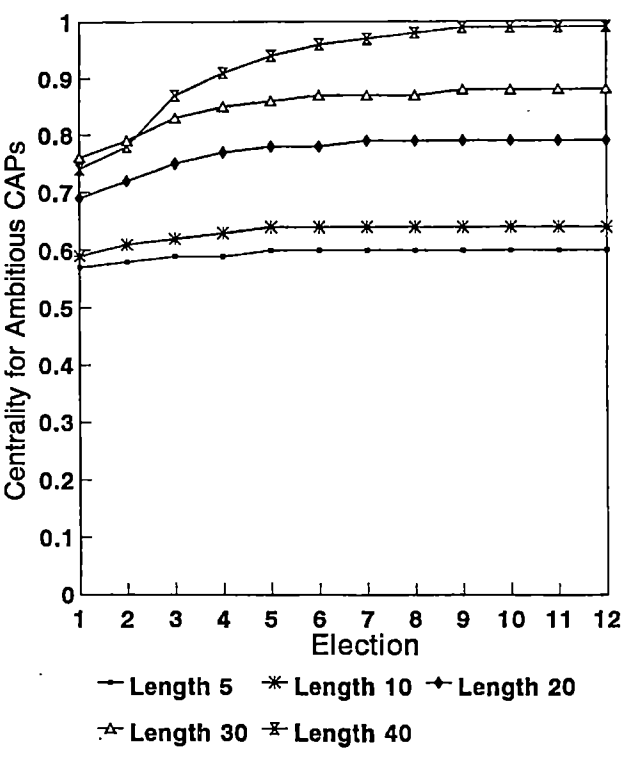
Ambitious Parties

For all three types of algorithms, ambitious parties moved in directions of higher centrality (see Figure 1). By the sixth election the CAPs and GAPs had average centralities above .9, and the RAPs above .8, which placed all three types of parties in the top .01% of all platforms! It appears that convergence to high centrality and the increase in centrality over time are invariant to the type of search algorithm. As might be expected, the CAPs and GAPs had higher centrality than the RAPs. With respect to the distribution of centrality, however, the differences were not large.



The probability of a challenger's winning decreased from almost 1 in the first election to near .4 by the twelfth election for all three algorithms (see Figure 1).[7] In our model, ambitious challengers have increasing difficulty defeating the incumbent. Incumbency advantage can be attributed to challengers' lack of information, the limitations of adaptive search, and the positions of incumbents' previously adapted platforms.

Ideological Parties



We would expect the centrality of outcomes in elections between ideological parties to be lower than if the parties were solely ambitious. As a consequence, the probability of winning should be much higher in ideological contests. Our results confirmed these expectations. Centralities were lower overall for ideological parties compared with ambitious parties, and there was less variation over elections (Figure 1). Still, all three algorithms were in the top 3% of platforms at the end of 12 elections. Moreover, the probability of

FIGURE 3

Centrality and Success by Campaign Length

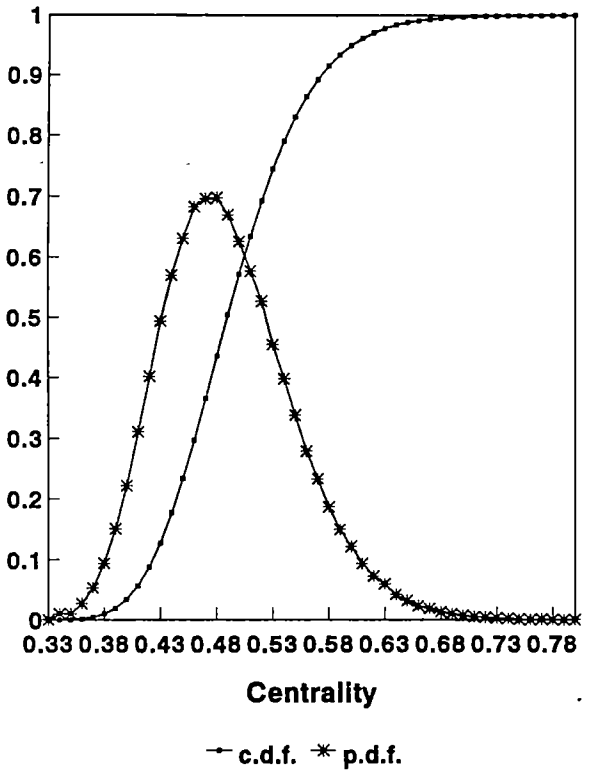
Values for the 8th election

200 trials

winning was high throughout the sequence of elections, tapering off in the later elections only for the RAPs (Figure 1). Note that the CAPs were not only more likely to win than the RAPs and the GAPs, but they also won with lower centrality. Data reveal the CAPs stayed closer to their ideal points. The CAPs ability to fine tune platforms issue-by-issue generates these results.

Another noteworthy result came from the simulation of ideological parties. We observed that for all three algorithms, the distance to party ideals increased by small amounts, while the distance to the median decreased over time (Figure 2). We refer to this positioning behavior as the *dumbbell waltz*. The challenging party dances in a neighborhood of its ideal platform until it finds a winning platform. This neighborhood slowly converges to areas of high centrality. A chart of winning platforms would consist of two disjoint neighborhoods (one near each of the ideal platforms) and would resemble a dumbbell. The ends of the dumbbell slowly converge as the number of elections increases (Figure 2).



Campaign Length

Increasing the length of the campaign increases the ability of parties to learn about, and adapt to, voters' collective preferences. Figure 3 shows centralities and probabilities of winning for ambitious and ideological CAPs as the length of the campaign increases from 5 to 40. As expected, both centrality and probability of winning tend to increase with campaign length. To give a complete 12-election example, the figure also reveals how increasing campaign length for ambitious CAPs qualitatively increases centrality. For ideological parties, however, centrality varies only slightly with campaign length (see Figure 3) because more informed and intelligent ideological parties are able to locate winning platforms nearer their ideal platforms.

Our results tend to support the idea that boundedly rational parties will converge to central regions of the issue space in a Downsian fashion.[8] Since centrality measures the closeness of parties to voters' ideal points, winning parties with very high centralities can be said to give voters high utility. In this sense, our results suggest that even with fairly simple adaptive parties (e.g., the RAPs), a two-party system should lead to normatively appealing outcomes. Not surprisingly, ambitious parties reach higher centrality than ideological parties. Finally, all three search procedures for both types of parties produced similar outcomes, indicating that there may exist large equivalence classes of adaptive behavior by parties that may allow researchers to undertake a unified analysis. Substantively, our use of three algorithms bol-

FIGURE A-1

Centrality Distribution/Density

Note: 10,000 Monte Carlo trials. c.d.f. = cumulative distribution function; p.d.f. = probability density function

sters the conclusion that departures from the strict informational and rationality assumptions of earlier formal models lead us to convergence results.[9]

DISCUSSION

Rational choice theories of electoral competition have led to two incompatible conclusions. On the one hand, convergence results offer an intuitively appealing explanation for the responsiveness and stability of two-party systems. On the other, chaotic results raise doubts about the legitimacy of democratic outcomes. Both sets of results have relied on strict assumptions of complete information and global optimization. We have relaxed these assumptions about parties and have observed the parties in our model (even ideological ones) converging to central regions of the issue space. Although some mathematical models indicate that democracy might yield arbitrary results with respect to voters' preferences, our model suggests that this typically will not happen with adaptive parties. Moreover, boundedly rational parties may not be able to defeat incumbents. Mathematical proofs of the existence of winning strategies should not be equated with the ability of human actors or organizations to locate them.[10]

Our results, supported by their invariance to parameter choices and search procedures, also help confirm basic intuitions about the role of information and ideologies in elections. As the length of campaigns increases or as parties have more information about voters, parties tend to converge toward centrist outcomes. This observation seems to be consistent with general comparisons of both national and local elections. Extreme candidates rarely emerge as national candidates; and when they do, they lose by a wide margin. Yet at the local level, extremists can thrive. The lack of information among voters has received a great deal of theoretical attention; the lack of information among parties and candidates deserves to be explored, as well.

Our techniques are designed to analyze the behavior of a complex adaptive system, a system in which endogenous aggregate behavior emerges from the knowledge- and rule-based behavior of individual agents. Our model can be extended in many directions, incorporating a variety of components known to exist in the real world. It is possible to include correlated preferences, noisy polls, coadaptive parties, interest groups, issue polling, voters with incomplete information, and multiple parties in future models.[11] With all of these extensions, there is the opportunity to calibrate a simulation to data.

APPENDIX

Figure A-1 shows numerically estimated distribution and density functions for the centrality of platforms.

Notes

Complete data and computer programs are available upon request. We wish to thank Jeffrey Banks, Michael Kirschenheiter, Roger Myerson, Benjamin Page, and Stan Reiter for helpful comments on earlier drafts. The research support of the Center for Mathematical Studies in Economics and Management Science at Northwestern University and the Santa Fe Institute and a grant from Sun Microsystems are gratefully acknowledged.

1. The top cycle set is the smallest set of points whose members defeat all points not in the set. For example, if A defeats B, B defeats C, C defeats A, and each defeats all other points in the space, then {A, B, C} is the top cycle set.

2. By *logical consistency* we mean in the narrow sense of adherence to a rule and not in the broader sense of satisfying mathematical axioms.

3. Central limit theorems and the like are not appropriate given the relatively small number of voters and the size of the space. With 15 issues, 7 positions, and 3 strengths, there are 21^{15} ($\approx 10^{20}$) possible voter types.

4. This construction allows an ideological party to choose a platform that is further from its ideal platform than the incumbent's platform is. However, this only occurs when the distance between party ideal points is improbably small.

5. As an example, in a five-issue, seven-position space, where the current party platform is (6, 2, 5, 4, 1), the party will be much more likely to test the platform (5, 2, 5, 4, 2) than the platform (1, 6, 1, 3, 6), given their relative distances to the current platform.

6. We use a crossover rate of .5; so on average six platform adaptations occur per generation. Therefore, in L/2 generations, the GAPs will test more than L platforms.

7. The dip in the second election results from our random assignment of an incumbent prior to the first election. Half the time, the challenger defeats the incumbent prior to adapting a new platform. After adaptation, the election is a landslide. Subsequently, the exincumbent (now the challenger) has a difficult time winning the second election against such a strong opponent.

8. Kramer (1977), relying on stricter assumptions, has shown that parties will converge toward the minmax set (the set of platforms that lose by a minimal amount) but that the minmax set is not a stable attractor. In other words, parties can leave the minmax set to win once they converge to it. Our results suggest that if movements out of the minmax set occur, they do not, on average, lower centrality.

9. The equivalent performances of the GAPs and the other less sophisticated algorithms also suggest that the underlying search problem is relatively easy.

10. In chess, a finite perfect information game, an optimal strategy exists, yet no one has found it to date.

11. Convergence tends to be robust to changes in the distribution of voters' preferences, although convergence rates may change. For a complete discussion, see Page, Kollman, and Miller (1992).

REPRESENTATIVE DEMOCRACY AND STATE BUILDING IN THE PROGRESSIVE ERA

EILEEN LORENZI McDONAGH *Northeastern University, Radcliffe College*

I draw upon state-building and legislative literatures to investigate how constituency-based representative institutions in the Progressive Era nationalized innovative public policies, thereby expanding the authority of the federal government as a component of the modern American state developing at that time. Using state-level referenda votes as measures of grassroots views, multivariate analysis discloses the impact of district opinion, as well as party and district economy, as major determinants of House roll call voting on landmark regulatory legislation authorizing federal intervention in market relationships, state suffrage qualifications, and life-style behaviors involving intoxicating beverages.

The Progressive Era has long been depicted as a responsive "search for order" activated by social, economic, and political problems attending rapid and brutal industrialization at the turn of the century (Burnham 1982, 47; Wiebe 1967). Recently, however, "new institutionalist" approaches point to the expansion of state capacity as the most salient outcome of that search, designating the Progressive Era as a critical time that set parameters for the development of the modern American state (Amenta et al. 1987; Buenker 1977, 57; Ethington n.d.; Orloff 1988; Skocpol 1992; Skowronek 1982).[1]

State capacity grew in two significant ways in the Progressive Era. First, after the turn of the century, more and more observers acknowledged that social and economic ills attributed to an unrestricted capitalistic market system were anything but self-correcting. Consequently, union-backed legislative policies, passed at both state and national levels, thereby expanding the scope of government to include intervention in laissez-faire's hitherto sacrosanct free-contract relationship between business and labor.[2] The power of government regulation also expanded to such new areas as the food and drug industries, as well as development of innovative income tax and fiscal policies (Epstein 1986).[3]

Second, the scope of government authority was not only reconstituted in the Progressive Era at the state and national levels but was transferred from the former to the latter. Previously decentralized state capacities located in dispersed "island communities" became unified and centralized (Wiebe 1967, xiii), producing what Samuel Beer terms a transitional period of dual federalism (1973, 69). How this reconstitution and transference came about, of course, poses one of the more intriguing questions to scholars investigating this period.

Electoral Models of Policy Innovation: Mainsprings and Wellsprings

The realignment thesis provides a powerful explanation accounting for how decentralized electoral opinion can be the "mainspring" of policy innovation at the national level, once it becomes expressed in a cataclysmic, critical election establishing a long-lasting partisan regime shift (Brady 1973, 1984, 1988; Burnham 1970; Key 1955, 1959).[4] Yet this model is not applicable to the 1900–1920 Progressive Era decades, falling (as they do) in the nonrealignment period between the critical election of 1896 and the New Deal.[5]

Others point to the "electoral connection" as the key feature of the American political system (Mayhew 1974) by showing how political elites attend to what we might term the "wellspring" of constituency opinion on an ongoing basis. In this view, citizens continuously have "a form of indirect access to public policy making," exerting pressure both at the point of elections and throughout terms of office (Arnold 1990; Bartels 1991; Ginsberg 1976; Mayhew 1974, 1987; Powell 1982, 658; Walker 1966, 286).[6]

Though scholars typically research the effects of discontinuous realigning elections upon adoption of innovative national policies (Shafer 1991), the state-building effects of continuous electoral processes remain relatively unexplored. Yet in at least one context, we might expect the ongoing electoral connection between local constituents and national elites to have state-building outcomes at the federal level, namely, a stage of policy development in which grassroots issue positions anticipate those to be established at the national level. In such circumstances, national political elites following progressive grassroots policy cues not only represent their constituents but thereby effectively transfer policy innovations from the state level (where they are already established) to the national level. In such a scenario, it is the representative structure of Congress linking it to grassroots constituents as a source of policy innovation that accounts for its institutional role as state-building agent passing legislation which expands federal authority.[7]

The Progressive Era embodies such a context as a time when innovative public policies were widely diffused across states prior to the adoption of similar policies at the national level (Gray 1973; Skocpol

1992). Before 1900, for example, 28 states passed some form of hours laws limiting the working day; and 15 states, including the most industrial, had passed laws specifically regulating hours of work for railroad and streetcar employees. Not surprisingly, in the wake of state-level diffusion of such policies, a comparable program of union-backed labor legislation began to be adopted at the national level after the turn of the century.

Yet while many view our federal system as one in which reform "percolates" up from the local to the state to the national level, few analyze what constitutes the percolation mechanisms.[8] Rather, scholars most often depict innovative public policies established at the national level in nonrealignment periods as a result of national forces alone or partisan sectional cleavages generated solely by economic interests.[9] This project expands such analysis by also assessing how local policy positions influenced the passage of innovative national legislation in the Progressive Era.

POLICY CONGRUENCE AND CONSTITUENCY OPINION

Policy congruence linkages between grassroots constituents and their representatives constitute, for many scholars, the core of democratic theory, empirically defined by the degree of issue concordance between the two. Though the meaning of policy congruence between representatives and their constituents raises complex questions, empirical assessments of how policy opinions of grassroots voters match those of their representatives are relevant to all analyses of representative roles and norms (Bartels 1991, 468, 457; Fiorina 1974; Kingdon 1981).[10] As Robert Weissberg put it succinctly, "Representation means a high correlation between constituency opinion and roll-call voting on a pairwise basis" (1978, 536).

Measuring Constituency Opinion

While roll call votes are readily available as concrete indices of legislators' issue positions in policy congruence research, measurement of constituency issue opinion has proved more vexing (Clausen 1973, 119; Hedlund and Friesema 1974, 399; Jewell 1985; Miller and Stokes 1963, 47). Warren Miller and Donald Stokes (1963) use direct, attitudinal survey measures of constituents' issue preferences in their classic study of policy congruence in the United States in the late 1950s. Philip Converse and Roy Pierce (1986) replicate this design in their study of France in the late 1960s and early 1970s. While both studies provide direct measures of constituency opinion, they also illustrate problems endemic to the use of attitudes as indices of policy positions.[11]

Yet, for historical research, the most seriously limiting feature of attitudinal surveys is the lack of them. The first systematic public opinion polling did not commence until the 1930s, rendering earlier periods, such as the Progressive Era, barren of attitudinal data. Clearly, researchers interested in the early twentieth century must turn elsewhere for direct evidence of grassroots opinion.

Referenda Votes

A technique advocated by contemporary researchers having potent utility for research on historical periods is the use of state-level referenda votes as direct measures of constituency issue positions. In some ways, referenda votes are the more preferred index of constituency opinion. They are discrete, behavioral legislative choices made by grassroots voters on specific policies and thus inherently more comparable to the roll call votes of legislators than the responses to survey questions can be.[12] Furthermore, their use in contemporary and historical studies of state legislative policy outcomes is impressive (Arneson 1927; Campbell 1977; Crane 1960; Dyksira and Hahn 1968; Erikson, Luttbeg, and Holloway 1975; Hedlund and Friesema 1974; Kuklinski 1977, 1978).

More recently, referenda votes have been used to study policy connections operating between state and national levels. L. Marvin Overby (1991), for example, used the returns of state referenda on nuclear freeze policies to show that constituency opinion affected House roll call voting on similar legislation in the 1980s. This resourceful application of referenda votes, nevertheless, failed to aggregate returns by congressional districts, using, instead, only state-level totals.

I use referenda votes, aggregated by congressional districts, as a direct measure of constituency opinion to investigate how policy congruence operated in the Progressive Era between grassroots voters and their representatives in the House. In addition to demonstrating the utility of referenda votes, I push a study of policy congruence back in time to key historical decades, illuminating how policy congruence contributed to the centralization of state authority occurring in the early twentieth century.[13]

DATA AND METHODOLOGY

To develop a measure of district-level opinion on union–labor, woman suffrage, and prohibition policies, I collected as many county-level state votes on referenda and initiatives as I could find by means of an extensive two-year search of state yearbooks found in the libraries of Harvard, Michigan, and Minnesota universities, the Library of Congress, uncoded data files at the University of Michigan Inter-University Consortium for Political and Social Research (ICPSR), and correspondence with many state archive facilities. I expanded the data set for labor to include more states by using state legislature votes as proxies for district referenda returns.[14] All data collected were at the county level, which I recoded to the

district-level on the basis of the *Official Congressional Directory*, which lists congressional districts by House member and county for every Congress.

The resulting data set, which includes most of the country on at least one issue, comprises a measure of grassroots opinion for 244 districts on union–labor issues, 241 districts on woman suffrage, and 101 districts on Prohibition.[15] I pooled local union–labor votes covering a range of issues, such as workmen's compensation, hours laws, the right to picket, minimum number on railroad crews, and minimum wage and conducted several tests to be sure these policies all fell on the same union–labor domain.[16] I also pooled district-level votes on woman suffrage and prohibition and developed a longitudinal measure of woman suffrage to examine how shifts at the district level over time correspond with shifts at the national level resulting in the 1919 passage of the amendment.[17]

District opinion is measured two ways: as a continuous percentage (percent voting in favor of an issue) and as a dichotomous measure defined as "oppose" (0–49% support) and "favor" (50–100% support). The latter is used in logistic regression analysis for scale comparability with other dichotomous variables.[18]

The Sixty-Third (1913–15) and Sixty-Fourth (1915–17) congresses passed landmark labor bills. I chose to analyze legislation that (1) was decided by a roll call vote, (2) had at least a minimal level of opposition (5%), and (3) was clearly labor in content, verified by reference to debates in the *Congressional Record* and historical scholarship.[19] In cases where several votes were taken on the same bill, I chose the votes most closely allied with labor interests, as determined by historical and *Congressional Record* sources. The roll call vote I analyze for the Clayton Act, for example, is the first version of this bill voted on by the House, since this was the version most actively backed by labor organizers, rather than the final compromise bill voted on after it had been sent to the Senate and returned to the House (Link 1956, 427–31). Additional labor legislation chosen for analysis on this basis are the vocational education bill and a labor dispute fund bill voted on in the Sixty-Third Congress.

In the Sixty-Fourth Congress I analyze the landmark vote on the Adamson Eight-Hour Day Act and the vote taken just prior to its passage on a procedural tactic related to its passage (1916); the first, 1916 vote on the Immigration Act requiring a literacy test for entry into the United States, rather than the vote taken in 1917 overriding Wilson's veto;[20] and unemployment legislation. I develop four labor scales out of this total collection of labor votes by cumulatively adding the number of supporting votes cast by House members on each of these scales to determine members' scale scores, as described below.

All House roll call votes on union–labor, woman suffrage, and Prohibition policies are coded at the House level as 0 for *nay* and *paired nay* votes and 1 for *yea* and *paired yea* votes; missing votes are omitted from the analysis. (The use of masculine pronouns when discussing representatives in the Sixty-Third and Sixty-Fourth congresses reflects the fact that no women had been elected to the House at this time.)

I use indices originally developed by Richard Bensel (1984) to code district economy as 1 for core districts ($300 or more value added per capita in manufacturing), 2 for diverse districts ($200–299) and 3 for periphery districts (less than $200).[21] I code party of House member as 1 for Democrats and 0 for Republicans. Policy congruence between House members and their constituents is analyzed using correlational analysis, cross tabulation, and logistic and linear regression analysis.

ANALYSIS AND FINDINGS

Let us begin by examining the impact of district opinion, House partisanship, and district economy on roll call voting on three key legislative policies debated in the Sixty-Third Congress: the Clayton Act, which passed with a strongly supporting vote of 83.4%; the Woman Suffrage Amendment, which failed to garner even a majority vote; and the Prohibition Amendment, which a bare majority in the House supported (52.3%).

Union–Labor: The Clayton Act

Passage of the Clayton Act in 1914 was a jewel of an accomplishment for the new presidential administration of Woodrow Wilson. Hailed by Samuel Gompers as "labor's magna carta" (quoted in Link 1956, 432), this legislation not only put in place moderately strong antitrust regulations but also supported the right of union workers to strike, thereby countering antilabor Supreme Court interpretations of the Sherman Anti-Trust Act (Sanders 1986). Democratic forces in the House backed the Clayton Act to the hilt, going so far as to invoke a binding caucus vote. The result was that over 95% of the Democrats voted for the Clayton Act compared to only 44% of the Republicans, leading some to the obvious conclusion that national-level partisan dynamics backed by executive leadership were the primary causes responsible for its passage.

According to our electoral model of policy innovation, however, constituency opinions on union–labor legislation should also figure prominently as influences determining the outcome of roll call votes on the Clayton Act. With our direct measure of grassroots opinion, we can investigate this possibility. Indeed, as indicated by the logistic regression analysis presented in Table 1 for Model 1, district opinion was clearly a powerful force contributing to the success of the Clayton Act. District opinion *alone* correctly predicts nearly 80% of the roll call votes on the Clayton Act. Even more telling, the addition of partisanship in Model 2 by no means negates the influence of district opinion; it remains virtually as strong a predictor as party. (Logit coefficients are 2.071 and 2.231, respectively, the positive sign for party indicating greater Democratic support.)

TABLE 1

Logit Coefficients for House Support for Clayton Act, Sixty-Third Congress, 1913–15

	HOUSE ROLL CALL VOTE ON CLAYTON ACT[a]		
INDEPENDENT VARIABLES	MODEL 1	MODEL 2	MODEL 3
District opinion[b]	1.896 (.599)**	2.071[c] (1.065)**	2.080 (.998)**

[a]House roll call votes coded 0 for nay, paired-nay, 1 for yea, paired-yea.
[b]For greater comparability with dichotomous variables, district issue vote coded 1 for 0–49%, 2 for 50–100%.
[c]Significance level calculated by computer program reported at .05 level; calculation based on truncated printed output falls slightly under requisite 1.96 z-score.
[d]House member's party coded 1 for Democrat, 0 for Republican.
[e]District economy coded 1 for core ($300 or more value added per capita in manufacturing), 2 for diverse ($200–$299), 3 for periphery (<$200); codes made available by Elizabeth Sanders.
**$p = .05$.
***$p = .001$.

By adding constituency opinion, therefore, we gain a more complete understanding of how the Clayton Act passed in the House with such an impressive majority. Not only was the Democratic party in control, having won 69% of the seats relative to 32% for the Republicans, but also grassroots opinion was strongly behind union–labor legislation. Support for union policies had diffused widely across states by 1914, reflected in an overall district mean support of 80.66 (McDonagh 1992). It was the duality, therefore, of both broad-based favorable grassroots sentiment and such national forces as the Democratic caucus and executive branch advocacy that produced winning margins for the Clayton Act.

Uncovering the strong relationship between constituency opinion and roll call voting on the partisan-backed Clayton Act raises another intriguing question: How might district opinion be involved in establishing party discipline operating on the passage of this controversial bill? Specifically, could broad-based constituency support for union–labor policies be one reason why Democrats made the Clayton Act a binding caucus vote in the first place?

I cannot investigate directly how constituency opinion may have influenced the Democratic caucus without access to its notes recording the roll call tally on this decision. It is relevant, however, that 87.8% of the Democrats in my sample were elected by districts registering strong support for union policies and that the overall district mean support for union–labor policies was 10 points higher for Democrats than Republicans (83.96 and 73.80, respectively, a statistically significant difference at $p = .05$; see McDonagh 1992).

For most Democrats, therefore, supporting the Clayton Act posed no conflict between constituency and party; rather, the dual congruency with both was most likely mutually reinforcing. It is not unreasonable, therefore, to assume that constituency influence—although empirically most easily measured in terms of its congruence with roll call votes (Kingdon 1981; Overby 1991)—undoubtedly had additional influences on informal decision-making processes responsible for the very visible partisan cleavages characterizing this bill (Holt 1967; Jones 1970; Link 1956).

Elizabeth Sanders (1986) points to the influence of level of industrialization on House roll call voting on the Clayton Act, which contained an antitrust component traditionally important to farmers, as well as the right to strike component appealing to labor interests. She analyzes how a farmer–labor alliance coalesced around its support, reflected in the disproportionate tendency of House members from rural, nonmanufacturing districts to support the measure compared to those who were elected from core districts where manufacturing interests usually electorally dominated those of labor (1986, pp. 144–45).

Looking at the relative impact of district, party, and district economy, therefore, broadens our understanding of influences upon passage of the Clayton Act, as reported in Table 1 for Model 3. District opinion clearly remains a distinct and powerful influence, even with the inclusion of party and district economy. (Logit coefficients are 2.080, 2.268, and 1.230, respectively.) Although we know that some northern Democrats and Republicans representing labor constituencies voted for the Clayton Act (Sanders 1986), the positive sign for district economy indicates that relatively greater support stems, in general, from periphery districts (as we would expect).

Analyzing votes *incongruent* with partisan and/or district economic interests also reveals the impact of district opinion. Republican House members representing core districts generally should be expected to vote against the Clayton Act. Yet, a small minority (19%) cast yea votes, and *all* of these incongruent votes are from Republicans representing districts supportive of progressive labor policies. For some, though not all, Republicans, prolabor constituents overrode both party and economic interests combined.

Similarly, despite their nearly unanimous support of the Clayton Act, a few Democrats voted against it; and these incongruent votes were cast by Democrats representing districts expressing a negative stance on union–labor issues, reflected in the probability of their yea vote dropping from .969 to .798 as we shift from "favorable" to "unfavorable" districts on labor policy. Similarly, Republicans from diverse districts

opposing labor policies are almost certain to vote nay, while those representing districts supportive of labor are more likely to vote yea.[22] These findings confirm, therefore, the independent influence of district opinion in multivariate models including partisanship and district economy.

Union Labor Scales: The Sixty-Third and Sixty-Fourth Congresses, 1913–17

Policy congruence research often employs scales measuring what Heinz Eulau terms "policy dispositions," rather than discrete roll call votes (Allen, Clausen, and Clubb 1971; Bartels 1991, 462–63; Clausen 1973; Eulau 1987; Olssen 1980). To expand analysis, I constructed four labor scales for the Sixty-Third and Sixty-Fourth Congresses: (1) a scale composed of votes on the Clayton Act, vocational education, and appropriations for a labor dispute fund (Sixty-Third Congress); (2) a scale composed of votes on the Adamson Eight Hour Day Act, passage of the immigration restriction bill, and unemployment insurance legislation (Sixty-Fourth Congress); (3) scales 1 and 2 combined; and (4) a scale of major pieces of legislation passed in either the Sixty-Third or Sixty-Fourth Congress (Clayton, Adamson, and immigration restriction bills).[23] A House member's scale score is the additive number of yea votes cast on a scale.[24]

Analysis of scaled votes show district opinion and party to be the primary determinants of labor support in the Sixty-Third and Sixty-Fourth Congresses (Table 2). Even when scales include a binding party vote (e.g., scales 1 and 3), the impact of district support remains strong. District opinion and party logistic coefficients approach parity as influences accounting for labor support (1.332 and 1.659, respectively), measured by scale 2 for the Sixty-Fourth Congress, again confirming the impact of district opinion for passage of national legislation.

Scales combining labor votes in both the Sixty-Third and Sixty-Fourth congresses (scales 3 and 4) also show the influence of constituency sentiment. District opinion is two-thirds that of party (1.903 and 3.099, respectively) as a predictor of House roll call voting on scale 3; and its impact on scale 4 (combining the Clayton, Adamson, and immigration restriction votes—the "Big Three") slightly exceeds the potency of party (1.360 and 1.171, respectively). Analysis of scaled labor votes, therefore, conforms to the pattern evident for individual labor votes, confirming the effect of district opinion as a significant influence upon House roll call voting on progressive labor policies at the national level.

Woman Suffrage and Prohibition

The woman suffrage issue has a fascinating legislative history (Flexner 1975). First introduced into Congress as the Susan B. Anthony Amendment in the aftermath of the Civil War in 1868, it was not until 1915, in

the Sixty-Third Congress, that the first roll call vote on this legislation was held in both the House and Senate. Another amendment also came up for consideration, namely, Prohibition. I examine the impact of district opinion as a sole explanatory variable, as well as the relative impact of district opinion, partisanship, and district economy on roll call votes for woman suffrage and Prohibition in Table 3.[25]

At the outset, it is clear that grassroots opinion is strongly related to both woman suffrage and Prohibition. (Logit coefficients are 1.518 and 1.404 and correctly predict 65.57% and 67.39% of the roll call votes, respectively, as reported in Table 3 for Model 1.) In addition, district opinion remains the strongest relative effect when partisanship and district economy are added (Model 2). For woman suffrage, the logit coefficient for district opinion is 1.250 compared to only −.140 and .664 for partisanship and district economy, respectively; and for Prohibition, the corresponding logit coefficients are 1.784 for district opinion compared to −1.419 and .992 for partisanship and district economy, respectively.

On the basis of the logistic regression models reported in Table 3, we can better understand the failure of the Woman Suffrage Amendment to garner even a majority of votes in 1915. District opinion was virtually the only influence and it was decidedly negative on the suffrage issue. The overall district mean level was a low 44.3% (McDonagh 1992). Little wonder that this legislation went down to such a conclusive defeat on its first House roll call vote in 1915.

The Prohibition Amendment deviates somewhat from the woman suffrage pattern (Table 3). Although district opinion is the strongest effect with a logit coefficient of 1.784, party is also a major influence, evident by the logit coefficient of −1.419 (the negative sign indicating greater Republican support). Analysis of this multivariate model, however, also helps account for the failure to generate the two-thirds majority vote necessary for passage of a constitutional amendment. Constituency opinion, the strongest effect, is insufficient for passage. The overall mean district support for prohibition was only 50.8%; and though Republicans were more likely to support prohibition, they were not the majority party in the Sixty-Third Congress, constituting less than a third of the membership compared to Democrats.[26] Without either broad-based district support or backing from the majority party in the House, we can see why this measure also failed in the Sixty-Third Congress.

Nationalizing the Electorate: Woman Suffrage, 1915–19

Though only 47.6% in the House voted to support the woman suffrage amendment in 1915, just four years later this same legislation received a yea vote from over 77% of House members. Though changes in national legislative policy often are attributed to turnover in House membership (Bartels 1991, 458), the intriguing question from the vantage point of this research is the degree to which the dramatic increase in House support between 1915 and 1919 rests upon a concomitant increase in grassroots sentiment over the same period.

House support patterns, indeed, impressively paralleled those at the district level from 1915 to 1919 (Table 4). While only 15.8% of all House districts supported woman suffrage in 1915, four years later, this figure had climbed to a staggering 57.9%, even while the degree of association between district opinion and House roll call voting on woman suffrage remained virtually constant (.533 in 1915 and .526 in 1919).[27] It was not the case, therefore, that the strength of the linkage itself between district opinion and House voting had increased in the intervening years. Rather, it was that suffrage support had diffused broadly across districts between 1915 and 1919, thereby providing a sufficient grassroots base for nationalization of this policy by 1919.

Though the story of how and why horizontal state-level suffrage diffused between 1915 and 1919 begs to be told,[28] our focus here is the vertical connection between the effect of this local diffusion on passage of national legislation. Specifically, how are longitudinal, diffusion patterns of constituency

TABLE 4

Longitudinal House Support for Woman Suffrage, Sixty-Third to Sixty-Sixth Congress, 1915–19

CONGRUENCY AND SUPPORT	SIXTY-THIRD CONGRESS (1915)[a]	SIXTY-SIXTH CONGRESS (1919)[b]
District opinion and House vote[c]	.533[d]***	.526***
House vote congruent with district opinion (%)	67.2	76.5
Districts supporting woman suffrage (%)	15.8	57.9
House vote supporting woman suffrage (%)	47.6	77.3

***$p = .001$.

support for woman suffrage linked to voting shifts on this issue in the House? To answer this question, I categorized districts as follows: those supporting woman suffrage as early as 1915 are *stable yes* districts; those converting to suffrage support by 1919 are *conversion yes*; and those remaining negative on the issue through 1919 are *stable no* districts.

I categorized House members in a similar way. Those supporting woman suffrage as early as 1915 are *stable yea* members; those converting to a yea vote by 1919 are *conversion yea*; those who remain opposed through 1919 are *stable nay*; and new House members casting a vote for the first time in 1919 are categorized either as *replacement yea* or *replacement nay* members, depending on their voting orientation.

We see clear evidence that longitudinal district patterns on woman suffrage correspond to longitudinal House voting patterns (Table 5). Members with either stable yea or stable nay voting pattern are more influenced by districts also exhibiting stable opinion than they are by conversion districts. (Logit coefficients are 4.346 and 2.398, respectively, as shown in column 1.)[29]

Similarly, House members who converted to a prosuffrage position by 1919 are most effected by conversion districts, as indicated by the size of the logit coefficient of 2.275 in Table 5, column 2. Stable antisuffrage districts had negative effects on House conversion to a prosuffrage stance (as we would expect), indicated by the size of the constant term (−1.625). The lack of cases of House members converting from stable yes districts most likely occurs because House members from such districts vote yea in the first place (column 1), thereby making options to convert to prosuffrage moot.[30]

Turning to replacement members, we see that the greatest effect stems from districts with stable patterns of support, as indicated by the logit coefficient of 9.423.[31] Districts with a longitudinal pattern of stable suffrage support produce yea votes virtually

TABLE 5

Logit Coefficients for Longitudinal House Support for Woman Suffrage, Sixty-Third to Sixty-Fourth Congress, 1913–21

DISTRICT OPINION TYPOLOGY[b]	LONGITUDINAL HOUSE SUPPORT FOR WOMAN SUFFRAGE[a]		
	STABLE MEMBERS[c]	CONVERSION MEMBERS[d]	REPLACEMENT MEMBERS[e]
Stable support district[f]	4.346*** (1.029)	—[g]	9.423 (39.841)
Conversion support district[h]	2.398*** (.368)	2.275*** (.468)	3.297** (1.072)
Intercept[i]	−.476** (.199)	−1.625*** (.303)	.780** (.364)
Correctly predicted (%)	78.40	78.07	89.29

Note: Figures are unstandardized logit coefficients; standard errors are in parentheses.
[a]House roll call votes coded 1 for yea and paired-yea, 0 for nay and paired-nay.
[b]District opinion defined as opposition = 0%–49%, support = 50%–100% State-level woman suffrage used when necessary as proxy for district measure.
[c]Stable House voters are those voting yea or nay consistently, 63d–66th Congresses.
[d]Conversion House voters are those converting from a nay to yea vote by 66th Congress; for analysis, they are grouped with contrasting stable nay House voters.
[e]Replacement House voters are those voting yea or nay for first time in 66th Congress.
[f]Stable support district is one consistently supporting woman suffrage, 1913–19.
[g]Insufficient case for analysis.
[h]Conversion support district is one opposed in 1915 but converting to support for woman suffrage by 1919.
[i]Intercept term is omitted stable opposed district, defined as a district opposed to woman suffrage, 1913–19.
**$p = .05$.
***$p = .001$.

without exception among House replacement members; and (as we would expect) districts more recently converting to a prosuffrage position also have a positive influence, though not quite as large, evident by the logit coefficient of 3.297. We find confirmation, therefore, that longitudinal constituency support patterns—rather than membership turnover alone—best account for House members' voting patterns on woman suffrage in 1919.

CONCLUSION: CONGRESS AND AMERICAN STATE DEVELOPMENT

Woodrow Wilson viewed Congress as the "central and predominant power" of our federal system (1956, 23); and contemporary research on Congress and legislative processes is a thriving academic industry.[32] Attention to how Congress may effect the operation of the larger political system, however, is less typical; and although the institutional "development of Congress" is a vital area of productive scholarship (Polsby 1968; Price 1971, 1975), development of the American political system itself as a function of congressional lawmaking is a much less common research focus.[33]

One reason why Congress as an institution has been less featured than, say, courts, parties, bureaucracies, interest groups, and the presidency is that scholarship on the Progressive Era customarily analyzes key legislative processes horizontally at either the state (Gray 1973; Skocpol 1992; Valelly 1989) or national level but not at the vertical nexus between the two. Yet it is the representative structure of Congress linking decentralized and centralized loci of political power on an ongoing basis that most distinguishes it from other national-level institutions in our constitutional system (Keller 1985, 1).

Drawing attention to vertical connections between grassroots opinion and national policy elites expands our understanding of how representative processes in the context of the Progressive Era contributed to the development of state capacity at the federal level during that period. By assessing the constituency bases of congressional decision making, we see how House members predisposed to vote congruently with their progressive constituents effectively transferred innovative legislation (once it was diffused across a decentralized, local level) to a centralized national one. As a result, Congress passed landmark regulatory legislation authorizing federal intervention in market relationships, state suffrage qualifications, and life-style behaviors involving intoxicating beverages.

Passage of highly partisan, union–labor measures, for example, depended upon widely diffused labor support at the constituency level, in addition to party and economic interests. Constituency opinion also emerged as a major determinant for a variety of House union–labor scales constructed for the Sixty-Third and Sixty-Fourth Congresses, including such pivotal legislative accomplishments as the Clayton Act, the Adamson Eight Hour Day Act, and immigration restriction.

Nationalizing the Electorate

We also discovered that longitudinal patterns of grassroots opinion, rather than merely turnover in House membership alone, were the most decisive influences accounting for the dramatic rise in House support for woman suffrage from 1915 to 1919. In addition to providing a striking example of the power of grassroots opinion for influencing passage of national legislation, the inclusion of civil rights issues in our analysis reveals new insights about the status of the electorate in state-building models. Though most often depicted as a virtually static feature of American political development (Skowronek 1982, 17–18; Skocpol 1988, 362; Skocpol and Ikenberry 1983, 92), the contested legislative status of woman suffrage suggests, instead, that the electorate is best conceptualized not as a condition of political development taking place at this time but, rather, as an object of that development.

Women's contested voting status in the Progressive Era, far from idiosyncratic, typifies legislation of this period wrestling with new definitions of which groups in the American polity are to have access to formal political power in the form of the vote. The major difference is that women succeeded in winning suffrage guarantees. By contrast, African-American men lost their right to vote on a de facto basis in this period, when, by 1908, every southern state had in place disenfranchising voting laws (Burnham 1987, 29; Kousser 1974). Similarly, the voting of immigrants in the urban North was depressed as a de facto result of "good government" legislation establishing registration and voting regulations (McCormick 1979, 295; Piven and Cloward 1988).[34]

Metaphors and Models of Development: Bulldozers, Laboratories or Coffee Pots?

The research presented here, therefore, suggests yet another metaphor (if not a model) to capture the character of the political development taking place in the Progressive Era in the domain of legislative innovation. In one of the most influential explanations of how the modern American state was built, Stephen Skowronek makes the case that it was necessary to dismantle decentralized loci of administrative state capacity in order to establish in their place strong, centralized agencies. In what might be characterized as a "bulldozer" model of political development, national government authority and offices were "*insulated from the people at large*, [and] governmental forms and procedures necessary for securing order in industrial America emerged through a labored exercise in *creative destruction* . . . by an *extended assault* on the previously established governmental order [i.e.,

decentralized state]" (Skowronek 1982, 9, emphasis added).

Though Skowronek may well be correct about the necessity for decentralized destruction to occur in order for the creation of centralized administrative agencies, surely, as we have seen, the same cannot be said of legislative policies adopted at the national level by Congress. Here, it is evident that passage of innovative legislation rests upon broadly based grassroots support. Without that support, national legislation fails (as we saw in the case of woman suffrage and Prohibition in the Sixty-Third Congress). With that constituency support, sweeping national legislative changes are possible—as we saw in the case of passage of union labor bills (where grassroot support was already widely diffused by 1914) and woman suffrage once prosuffrage opinion had spread across sufficient districts.

Another metaphor is needed, therefore, to portray the legislative domain of American political development. Here, the famous dictum of Justice Louis Brandeis comes to mind, in which he memorialized our federal system as a "laboratory" where a "single courageous State may, if its citizens choose, . . . try novel social and economic experiments without risk to the rest of the country" (*New State Ice Company* v. *Liebmann* 1932, 311).

Yet we must ask, How apt is this? Far from merely offering national political elites a range of legislative innovations from which they may pick and choose, findings here show how constituency opinion, once it is broadly diffused, provides proactive constraints and guides influencing the national adoption of legislative alternatives. Local policies, therefore, are not merely *copied* at the national level but *transferred* to the national level by means of representative institutions drawing on grassroots support for those policies; and this transfer had vital state-building ramifications in the context of the Progressive Era, when local opinion favoring the expansion of state capacity was in advance of national reform.

Furthermore, although I have assessed only direct effects of constituency opinion upon House roll call voting, one can speculate about indirect effects of district opinion also likely to be operating (Overby 1991). It is plausible, for example, that the decision of the Democratic caucus to make the Clayton Act a binding vote rested on Democratic constituencies strongly supportive of the union–labor policies. Similarly, Wilson's backing of this bill is best viewed as the tip of a pyramid of power whose base is grassroots support. His switch to a strongly supportive stance on woman suffrage after grassroots opinion was in place illustrates the same point (Snapp 1975).

Finally, there is the well-worn notion that innovation can "percolate" up from the local to the state to the national level in our federal system. Operationalizing the "coffee pot" that makes that percolation possible identifies district opinion as a source of innovative public policies in the Progressive Era and representative institutions as structures providing effective mechanisms for transferring innovation from the local to the national level. As a result, we see Congress in a new light as a proactive institutional agent in the Progressive Era by virtue of its representative structure using progressive grassroots support to expand legislative federal authority as a key component in the development of the modern American state.

Notes

This research is supported by National Science Foundation Grant SES 8921529 and by the Henry A. Murray Research Center of Radcliffe College. Acknowledgement is extended to the Inter-University Consortium for Political and Social Research for providing some of the data used in this research. The author gratefully acknowledges the helpful advice of Walter Dean Burnham, Aage Clausen, Joseph Copper, Martha Derthick, Philip Ethington, Morris Fiorina, Richard Harris, John Hibbing, Christopher Howard, Patricia Hurley, Charles Jones, Gary King, John Kingdon, Morgan Kousser, David Mayhew, Sidney Milkis, Karen Orren, Elizabeth Sanders, Theda Skocpol, Stephen Skowronek, Charles Stewart, Eric Uslaner, and Sidney Verba; the research assistance of Rachel Harris, Susan Lee, and Thomas Sample; and the programming assistance of Jason Wittenberg. Special thanks are extended to Elizabeth Sanders for providing some of the data used in this research.

1. As Stephen Skowronek puts it, the dramatically accelerated expansion of national administration in the 1930s and again in the 1960s "may seem to dwarf the significance of the state-building episode" of the Progressive Era, but the "course of institutional development during these more recent decades and the governmental problems encountered in these developments are rooted in this turn-of-the-century departure" (1982, 14).

2. While some investigate the leadership characteristics of Progressives (Thelen 1969, 331), others point out that Progressives did not seek to change the free-market system but, rather, to restrict only its most insidious perceived consequences—"externalities," in the language of economists (Beer 1973, 64–67).

3. Some viewed the invention of direct democracy instruments of governance (e.g., the referendum, initiative, recall, direct primaries, and direct election of senators) as means for accomplishing innovative legislative goals (Link and Catton 1967).

4. Brady (1984) carefully delineates distinctions between electoral results and structural effects characterizing realignment periods.

5. Though partisan strength and dominance shifted considerably from Democratic to Republican margins in the 1900–1920 period, no long-lasting reconfiguration of partisanship occurred during this period (Allen and Clubb 1974). David Canon (n.d.), however, does credit the gradual increase in the number of Democrats elected over time as responsible for the erosion of Republican hegemony in the early twentieth century, even in the absence of full-scale realignment.

6. Patricia Hurley cites the importance of the "linkage between election results and congressional output" not only "during the rare periods of critical realignment" but also as a more general phenomenon (1979, 46). The possible relationship between constituency opinions measured here and scaled ideological orientations remains an avenue for future work.

7. William Riker describes this process, in the context of passage of constitutional amendments in the Progressive Era, as one that simply "universalized a situation which a majority of state legislatures had already created" (1955, 468). According to his analysis, therefore, "peripheralized federalism"

was used as a way to increase the strength of "centralized federalism" (468–69).

8. An exception is Amenta and his colleagues, who analyze the 1935 Social Security Act in terms of prior, state-level policies (1987, 139).

9. Those pointing to national forces operating in the Progressive Era often note the power of the presidency along with that of the Democratic caucus ruling the House after the overthrow of Speaker ("Czar") Cannon in 1910 (Blum 1954; Clubb 1963; Holt 1967; Jones 1970; Link and Catton 1967, chap. 5; Noble 1984, 1001; Roady 1951; Silbert 1966; Tulis 1987; see Bensel 1984 and Sanders 1986, 1990a, 1990b, n.d. for insightful analyses of how economic, regional interests influence national roll call voting).

10. The "representative bond" between grassroots voters and elected policy elite officials has been the subject of intense theoretical and empirical concern (Converse and Pierce 1986; Erikson 1978, 526; Eulau 1987, 176; Eulau et al. 1959; Eulau and Karps 1977; Haefele 1972; Pitkin 1967); and many feasible models of the representative bond have been formulated, such as descriptive, trustee, and delegate relationships. While empirical congruence is not identical to representation (Eulau 1987), it remains one of the most fundamental analytical axes for studies of democratic, representative processes, despite measurement difficulties (Converse and Pierce 1986, 564; Jewell 1985).

11. Small samples (necessitated by the expense of public opinion surveys) attenuate coefficients statistically due to means error (Achen 1977, 1978). In addition, a basic incommensurability exists between general psychological attitudes held by constituents and the specificity of behavioral roll call voting acts of legislators to which they are compared (Stone 1979).

12. Referenda votes are preferable to attitudes as measures of constituency opinion because they are behavioral, dichotomous, yea/nay acts on specific legislative issues. For this reason, referenda votes inherently have scales more commensurable with legislators' roll call voting decisions than do attitudes, which are more diffuse and usually measured as ordinal, rather than dichotomous, variables. Also, summing referenda votes across a district yields a central tendency measure—percentage of support—that includes information about the variance, or heterogeneity, in the district. Homogeneous districts will have either a very high or a very low percentage of support, while heterogeneous districts will register support at marginal levels around 50%. The central tendency measure used across a district for attitudinal scales, on the other hand, is most often the "mean district attitude score," which contains no information about level of district variance.

13. David Mayhew makes the telling point that political elites, including those active at the state level responsible for referenda, are the determinants of public opinion (1986, 4–5). However, this study focuses on the relationship between public opinion at the local level and national political elites, drawing upon the research of others to explicate the forces responsible for generating grassroots public opinion in the first place.

14. These votes include state constitutional amendments requiring referenda approval, as well as referendum and initiative votes. States lacking legislative activity on an issue necessarily are excluded from this analysis.

15. Some districts voted on several referenda in the same issue area at the same time, and other districts cast votes on several referenda in the same issue area at different points in time. I did a factor analysis of referenda to be sure they were comparable to each other in issue content, as defined by their loading on the same factor. All issue categorizations of referenda were confirmed by factor analysis. I then chose among referenda, selecting for analysis those closest in time and content to selected House roll call votes. Where several referenda in the same issue domain were held at the same time, I chose referenda similar in content across states to form the pooled district-level measure of constituency opinion. Additional information will be provided on request.

16. I checked state *Proceedings* of the American Federation of Labor (AFL) to be sure votes used were supported by labor at the local level. I did a factor analyses within each state to be sure that all votes identified as union-labor were on the same factor. I also regressed the pooled labor vote index and each state (coded as a dummy variable) on House roll call voting on labor issues to determine whether there might be additional, independent effects stemming from particular state cultures. No state exhibited a statistically significant ($p = .10$) independent regression coefficient on House roll call voting on labor issues.

17. State-level passage of suffrage is used where district-level votes are not available. Districts in 1915 opposed to woman suffrage are coded 0, and those supporting woman suffrage are coded 1; the same convention is used for 1919. Comparing codes in 1915 and 1919 yields information about whether a district maintained a stable position (either supporting or opposition suffrage) or converted from opposition to support by 1919. (No districts converted in the other direction.) Following scholarly convention, a major form of woman suffrage is defined as full, presidential, and primary woman suffrage (Keller 1977, 15–18; Banaszak n.d.). Information about specific votes used in this analysis will be provided on request.

18. Since the size of a logistic regression coefficient can be effected by the scale size of the independent variable, it is preferable, when doing this type of analysis, to keep all independent variables on relatively comparable scales. Since *party* is a dichotomous variable, other independent variables used in logistic regression analysis have been scaled with this reference in mind.

19. Using these criteria, some important labor votes are omitted, such as the seamen's bill protecting sailors on the high seas, which passed in the Sixty-Third Congress in 1913 on the basis of a voice vote, and the Workmen's Compensation Act, which passed in the Sixty-Fourth Congress by such wide margins that there is not enough variation in my sample to analyze it.

20. The assumption is that initial sources of support and opposition may become clouded in the process of a legislative showdown with the executive branch.

21. I extend grateful thanks to Elizabeth Sanders for making available for this research district codes for sectional interests.

22. The probability of a yea vote shifts from .128 to .539 respectively.

23. Together, these Congresses present a good test case for assessing policy congruence effects by introducing the dual conditions of high replacement and significant alteration in partisan strength. Replacement voters in the Sixty-Fourth Congress comprise nearly half my sample (43.1%), reflecting the dramatic drop in Democratic strength in the House from 1913 to 1915. Though still the majority party in 1915, Democrats lost 61 seats, while Republicans gained 69, between the Sixty-Third and Sixty-Fourth Congresses. The 13 Progressive Republicans and one Independent elected to the Sixty-Third Congress are omitted from analysis.

24. House members voting on less than half the scale items are omitted from the analysis of that scale. For each of the four scales, at least one of the votes cast had to include a vote on the Clayton, Adamson, or immigration restriction bills (the "Big Three").

25. Scholars often note the association of woman suffrage with welfare issues in the Progressive Era, bolstered by women's identification with maternal, nurturing values and effectiveness in reshaping social reform policies (Cott 1987; Skocpol 1992). To the extent that labor issues drew upon welfare concerns, we might expect district economic indexes related to labor also to be related to voting patterns on woman suffrage.

26. Republican House support for Prohibition most likely stemmed from its association with rural, midwestern identities also often represented by Republican partisan interests (McDonagh and Price 1985, 423–26).

27. In addition, House members in 1915 and 1919 were

inclined to vote congruently with their districts at about the same rates (67.2% and 76.5%, respectively).

28. See Banaszak n.d.

29. The positive logit coefficient of 2.398 for conversion districts reflects the behavior of House members voting yea on suffrage prior to their districts' conversion to support for suffrage. One might say that such House members correctly anticipated a switch in district support for suffrage.

30. The dependent variable in Table 6, column 2, is defined by House members' either converting to a prosuffrage position by 1919 or stable House members' continuing to vote nay by 1919. Of this group, only one House member represents a district with a stable prosuffrage position, precluding analysis of how stable prosuffrage district opinion might effect conversion versus stable opposition House voting patterns.

31. The high standard error for this coefficient most likely stems from the fact that stable districts both for and against woman suffrage registered high rates of yea voting among House replacement members, though the rate of members from stable districts supporting suffrage was relatively much higher than for those representing stable districts opposing suffrage (100% and 68%, respectively).

32. Writing in 1885, Wilson (1956) attributed the power of Congress to a tightly disciplined committee system. The structural reorganization of the House in 1910, however, points more in the direction of a wider range of factors (e.g., partisan organization, grassroots opinion, and the effects of changing economic interests).

33. New institutionalists focusing on Congress typically use organizational models that draw attention to its administrative operation as an institutional structure, rather than electoral models analyzing connective representational linkages between grassroots constituents and national policy elites (Rohde and Shepsle 1978; Shepsle and Weingast 1981; Weingast 1987). For an insightful review and critique of new institutionalism literature, see March and Olsen 1984.

34. Passage of southern disenfranchisement laws begins in the late nineteenth century and is complete by the early years of the Progressive Era. Congress, though well aware of southern intent to subvert the Fifteenth Amendment through such legislation, nonetheless passes no legislation counteracting southern disenfranchisement in the Progressive Era. As late as 1919, southern representatives boasted about their successful disenfranchisement of African-American men's vote without suffering even verbal reprimands (as reported in the *Congressional Record* for the Sixty-Sixth Congress). In J. Morgan Kousser's view, disenfranchisement is a typical "Progressive reform" (1974, 260).

SENIORITY IN LEGISLATURES

RICHARD D. MCKELVEY *California Institute of Technology*
RAYMOND RIEZMAN *University of Iowa*

We construct a stochastic model of a legislature with an endogenously determined seniority system. We model the behavior of the legislators as well as their constituents as an infinitely repeated divide-the-dollar game. The game has a stationary equilibrium with the property that the legislature imposes on itself a non-trivial seniority system, and that incumbent legislators are always reelected.

Why do legislatures have seniority systems? Why do incumbent legislators tend to be reelected by wide margins? These are questions that have engaged legislative scholars for some time.

On the issue of the incumbency advantage, a large empirical literature has advanced a number of explanations for this effect. Jacobson (1983) gives a good review of this literature. The explanations range from the increased access of incumbents to money and the media (see, e.g., Mayhew 1974a), to the effects of gerrymandering (Erikson 1972; Jacobson 1983, 13–15), to the decline of the party system and consequent increased use of incumbency, rather than party, as a voting cue (Ferejohn 1977), to constituency service and expertise built up by veteran legislators (e.g., Fiorina 1977a, 1977b; Mayhew 1974b).

Although the question of incumbency advantage and its relation to legislative organization have received considerable attention in the empirical literature on Congress, we know of no attempt to see if any of these explanations can be derived from a full-equilibrium, dynamic model. All of these explanations of the incumbency effect are nondynamic, partial equilibrium explanations. In other words, it is not clear that all individuals at all points in time are behaving rationally. For example, the explanations of the incumbency effect in terms of money and the media typically do not explain why voters should be swayed repeatedly by advertising and campaign literature. The explanation based on gerrymandering assumes that voters' behavior can be determined by certain socioeconomic characteristics of the voters, such as party identification, race, sex, income and religion. It ignores the possibility that both voters and candidates may have incentives to alter their behavior based on the new district characteristics. The explanation based on the decline of parties has no well worked-out theory as to why voters should use cues such as party or incumbency in the first place. The explanation based on constituency service has some weaknesses when one considers the timing of voter and candidate decisions. For example, why should voters vote for candidates who have done a lot for them in the past if the voters have already collected the rewards of the candidate's behavior? These models are a rich source of ideas; and some of the ideas could undoubtedly be made part of a consistent theory in which all participants are behaving rationally and timing issues are dealt with explicitly. However, this has not yet been done.[1]

From our perspective, the most interesting observation in this literature is that many of these variables are determined endogenously by the legislature. It has been argued persuasively by Mayhew (1974b) and Fiorina (1977b) that *Congress organizes itself to serve the reelection goals of its members.* Thus, the franking privilege, the specialized committee system, the norm of reciprocity, and so on are all seen as ways in which Congress advances the reelection goals of its members. Fiorina has taken this argument to its extreme in his thesis that big government is partially a result of the fact that members of Congress benefit from the increased opportunities to intervene in the bureaucracy on the behalf of their constituents.

We shall consider one particular aspect of legislative organization, namely, the seniority system, and build a theoretical model connecting the seniority system with the reelection goals of the legislators: we formulate a full-equilibrium, dynamic model of policy formation in a representative system in which a seniority system emerges endogenously.[2] We develop a model in which both voters and legislators are acting rationally both on and off the equilibrium path. Voters take into account the fact that their representative is only a member of a legislative body and legislators realize that their actions will affect voters' behavior in subsequent elections. All agents take into account the dynamic effects of all of their actions.

Our approach is to model the representative process as an $\mathcal{L} + n$–player stochastic game, where $\mathcal{L}$ is the number of legislators, and n is the number of voters, partitioned into $\mathcal{L}$ distinct districts. The game alternates back and forth between the voter game and the legislative game. The voter game will consist of a game in which all the voters in each of the $\mathcal{L}$ legislative districts vote to determine who will be their representative for the next legislative session. The legislative game will consist of a game in which the legislators decide whether or not to have a seniority system for the current session and then proceed to select a policy. The policy selected is a decision on a distribution of a fixed amount of money among the legislative districts. We shall model the legislative

game using the approach of Baron and Ferejohn (1989), who consider the legislative game as a form of a Rubinstein bargaining game: a random recognition rule, which depends on seniority, determines the legislator who makes a proposal. The legislators then vote, by majority rule, whether to accept or reject the proposal. The process continues until the legislature accepts a proposal—at which time the legislature adjourns, and new elections are held (i.e., we return to the voter game).

We show that an equilibrium exists in which the legislature always votes to impose on itself a nontrivial seniority system. In the proposal stage, the proposer selects a minimum winning coalition, retaining $(\mathcal{L} + 1)/2\mathcal{L}$ for its own district and allocating $1/\mathcal{L}$ to the districts of the remaining coalition members. Districts that are not part of the winning coalition get nothing. This proposal passes and the game proceeds to the voter game. Voters always reelect incumbents. The intuition behind the results is that voters, understanding the incentives in the legislative game, realize that their representative will be disadvantaged without seniority.

These results contrast with those found in most formal models of voting. Most formal voting models predict tied elections, with no incumbency effects. In our model the incumbent always wins by a unanimous margin. In addition, we have an endogenously chosen seniority system. These two phenomena are related to each other in that the seniority system and the incumbency effect support each other in equilibrium.

It is tempting to interpret the equilibrium of this model as a situation in which legislators blackmail voters to reelect them through the imposition of the seniority system. However, note that that is not exactly what happens in the model. In our model, the legislators cannot commit future legislatures to adopt a seniority system. The future legislature is free to vote against the seniority system if it is not in the interest of the legislators in that legislature to do so. What drives the incumbency effect in our model is the recognition by voters that self-interested legislators with seniority will vote for a seniority system. If a sufficient number of the other legislators have seniority, then it is in the self-interest of a district to make sure that its legislator does also, since the legislature will undoubtedly impose a seniority system. If all voters think this, it becomes a self-fulfilling prophecy.

THE GENERAL FRAMEWORK

Before introducing the model, we develop some general notation for stochastic games. Our model will be a special case of such a general model. Assume that there is a set N of *players*, a set X of *alternatives*, and for each player $i \in N$, a Von Neumann Morgenstern *utility function* u_i: $X \to \mathbb{R}$ over the set of alternatives. We assume that X contains a *null outcome*, x_0 with $u_i(x_0) = 0$ for all $i \in N$. Let $\mathcal{T}$ be a set of *states*. We now define a *stochastic game*, $\Gamma = \{\Gamma^t: t \in \mathcal{T}\}$ to be a collection of *game elements* $\Gamma^t = (S^t, \pi^t, \psi^t)$. Here $S^t = \Pi_{i\in N} S_i^t$ is an n-tuple of *pure strategy sets*. Next π^t: $S^t \to \mathcal{M}(\mathcal{T}) = \Delta^{|\mathcal{T}|}$ is a *transition function* specifying for each $s^t \in S^t$ a probability distribution, $\pi^t(s^t)$ on $\mathcal{T}$, which determines for each $s^t \in S^t$ and $y \in \mathcal{T}$, the probability $\pi^t(s^t)(y)$ of proceeding to game element Γ^y. Finally, ψ^t: $S^t \to X$ is an *outcome function* that specifies for each $s^t \in S^t$ an outcome $\psi^t(s^t) \in X$. We let $S = \Pi_{t\in\mathcal{T}} S^t$ be the collection of pure strategy n-tuples, one for each game element. We write $\Sigma_i^t = \mathcal{M}(S_i^t)$, where $\mathcal{M}(S_i^t)$ is the set of probability distributions over S_i^t, and then define $\Sigma_i = \Pi_{t\in\mathcal{T}}\Sigma_i^t$ to be the set of *stationary strategies* for player i. Elements of Σ are written in the form $\sigma = (\sigma_1, \sigma_2, \ldots, \sigma_n)$. We also use the abusive notation $\sigma^t(s^t) = \Pi_{i\in N}\sigma_i^t(s_i^t)$ and $\sigma(s) = \Pi_{t\in\mathcal{T}}\sigma^t(s^t)$ to represent the probability under σ of choosing the pure strategy profile $s^t \in S^t$ and $s \in S$, respectively.

For stationary strategies, we can define the payoff function M^t: $\Sigma \to \mathbb{R}^n$ by

$$M_i^t(\sigma) = \sum_{\tau=1}^{\infty} \sum_{r\in\mathcal{T}} \pi_\tau^t(\sigma)(r) \cdot u_i(\psi^r(\sigma^r)), \qquad (1)$$

where $\pi_\tau^t(\sigma)(r)$ is defined inductively by

$$\pi_1^t(\sigma)(r) = \pi^t(\sigma^t)(r) = \sum_{s^t\in S^t} \sigma^t(s^t) \cdot \pi^t(s^t)(r)$$

$$\pi_\tau^y(\sigma)(r) = \sum_{y\in Y} \pi_{\tau-1}^y(\sigma)(y) \cdot \pi_1^y(\sigma^t)(r)$$

and $u_i(\psi^t(\sigma^t))$ is defined by

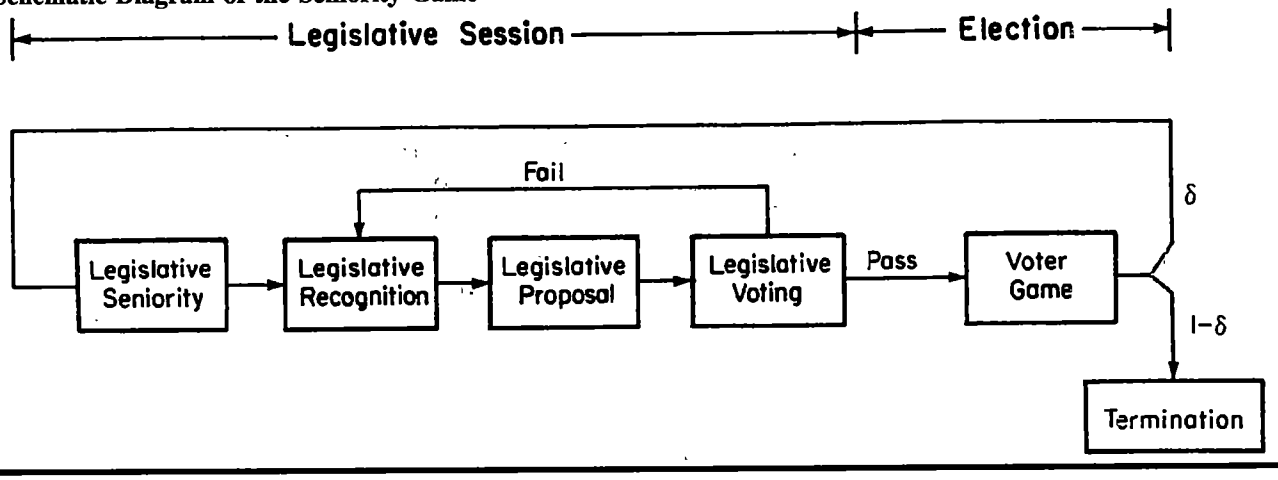
$$u_i(\psi^t(\sigma^t)) = \sum_{s^t\in S^t} \sigma^t(s^t) \cdot u_i(\psi^t(s^t)).$$

Note that this is only well defined if the sum in equation 1 converges for all σ, t, and i.

A strategy n-tuple, $\sigma \in \Sigma$ is said to be a *Nash equilibrium* if $M_i(\sigma_i', \sigma_{-i}) \le M_i(\sigma)$ for all $\sigma_i' \in \Sigma_i$. Applying Bellman's optimality principle (see, e.g., Sobel 1971, theorem 3), it follows that any stationary Nash equilibrium can be characterized by a collection $\{v^t\}_{t\in\mathcal{T}} \subseteq \mathbb{R}^n$ of values for each game element Γ^t and a strategy profile, $\sigma \in \Sigma$ satisfying two properties.

P1. *For all $t \in \mathcal{T}$, σ^t is a Nash equilibrium to the game with payoff function G^t: $\Sigma^t \to \mathbb{R}^n$ defined by*

$$G^t(\sigma^t) = u(\psi^t(\sigma^t)) + \sum_{y\in\mathcal{T}} \pi^t(\sigma^t)(y) \cdot v^y$$



$$= E_{\sigma^t}\left[u(\psi^t(s^t)) + \sum_{y\in\mathcal{T}} \pi^t(s^t)(y) \cdot v^y\right]$$

$$= \sum_{s^t\in S^t}\sigma^t(s^t) \cdot \left[u(\psi^t(s^t)) + \sum_{y\in\mathcal{T}} \pi^t(s^t)(y) \cdot v^y\right].$$

P2. *For all $t \in \mathcal{T}$, $v^t = G^t(\sigma^t)$.*

Figure 1

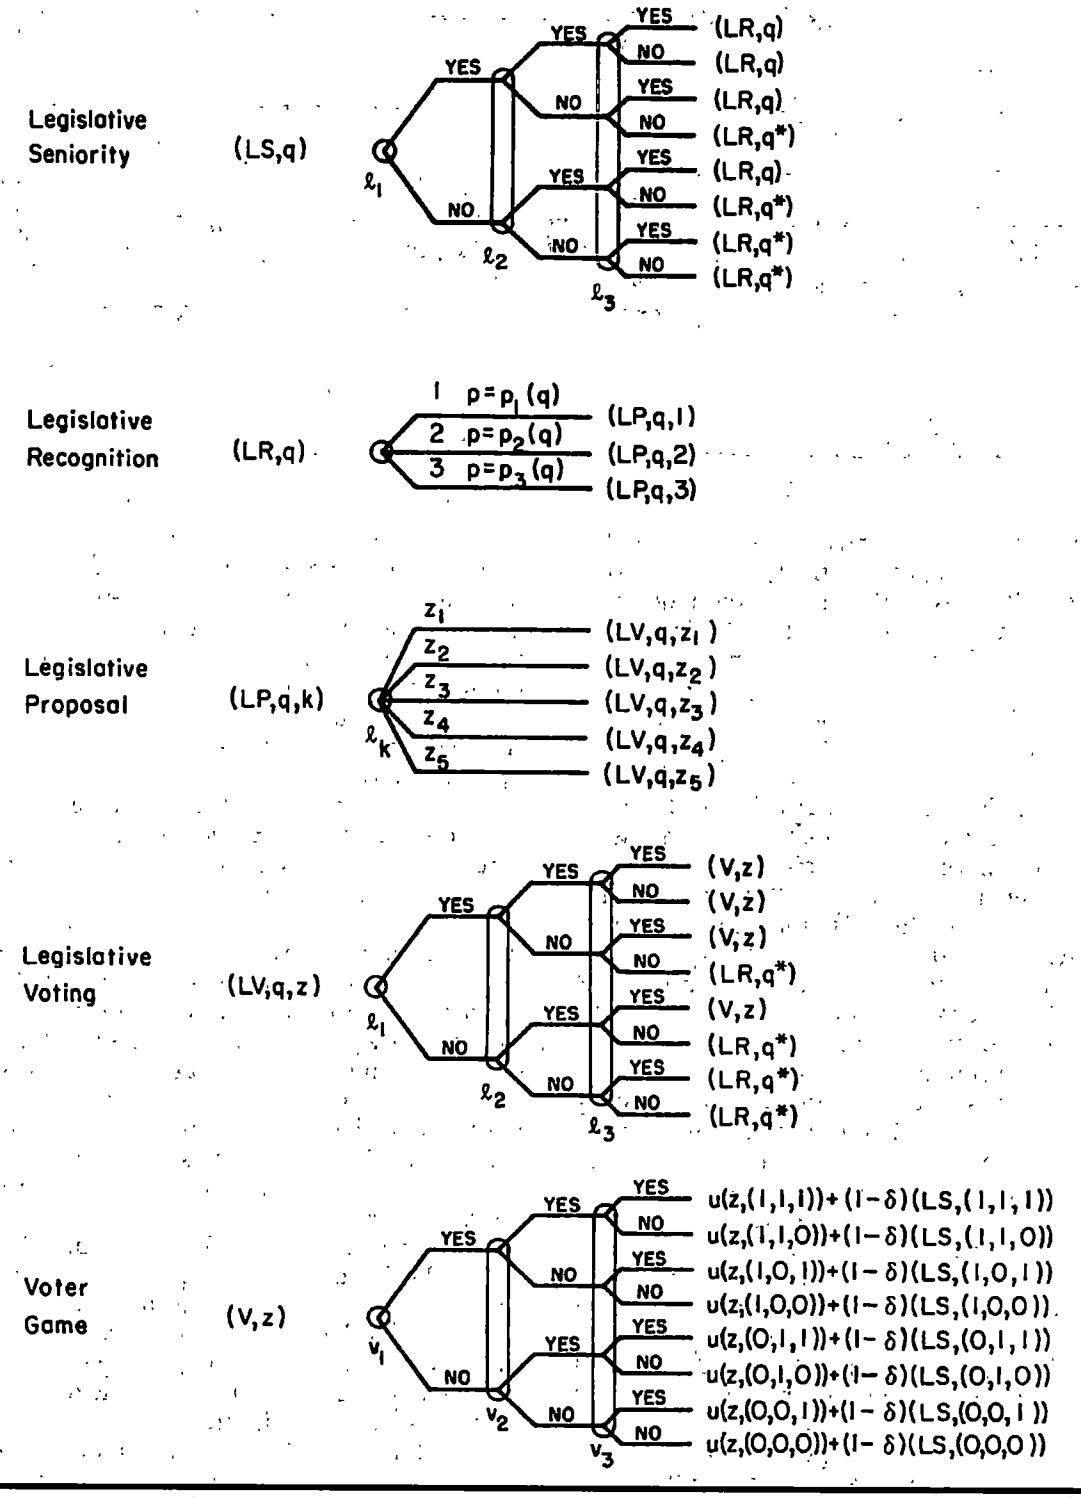
Schematic Diagram of the Seniority Game

We will use this result to characterize equilibria in the stochastic game we consider. Finally, it also follows from Sobel's (1971) results that a Nash equilibrium in the set of stationary strategies is also a Nash equilibrium in the larger class of nonstationary strategies.

THE GAME

We consider an infinitely repeated game between legislators and their constituents.[3] The game alternates back and forth between a legislative session and an election, as illustrated in Figure 1. In the legislative session, the actors are the legislators (one from each legislative district), and the job of the legislature is to divide a dollar between the legislative districts. The legislative session consists of four parts: a vote on the seniority structure, random recognition of a member, a proposal by the randomly selected member, and a vote on the proposal. In the vote on the seniority structure, if a majority of the legislators vote for a seniority system, a seniority system is imposed; otherwise, there is no seniority system. Next, a random recognition rule, like that of Baron and Ferejohn (1989) is used to select a legislator as a proposer. If no seniority system was passed, all legislators have equal probability of being selected. On the other hand, if a seniority system was passed, then the probability of recognition is an increasing function of i's relative seniority. The proposer then proposes a division of the dollar by legislative district. Finally, the legislature votes on the proposal. If the proposal is defeated, a new proposer is selected and the game continues as before, except that in the second round and thereafter seniority is ignored in selecting the proposer.[4] Once a proposal passes the legislature, the legislative session ends, and the game moves to the election.

In the election, the actors are the voters in the legislative districts. In each district, the voters can choose to reelect their incumbent legislator (in which case the legislator has seniority in the next session and receives a salary c) or not to reelect the incumbent (in which case their legislator receives no salary and goes to the next session with no seniority).[5] After each election the legislative game begins again with the new seniority structure.



All agents have utility functions that are the discounted present value of their lifetime stream of utility. For the legislators, in each period, payoffs consist of a salary, which depends on whether they are reelected, and a percentage $(1 - \theta)$ of what they secure for their district. Thus, they skim some exogenously given portion of their district's payoff. In each period, the voters get θ times their share of what their legislator is able to secure for the district.

Figure 1 gives a schematic diagram that illustrates the basic components and the sequence of events for the seniority game. We now define the legislative seniority game more formally as a special kind of stochastic game. Each of the aforementioned components will be a game element in the stochastic game. We will specify the strategy sets, transition functions, and outcome functions for each of these game elements. The reader may find it useful to refer to Figure 2 in understanding the following definitions. This figure illustrates the extensive form game tree for each of the game elements in the case in which there are just three legislative districts, one voter per district, and five possible policy choices.

We let $N = L \cup V$, where L is the set of *legislators*, with $\mathcal{L} = |L| \geq 3$ odd, and V is the set of *voters*. We assume that $X' = \Delta^{\mathcal{L}} \times \{0, 1\}^{\mathcal{L}}$, and $X = X' \cup \{x_0\}$. Elements of X' are written in the form $x = (z, q)$, where $z = (z_1, \ldots, z_{\mathcal{L}}) \in Z = \Delta^{\mathcal{L}}$ and $q = (q_1, \ldots, q_{\mathcal{L}}) \in Q = \{0, 1\}^{\mathcal{L}}$. We assume that there is a function $\phi: V \to L$ identifying the legislative districts, such that voter v is in legislator ℓ's district if $\phi(v) = \ell$. We assume that $n_\ell = |\phi^{-1}(\ell)|$ is odd for all $\ell \in L$. We assume that utility functions over X' are of the form $u_i(x) = (1 - \theta)z_i + cq_i$ for $i \in L$, and $u_i(x) = (\theta/n_{\phi(i)})z_{\phi(i)}$ for $i \in V$. So $Q = \{0, 1\}^{\mathcal{L}}$ represents the seniority

FIGURE 2

Extensive Forms for Each Game Element with Three Legislative Districts, and One Voter per District

structure of the legislature, with typical element $q = (q_1, \ldots, q_{\mathcal{L}})$. Thus, $q_i = 1$ indicates that legislator i has seniority, whereas $q_i = 0$ indicates it does not have seniority.

Let $0 < \delta < 1$ be a fixed discount rate and q^* be the element of Q satisfying $q_i^* = 1$ for all i. Let p: $Q \to \Delta^{\mathcal{L}}$ be a function which indicates the proposal power of each legislator as a function of its seniority (if a seniority system is adopted). We assume that p is strictly monotonic in each component: for all $q \in Q$ and $i \in L$, $q_i > q_i' \Rightarrow p_i(q) > p_i(q_i', q_{-i})$ and that $q_i = q_j \Rightarrow p_i(q) = p_j(q)$. Thus, more seniority means a higher

probability that a legislator will be selected as the proposer; and legislators with the same seniority have equal probability of being selected.

There are a total of six game elements, referred to as Termination Game, Legislative Seniority Game, Legislative Recognition Game, Legislative Proposal Game, Legislative Voting Game, and Voter Game. These games are indexed by the corresponding element in the set $\{T, LS, LR, LP, LV, V\}$. Each game element can be further indexed on a state variable. The state spaces for these games are $\emptyset$, Q, Q, $Q \times L$, $Q \times Z$, and Z, respectively. In order to be able to distinguish the difference between the games by means of the state variable we append the identifying element as the first element of the state for each game element. Thus, $\mathcal{T} = (\{T\}) \cup (\{LS\} \times Q) \cup (\{LR\} \times Q) \cup (\{LP\} \times Q \times L) \cup (\{LV\} \times Q \times Z) \cup (\{V\} \times Z)$ is the set of possible states.[6] We now define the strategy sets and transition functions for the game elements.

Termination Game

For $t = T \in \{T\}$,

$$S_i^t = \{0\} \quad \text{if} \quad i \in N.$$

For all $s^t \in S^t$,

$$\pi^t(s^t)(T) = 1$$

and

$$\psi^t(s^t) = x_0.$$

The Termination Game is just a dummy game element that occurs when the game ends. It is indicated by $t = T$. After each election, the stochastic game proceeds to the termination game with probability $1 - \delta$. In the termination game, each agent has a dummy strategy set, consisting of the singelton $\{0\}$; and the transition function π^t specifies that for any strategy choice, we remain in Termination Game with probability 1. In each period, the null outcome occurs, giving all agents utility 0. Hence, once the Termination Game is reached, all agents get 0 ever after. This is a formal way of introducing discounting into the model. In expected value, this makes utility in other parts of the game equal to the discounted current value of the future utility stream, where players discount future payoffs by a factor δ.

Legislative Seniority Game

For $t = (t_0, t_1) \in \{LS\} \times Q$,

$$S_i^t = \begin{cases} \{0, 1\} & \text{if } i \in L \\ \{0\} & \text{if } i \in N - L. \end{cases}$$

For all $s^t \in S^t$,

$$\pi^t(s^t)(LR, t_1) = 1 \quad \text{if} \quad \Sigma_{i \in L} s_i^t > \frac{\mathcal{L}}{2},$$

$$\pi^t(s^t)(LR, q^*) = 1 \quad \text{if} \quad \Sigma_{i \in L} s_i^t \leq \frac{\mathcal{L}}{2},$$

and

$$\psi^t(s^t) = x_0.$$

The Legislative Seniority Game is the first stage of the legislative session. In this game, the legislature votes whether or not to have seniority for the current session. This game is indexed by $t = (S, t_1)$, where $t_0 = S$ indicates that we are in the Legislative Seniority Game, and t_1 is the current seniority vector. Since this game is a game between legislators, only the legislators have nontrivial strategy sets in the game. The strategy set for a legislator i is the set $\{0, 1\}$, where *0* represents a *no* vote, and *1* represents a *yes* vote. The transition function π^t indicates that we proceed with probability 1 to the Legislative Recognition Game. The vote determines which seniority vector is used in the Legislative Recognition Game. If a majority of the legislators vote for seniority, then the current seniority vector, t_1, is used in the Legislative Recognition Game. If there is not a strict majority for seniority, then the seniority vector q^*, which assigns equal weight to all legislators, is used.

Legislative Recognition Game

For $t = (t_0, t_1) \in \{LR\} \times Q$,

$$S_i^t = \{0\} \quad \text{if} \quad i \in N.$$

For all $s^t \in S^t$ and $y \in L$,

$$\pi^t(s^t)(LP, t_1, y) = p_y(t_1)$$

and

$$\psi^t(s^t) = x_0.$$

The Legislative Recognition Game is the second stage of the legislative session. This game is indexed by $t = (LR, t_1)$, where $t_0 = LR$ indicates we are in the Legislative Recognition Game, and t_1 is the current seniority vector. All agents have singleton strategy sets in this game. Thus, this game is just a chance move, which selects the legislator to make a proposal. From this game, we go with probability 1 to the Legislative Proposal Game. The probability that any legislator is selected is determined by the function $p_y(t_1)$. If seniority passed in the Legislative Seniority Game, the argument of p_y is t_1, which is the vector of seniorities of the legislators. If seniority failed, then $t_1 = q^*$ is used for the seniority vector. A legislator is selected by a random recognition rule to make a proposal for consideration by the legislature. This rule is similar to the Baron–Ferejohn recognition rule, except that we let the recognition rule be a function of seniority. Assumptions made above about p_y guarantee that higher seniority leads to higher probability of being selected.

Legislative Proposal Game

For $t = (t_0, t_1, t_2) \in \{LP\} \times Q \times L$,

$$S_i^t = \begin{cases} Z & \text{if } i = t \\ \{0\} & \text{if } i \in N - \{t\}. \end{cases}$$

For all $s^t \in S^t$,

$$\pi^t(s^t)(LV, t_1, s_t^t) = 1$$

and

$$\psi^t(s^t) = x_0.$$

The Legislative Proposal Game is the third stage of the legislative session. This game is indexed by $t = (LP, t_1, t_2)$, where $t_0 = LP$ indicates that we are in the Legislative Proposal Game; $t_1 \in Q$ is the current seniority structure that has been approved by the legislature; and $t_2 \in L$ represents the legislator who has been selected to make a proposal. In this game element, the only legislator with a nontrivial strategy set is legislator $j = t_2$, whose strategy set is Z, the set of possible divisions of the dollar between the legislative districts. If the legislator proposes the division z, then we proceed with probability 1 to the Legislative Voting Game (LV, t_1, z).

Legislative Voting Game

For $t = (t_0, t_1, t_2) \in \{LV\} \times Q \times Z$,

$$S_i^t = \begin{cases} \{0, 1\} & \text{if } i \in L \\ \{0\} & \text{if } i \in V. \end{cases}$$

For all $s^t \in S^t$,

$$\pi^t(s^t)(V, t_1) = 1 \quad \text{if} \quad \Sigma_{i \in L}\, s_i^t > \frac{\mathcal{L}}{2},$$

$$\pi^t(s^t)(LP, q^*) = 1 \quad \text{if} \quad \Sigma_{i \in L}\, s_i^t \leq \frac{\mathcal{L}}{2},$$

and

$$\psi^t(s^t) = x_0.$$

The Legislative Voting Game is the fourth and last stage of the legislative session. This game is indexed by $t = (LV, t_1, t_2)$, where $t_0 = LV$ indicates that we are in the Legislative Voting Game, $t_1 \in Q$ indicates the current seniority vector, and $t_2 \in Z$ indicates the proposal for division of the dollar that was selected by the proposer in the Legislative Proposal Game. In this game, each legislator has the strategy set $\{0, 1\}$. Here, a zero represents a *no* vote, a one a *yes* vote, on the proposal t_1. If the legislators vote to accept the proposal, the legislative session ends, and we proceed with probability 1 to the Voter Game. If the legislators reject the proposal, then we return with probability 1 to the Legislative Recognition Game, with the exception that seniority is ignored in selecting the proposer. We shall discuss what happens if seniority is used in subsequent proposal rounds. Note that the Legislative Proposal and Legislative Voting Games together are similar to the closed rule version of the Baron–Ferejohn model.

Voter Game

For $t = (t_0, t_1) \in \{V\} \times Z$,

$$S_i^t = \begin{cases} \{0, 1\} & \text{if } i \in V \\ \{0\} & \text{if } i \in L. \end{cases}$$

For all $s^t \in S^t$,

$$\pi^t(s^t)(y) = \begin{cases} \delta & \text{if } y = (S, q(s^t)) \\ 1 - \delta & \text{if } y = T \end{cases}$$

and

$$\psi^t(s^t) = (t_1, q(s^t)),$$

where $q(s^t) = (q_1(s^t), q_2(s^t), \ldots, q_{\mathcal{L}}(s^t)) \in Q$ is defined by

$$q_i(s^t) = \begin{cases} 1 & \text{if } \sum_{j \in \phi^{-1}(i)} s_j^t > \dfrac{n_\ell}{2} \\ 0 & \text{if } \sum_{j \in \phi^{-1}(i)} s_j^t \leq \dfrac{n_\ell}{2} \end{cases}$$

and where $0 < \theta < 1$ and $0 < c$ are constants. The Voter Game consists of a set of simultaneous elections in all of the legislative districts. This game is indexed by $t = (V, t_1)$, where $t_0 = V$ indicates that we are in the Voter Game, and $t_1 \in Z$ represents the outcome of the Legislative Voting Game. In each legislative district, the voters of that district vote whether or not to reelect their legislator. In the version of the game as it is presented here, there is only one legislator in each district and no challenger. So the effect of a negative vote in a given district is that the legislator from that district does not get a salary for the next period and loses seniority.

This completes the description of the stochastic game. Note that there are no payoffs except in the voter game. At that point policy $x = (t_1, q(s^t))$ is implemented. Thus, the pie is divided up among the districts according to $z = t_1 \in \Delta^{\mathcal{L}}$, and $q(s^t) \in Q$ determines which legislators get reelected and which do not. Given the utility functions we have specified, it follows that the output $t_{1\ell}$ to district ℓ is first divided up with $\theta t_{1\ell}$ actually delivered to the voters and $(1 - \theta)t_{1\ell}$ being skimmed off by legislator ℓ. The voters each get an even share of the delivered output. The legislators, in addition to their share of the output, get a salary that is dependent on whether they are reelected or not.

Figure 2 presents a schematic depiction of the game for the case of three legislators, three voters (one per

district), and five possible proposals. The Legislative Seniority vote determines the probabilities in the Legislative Recognition Game. A proposer is selected who makes a proposal in the Legislative Proposal Game. The legislature votes on this proposal. If it passes, the game proceeds to the Voter Game and a new election is held leading to a new session of the legislature. (The discounting comes in here.) If the proposal fails, the game goes back to the Legislative Recognition Game, with seniority not used to determine the probabilities of recognition. From here, the game proceeds as before.

RESULTS

Our main result is that there exists an equilibrium to the stochastic game in which a seniority system is adopted and incumbent legislators always get reelected.

PROPOSITION 1. *The following is a stationary equilibrium to the stochastic game defined in the previous section:*

1. Legislative Seniority Game. For $t \in \{LS\} \times Q$, *and* $i \in L$,

$$\sigma_i^t(t_{1i}) = 1$$

2. Legislative Proposal Game. For $t \in \{LP\} \times Q \times L$,

$$\sigma_i^t = \frac{1}{|\Omega_t|} \sum_{w \in \Omega_t} \delta_{z_i(w)},$$

where $\Omega_t = \{\omega \in \{0, 1\}^{\mathcal{L}}: \Sigma_i \omega_i = (\mathcal{L} + 1)/2, \omega_t = 1\}$, δ_x *is the Dirac delta at* x, *and* z_t: $\Omega_t \to \mathbb{R}^{\mathcal{L}}$ *is defined by*

$$z_{ti}(\omega) = \begin{cases} \dfrac{\mathcal{L}+1}{2\mathcal{L}} & \text{if } i = t \\ \dfrac{1}{\mathcal{L}} & \text{if } i \neq t,\ \omega_i = 1 \\ 0 & \text{otherwise.} \end{cases}$$

3. Legislative Voting Game. For $t \in \{LV\} \times Q \times Z$, *and* $i \in L$,

$$\sigma_i^t(1) = \begin{cases} 1 & \text{if } t_{1i} \geq \dfrac{1}{\mathcal{L}} \\ 0 & \text{if } t_{1i} < \dfrac{1}{\mathcal{L}}. \end{cases}$$

4. Voter Game. For $t \in \{V\} \times Z$, *and* $i \in V$,

$$\sigma_i^t(1) = 1.$$

Proof. The formal proof is in the Appendix. The proof is straightforward, and simply consists of verifying that these strategies satisfy the Bellman conditions that characterize a Nash equilibrium of a stochastic game. These conditions are given as conditions P1 and P2. To verify this, we first specify values, v^t, for each game element. These values represent the value of the game element if equilibrium behavior is followed forever after. The Bellman conditions require that if we replace all game elements by their values, then for each game element, fixing the values of the other game elements, the specified strategies are a Nash equilibrium for that game element (P1), and the computed value of each game element at the equilibrium strategies is equal to the specified value (P2). While the proof is straightforward, it is tedious, since each of these conditions must be verified for all of the six game elements.

Remarks. The proposition gives equilibrium strategies for both the legislators and voters in the stochastic game. We first describe the equilibrium and then provide some intuition for the result. In the Legislative Seniority Game all legislators who have seniority vote in favor of the seniority system, and those who do not have seniority vote against the seniority system. Since in equilibrium all legislators get reelected the, seniority system always passes.

In the Legislative Proposal game, the proposer selects a minimal winning coalition of legislators, which includes itself. The proposer retains $(\mathcal{L} + 1)/2\mathcal{L}$ for its own district, leaving $1/\mathcal{L}$ to be allocated to the districts of each of the remaining members of the coalition. Districts that are not a part of the winning coalition are allocated 0. Thus, the proposer obtains a premium of $(\mathcal{L} + 1)/2\mathcal{L} - 1/\mathcal{L} = (\mathcal{L} - 1)/2\mathcal{L}$ due to its proposal power. As $\mathcal{L} \to \infty$, the premium increases with a limit of one-half.

In the Legislative Voting Game, a legislator votes for a proposal if and only if the legislator receives at least $1/\mathcal{L}$. Thus, if the proposer has proposed an equilibrium proposal, it will pass. Finally, in the Voter Game, the voters always vote to reelect their legislators. It should be noted that although the proof shows only that this is a Nash equilibrium for the voters, in fact, the strategy of voting for the incumbent is a dominant strategy for the voters in any given legislative district, taking the behavior in the remainder of the game as fixed.

Several features of this equilibrium stand in sharp contrast to the results that come out of the traditional voting literature. Most voting models predict tied elections, with no incumbency effects. Here, we obtain instead equilibrium behavior by the voters in which the incumbent wins by a large (unanimous) margin. The intuition behind the result is simple: the voters know that in equilibrium the seniority system will pass and thus that it is in the their best interest to reelect the incumbent, since a senior legislator will be more easily able to serve the constituency than a junior legislator. Note that voters do not know that there will be a seniority system in the next session

but, rather, know that in the steady-state equilibrium, seniority will be voted in each session.

Finally, we emphasize that we have only identified one equilibrium of this model. There may be other equilibria. In fact, we believe that there would also be an equilibrium in which seniority is rejected by the legislature and all legislators are defeated for reelection. This later equilibrium may be able to be refined away by appropriate equilibrium refinements, since voters would all be indifferent, in equilibrium, between voting for the incumbent and voting for the challenger.

EXTENSIONS

The Power of the Initial Proposal

In our model the seniority system works through the proposal stage, by influencing the probability that legislators will get chosen to be the proposer. We assumed that seniority is only used for selecting the proposer in the first round of any legislative session. Thus, if a proposal is turned down in the legislature, seniority is no longer used to select the proposer during that legislative session. In a companion paper we analyze the case in which seniority is in effect throughout the legislative session (McKelvey and Riezman (n.d.). One might think that this system (which, on its face, gives more power to the senior members) would make them better off and hence would be selected by them. However, we show that the opposite is the case. When seniority is in effect for the entire session, there is no symmetric stationary equilibrium in which senior and nonsenior legislators have different values and in which voters always reelect incumbents. In other words, when seniority is used throughout the session, there is no equilibrium in which seniority has benefits for legislators. Thus, legislators would be indifferent between having, and not having, such a seniority system and would hence prefer a seniority system in which seniority is used only for the first proposal in each legislative session. Thus, we get the rather paradoxical result that legislators who have seniority would choose a seniority system that on its face gives less power to senior members.

It is worth pointing out that a seniority system that gives only initial proposal power is a realistic description of the seniority system for the U.S. Congress in the sense that seniority is embodied in the committee system. The committees make proposals by sending bills to the floor. Once the bills go to the floor, the committees lose most of their power, since bills that are amended or defeated generally do not go back to committee in that session. Hence, our model might explain certain features about how seniority systems are set up—in particular, the importance of initial proposal power.

We briefly describe the result from the companion paper. The game is altered by changing the Legislative Voting Game so that when a proposal is rejected, the subsequent Legislative Recognition Game will use the original seniority vector. The rest of the stochastic game is as before. In other words, the Legislative Voting Game is

The Revised Legislative Voting Game

For $t \in \{LV\} \times Z$,

$$S_i^t = \begin{cases} \{0, 1\} & \text{if } i \in L \\ \{0\} & \text{if } i \in V. \end{cases}$$

For all $s^t \in S^t$,

$$\pi^t(s^t)(V, t_1) = 1 \quad \text{if} \quad \Sigma_{i \in L}\, s_i^t > \frac{\mathcal{L}}{2},$$

$$\pi^t(s^t)(LR, t_1) = 1 \quad \text{if} \quad \Sigma_{i \in L}\, s_i^t \leq \frac{\mathcal{L}}{2},$$

and

$$\psi^t(s^t) = x_0.$$

Consider the stochastic game of the previous section, substituting the above game for the previous Legislative Voting Game. Call this the Revised Game. The following proposition is proved in McKelvey and Riezman (n.d.).

PROPOSITION 2. *In the Revised Game there is no symmetric stationary equilibrium with the following two properties:*

1. *Voters always reelect incumbents:*

   For $t \in \{V\} \times Z$, and $i \in V$: $\sigma_i^t(1) = 1$ for all i.

2. *The value of senior and nonsenior members in the Legislative Seniority Game is different.*

The intuition behind this result has to do with how proposers choose coalition partners. Once chosen, proposers want to include in the coalition those with the lowest continuation values, because they can be given less and will still vote for the proposal. It follows, then, when seniority is used throughout the legislative session, that if seniority benefits senior members, they will be less likely to be included in coalitions. Proposition 2 shows that this effect of being chosen less often swamps any other advantages of using seniority throughout the session. Thus, once the proposer is chosen, senior members want to look like nonsenior members so they are as likely to be included in the coalition.

Ordinal Seniority

Our model assumes a binary seniority system: a legislator either has seniority or does not. The next step is to introduce the possibility of ordinal seniority, where a legislator's seniority measures the number of times the legislator has been reelected. The congressional seniority system is an ordinal system.

If each legislator has an independent probability of dying or retiring, then at any point in time, the distribution of seniority, even in equilibrium, could be heterogeneous. Depending on the distribution of seniority and exactly how seniority affects the probability of being selected as the proposer, a seniority system would not necessarily be adopted by the legislature in the first place. Hence, with ordinal seniority, it appears that seniority system may occasionally be defeated. We plan to explore this issue in future work.

CONCLUSION

We have developed a formal model of voter behavior and legislative decision making in which the seniority system and the incumbency effects emerge as an equilibrium. There are a number of weaknesses in this model. We have assumed an unrealistically simple model of the legislative session and of how seniority plays a role; that is, the legislative session is characterized by a random recognition voting game similar to the Baron–Ferejohn model. Second, we assume that the only decision made by the legislature is a decision on the division of a fixed pie. We also assume that legislators' preferences are a function of how much they get for their constituents, rather than just whether they are reelected. We hope to remedy some of these weaknesses in the future. Despite these obvious weaknesses of the model, the model illustrates that it is possible to construct consistent formal models that connect legislative organization with reelectoral goals of legislators. Within the context of this model we have shown that when the effect of seniority is to change the probability of recognition on the first round, seniority has value. If seniority changes the probability of recognition on every round, then senior members get no benefits from seniority.

APPENDIX: PROOF OF PROPOSITION 1

We first specify the values, v^t, associated with these strategies. We then verify that for these values, property P1 and P2 are satisfied. For the following equations, we set $w_1 = (\mathcal{L} + 1)/2\mathcal{L}$, and $w_2 = 1/\mathcal{L}$. Also, we define $Z^1 = \{z \in Z: |\{j \in L: z_j \geq w_2\}| > \mathcal{L}/2\}$, *and* $Z^0 = Z - Z^1$. Similarly, define $Q^1 = \{q \in Q: |\{i \in L: q_i = 1\}| > \mathcal{L}/2\}$, and $Q^0 = Q - Q^1$.

The values of the games are defined below. To interpret these values, go to the definitions of the individual games. For example, for $t \in \{LS\} \times Q$, you are in the Legislative Seniority Game. $v_i^t = v_i^{(R, t_1)}$ means that the value of the seniority game given that seniority has passed ($t_1 \in Q^1$) is the value in the Legislative Recognition Game with seniority vector t_1. If seniority does not pass ($t_1 \in Q^0$), then the value of the game is given by the value in the Legislative Recognition Game with seniority vector q^*. Other values are defined in a similar way.

For $t \in \{T\}$,

$$v_i^t = 0 \text{ for all } i \in N.$$

For $t \in \{LS\} \times Q$,

$$v_i^t = v_i^{(R, t_1)} \text{ if } t_1 \in Q^1,$$

$$v_i^t = v_i^{(R, q^*)} \text{ if } t_1 \in Q^0.$$

For $t \in \{LR\} \times Q$,

$$v_i^t = (1 - \theta)\left[p_i(t_1)w_1 + \frac{1}{2}\sum_{y \in \mathcal{L} - \{i\}} p_y(t_1)w_2\right] + c + \delta v_i^* \quad \text{if } i \in L,$$

$$v_i^t = \frac{\theta}{n_{\phi(i)}}\left[p_{\phi(i)}(t_1)w_1 + \frac{1}{2}\sum_{y \in \mathcal{L} - \{\phi(i)\}} p_y(t_1)w_2\right] + \delta v_i^* \quad \text{if } i \in V,$$

where

$$v_i^* = v_i^{(R, q^*)} = \begin{cases} \dfrac{1}{1 - \delta}\left[\dfrac{1}{\mathcal{L}}(1 - \theta) + c\right] & \text{if } i \in L, \\ \dfrac{1}{1 - \delta}\left[\dfrac{\theta}{\mathcal{L} n_{\phi(i)}}\right] & \text{if } i \in V. \end{cases}$$

For $t \in \{LP\} \times Q \times L$,

$$v_i^t = (1 - \theta)w_1 + c + \delta v_i^* \quad \text{if } i = t,$$

$$v_i^t = \frac{1}{2}(1 - \theta)w_2 + c + \delta v_i^* \quad \text{if } i \neq t,$$

$$v_i^t = \frac{\theta}{n_{\phi(i)}} w_1 + \delta v_i^* \quad \text{if } \phi(i) = t,$$

$$v_i^t = \frac{1}{2}\frac{\theta}{n_{\phi(i)}} w_2 + \delta v_i^* \quad \text{if } \phi(i) \neq t.$$

For $t \in \{LV\} \times Q \times Z^1$,

$$v_i^t = (1 - \theta)t_{1i} + c + \delta v_i^* \quad \text{if } i \in L,$$

$$v_i^t = \theta t_{1\phi(i)} + \delta v_i^* \quad \text{if } i \in V.$$

For $t \in \{LV\} \times Q \times Z^0$,

$$v_i^t = v_i^* \quad \text{if } i \in N.$$

For $t \in \{V\} \times Z$,

$$v_i^t = (1 - \theta)t_{1i} + c + \delta v_i^* \quad \text{if } i \in L,$$

$$v_i^t = \frac{\theta}{n_{\phi(i)}} t_{1\phi(i)} + \delta v_i^* \quad \text{if } i \in V.$$

The next step in the proof is to verify property P2, which requires that for each game and each player the payoffs correspond to the values we have specified. To do this, we start with the definition of G and

then, using the definitions of the game elements and the equilibrium strategies, show that the payoffs equal the appropriate values.
For $t \in \{T\}$,

$$G^t(\sigma^t) = E_{\sigma^t}\left[u(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y)v^y\right]$$
$$= u(x_0) + \pi^t(\sigma^t)(t)v^t = v^t.$$

For $t \in \{LS\} \times Q$,

$$G_i^t(\sigma^t) = E_{\sigma^t}\left[u_i(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y)v_i^y\right]$$
$$= u_i(\psi^t(t_1)) + \sum_{y \in \mathcal{T}} \pi^t(t_1)(y)v_i^y$$
$$= \begin{cases} v_i^{(LR,\, t_1)} & \text{if} \quad \sum_{i \in L} t_{1i} > \dfrac{\mathcal{L}}{2} \\ v_i^{(LR,\, q^*)} & \text{if} \quad \sum_{i \in L} t_{1i} \le \dfrac{\mathcal{L}}{2} \end{cases}$$
$$= \begin{cases} v_i^{(LR,\, t_1)} & \text{if} \quad |\{i \in L\colon t_{1i} = 1\}| > \dfrac{\mathcal{L}}{2} \\ v_i^{(LR,\, q^*)} & \text{if} \quad |\{i \in L\colon t_{1i} = 1\}| \le \dfrac{\mathcal{L}}{2} \end{cases}$$
$$= \begin{cases} v_i^{(LR,\, t_1)} & \text{if} \quad t_1 \in Q^1 \\ v_i^{(LR,\, q^*)} & \text{if} \quad t_1 \in Q^0. \end{cases}$$
$$= v^t.$$

For $t \in \{LR\} \times Q$,

$$G^t(\sigma^t) = E_{\sigma^t}\left[u(\psi^t(\sigma^t)) + \sum_{y \in \mathcal{T}} \pi^t(\sigma^t)(y)v^y\right]$$
$$= u(x_0) + \sum_{y \in L} p_y(t_1)v^y.$$

So, for $i \in L$,

$$G_i^t(\sigma^t) = p_i(t_1)v_i^i + \sum_{y \in \mathcal{L} - \{i\}} p_y(t_1)v_i^y$$
$$= p_i(t_1)[(1-\theta)w_1 + c + \delta v_i^*]$$
$$+ \sum_{y \in \mathcal{L} - \{i\}} p_y(t_1)\left[\frac{1}{2}(1-\theta)w_2 + c + \delta v_i^*\right]$$
$$= (1-\theta)\left[p_i(t_1)w_1 + \frac{1}{2}\sum_{y \in \mathcal{L} - \{i\}} p_y(t_1)w_2\right]$$
$$+ c + \delta v_i^* = v_i^t$$

and for $i \in V$,

$$G_i^t(\sigma^t) = p_{\phi(i)}(t_1)v_i^{\phi(i)} + \sum_{y \in \mathcal{L} - \{\phi(i)\}} p_y(t_1)v_i^y$$
$$= p_{\phi(i)}(t_1)\left[\frac{\theta}{n_{\phi(i)}}w_1 + \delta v_i^*\right]$$
$$+ \sum_{y \in \mathcal{L} - \{\phi(i)\}} p_y(t_1)\left[\frac{\theta}{2n_{\phi(i)}}w_2 + \delta v_i^*\right]$$
$$= \frac{\theta}{n_{\phi(i)}}\left[p_{\phi(i)}(t_1)w_1 + \sum_{y \in \mathcal{L} - \{\phi(i)\}} \frac{1}{2}p_y(t_1)w_2\right]$$
$$+ \delta v_i^* = v_i^t.$$

For $t \in \{LP\} \times Q \times L$,

$$G^t(\sigma^t) = E_{\sigma^t}[u(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y)v^y]$$
$$= u(x_0) + E_{\sigma^t}[v^{(LV,\, s_t^t)}].$$

But since $\sigma_t^t(Z^1) = 1$, we have, for $i \in L$,

$$G^t(\sigma^t) = E_{\sigma^t}[(1-\theta)s_t^t + c + \delta v^*]$$
$$= (1-\theta)E_{\sigma^t}[s_t^t] + c + \delta v^*.$$

But

$$E_{\sigma^t}[s_t^t] = E_{\sigma^t}\left[\frac{1}{|\Omega_t|}\sum_{w \in \Omega_t} \delta_{z_t(w)}\right] = \frac{1}{|\Omega_t|}\sum_{w \in \Omega_t} E_{\sigma^t}[\delta_{z_t(w)}]$$
$$= \frac{1}{|\Omega_t|}\sum_{w \in \Omega_t} z_t(\omega).$$

So

$$E_{\sigma^t}[s_{ti}^t] = \frac{1}{|\Omega_t|}\sum_{w \in \Omega_t} z_{ti}(\omega) = \frac{1}{|\Omega_t|} \cdot |\Omega_t| \frac{\mathcal{L}+1}{2\mathcal{L}}$$
$$= \frac{\mathcal{L}+1}{2\mathcal{L}} = w_1 \text{ if } i = t$$

$$E_{\sigma^t}[s_{ti}^t] = \frac{2\left[\dfrac{\mathcal{L}-1}{2}\right]!}{(\mathcal{L}-1)!} \cdot \frac{(\mathcal{L}-2)!}{2\left[\dfrac{\mathcal{L}-3}{2}\right]!} \cdot \frac{1}{\mathcal{L}}$$
$$= \frac{\left[\dfrac{\mathcal{L}-1}{2}\right]}{(\mathcal{L}-1)} \cdot \frac{1}{\mathcal{L}} = \frac{1}{2\mathcal{L}} = \frac{1}{2}w_2 \quad \text{if} \quad i \neq t.$$

Thus,

$$G_i^t(\sigma^t) = \begin{cases} (1-\theta)w_1 + c + \delta v_i^* & \text{if} \quad i = t \\ \dfrac{1}{2}(1-\theta)w_2 + c + \delta v_i^* & \text{if} \quad i \neq t \end{cases}$$
$$= v_i^t$$

and for $i \in V$,

$$G_i^t(\sigma^t) = E_{\sigma^t}\left[\frac{\theta}{n_{\phi(i)}} s_{ti}^t + \delta v_i^*\right] = \frac{\theta}{n_{\phi(i)}} E_{\sigma^t}[s_{ti}^t] + \delta v_i^*$$

$$= \begin{cases} \dfrac{\theta}{n_{\phi(i)}} w_1 + \delta v_i^* & \text{if} \quad \phi(i) = t \\ \dfrac{1}{2}\dfrac{\theta}{n_{\phi(i)}} w_2 + \delta v_i^* & \text{if} \quad \phi(i) \neq t \end{cases}$$

$$= v_i^t.$$

For $t \in \{LV\} \times Q \times Z^1$, since $t_1 \in Z^1$, it follows that

$$\sigma^t\left(\sum_{i \in L} s_i^t > \frac{\mathcal{L}}{2}\right) = 1.$$

So $\pi^t(\sigma^t)(V, t_1) = 1$. Hence,

$$G_i^t(\sigma^t) = E_{\sigma^t}\left[u_i(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y) v_i^y\right]$$

$$= u(x_0) + \pi^t(\sigma^t)(t_1, V) v_i^{(V, t_1)} + \pi^t(\sigma^t)$$

$$(q^*, 2) v_i^{(LR, q^*)}$$

$$= v_i^{(V, t_1)} = \begin{cases} (1-\theta) t_{1i} + c + \delta v_i^* & \text{if} \quad i \in L \\ \theta t_{1\phi(i)} + \delta v_i^* & \text{if} \quad i \in V \end{cases}$$

$$= v_i^t.$$

For $t \in \{LV\} \times Q \times Z^0$, since $t_1 \in Z^0$, it follows that

$$\sigma^t\left(\sum_{i \in L} s_i^t \leq \mathcal{L}/2\right) = 1,$$

so $\pi^t(\sigma^t)(q^*, 2) = 1$. Hence,

$$G_i^t(\sigma^t) = E_{\sigma^t}\left[u_i(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y) v_i^y\right]$$

$$= u(x_0) + \pi^t(\sigma^t)(t_1, V) v_i^{(V, t_1)}$$

$$+ \pi^t(\sigma^t)(q^*, 2) v_i^{(LR, q^*)}$$

$$= v_i^{(LR, q^*)} = v_i^* = v_i^t.$$

For $t \in \{V\} \times Z$,

$$\pi^t(s^t)(y) = \begin{cases} \delta & \text{if} \quad y = (S, q(s^t)) \\ 1 - \delta & \text{if} \quad y = T, \end{cases}$$

$\sigma_i^t(1) = 1$ for all i.

$$G^t(\sigma^t) = E_{\sigma^t}\left[u(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y) v^y\right]$$

$$= E_{\sigma^t}[u(t_1, q(s^t))] + \delta \pi^t(\sigma^t)(q(s^t), 1) v^{(S, q(s^t))}$$

$$= u(t_1, q^*) + \delta v^{(S, q^*)} = u(t_1, q^*) + \delta v^*$$

So, for $i \in L$,

$$G_i^t(\sigma^t) = (1-\theta) t_{1i} + c q_i^* + \delta v_i^*$$

$$= (1-\theta) t_{1i} + c + \delta v_i^* = v_i^t$$

and for $i \in V$,

$$G_i^t(\sigma^t) = \frac{\theta}{n_{\phi(i)}} t_{1\phi(i)} + \delta v_i^* = v_i^t.$$

We next verify that property P1 is satisfied, that is, that σ^t is a Nash equilibrium. For each game element we show that no player can benefit from playing a different strategy.

For $t \in \{V\} \times Z$, we want to show that σ^t is a Nash equilibrium to the game with payoff function G^t, where $\sigma_i^t(1) = 1$ for all $i \in V$. It suffices to show that for each $i \in V$, σ_i^t is at least as good as any pure strategy $s_i' \in S_i^t$. So,

$$G_i^t(\sigma^t) \geq G_i^t(\sigma_i', \sigma_{-i}^t)$$

$$\Leftrightarrow E_{\sigma^t}\left[u_i(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y) v_i^y\right]$$

$$\geq E_{\sigma_{-i}^t}\left[u_i(\psi^t(s_i', s_{-i}^t)) + \sum_{y \in \mathcal{T}} \pi^t(s_i', s_{-i}^t)(y) v_i^y\right]$$

for all $s_i' \in S_i^t$. Writing $\underline{1}$ for the $|V|$ component vector of ones, we can rewrite this inequality as

$$u_i(\psi^t(\underline{1})) + \sum_{y \in \mathcal{T}} \pi^t(\underline{1})(y) v_i^y$$

$$\geq u_i(\psi^t(s_i', \underline{1}_{-i})) + \sum_{y \in \mathcal{T}} \pi^t(s_i', \underline{1}_{-i})(y) v_i^y$$

$$\Leftrightarrow \delta v_i^{(S, q(\underline{1}))} \geq \delta v_i^{(S, q(s_i', \underline{1}_{-i}))} \Leftrightarrow v_i^* \geq v_i^{(S, q(s_i', \underline{1}_{-i}))}$$

But $q(s_i', \underline{1}_{-i}) \geq \underline{1} - \varepsilon_\ell$, where $\ell = \phi(i)$, and ε_ℓ is the ℓth standard basis vector. Further, since $\underline{1} - \varepsilon_\ell \in Q^1$, we have $q(s_i', \underline{1}_{-i}) \in Q^1$. So $v_i^{(S, q(s_i', \underline{1}_{-i}))} = v_i^{(LR, q(s_i', \underline{1}_{-i}))}$. Hence, the above inequality can be written

$$v_i^* \geq \frac{\theta}{n_{\phi(i)}}\left[p_{\phi(i)}(q(s_i', \underline{1}_{-i})) w_1 + \frac{1}{2} \sum_{y \in \mathcal{L} - \{\phi(i)\}} p_y(q(s_i', \underline{1}_{-i})) w_2\right] + \delta v^*{}_i$$

$$\Leftrightarrow \frac{\theta}{\mathcal{L} n_{\phi(i)}} \geq \frac{\theta}{n_{\phi(i)}}\left[p_{\phi(i)}(q(s_i', \underline{1}_{-i})) w_1 + \frac{1}{2}(1 - p_{\phi(i)}(q(s_i', \underline{1}_{-i}))) w_2\right]$$

$$\Leftrightarrow \frac{1}{\mathcal{L}} = p_i(q_0) w_1 + \frac{1}{2}(1 - p_i(q_0)) w_2$$

$$\geq p_i(q(s_i', \underline{1}_{-i}))w_1 + \frac{1}{2}(1 - p_i(q(s_i', \underline{1}_{-i})))w_2$$

$$\Leftrightarrow [p_i(q_0) - p_i(q(s_i', s_{-i}))]\left(w_1 - \frac{1}{2}w_2\right) \geq 0.$$

Now if $n_{\phi(i)} = |\phi^{-1}(\phi(i))| > 1$ (there is more than one voter in district i), then $q_0 = q(s_i', \underline{1}_{-i})$; thus, one voter changing a vote does not affect the outcome. Hence, the above expression equals 0, and it follows that σ^t is a Nash equilibrium for G^t. If $n_{\phi(i)} = 1$ (there is a single voter in district i), then since $\sigma_i^t(1) = 1$ and $s_i' \leq 1$, it follows that $q_{0i} = \underline{1}$ and $q_i(s_i', \underline{1}_{-i}) = s_i' \leq 1$. In this case, one voter changing a vote changes the outcome. Hence, monotonicity of p implies that $[p_i(q_0) - p_i(q(s_i', \underline{1}_{-i}))] \geq 0$, and the last inequality holds if and only if

$$\left[w_1 - \frac{1}{2}w_2\right] = \frac{\mathcal{L}+1}{2\mathcal{L}} - \frac{1}{2\mathcal{L}} = \frac{1}{2} \geq 0.$$

Since all terms in the last expression are positive, this inequality holds; and it follows that s^t is a Nash equilibrium for G^t. This demonstrates that from the voter's point of view, changing a vote either does not change the outcome or changes the outcome in such a way as to make that voter worse off.

For $t \in \{LS\} \times Q^1$, we want to show that σ^t is a Nash equilibrium to the game with payoff function G^t, where $\sigma_i^t(t_{1i}) = 1$ for all $i \in L$. It suffices to show that for each $i \in L$, σ_i^t is at least as good as any pure strategy $s_i' \in S_i^t$. So,

$$G_i^t(\sigma^t) \geq G_i^t(\sigma_i', \sigma_{-i}^t)$$

$$\Leftrightarrow E_{\sigma^t}[u_i(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y)v_i^y]$$

$$\geq E_{\sigma_{-i}^t}[u_i(\psi^t(s_i', s_{-i}^t)) + \sum_{y \in \mathcal{T}} \pi^t(s_i', s_{-i}^t)(y)v_i^y]$$

for all $s_i' \in S_i^t$. Using $\sigma_i^t(t_{1i}) = 1$, this can be reduced to

$$u_i(\psi^t(t_1)) + \sum_{y \in \mathcal{T}} \pi^t(t_1)(y)v_i^y \geq u_i(\psi^t(s_i', (t_1)_{-i})) + \sum_{y \in \mathcal{T}} \pi^t(s_i', (t_1)_{-i})(y)v_i^y.$$

Since $t_1 \in Q^1$, it follows that $\Sigma_{j \in L} t_{1j} > \mathcal{L}/2 \Rightarrow \pi^t(t_1)(LR, t_1) = 1$. So we get

$$v_i^{(LR, t_1)} \geq \pi^t(s_i', (t_1)_{-i})(LR, t_1)v_i^{(LR, t_1)} + \pi^t(s_i', (t_1)_{-i})(LR, q^*)v_i^{(LR, q^*)}.$$

Clearly, if $\pi^t(s_i', (t_1)_{-i})(LR, t_1) = 1$, legislator i is not pivotal and the above is an equality. So we consider the case when legislator i is pivotal, $\pi^t(s_i', (t_1)_{-i})(LR, t_1) \neq 1$. In this case, we must have $\Sigma_{j \in L} t_{1j} > \mathcal{L}/2$ and $s_i' + \Sigma_{j \in L - \{i\}} t_{1j} < \mathcal{L}/2$. So $t_{1i} = 1$, and $s_i' = 0$. Thus, $\pi^t(s_i', (t_1)_{-i})(LR, q^*) = 1$, and the above inequality can be rewritten

$$v_i^{(LR, t_1)} \geq v_i^{(r, q^*)}$$

$$\Leftrightarrow (1 - \theta)\left[p_i(t_1)w_1 + \frac{1}{2}\sum_{y \in \mathcal{L} - \{i\}} p_y(t_1)w_2\right] + c + \delta v_i^*$$

$$\geq (1 - \theta)\left[q_i^* w_1 + \frac{1}{2}\sum_{y \in \mathcal{L} - \{i\}} q_y^* w_2\right] + c + \delta v_i^*$$

$$\Leftrightarrow p_i(t_1)w_1 + \frac{1}{2}(1 - p_i(t_1))w_2 \geq q_i^* w_1 + \frac{1}{2}(1 - q_i^*)w_2$$

$$\Leftrightarrow p_i(t_1)\left(w_1 - \frac{1}{2}w_2\right) \geq q_i^*\left(w_1 - \frac{1}{2}w_2\right)$$

$$\Leftrightarrow p_i(t_1) \geq q_i^*.$$

Now $p_i(t_1)$ is the probability that i will be selected, given that seniority is used and that $(\mathcal{L} + 1)/2$ members (including i) have seniority and $(\mathcal{L} - 1)/2$ do not have seniority. The seniority assumption implies that for all $q \in Q$, and $i, j \in L$, $q_i > q_i' \Rightarrow p_j(q) < p_j(q_i', q_{-i})$, $i \neq j$; that is, higher (lower) seniority for legislator i means that every other legislator now has a lower (higher) probability of being selected than the proposer. Now begin at q^* (assume every legislator has seniority) and remove seniority for $(\mathcal{L} - 1)/2$ legislators (not including i). At each step, p_i increases. Therefore, the last inequality is satisfied. Hence, σ^t is a Nash equilibrium for G^t.

For $t \in \{LS\} \times Q^0$, as above, we have

$$G_i^t(\sigma^t) \geq G_i^t(\sigma_i', \sigma_{-i}^t)$$

$$u_i(\psi^t(t_1)) + \sum_{y \in \mathcal{T}} \pi^t(t_1)(y)v_i^y \geq u_i(\psi^t(s_i', (t_1)_{-i})) + \sum_{y \in \mathcal{T}} \pi^t(s_i', (t_1)_{-i})(y)v_i^y$$

for all $s_i' \in S_i^t$. Since $t_1 \in Q^0$, it follows that $\Sigma_{j \in L} t_{1j} \leq \mathcal{L}/2 \Rightarrow \pi^t(t_1)(LR, q^*) = 1$. So we get

$$\Leftrightarrow v_i^{(LR, q^*)} \geq \pi^t(s_i', (t_1)_{-i})(LR, t_1)v_i^{(LR, t_1)} + \pi^t(s_i', (t_1)_{-i})(LR, q^*)v_i^{(LR, q^*)}.$$

Clearly, if $\pi^t(s_i', (t_1)_{-i})(LR, q^*) = 1$, legislator i is not pivotal and the above is an equality. So we consider the case when legislator i is pivotal, $\pi^t(s_i', (t_1)_{-i})(LR, q^*)) \neq 1$. In this case, we must have $\Sigma_{j \in L} t_{1j} \leq \mathcal{L}/2$ and $s_i' + \Sigma_{j \in L - \{i\}} t_{1j} > \mathcal{L}/2$. So $t_{1i} = 0$, and $s_i' = 1$. Thus, $\pi^t(s_i', t_{1-i})(LR, t_1) = 1$, and the above inequality can be rewritten

$$v_i^{(LR, q^*)} \geq v_i^{(LR, t_1)}$$

$$\Leftrightarrow (1 - \theta)\left[q_i^* w_1 + \frac{1}{2}\sum_{y \in \mathcal{L} - \{i\}} q_y^* w_2\right] + c + \delta v_i^*$$

$$\geq (1 - \theta)\left[p_i(t_1)w_1 + \frac{1}{2}\sum_{y \in \mathcal{L} - \{i\}} p_y(t_1)w_2\right] + c + \delta v_i^*$$

$$\Leftrightarrow q_i^* w_1 + \frac{1}{2}(1 - q_i^*)w_2 \geq p_i(t_1)w_1 + \frac{1}{2}(1 - p_i(t_1))w_2$$

$$\Leftrightarrow q_i^*\left(w_1 - \frac{1}{2}w_2\right) \geq p_i(t_1)\left(w_1 - \frac{1}{2}w_2\right)$$

$$\Leftrightarrow q_i^* \geq p_i(t_1).$$

But $p_i(t_1)$ is the probability that i will be selected, given that seniority is used and that $(\mathcal{L} - 1)/2$ members have seniority and $(\mathcal{L} - 1)/2$ (including i) do not have seniority. Using reasoning similar to that above, begin at q^* (assume no legislator has seniority) and add seniority for $(\mathcal{L} - 1)/2$ legislators (not including i). At each step, p_i decreases. Therefore, the last inequality is satisfied. Hence, σ^t is a Nash equilibrium for G^t.

For $t \in \{LV\} \times Q \times Z^1$, we want to show that σ^t is a Nash equilibrium to the game with payoff function G^t, where

$$\sigma_i^t(1) = \begin{cases} 1 & \text{if} \quad t_{1i} \geq \dfrac{1}{\mathcal{L}} \\ 0 & \text{if} \quad t_{1i} < \dfrac{1}{\mathcal{L}} \end{cases}$$

for all $i \in L$. It suffices to show that for each $i \in L$, σ_i^t is at least as good as any pure strategy $s_i' \in S_i^t$. So,

$$G_i^t(\sigma^t) \geq G_i^t(\sigma_i', \sigma_{-i}^t)$$

$$\Leftrightarrow E_{\sigma^t}[u_i(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y)v_i^y]$$

$$\geq E_{\sigma_i'}[u_i(\psi^t(s_i', s_{-i}^t)) + \sum_{y \in \mathcal{T}} \pi^t(s_i', s_{-i}^t)(y)v_i^y]$$

for all $s_i' \in S_i^t$. Since $t_1 \in Z^1$, $|\{j \in L: t_{1j} \geq w_2\}| > \mathcal{L}/2$. But $\sigma_i^t(1) = 1$ if $t_{1i} \geq 1/\mathcal{L} = w_2$. So, define $r \in \{0, 1\}^{\mathcal{L}}$ by $r_i = 1$ if $t_{1i} \geq w_2$ and $r_i = 0$ if $t_{1i} < w_2$. Then $\sigma(r) = 1$ and $\sigma_{-i}(r_{-i}) = 1$. Since $\Sigma_{i \in L} r_i > \mathcal{L}/2$, $\pi^t(r)(t_1, V) = 1$, and the above equation can be reduced to

$$u_i(x_0) + \sum_{y \in \mathcal{T}} \pi^t(r)(y)v_i^y \geq u_i(x_0) + \sum_{y \in \mathcal{T}} \pi^t(s_i', r_{-i})(y)v_i^y$$

$$\Leftrightarrow \sum_{y \in \mathcal{T}} \pi^t(r)(y)v_i^y \geq \sum_{y \in \mathcal{T}} \pi^t(s_i', r_{-i})(y)v_i^y$$

$$\Leftrightarrow v_i^{(V, t_1)} \geq \pi^t(s_i', r_{-i})(V, t_1)v_i^{(V, t_1)} + \pi^t(s_i', r_{-i})(LR, q^*)v_i^{(LR, q^*)}.$$

Clearly, if $\pi^t(s_i', r_{-i})(V, t_1) = 1$, legislator i is not pivotal and the above is an equality. So we consider the case when legislator i is pivotal, $\pi^t(s_i', r_{-i})(V, t_1) \neq 1$. In this case, we must have $\Sigma_{j \in L} r_j > \mathcal{L}/2$ and $s_i' + \Sigma_{j \in L - \{i\}} r_j < \mathcal{L}/2$. So $r_i = 1$, and $s_i' = 0$. Thus, $\pi^t(s_i', r_{-i})(LR, q^*) = 1$, and the above inequality can be rewritten

$$v_i^{(V, t_1)} \geq v_i^{(LR, q^*)} \Leftrightarrow (1 - \theta)t_{1i} + c + \delta v_i^* \geq v_i^*$$

$$\Leftrightarrow t_{1i} \geq \frac{1}{(1 - \theta)}[(1 - \delta)v_i^* - c].$$

$$\Leftrightarrow t_{1i} \geq \frac{1}{(1 - \theta)}\left[\left[\frac{1}{\mathcal{L}}(1 - \theta) + c\right] - c\right].$$

$$\Leftrightarrow t_{1i} \geq \frac{1}{\mathcal{L}}.$$

But $s_i^t = 1 \Rightarrow t_{1i} \geq w_2 = 1/\mathcal{L}$. Hence, the above inequality holds; and we have shown that $G_i^t(\sigma^t) \geq G_i^t(\sigma_i', \sigma_{-i}^t)$, so σ^t is a Nash equilibrium for G^t.

For $t \in \{LV\} \times Q \times Z^0$, define r as above. Since $t_1 \in Z^0$, $|\{j \in L: t_{1j} \geq w_2\}| \leq \mathcal{L}/2$, we get $\Sigma_{i \in L} r_i \leq \mathcal{L}/2$, implying $\pi^t(r)(LR, q^*) = 1$. Then arguing as above,

$$G_i^t(\sigma^t) \geq G_i^t(\sigma_i', \sigma_{-i}^t)$$

$$\Leftrightarrow v_i^{(LR, q^*)} \geq \pi^t(s_i', r_{-1})(V, t_1)v_i^{(V, t_1)} + \pi^t(s_i', r_{-i})(LR, q^*)v_i^{(LR, q^*)}$$

for all $s_i' \in S_i^t$. Clearly, if $\pi^t(s_i', r_{-i})(LR, q^*) = 1$, legislator i is not pivotal and the above is an equality. So we consider the case when legislator i is pivotal, $\pi^t(s_i', r_{-i})(LR, q^*) \neq 1$. In this case, we must have $\Sigma_{j \in L} r_j < \mathcal{L}/2$ and $s_i' + \Sigma_{j \in L - \{i\}} r_j > \mathcal{L}/2$. So $r_i = 0$, and $s_i' = 1$. Thus, $\pi^t(s_i', r_{-i})(V, t_1) = 1$, and the above inequality can be rewritten

$$v_i^{(LR, q^*)} \geq v_i^{(V, t_1)} \Leftrightarrow v_i^* \geq (1 - \theta)t_{1i} + c + \delta v_i^*$$

$$\Leftrightarrow \frac{1}{(1 - \theta)}[(1 - \delta)v_i^* - c] \geq t_{1i}.$$

$$\Leftrightarrow \frac{1}{(1 - \theta)}\left[\left[\frac{1}{\mathcal{L}}(1 - \theta) + c\right] - c\right] \geq t_{1i}.$$

$$\Leftrightarrow \frac{1}{\mathcal{L}} \geq t_{1i}.$$

But $s_i^t = 0 \Rightarrow t_{1i} < w_2 = 1/\mathcal{L}$. Hence, the above inequality holds; and it follows that σ^t is a Nash equilibrium for G^t.

For $t \in \{LP\} \times Q \times L$, we want to show that σ^t is a Nash equilibrium to the game with payoff function G^t, in which

$$\sigma_t^t = \frac{1}{|\Omega_t|}\sum_{w \in \Omega_t} \delta_{z_t(w)},$$

where $\Omega_t = \{\omega \in \{0, 1\}^{\mathcal{L}}: \Sigma_i \omega_i = (\mathcal{L} + 1)/2, \omega_t = 1\}$ and $z_t: \Omega_t \to \mathbb{R}^{\mathcal{L}}$ is defined by

$$z_{ti}(\omega) = \begin{cases} \dfrac{\mathcal{L} + 1}{2\mathcal{L}} & \text{if} \quad i = t \\ \dfrac{1}{\mathcal{L}} & \text{if} \quad i \neq 1,\ \omega_i = 1 \\ 0 & \text{otherwise} \end{cases}$$

for all $i \in L$. It suffices to show that σ_t^t is at least as good as any pure strategy $s_t' \in S_t^t$. So, for all $s_t' \in S_t^t$,

$$G_t^t(\sigma^t) \geq G_t^t(\sigma_t', \sigma_{-t}^t)$$

$$\Leftrightarrow E_{\sigma^t}[u_t(\psi^t(s^t)) + \sum_{y \in \mathcal{T}} \pi^t(s^t)(y)v_t^y]$$

$$\geq E_{\sigma_{-t}'}[u_t(\psi^t(s_t', s_{-t}^t)) + \sum_{y \in \mathcal{T}} \pi^t(s_t', s_{-t}^t)(y)v_t^y]$$

$$\Leftrightarrow u_t(x_0) + \frac{1}{|\Omega_t|} \sum_{w \in \Omega_t} \sum_{y \in \mathcal{T}} \pi^t(z_t(\omega), \underline{0}_{-t})(y)v_t^y$$

$$\geq u_t(x_0) + \sum_{y \in \mathcal{T}} \pi^t(s_t', \underline{0}_{-t})(y)v_t^y$$

$$\Leftrightarrow \frac{1}{|\Omega_t|} \sum_{w \in \Omega_t} v_t^{(LV, z_t(\omega))} \geq v_t^{(LV, s_t')}.$$

But now, for all $\omega, \omega' \in \Omega_t$, $z_{tt}(\omega) = z_{tt}(\omega')$. So, writing $z_{tt} = z_{tt}(\omega)$, then the above inequality becomes

$$\frac{1}{|\Omega_t|} \sum_{w \in \Omega_t} v_t^{(LV, z_t(\omega))} = (1 - \theta)z_{tt} + c + \delta v_t^* \geq v_t^{(LV, s_t')}$$

Now if $s_t' \in Z^0$, which means that the proposal will not pass, then $v_t^{(LV, s_t')} = v_t^*$. So the above inequality becomes

$$(1 - \theta)\frac{\mathcal{L} + 1}{2\mathcal{L}} + c \geq (1 - \delta)v_t^* = (1 - \theta)\frac{1}{\mathcal{L}} + c$$

$$\Leftrightarrow \frac{\mathcal{L} - 1}{2\mathcal{L}} \geq 0 \Leftrightarrow \mathcal{L} \geq 1.$$

Since this inequality holds, σ^t is a Nash equilibrium for G^t in this case. On the other hand, if $s_t' \in Z^1$, the proposal is one that will pass; then in order to have $|\{j \in L: s_{tj} > w_2\}| \geq \mathcal{L}/2$, we must have $s_{tt}' \leq s_{tt}^t$. But then

$$\frac{1}{|\Omega_t|} \sum_{w \in \Omega_t} v_t^{(LV, z_t(\omega))}$$

$$= (1 - \theta)s_{tt}^t + c + \delta v_t^* \geq (1 - \theta)s_{tt}' + c + \delta v_t^* = v_t^{(LV, s_t')}.$$

Hence, σ^t is a Nash equilibrium for G^t.

Notes

This paper was funded in part by National Science Foundation Grants SES–864348 and SES–9022932 to the California Institute of Technology and SES–9023056 to the University of Iowa. This paper was written in part while Raymond Riezman was a visiting professor at the California Institute of Technology. We thank Ken Shepsle and Jeff Banks for useful comments on earlier drafts.

1. There have been partial attempts in this direction. Austen-Smith and Banks (1988) develop a full-equilibrium model of voter and legislative behavior in a parliamentary system. However, their model is not dynamic, since it deals with a one-shot game. Kramer (1977), Baron (1989), and Ferejohn (Baron and Ferejohn 1989) have developed dynamic models of policy formation and legislative organisation; but these models are not full-equilibrium, since they do not explicitly consider voter and legislative interactions.

2. On the issue of seniority, there has been remarkably little formal work in the political science literature. One exception is Shepsle and Nalebuff (1990), which develops a model explaining the existence of seniority systems in the group provision of public or private goods. Their explanation is based on a model of overlapping generations, in which agents need to have incentives to participate throughout their lifetime. This explanation does not depend on any characteristics of the group that are unique to legislative bodies and hence is equally applicable to firms and legislative bodies. Although there has not been a lot of explicit work on seniority, there has been a substantial body of formal work looking at the role of specialized committees in legislative organization (e.g., Gilligan and Krehbiel 1990; Shepsle 1979).

3. We model the infinitely repeated game as a stochastic game and only consider stationary solutions, thus avoiding the usual problems associated with the folk theorems in repeated games.

4. It is important to note that in our formulation, the seniority system only matters on the initial proposal. An interesting variation to consider would be the case in which seniority counts not only on the first proposal but on all successive proposals, as well. We believe that our formulation makes sense for two reasons. First, it captures an aspect of how congressional rules operate—namely, seniority is embodied in the committee system, which gives higher-than-average influence to ranking committee members to specify the proposed legislation. But if a majority of the legislators oppose a committee proposal on the floor, then the committee effectively loses its power, and the proposal of the committee can be amended by the full legislature at will. Second, suppose one defines the status quo to be fair division (each district gets $1/\mathcal{L}$). Then our model is equivalent to a model in which the failure of a proposal leads to a reversion to the status quo.

5. While this is not completely realistic, it captures the idea that voters can punish their representatives who they feel are not acting in their best interests. Our formulation allows more limited punishments than would be the case if voters could remove the legislator from office permanently.

6. Elements of $\mathcal{T}$ will be denoted by t. If t has two components, then we write $t = (t_0, t_1)$. The reader is cautioned that t is a variable indexing the games and thus can represent different things in different games.

THEORY AND PRACTICE: ALFARABI'S *PLATO* REVISITED

CHRISTOPHER COLMO *Rosary College*

According to Leo Strauss, knowledge of the best way of life is crucial to political philosophy. In "Farabi's Plato," *Strauss asks, assuming that the theoretical life can be known to be the best way of life, what is the status of this knowledge? Is the knowledge of the best way of life itself theoretical knowledge or practical knowledge? Without a coherent answer to this question, we cannot be certain that we know what we mean when we claim to know that philosophy is the best way of life. Strauss answers clearly the question about the status of the knowledge of the best way of life by affirming that it is practical, not theoretical, knowledge. For a variety of reasons, this answer is not persuasive in the form in which Strauss gives it.*

One of the most conspicuous themes of the work of Leo Strauss is the relationship between theory and practice. Whether Strauss regards this relationship as the highest, or one of the highest, themes of philosophy, he certainly sees it as one of the most urgent or necessary (1953, 162–63). In a recent book on Strauss, Heinrich Meier draws attention to the relatively early article "Farabi's *Plato*" (Strauss 1945), in which Strauss directly and specifically addresses this subject (Meier 1988a, 95–96). Despite the title, the article gives a strikingly explicit account not only of the views of Farabi, or Alfarabi, but also of Strauss himself, at least at that time, on what we can know about the dignity of philosophy as a way of life—the theoretical life—and about the practical alternatives to it.

Alfarabi (870–950 C.E.) was an Islamic philosopher with whom Strauss concerned himself for at least 20 years.[1] Strauss was interested in Alfarabi as a predecessor of Maimonides and as a representative of a kind of rationalism distinct from modern rationalism. While Strauss saw modern rationalism as somehow in the service of the conquest of nature and, as such, having an essentially practical aim, Alfarabi, as interpreted by Strauss, presented an alternative rationalism that was essentially theoretical or contemplative. Strauss, like Nietzsche, seems to have diagnosed a crisis of modern rationalism; but where Nietzsche is forced to turn away from reason in search of a cure, Strauss seeks a remedy in a return to an earlier form of rationalism. Meier finds in "Farabi's *Plato*" a significant statement of the philosophical position Strauss continued to elaborate over the following quarter of a century. Since Alfarabi's philosophy is of interest in its own right, we have two reasons for examining Strauss's early essay.

The full title of the short work that I, following Strauss, shall call the *Plato* is *The Philosophy of Plato, Its Parts, the Ranks of Order of Its Parts, from the Beginning to the End.* It is part 2 of the three-part *Philosophy of Plato and Aristotle,* part 1 being *The Attainment of Happiness* and part 3, *The Philosophy of Aristotle.*[2] Strauss focuses his attention on the *Plato* because he believes that Alfarabi has been more candid in that work (where Alfarabi speaks through the mouth of Plato) than in works where he speaks in his own name—for example, *The Attainment of Happiness* (Strauss 1945, 371–75).

I shall consider three topics, with a view to reflecting on the proper relation between knowledge or science on the one hand and human life or practice and its aims, on the other: (1) Does the knowledge of the best way of life belong to what Strauss calls philosophy "in the precise sense" (1945, 365) or does it belong to moral and political philosophy? (2) How do Alfarabi and/or Strauss view the status of Plato's philosopher–king? Is political ability ultimately identical with philosophic ability? Could the two ever be combined in one individual? (3) Can philosophy change the world, as Marx hoped? Or does the philosopher necessarily exist in an imperfect world, now and always, as Strauss's Alfarabi contends? Is philosophy essentially practical or theoretical?

While I try to review several aspects of Strauss's argument, it may be helpful to state the most significant conclusion of the inquiry at this point. For Strauss, much depends on the question, What is the right way of life? The standard by which to judge the best political order depends on the right, or best, way of life. The practical question about the best political order can be answered only by answering the question about the best way of life. The question about the best way of life is also a practical question. It is a deeper—a more fundamental—practical question than the question about the best political order. For Strauss, the right or best way of life turns out to be philosophy "in the precise sense" of theoretical, not practical, inquiry. Philosophy as the right or best way of life is not a value. It is not an arbitrary belief, conviction, preference, or life-style. According to Strauss, philosophy can be known to be the best way of life. In "Farabi's *Plato,*" Strauss does not try to prove that philosophy is the best way of life. Rather, he devotes his attention to the question, Given that philosophy can be known to be the right way of life, what is the status of this knowledge? Is this knowledge itself theoretical knowledge or practical knowledge? Without a coherent answer to this question, we cannot be certain that we know what we mean when we claim to know that philosophy is the best way of

life. This knowledge is crucial for political philosophy as it is understood by both Strauss and Alfarabi. Strauss answers the question clearly by affirming that the knowledge of the best way of life is itself practical, not theoretical, knowledge. I give reasons why this position is not persuasive.

In Strauss's classification of the forms of knowledge, practical knowledge is of lower rank or dignity than theoretical knowledge. It is hard to avoid the conclusion that practical knowledge is of lower cognitive status. Given that Alfarabi treats theoretical knowledge as certain knowledge, one must wonder whether practical knowledge is not less than certain. The consequences are obviously serious if the claim that philosophy is the best way of life is not more certain or true than rival claims on behalf of piety, honor, or pleasure. We are forced at least to raise the question how the classification of the knowledge of the best way of life as merely practical avoids decaying into the view that such "knowledge" is in fact a value judgment, preference, or mere conviction. It may seem ludicrous to suggest that Strauss ascribes to Alfarabi—and himself subscribes to—a position that collapses into a value judgment; but it may be equally ludicrous not to raise this question. Nietzsche would have us believe that all philosophers make such judgments, and Rosen singles out Strauss as being on this point a Nietzschean who regards philosophy as an act of the will (Rosen 1987, 110–11, 122–23, 127, 137). Clearly, Strauss does not intend to make philosophy an act of the will (see my earlier work, Colmo 1990). It is equally clear, however, that Strauss's own position collapses if he cannot give a coherent account of the knowledge by which he knows that philosophy is the best way of life. That account, as Strauss presents it in the totality of his writings, is by no means obvious. This problem is the motive for the critique of Strauss's view I now offer, of which the first section contains the most important results. I subsequently draw out further implications of Strauss's position and, in some cases, point to ways in which alternatives to Strauss's interpretation of Alfarabi suggest alternative answers to the basic philosophic questions at issue.

PHILOSOPHY PROPER AND POLITICAL PHILOSOPHY

Alfarabi makes it plain that the practical or political art (we would call it political philosophy) is concerned with discovering and providing for the "desired way of life" (1969, 60). Let us begin with the question whether the desired way of life, the life that makes man perfect or happy, can be the virtuous way of life (p. 54)? More specifically, can the virtues practiced in mosques and temples (i.e., the virtues inculcated by religion) make human beings perfect and happy (p. 61)?

Strauss argues persuasively that for Alfarabi, religion and the virtues based on religion do not provide the desired way of life (1945, 373). Strauss contends, more openly than Alfarabi, that the moral life (including, of course, the moral life based upon religion) cannot be the desired way of life because the moral life as such does not allow one to ask why one should be moral: "The moral life consists of the submission to the demands of honor and duty without reasoning why" (p. 388). The premise of Strauss's Alfarabi is that the desired way of life must be a reasoned way of life or a way of life of which a reasoned account can be given. The desired way of life cannot be based on mere choice be that choice inspired, mysterious, arbitrary, or irrational. The way of life acceptable to philosophy must be justified by reason. But morality that is rationally justified is no longer morality. Moral actions must be "choiceworthy for their own sake," that is, because they are moral, not because they are rationally dictated (Strauss 1964, 27). The virtuous way of life cannot be the desired way of life because morality as such is inherently unphilosophic. Moral philosophy, if such a thing is possible, cannot be a part of philosophy in the precise sense. Of course, it is important to add that nothing stops Strauss or anyone else from moving outside the assumption made here in order to seek a morality that is rationally grounded.

The moral life by itself cannot be the best way of life because it is unphilosophic. That the best—or, as Alfarabi says, desired—way of life, is the philosophic becomes plain in Alfarabi's discussion of the Socratic way of life. Alfarabi asserts, in terms much harsher than those used by Plato's Socrates, that the unexamined life is not worth living (1969, 63–64). The philosophic life is the only desirable life. But what is the philosophic life? According to Socrates, philosophy includes the study of the moral, political, or practical things. For this reason, even Socrates does not escape Alfarabi's implicit criticism, according to Strauss (1945, 363–65, 382–83). The best way of life is not the one that examines practical matters. Man's perfection is to be found in the knowledge of "the substance of each of the beings," "the beings," or the "natural beings" (Alfarabi 1969, 54, 56, 60, 65). The way of life devoted to the pursuit of such knowledge is what Strauss calls philosophic in the precise sense (1945, 365). Whereas the moral or practical things are the products of human action or choice, philosophy in the strict sense seeks knowledge only of the natural things, which are not products of any human knowing, making, action, or choice. Philosophy in the precise sense is strictly theoretical.

If we go this far with Alfarabi, then we arrive at a pressing difficulty. The "difference between the truly virtuous way of life and all other ways of life is based, not on a difference of purpose, of quality of the will, but on a difference of knowledge" (Strauss 1945, 388–89). Philosophy, as the life of reason, cannot be based upon an arbitrary choice or an act of the will. The philosophic way of life must be *known* to be superior to the moral or political life. The difficulty

arises when we try to classify the kind of knowledge by which we know that philosophy is the right, or desired, way of life. Alfarabi carefully distinguishes between the knowledge of the beings (whatever these may be) and the knowledge of the ways of life (1969, 56; Strauss 1945, 365). A way of life is not a being (Strauss 1945, 389). Strauss does not try to avoid the obvious conclusion that even knowledge of the best way of life is not philosophic or theoretical knowledge; knowledge of the best way of life is supplied by the highest practical art (p. 365).

Strauss's interpretation would eventually have to be brought into harmony with three works in which Alfarabi asserts or implies that "only the theoretical rational faculty can attain real knowledge of what happiness is" (cited in Galston 1990, 69). This amounts to saying, contra Strauss, that knowledge of the best way of life is theoretical knowledge. In general, Galston seems to take the view that Alfarabi blurs the traditional distinction between theoretical and practical knowledge so that the former includes much of the latter.

The assertion that the knowledge of the best way of life is not itself philosophic knowledge (strictly speaking) goes well beyond the assertion, discussed earlier, that the virtuous or moral way of life is not, as such, philosophic. This assertion is clearly based on philosophic knowledge. This knowledge in no way implies, however, that philosophy itself cannot be philosophically known to be the best way of life. Nor, certainly, does it imply that knowledge of philosophy as the best way of life is itself moral "knowledge," rather than philosophic knowledge.

Strauss moves in a different direction. In keeping with the differentiation of theoretical and practical knowledge, he suggests that it would be foolish to assume that philosophy exhausts itself in the investigation of the relation between philosophy and happiness (1945, 363). In other words, it would be foolish to assume that philosophy exhausts itself in the quest for the best way of life or that the philosopher has no leisure for anything other than this quest (1964, 21, 29). Indeed, the quest for the best way of life and the knowledge of that way of life are "strictly speaking merely preliminary" (1945, 366). The study of "the human or political meaning of philosophy" does not belong "to the same level" as philosophy proper (pp. 366, 368). One is even a little surprised to find that in the course of explaining Alfarabi's remarks on the limitations of Plato's Socrates as compared with Plato himself, Strauss says that Socrates was "merely a moral philosopher" who "neglected natural philosophy" (1945, 383; see Alfarabi 1969, 66–67). The moral philosophy that is disparaged here seems to include reflection on philosophy as the best way of life; Socratic reflection surely included this subject.

Since it is not philosophy strictly speaking, what is the status of political philosophy understood as the investigation of the human meaning of philosophy? Strauss cannot deny that practical knowledge in this extended sense is really knowledge. The discovery of the philosophic life as the best way of life cannot be reduced to the level of an arbitrary choice or an act of the will. The superiority of the philosophic life must be known, not willed (1945, 389). This point is central to Strauss's position.[3] Hence, Strauss's final formulation of the problem in "Farabi's *Plato*" seems to be that knowledge of the right way of life can "be described as philosophic since only the philosopher is competent to elaborate that question and to answer it" (p. 366). Such knowledge, however, is of a lower level than theoretical knowledge; even the highest practical knowledge is merely preliminary. Moreover, that the knowledge of the ways of life is not a proper subject of theory (because, to repeat, ways of life are not beings) is itself a theoretical insight (p. 389). To summarize in a way that may be more precise than clear, the knowledge that the theoretical life is the best way of life can be theoretically known to be merely practical knowledge.

Is merely practical knowledge certain knowledge? According to Alfarabi, theoretical knowledge is certain knowledge (Alfarabi 1969, 13; Mahdi 1973, 7–9). Strauss says that Alfarabi identifies philosophy with "the art of demonstration" (1945, 364). But in his *Philosophy of Aristotle*, Alfarabi calls the art of demonstration "the art of certainty" (1969, 87). If the distinguishing feature of theoretical knowledge is its certainty, is practical knowledge somehow uncertain? If it is, then how does philosophy ward off the rival claims of other ways of life? Ways of life that are openly based on faith, belief, or conviction would seem to be, at any rate, more consistent than a philosophic life dedicated to knowledge but itself based on faith or conviction (Strauss 1953, 75). The least one can say is that in "Farabi's *Plato*," Strauss defines a position that entails this serious dilemma without, however, acknowledging it or dealing with it.

It is interesting to compare Strauss's 1945 essay with his later writings. In *The City and Man*, Strauss raises the question whether it is possible to know that the philosophic life is the best life:

> Socrates could not know this if he did not know that the only serious alternative to the philosophic life is the political life and that the political life is subordinate to the philosophic life: political life is life in the cave which is partly closed off by a wall from life in the light of the sun; the city is the only whole within the whole or the only part of the whole whose essence can be wholly known. (1964, 29)

Knowledge of the best way of life comes from understanding the relationship between the philosophic life and political life, or life in the cave. But Strauss does not tell us whether this understanding is theoretical or practical, though the last clause in the passage just quoted seems to invite the conclusion that understanding of politics is a very high, if not the highest, kind of understanding. Does Strauss here mean to suggest the possibility that practical knowledge is more certain than theoretical knowledge? From this perspective, there would seem to be no longer any reason to exclude practical knowledge (as

being the most certain knowledge) from philosophy in the precise sense.

In an essay first published toward the end of his life (1971), "Philosophy as Rigorous Science and Political Philosophy," Strauss returned to the issue of this relationship (1983, chap. 1). The closest equivalent to what Strauss calls moral philosophy in "Farabi's *Plato*" is what he calls *Weltanschauungsphilosophie* (ibid.)—assuming it is not closer to what Farabi calls the religious investigation of the beings (1945, 373, n. 42). *Weltanschauungsphilosophie* conceptualizes religious, aesthetic, ethical, political, and practical–technical experience. Although this kind of philosophy "presents the relatively most perfect solution of the riddles of life and the world," it is nevertheless to be distinguished from philosophy as rigorous science for the same reason that Alfarabi distinguishes between moral philosophy and theoretical philosophy. *Weltanschauungsphilosophie* is the "philosophy" of the cave because in one way or another it presents, as true, things about which we cannot be certain, no matter how much we may want that certainty. If this is so, then the thought from *The City and Man* can be restated by saying that Socrates can know that the philosophic life is the best way of life only because he can know that philosophy as rigorous science is unqualifiedly superior to *Weltanschauungsphilosophie*. Moreover, the superiority of philosophy as rigorous science seems to depend on its more stringent standard of certainty.

Our primary question now becomes whether knowledge of the competing claims of the two kinds of philosophy is itself practical knowledge or theoretical knowledge. This time Strauss gives us a fairly straightforward answer:

> Reflection on the relation of the two kinds of philosophy obviously belongs to the sphere of philosophy as rigorous science. It comes closest to being Husserl's contribution to political philosophy. . . . In order to see the relation between philosophy as rigorous science and the alternative to it clearly, one must look at the political conflict between the two antagonists, i.e., at the essential character of that conflict. (1983, 36–37)

I take it that knowledge of the essential character of the conflict between the two kinds of philosophy includes knowledge of the superiority of philosophy as rigorous science. According to Strauss, it is only through such knowledge that Socrates could know the philosophic life to be the best life. Finally, Strauss makes it clear that such knowledge (knowledge of the best way of life) belongs to the sphere of philosophy as rigorous science. But it is equally clear that in "Farabi's *Plato*" this is not the case. There, reflection on the practical issue of the relation between theoretical philosophy and practical philosophy or reflection on the human meaning of philosophy does not belong to philosophy strictly speaking or to philosophy as rigorous science.

"Farabi's *Plato*" leaves the reader in some uncertainty concerning the status of reflection on the best way of life. Knowledge of the best way of life, the philosopher's self-knowledge (1945, 366), seems to be neither knowledge strictly speaking, nor religion, nor morality. But if it is none of these, what is it? Plato suggests that what lies between knowledge and ignorance is opinion or right opinion. There is considerable doubt as to whether even right opinion—much less, mere opinion—"can nevertheless be described as philosophic" (ibid.). Yet Strauss cannot settle for less if the superiority of the philosophic life is to be known, rather than merely willed. Such difficulties may have moved Strauss to elevate political philosophy—understood as comprehending the question of the best way of life—to the level of philosophy as rigorous science. While this clarifies the epistemological status of political philosophy, it seems paradoxical. How can the knowledge of the best way of life fail to be a kind of practical knowledge? Alfarabi, for one, always identifies the knowledge of the desired way of life as practical knowledge. Strauss insists upon this point and Miriam Galston reinforces it when she argues that for Alfarabi, the practical differs from the theoretical not in subject matter but in purpose, namely, a concern with human happiness (1990, 55, 69). Even if we reclassify knowledge of the best way of life as theoretical knowledge, some problems remain.

In making use of "Farabi's *Plato*," Meier runs the risk (as he is no doubt aware) that Strauss may have partially changed his mind in later years. But the risk may not be as great as we have made it seem. The difference between "Farabi's *Plato*" and "Philosophy as Rigorous Science and Political Philosophy" hides a basic agreement concerning one of the problems Strauss must surely have had in mind when he spoke of "the fundamental and permanent problems" (1959, 39). What is consistent in the two essays is the supremacy of theoretical knowledge over self-knowledge or practical knowledge.[4] The knowledge of the best way of life is either practical and therefore the lowest level of philosophy (as in the former essay) or given full theoretical status (as in the latter essay).[5] Strauss never adopts the view that philosophy proper consists of theoretical and practical philosophy on an equal level (1945, 366). He never suggests that if knowledge of the best way of life is to be ranked higher among levels of knowledge then this should be accomplished by elevating the rank of practical knowledge, rather than by removing the knowledge of the best way of life from the level of the practical altogether. The two essays share a fundamental assumption or tendency.

THE PHILOSOPHER–KING

Strauss's interpretation is based on the distinction that Alfarabi obviously makes between the science of the beings and the science of the ways of life (Alfarabi 1969, esp. 56). But Alfarabi makes another statement that is difficult to reconcile with the implications of this distinction. Alfarabi explicitly identifies philosophy with the royal art. Indeed, he follows Plato in making human happiness dependent on the exist-

ence of a philosopher–king. The passage in question is worth quoting in full as Strauss translates it:

> [According to Plato,] the *homo philosophus* and the *homo rex* are the same thing. (1) [According to Plato,] each of the two (*sc.* the philosopher and the king) is rendered perfect by one function and one faculty. (2) [According to Plato,] each of the two (*sc.* the philosopher and the king) has one function which supplies the science desired from the outset and the way of life desired from the outset; (3) each of the two (*sc.* functions) produces in those who take possession of it, and in all other human beings, that happiness which is truly happiness. (Strauss 1945, 367)

For Strauss, none of the statements in the passage he quotes strictly identifies philosophy with kingship or the royal art. The statements do no more than assert that philosophy and the royal art exist together in the same man; the two things are not identical.[6] Because the third statement goes so far, however, as to assert that philosophy produces the happiness of all human beings, it does "practically" identify philosophy with the royal art (p. 367). But Strauss regards this "extravagantly philanthropic remark," when taken literally, to be a "sheer absurdity" (p. 378). According to Strauss, such an extravagant remark on Alfarabi's part has three purposes.

First, if philosophy is the best way of life or the only true happiness, most human beings would be excluded from happiness (Strauss 1945, 381). The identification of philosophy with kingship helps to avoid or hide this conclusion, since the philosopher–king makes possible the happiness of "all," or of the nonphilosophic many.

Second, the royal art is the practical art that provides the desired, or right, way of life (Alfarabi 1969, 60). From this point of view, the identification of philosophy with kingship is a "pedagogic device" leading the reader toward the view that philosophy supplies not only the science of the beings but also the right way of life (1945, 370). Philosophy is self-sufficient. If philosophy is itself the royal or political art, then it is in no way dependent upon politics for guidance toward the desired way of life.

Alfarabi's third point, as Strauss sees it, derives from the fact that the philosopher necessarily lives in political society and that his relations with his nonphilosophic fellow citizens are "naturally difficult" (1945, 382). The philosopher needs a kind of political art in order to deal with these difficulties. Another way to say this is that philosophy, or wisdom, on the one hand and self-knowledge, or moderation (*sophrosyne*), on the other "cannot be separated from each other" (p. 366). The recognition that philosophy and the royal art cannot be separated does not require, however, that we take the identification of philosophy with kingship literally.

Alfarabi, Strauss says, "leaves no doubt . . . that philosophy and the royal art are coextensive" (1945, 368). Philosophy and the royal or political art necessarily exist together in the same human being: "A human being cannot acquire the specific art of the philosopher without at the same time acquiring the specific art of the king and *vice versa*" (p. 367). Strauss thinks that this view is an acceptable *alternative* to the view that philosophy and kingship are identical.

Strauss provides the following gloss on statements 2 and 3 of the quoted passage in which Alfarabi describes the relationship between philosophy and the royal art:

> The function of the philosopher supplies by itself both the science of the beings and the right way of life and thus produces true happiness in both the philosophers and all other human beings; the function of the king supplies by itself both the science of the beings and the right way of life and thus produces true happiness in both the kings and all other human beings. (1945, 367)

This restatement of Alfarabi's text brings out the fact that the text is quite compatible with the view that the function of the philosopher and the function of the king are two separate functions. Since there are two distinguishable functions, Strauss is able to preserve "the difference of level between philosophy proper and moral or political investigations" (p. 368). The reference to "all human beings" falls under the heading of philanthropic extravagance explained above.

Strauss's restatement, however, does not bring out the fact that the function of the philosopher is "one function"—or "a single skill," as Mahdi translates it (Alfarabi 1969, 60)—just as the royal function is "one function." Even allowing for some kind of distinction between the philosopher and the king, it is still the case that *one* function or a *single* skill supplies both the desired science (the science of the beings, according to Strauss) and the desired way of life.[7] We would have to admit that the one function or the single skill somehow combines theory and practice. Since Strauss sees theory as being on a different level from practice, the notion that one function or a single skill supplies the desired theory and the desired practice requires clarification.

Strauss offers the following explanation. Philosophy, while primarily and essentially directed toward the science of the beings, "cannot be exercised fully without producing the right way of life"; kingship cannot be exercised fully without producing the science of the beings, but it remains "primarily and essentially concerned with the right way of life" (1945, 368). In the best case, philosophy and kingship cannot be separated; but they are not identical.

It is certainly not unfair to ask why, if philosophy is essentially concerned with one thing and kingship is essentially concerned with another thing, Alfarabi emphasizes that the single function–philosophy–is concerned with two things (one theoretical and one practical) and the single function–kingship–is likewise concerned with two things? To speak only of philosophy, it can supply both the desired knowledge and the desired way of life only if it supplies both theory and practice. Strauss himself draws the necessary conclusion from his own premises: "The identification of philosophy as the highest theoretical art with the royal art as the highest practical art can be

literally valid . . . if contemplation itself is the highest form of action" (1945, 386).

Strauss does not indicate whether the single function or art that supplies both the desired science and the desired way of life also supplies the knowledge of the desired way of life: With this question, I return to the first topic of the essay. Alfarabi's (1969) ambiguous expression *desired science* or *desired knowledge* certainly seems to suggest the possibility that the desired science might include not only the science of the beings, mentioned by Strauss in his gloss to the text but also "the science of the ways of life," which Strauss mentions elsewhere (1945, 365). The knowledge of the right way of life would certainly seem to be some part of the desired science. The least one could say is that while Strauss emphasizes the difference of level between the theoretical and the practical, Alfarabi emphasizes the unity of the function or skill that supplies both theory and practice.

For Strauss, a unity of theory and practice can occur only on the plane of the theoretical: theory or contemplation itself is the highest form of action. There is a place where Alfarabi, in a somewhat different way, considers the possibility of a man who combines theoretical science and practical science; but he does not there say whether the combination itself ought to be regarded as theoretical or practical (1969, 66). On the latter point, there is only one explicit statement in the *Plato*: Alfarabi treats the practical arts as the arts that combine knowledge and action (p. 58). He is silent about the possibility of a combination of knowledge and action on the level of the theoretical. Indeed, shortly before the passages suggestive of a philosopher–king, Alfarabi lists three possibilities: a scientific art that supplies the desired knowledge, a practical art that supplies that knowledge, or a practical art that supplies the desired way of life (p. 59). While Alfarabi at least entertains the possibility of a practical art that supplies the desired knowledge, he does not entertain the possibility of a scientific or theoretical art that supplies the desired way of life.[8]

Statements by Alfarabi relevant to the subject of the philosopher–king do more than open the question whether theory is not itself the highest form of practice. As we have seen, under Strauss's scrutiny, Alfarabi's statements also raise the question whether philosophy is coextensive with practice in the sense of political kingship. Could both functions exist in the same human being? Would the excellence of the philosopher complement that of the king and vice versa? Or would the attempt to perform both functions diminish the performance of each in itself? In the latter case, is division of labor—one person, one function—superior to any attempt at the coexistence of the two functions in one human being? Or does the perfection of any one function fall short of being the perfection of the whole person?

As Strauss explains (and as we have seen), Alfarabi "leaves no doubt" that in the best case philosophy and kingship coexist in the same human being. This does not mean that the best philosopher must rule a specific city or nation but, rather, that the best human being combines the two capacities. Strauss goes so far as to suggest that the philosopher and the king have the same nature (1945, 368, n. 28).

Here, again, it is instructive to compare "Farabi's *Plato*" with a later statement by Strauss. In "Xenophon's *Anabasis*," Strauss makes the following observation:

> Xenophon stands somewhere in between the older Cyrus [a manly or political man] and Socrates. By this position he presents to us not a lack of decisiveness but the problem of justice: justice requires both the virtue of a man . . . and the virtue of Socrates; the virtue of the [manly or political] man points to Socratic virtue and Socratic virtue requires as its foundation the virtue of the man; both kinds of virtue cannot coexist in their plenitude in one and the same human being. (1983, 128)

In "Farabi's *Plato*," Strauss presents the coexistence of political and philosophic excellence in one human being as an alternative to the identification of those two excellences. One cannot acquire the one "without at the same time" acquiring the other (1945, 367). In his essay on Xenophon, he presents the two virtues as incompatible "in their plenitude." These two statements contradict each other. What remains constant between the two essays is the superiority of the virtue of Socrates, the theoretical human being, to the virtue of Cyrus, the political being. Indeed, the gulf between the two has widened from the first essay to the second; theory remains supreme.

Galston presents evidence that Alfarabi shared the view espoused by Strauss in his article on Xenophon (1990, 84). The activities presupposed by practical perfection could be understood "to be incompatible with, and possibly to undermine, the activity comprising theoretical perfection." This problem arises because of passages in Alfarabi in which theoretical perfection requires the complete transcendence of the body. On balance, Galston (1990, 53–94, esp. 56 and 91, n. 69) rejects this view in favor of what she calls the comprehensive understanding of happiness, wherein theoretical and practical activity are both part of the essential nature of happiness.

My own view is that practical activity is somehow fundamental—though by this I do not mean to imply that public service for the benefit of others is necessarily fundamental (see Galston 1990, 87). Nor do I at all mean that one must actually win an election and hold public office in order to actualize one's full potential as a human being. Rather, the effectual truth (to borrow a phrase from Machiavelli) of the notion that theoretical perfection requires the transcendence of the body is that one must write (Walzer 1985, 261). Writing is a practical activity in that it both aims at the author's own happiness and is a creative activity. I can think of no compelling reason why legislative activity (writing the laws of a people) or, at any rate, preparing the ground for such legislative activity should not be included in the kind of writing that is essential to the philosopher's practical activity. Nor do I see this practical activity as ultimately incompatible with theoretical perfection. On the con-

trary, if we know only what we make, then some kind of creative activity is essential to theoretical activity.

I am aware that for many scholars, the notion that we know only what we make is a distinctively modern notion, certainly not one to be found in Plato or Alfarabi. For reasons that go well beyond the scope of this paper, I reject this view. Plato and Alfarabi (in contrast to Socrates, who wrote nothing) show by their deeds the importance of creativity to the highest human life. It is not necessary to separate knowing from making, theory from practice, in order to discover the difference between ancients and moderns. The distinction between ancients and moderns would be sufficiently established if it could be shown that only for the moderns does the knowability of what we make lead to the possibility of wisdom. Nowhere do Plato or Alfarabi reach the conclusion that through knowing (so far as we are able) the things that we have made, we may thereby hope to know everything, because we have in principle made everything. On the contrary, the admission that we know *only* what we have made is a recognition of human finitude. There is no necessity to follow Strauss in separating theory from practice, knowing from making, in order to avoid the hubris of trying to turn philosophy into wisdom (see Colmo 1990, 158).

THE JUST CITY

According to Strauss, Alfarabi clearly distinguishes between theory and practice, with theory ranking higher. The goal of the best way of life is essentially theoretical, not practical. Yet Strauss also insists that philosophy cannot be separated from self-knowledge or from moderation. Self-knowledge includes the realization of the need for the truth about the whole, as well as "of the difficulties obstructing its discovery and its communication" (1945, 366). Self-knowledge is essentially practical or political knowledge. Strauss seems to separate the theoretical and the practical while at the same time tying them together.

The contradiction in Strauss's position (at least within the Alfarabi essay) is merely superficial. With the problem of communication, which Strauss raises in this context, we are clearly in the realm of politics—not in the esoteric sense of the practical knowledge that leads to philosophy but in the ordinary sense of one's political relations with one's fellow human beings. The philosopher's self-knowledge is essentially practical or political knowledge in a sense that includes knowing how to get along with one's fellow citizens. The philosopher knows that his knowledge as a philosopher is strictly theoretical; for it is knowledge about the things that are independent of human choice or action, not about the objects of choice and action that concern the vast majority of the philosopher's fellow citizens. The philosopher is not an expert of the sort that knows how to get things done. Only the fellow citizen who is a potential philosopher might benefit from the philosopher's practical knowledge that philosophy is the best way of life. But this very knowledge might be harmful to most citizens, since it "is tantamount to closing the very prospect of happiness to the large majority of men" (1945, 378). Most human beings cannot be philosophers and are, hence, barred from the best way of life. But the philosopher must not communicate this knowledge, lest he drive his fellow citizens to anger or despair. For this reason, the philosopher's self-knowledge, in so far as it governs his relations with other citizens, is primarily a knowledge of the need for moderation.

Strauss does not go so far as to advocate, in the name of moderation, a philosophic withdrawal from political life, although he does mention this alternative (1945, 362). What he suggests is the abandonment of what he calls Socrates' "revolutionary" quest for the just city. It is not necessary for the philosopher openly to challenge the city, as Socrates did, thereby incurring, as Strauss puts it, "persecution and violent death" (p. 383), a phrase that seems to owe more to Hobbes than to Alfarabi. Alfarabi's Plato offers an alternative to the revolutionary way of Socrates:

> Plato substituted for [the revolutionary quest] a much more "conservative" way of action, *viz.*, the gradual replacement of the accepted opinions by the truth or an approximation to the truth. The replacement, however gradual, of the accepted opinions is of course a destruction of the accepted opinions. But being emphatically gradual, it is best described as an undermining of the accepted opinions. (ibid.)

In keeping with this "conservative" line of action, the philosopher–king who rules openly is replaced by the "secret kingship of the philosopher who lives privately as a member of an imperfect community" (p. 384). Although the philosopher lives privately, this does not necessarily mean that he altogether withdraws from politics. He will not openly confront the city, but he still may exercise a kind of "secret kingship"—through his writings, for example.

Strauss and Alfarabi are in full agreement that any political influence exercised by this private or secret rule will be "emphatically gradual," but it is still necessary to ask what the goal is of this gradual philosophic political action. Strauss answers,

> The goal of the gradual destruction of the accepted opinions is the truth, as far as the elite, the potential philosophers, is concerned, but only an approximation to the truth (or an imaginative representation of the truth) as far as the general run of men is concerned (1945, 384).

The aim of the philosopher's gradual political action with respect to the potential philosophers is to undermine—and ultimately to destroy—their belief in the accepted opinions of their community. But why does Strauss call this way of acting "conservative"? The fact that it is gradual and secretive merely makes it conspiratorial, not conservative. It is conservative, however, with respect to the accepted opinions of the vast majority of citizens. These opinions can be at best only approximations to the truth. This might

suggest that the activity of liberating the philosophers is merely a more extreme version of the activity of approximating the truth for the majority of people. The two activities might seem to go hand in hand; but in fact, they are opposed to one another. No matter how close the accepted opinions might be brought to the truth, these opinions are false. For example, the political truth is that one should act morally because moral action is good for its own sake—or so says Strauss, though Galston reports that "the doctrine that actions must be chosen for their own sake to qualify as moral does not appear in Alfarabi's writings" even where one would expect it for moral and political reasons (1990, 172).[9] For the philosopher, however, morality is, in Strauss's words, "merely a means toward" the true happiness of the philosophic life (1945, 387). The potential philosopher must somehow be taught the philosophic truth about morality in such a way that teaching does not corrupt the nonphilosophic many. A parallel situation exists with respect to religion: "Conformity with the opinions of the religious community in which one is brought up is a necessary qualification for the future philosopher" (p. 383)—even though an equally necessary qualification is that these opinions not retain their grip on the mind. Certainly, no philosopher would expose the religious errors of his community in an irresponsible attempt to create a secular society in which error does not exist. Every philosopher recognizes the need for moral and religious belief in a healthy political community. He also recognizes that these beliefs can never be converted into rational knowledge. The philosopher, as secret king, will do his best publicly to promote the accepted opinions with respect to morality and religion while esoterically working through his books to destroy the hold of those opinions over the minds of potential philosophers. This is the goal of the gradual, secret political activity of the philosopher as understood by Strauss.

The political activity of the philosophers aims at the benefit of potential philosophers, but what of the philosopher's duty to the community as a whole? Certainly, the philosopher tries to avoid hurting the nonphilosophers through any action that would undermine the moral and political opinions of the community; but does the philosopher have a desire or an obligation to benefit the community as a whole in a positive way? Reforming the tax structure or improving the school system certainly are not the duty of the philosopher as philosopher; nor are they goals that are amenable to the secret, gradual activity of the philosopher. Strauss is altogether silent about this kind of political reform. Gradual improvement of the tax structure or of the school system are certainly possible; but they are not the business of the philosopher, and it is not likely that they could be brought about through esoteric writing (unless we are to interpret the Platonic dialogues as a massive contribution to school reform). Such reforms require just the kind of open, public participation in political affairs that Strauss's philosopher eschews. Gradual reform of the moral and religious beliefs of his community might be more in the philosopher's line of work, but this could only be done for the ultimate benefit of the potential philosopher. Altering the religious beliefs held by the vast majority of citizens can only mean the exchange of one darkness for another, for these beliefs can never be converted into rational knowledge.

In the light of this philosophic conservatism with respect to political action, how are we to understand Plato's claim that the just city comes into being through the rule of the philosopher (*Republic* 473d–e)? Alfarabi tells us that the rule of the philosopher is not possible in imperfect cities (1969, 62), and Strauss adds that imperfect cities constitute "the world as it actually is and as it always will be" (1945, 381). In other words, "there are examples of men of the highest excellence whereas there are no examples of cities of the highest excellence" (1964, 49). Hence, the philosopher must learn to live in the nonphilosophic city, a place in which he is always "in grave danger" (Alfarabi 1969, 67; Strauss 1945, 382). Part of the philosopher's self-knowledge involves learning to cope with this danger. He must learn to "adjust himself to the requirements of political life, or to the ways and opinions of the vulgar" (1945, 383). To some extent, then, the philosopher must, after all, assimilate himself to the ways of the vulgar (see p. 362). The philosopher's self-knowledge is moderation. Precisely because the theoretical way of life can never be translated directly into moral or political practice, it is necessary that theory not be separated from practical wisdom (though Strauss does not say whether philosophy and moderation can "coexist in their plenitude"). Strauss's moderate conclusion is that there can be no revolution leading to the just city.

I shall try to summarize Strauss's interpretation of Alfarabi on the subject of the political activity of the philosopher. The philosopher will not confront the nonphilosophic community in which he lives. Indeed, because he is a philosopher, he is in danger from the moral and believing community. He may consider himself lucky just to be left alone. Moreover, his greatest pleasure and happiness is not political activity of any kind but, rather, theoretical contemplation. For these reasons, the complete withdrawal from political life must be tempting. If he does not succumb to this temptation, it can only be because of his interest in and care for those in the community who are potential philosophers (but see Galston 1990, 87). His attempt to communicate with these future philosophers poses a grave threat to the moral and religious beliefs of the community. Hence, the philosopher must undertake to communicate the most daring or radical thoughts in a way that minimizes their political impact.[10] In this respect, the political action of the philosopher can correctly be described as conservative.

It is probably not possible in this case to repeat my approach of contrasting these sentiments with anything Strauss said later. He did not change his views.

It is, however, instructive to compare Strauss's statement with the last page of Alfarabi's *Plato*, upon which he bases it. Alfarabi says that Plato

> mentioned the Athenians (his own people) and their ways of life. He described how to abolish their laws and how to turn them away from them. He described his view regarding the way in which they could be moved gradually, and he described the opinions and the laws toward which they should be moved after the abolition of their ways of life and laws. (1969, 67)

Nothing could be more striking than the contrast between Strauss's "conservative" way of action (which is not to be confused with a conservative way of thinking) and the revolutionary tone of Alfarabi's closing paragraph.[11] Strauss and Alfarabi agree that change must be gradual, but Alfarabi mentions as the ultimate goal much more sweeping changes than anything even hinted at by Strauss. Indeed, Strauss does what he can to soften Alfarabi's language. For example, while Alfarabi refers, in the full passage, three times to the destruction or abolition of the generally accepted ways of life and corrupt laws, Strauss says that this destruction is "best described as an undermining" (1945, 383). The best description, it would seem, was not Alfarabi's. Strauss's wording made it less shocking. Instead, Alfarabi goes out of his way, as it were, to alarm the reader with the thought that at least one philosopher, Plato, sought to abolish the way of life of his own people. Moreover, Plato sought to act as a legislator, replacing the old laws with new laws.

Strauss's esoteric reading of the passage just quoted tends to make it more conservative, more moderate, than it appears to be on the surface. By Strauss's own account of esoteric writing, however, one would expect the surface of a statement to be more moderate than the hidden truth. At least one detail of the passage suggests that Alfarabi's true intention is more radical than what he says on the surface. We notice that Alfarabi explains that the Athenians are Plato's own people. Is it possible to conceive of a student of the *Plato* who did not know this? And if this knowledge is helpful, why withhold it until the end of the book? Strauss is surely right in thinking that the *Plato* is an esoteric work; it teaches by implication and insinuation. Under the circumstances, the notion that a philosopher might attempt to destroy or abolish the way of life and the laws of his own city or nation can only be taken as a subtle (but not too subtle) challenge by Alfarabi to his own people and to the Islamic law, the *shari'a* (1945, 372, n. 40). Naturally, in relation to Plato, Alfarabi speaks of changing the Athenian *nomoi* (laws); but he also uses the comprehensive expression "ways of life," which in the case of his own people would surely extend to the *shari'a*.[12] I do not think that Strauss's overall interpretation of the *Plato* allows him to notice the possibility that Alfarabi may here be making an amazingly bold declaration of his own political purpose (see Mahdi 1973, 25, n. 10). Strauss certainly does not mention this point.

As we have seen, Strauss does notice and make use of a statement in the *Attainment of Happiness* in which Alfarabi counsels that "conformity with the opinions of the religious community . . . is a necessary qualification for the future philosopher" (Strauss 1945, 383–84 and 373, n. 41). The philosopher accepts the world as he finds it; and this, certainly, is in some sense true. Strauss supports his "conservative" interpretation of Alfarabi by citing a reference in the *Attainment of Happiness* to outward conformity in matters of religion. Strauss interprets the last page of the *Plato* in the light of a statement made in the *Attainment of Happiness* and uses that statement to make the conclusion of the *Plato* seem more moderate or conventional than it might otherwise seem. This is surprising, to say the least, given the "canon of interpretation" that Strauss wishes the reader "scrupulously to follow": "Apart from purely philologic and other preliminary considerations, one is not entitled to interpret the *Plato*, or any part or passage of it, by having recourse to Farabi's other writings. One is not entitled to interpret the *Plato* in the light of doctrines, expounded by Farabi elsewhere, which are not mentioned in the *Plato*" (p. 375). Strauss explicitly mentions that one must favor the *Plato* in any place where its teaching conflicts with the *Attainment of Happiness*. Moreover, it is clear that Strauss particularly has in mind the priority of the *Plato* on religious matters. He is aware of the "deep silence" of the *Plato* with respect to the other life, the immortality of the soul, the soul itself, and even the Platonic ideas and the *nous* (intellect) by which the ideas are known (pp. 364, 371–72).[13] He is aware—and he has made us aware—that by this silence Alfarabi rejects these ideas or beliefs. But the *Plato* observes a deep silence (or, at any rate, a direct or explicit silence) on the issue of religious conformity. It is hard to avoid the conclusion that by introducing the idea of the necessity of religious conformity into his interpretation of the *Plato*, Strauss does not pursue the implications of his own canon of interpretation.[14]

What are those implications? How will we understand the last page of the *Plato* if we do not read it in the light of pious statements that Alfarabi makes elsewhere? Certainly, the *Plato* does not deny that the philosopher must be circumspect; he is, after all, in grave danger. Indeed, Alfarabi makes it clear that the art of Thrasymachus (i.e., the art of the sophist) may be most useful to the philosopher in speaking to the multitude (1969, 66; Strauss 1945, 383). Alfarabi translates the title of the Platonic dialogue *Sophist* as "falsifier." One of the most necessary aspects of such falsification in Alfarabi's circumstances must surely have been outward conformity in matters of religion.[15]

Even so, it is clear that the *Plato* is much more reticent than the *Attainment of Happiness* in stating the need for conformity in religious matters. I do not believe that this difference of emphasis can be understood on the basis of Strauss's interpretation of the *Plato*. Strauss is primarily concerned, in "Farabi's *Plato*," with the fact that most people "are eternally

barred, by the nature of things," from philosophy (1945, 381). Hence, if philosophy is to be possible at all, then it must be possible in imperfect, nonphilosophic cities. According to Strauss, Alfarabi's "last word" on this subject is that philosophy and the perfection of philosophy do not require the establishment of the perfect political community (ibid.). Consequently, Strauss turns the focus of his attention away from the question of how to improve political life and toward the question of how the philosopher can survive and continue to philosophize in imperfect cities taken as they are. In trying to deal with this problem, Strauss pursues his inclination or tendency to separate the philosophic, or theoretical, from the practical, or political. Indeed, separation becomes opposition as philosophic radicalism is juxtaposed with political conservatism. Turning to Alfarabi, we see that he also recognizes the severe limits of political change (see, e.g., p. 384, n. 69). He recognizes that the philosopher will never be glorified or exalted by the citizens (i.e., will never rule openly or officially) and that all change must be gradual (1969, 67). Strauss's interpretation notwithstanding, however, the *Plato* emphasizes the political change that is possible.[16] Outward conformity is not always necessary, at least not to the same degree or to the same kinds of laws. If anything, the *Plato* makes clear that Alfarabi may have overestimated, in a particular case, his ability to abolish the ways of life and the laws of "his own people."

Strauss suggests that when Alfarabi talks about the legislator who will bring into being the just city of the philosopher, Alfarabi means, by *legislator* a prophet, "the founder of a revealed religion" (Strauss 1945, 380; see Alfarabi 1969, 66). On this interpretation, the just city would not be possible except on the basis of revelation. Strauss leaves no doubt that since the just city is possible only on this basis, it is not possible as an actual city, or the just city is possible only "in speech" (1945, 379).

My own suggestion is that Alfarabi himself is an example of the kind of legislator he has in mind as the founder of what he always calls "the other city"—that is, other than the cities existing in his time but certainly not otherworldly.[17] If this makes Alfarabi a prophet—a subject nowhere explicitly mentioned in the *Plato* (but see Alfarabi 1969, 61)—then so be it. Alfarabi's "prophecy," or legislation, is clearly not based on divine revelation. The only plausible source of Alfarabi's legislative authority is his philosophic insight. Alfarabi's efforts to be the founder of "the other city" presuppose less opposition and more cooperation between the theoretical life and the practical, political life than Strauss seems to grant.

Notes

1. Published works dealing with Alfarabi span the period from Strauss 1935 to Strauss 1957.

2. I have used the English translation of all three works by Mahdi (1969). Unless otherwise indicated, all parenthetical citations in the text are to pages of Mahdi's translation of Alfarabi *with the exception* of references between 357 and 393, which refer to pages in Strauss 1945.

3. See, e.g., Strauss 1965, 29–30. I have no explanation for Strauss's statement, in the last paragraph of "Farabi's *Plato*," that philosophy is animated by a "conviction" about the life worth living—a word that seems to imply belief and will, rather than knowledge.

4. Meier correctly represents Strauss's theoretical emphasis when he quotes Strauss's reference to "the necessarily anonymous truth" (Meier 1988b, 765; cf. Strauss 1945, 377). On Farabi's view of the "anonymous truth," contrast the relatively lengthy account of Protagoras' view (i.e., that the knowledge natural to man is not anonymous but relative to each individual) with the brief and obscure account of Plato's rejection of Protagoras' view (Alfarabi 1969, 54). This is one of only two places in the *Plato* (not counting the title) where Plato is mentioned by name. In the place where the anonymity of thinking is the issue, Alfarabi does not allow the philosopher to remain anonymous.

I am reminded that the Socratic ideas make the human good anonymous. It is indeed strange that Socrates and Descartes should share in their thinking the common feature that what is truly intelligible (the ideas in one case, body as extension in the other) is not alive. It is not surprising that a rift between the intelligible and the good has become a problem (*the* problem?) in Western thought. The nature Strauss points out a similar or related "defect" in the nature Socrates (1966, 59). In my view, one would expect Strauss to share this "defect" and hence not to notice it in Socrates. Obviously, my net does not catch all the fish in Strauss's waters.

5. These two alternatives are, in a way, present within "Farabi's *Plato*." Early in that essay, realization of the need to adjust to the requirements of political life belongs to "self-knowledge" (Strauss 1945, 366), while, later, that realization seems to derive from "insight into the nature of beings" (p. 383). The latter view seems very close to the position Strauss takes in "Philosophy as Rigorous Science and Political Philosophy."

6. While she does not offer an interpretation of the passage just quoted, Galston cites with approval the passage in which Strauss says that philosophy and kingship are not the same art. But this observation is appended to a paragraph stating that "Alfarabi appears to maintain the more extreme thesis that [practical rational excellence and moral virtue] are constitutive parts of philosophy itself" (1990, 64).

7. Alfarabi's *Enumeration of the Sciences* confirms the thought that the highest royal craft is supplied by one faculty, not two. See Mahdi 1975, 131–37.

8. Alfarabi says that the practical arts are not adequate for obtaining the desired knowledge or the desired way of life (1969, 59). But the desired way of life is by definition the product of a practical art (p. 60). The first statement makes sense only if it is limited to the generally accepted practical arts or to the practical arts practiced by the multitude (p. 59).

9. See n. 13.

10. Strauss's own publications from the last decade of his life might be thought to exemplify this kind of writing.

11. The contrast between the end of the *Plato* and Maimonides' *Guide of the Perplexed* 2.11 is also striking. Maimonides presents himself as building "a great wall" around the Law to protect it, a project that certainly sounds conservative. Strauss tells us that he studies Alfarabi in order to have the necessary background for understanding Maimonides (1945, 357, 393). Is it not possible, however, that Strauss's understanding of Alfarabi is colored by reading Alfarabi under the influence of a knowledge of Maimonides' intention to protect and preserve the Jewish law? Does Maimonides in fact become the background for Strauss's interpretation of Alfarabi? However that may be, the contrast I am suggesting between Alfarabi and Maimonides need not be explained in terms of basic philosophic differences. It is one thing to attack the *shari'a* at a time of Muslim power; it would have been quite another thing to attack the halakha during the Diaspora. On Alfarabi and Maimonides, see Berman 1974, esp. 163.

12. On the distinction between *nomoi* and *shari'a*, see Maimonides' *Guide to the Perplexed* 2.40. Galston comments that there is no reason "to assume that Alfarabi must have viewed the conventions of his time as disparagingly as Socrates regarded the way of life of the Athenians," but she offers no Alfarabian text as support for this claim or for her own view that "many features of Islam were a vast improvement over Greek morality and opinions" (1990, 173).

13. As Strauss points out, Alfarabi is silent about immortality while mentioning the *Phaedo*, in which immortality is, of course, a major theme. Strauss concludes, rightly I think, that this silence amounts to a rejection of the doctrine of immortality. According to Alfarabi's summary, the *Phaedo* seems to be a book about whether a man should be willing to die for the sake of the practice of the true moral virtues, this alone being sufficient reason to sacrifice one's life if need be (1969, 63). I take it that there is a connection between Alfarabi's rejection of immortality and his refusal to give a clear affirmative answer to the moral question he raises here. Alfarabi and Kant seem to agree that if morality is to be treated as an end in itself and if human beings are to be expected to make sacrifices commensurate with such an end, then it is necessary to assume that the soul is immortal. Alfarabi does not agree, however, in making this last assumption.

14. One could avoid this conclusion if one assumed that Strauss is here writing esoterically. Given that Strauss is an esoteric writer, does that fact dispose of the present case? In this instance, we could avoid what seem to be contradictions in Strauss's argument by ignoring his "conservative" remarks about political action, just as we are inclined to ignore Alfarabi's admonitions to religious conformity or, at any rate, to minimize their significance. But the weight of the evidence is against this view of Strauss's intention in the case in point. For one thing, it is possible to discover in Alfarabi a political alternative to the acceptance of the imperfect communities existing in his time. Strauss's "conservative" remarks, however, seem to be his "last word" on the subject. I have placed the word *conservative* in quotation marks as a reminder that it applies only to Strauss's attitude toward political action; there is nothing conservative about Strauss's thinking.

15. This certainly does not mean that one compartmentalizes one's thinking so that one is a believer on holy days and a philosopher on other days (Strauss 1945, 374). See Alfarabi's criticism of the sophist Hippias, whom Alfarabi speaks of as if he were in fact two men (1969, 59). This passage helps us to understand how Alfarabi would distinguish between the philosopher and the sophist. The sophist is somehow a man in contradiction with himself. But then, we may ask, does anyone ever fully escape contradiction?

16. Muhsin Mahdi sees the realization of the political good as being Alfarabi's "central concern." Concerning the view that philosophers "should tend only their private gardens," Mahdi writes: "Perhaps there are times and places which necessitate these views. But one need not make a virtue out of necessity" (1981, 19–21).

17. According to Alfarabi, the title of the book dealing with the legislator (the *Epinomis*) means "investigator." In the *Plato*, the one who is repeatedly said to investigate is Plato himself. Alfarabi is, of course, also such an investigating legislator.

FREEDOM, COMMUNITY AND FUNCTION: COMMUNITARIAN LESSONS OF MEDIEVAL POLITICAL THEORY

CARY J. NEDERMAN *University of Arizona*

The communitarian critique of liberal individualism is presently experiencing something of a decline. One of the reasons for the failure of communitarians to make a lasting impact on liberal theory may be the historical precedents to which communitarians have turned, such as Aristotle and civic republicanism. I argue that communitarian theory may more fruitfully draw upon a model of the relation between individual and community derived from the Latin Middle Ages. This approach—communal functionalism—claims that the community is essentially composed neither of individuals nor of citizens but, rather, of functional groups or parts arranged according to their contribution to the community. I consider two variants of this framework, John of Salisbury's "physiological" version and Marsiglio of Padua's "civic" account. I close with an evaluation of the relevance—and also some of the limitations—of the communal functionalist model in relation to the requirements of contemporary communitarian theory.

One of the most striking features of the debate between communitarians and liberal individualists that has dominated Anglo-American political theory during the last decade or more is the extent to which it has been conducted through the medium of the history of Western political thought. In particular, the communitarians, arguing for what has been called "the politics of the common good" (Sandel 1984; Taylor 1986), have often turned to traditional models of civic-based virtue.[1] Some have followed Aristotle's defense of a community which is composed of citizens who are competent both to rule and be ruled and in the public realm of which all are accorded an appropriate share of burdens and rewards (Beiner 1983; MacIntyre 1985; Nussbaum 1990). Others have looked to civic republicanism (as espoused by, e.g., Machiavelli, Rousseau, and Hegel) for its devotion to political participation as the expression of a uniquely civic mode of virtue (MacIntyre 1985, 236–38; Oldfield 1990a, 181–85; Taylor 1989, 165–72).

In all too many cases, however, such attempts to formulate communitarian principles along lines derived from earlier political theories have been faulty. Serious questions have been posed about the historical accuracy and philosophical fidelity of communitarian interpretations of Aristotle and the "civic republicans" (Mulgan 1990; Newell 1987; Oldfield 1990b; Yack 1985). Certain communitarian thinkers have merited the accusation of "romanticism" on the grounds that the earlier social practices and doctrines which they laud as built upon a substantive notion of the common good actually reflected a failure to appreciate alternative conceptions of that good and consequently mirrored the hegemony of one set of racial, gender, or class interests (Gutmann 1985, 318–29; Holmes 1989, 239–40; Kymlicka 1990, 225–27).

Behind the complaints raised by liberal critics with regard to the communitarian appropriation of the past appears to be the assumption that classical Greek and republican notions of the common good were so thickly defined as to exclude a realm of individual, independent judgment about social (or personal) goods or virtues from emerging. While this seems to me to be essentially true (neither Aristotelian nor republican conceptions of the good permitting much room for a diversity of viewpoints about basic ends or definitions of a "way of life"), it does not justify the further conclusion that *all* traditional accounts of the public good are guilty of the same "thickness." Liberal theory seems to take largely for granted that every conception of the communal good that moves beyond the minimal (or thin) requirements of public order and tolerance falls prey to the same charge: it imposes an "exclusivist," quasi-totalitarian conception of a common life upon individuals, who are thereby prevented from choosing their own life plans. In sum, it is presumed that all versions of communitarianism are antiindividualistic and are so in the same way.

As a purely philosophical claim, this view is suspect; for the liberal understanding of the common good seems to trade on an ambiguity that has become attached to previous communitarian usages of that phrase. Communitarians have generally sought to argue that a community is defined in terms of a substantive good or set of goods that generate a fundamental civic identity within which all members are embedded and to which they ought to be socialized. Liberals have been prone to construe this as equivalent to the rejection of individual diversity in relation to human goods. But it is one matter to claim the unity of the common good and another to assert the impossibility of different interpretations of the *same* common good (or different ways of realizing that good) according to the range of roles or positions within society. Unquestionably, communitarianism is committed to the view that a single common good exists; it need not (logically speaking) also be committed to the view that this good will be understood

or applied identically by all persons. Instead, it seems plausible to adopt the view that the realization of any common good is conditioned by circumstance, in the sense that different persons occupying divergent life situations will conceive of the common good in a manner relevant to their social needs and surroundings. This is not to say, however, that such persons adopt substantively differently or incompatible conceptions of that common good. It is rather to assert that their public selves are not formed abstractly or generally (by reference to a mode of civic virtue identical for all citizens) but are shaped in a concrete and mediated fashion by way of a determinate role or position within the overall communal structure. The communitarian supposition that there *is* a common good is thus upheld in a manner consonant with the existence of diverse points of view regarding that good.

Nor does this alternate version of the communitarian thesis lack historical precedent; for if one looks not to the ancient Greeks or the modern republicans but, instead, to the Latin Middle Ages (a period too often ignored entirely by political theorists) one discovers a theoretical framework, that I label *communal functionalism,* which deflects some of the more serious charges against communitarianism. At the heart of communal functionalism is the claim that the community is, in the first instance, composed neither of individuals nor of citizens but, rather, of functional groupings or parts, arranged according to the nature of their contribution to the communal whole. This is essentially an organic conception of social life but one with certain distinctive features; for it defines membership in the community as a direct result of one's contribution, through the performance of a given function, to the well-being or health of the whole. Yet although types of contribution to the community are distinguished—and specialization of function (or division of labor) thereby posited—there is no attempt to postulate a hierarchy of functions in order to exclude some part or parts from a place in public life or to cast aspersions on the qualifications of certain groups to exercise a basic role in government. On the contrary, any person from any segment of society that contributes in any way to the welfare of the communal unit is thereby accorded an equal capacity to gage the needs of the community and to perform one's functions accordingly. This means that the community must guarantee a basic liberty of judgment and expression for all its members, regardless of the tasks that they perform.

In contrast with the mode of specialization typical of Plato's ideal polis, the division of responsibilities according to the communal functionalist model entails the diffusion of concern about the good of the whole. Communal functionalism does not transform ruling into a specialized art, nor does it lead to a corporate pluralism that limits the participation of the various parts of society to promotion of their narrow self-interests within a public forum. Rather, it maintains that each segment of the community, precisely insofar as it contributes to the good of the whole in a particular fashion (by performing some specific function), also thereby acquires a general duty toward the maintenance of the social organism. There are no grounds upon which the exercise of this general duty may legitimately be suppressed; the maintenance of the common good, as opposed to rule in accordance with some private or partial set of interests, is deemed to depend upon the ability of each and every member to determine autonomously the standards by which the healthy community is to be governed.

The approach to the relation between the community and the individual afforded by communal functionalism seems to resolve many of the valid concerns voiced by liberal individualists about the sort of holism implicit within communitarianism, since it acknowledges the indispensability of individual rational judgment in regard to the public welfare. Claims of superior status or authority in themselves carry no preeminent weight in the process of public deliberation and decision making. Communal functionalism resists efforts to override or undercut personal choice. The lack of respect for individual intellect and volition of which communitarianism sometimes stands accused is not a factor. The terms of the model are violated by the denial to any segment of the community of the opportunity to dissent or to offer rational arguments about matters touching upon the interpretation of the public good.

Expression of the basic principles of communal functionalism abounded during the Middle Ages.[2] Generally speaking, however, the doctrine was articulated within either an organic or a civic framework. The first view is found in the mid-twelfth-century philosopher and churchman John of Salisbury, who concentrates upon the interrelation of parts constituting the "physiology" of the body politic. The second is expressed by Marsiglio of Padua, an early fourteenth-century scholastic philosopher and antipapal polemicist, who appeals to the formal consent of the constituent parts of the community. I shall examine both the diversity and unity present within communal functionalist discourse: communal functionalism is not a single, narrowly specified set of doctrines but a general matrix, a paradigm, within which much creative theoretical discussion occurred during the Middle Ages. I also seek to evaluate some of the lessons that communal functionalism may be capable of contributing to current communitarian debate, as well as to assess potential limitations within the framework.

COMMUNAL PHYSIOLOGY

Although the organic metaphor comparing the political community to a living creature was widely employed during the Middle Ages, it is generally agreed that John of Salisbury's version of the analogy, presented in his major treatise, the *Policraticus* (completed in 1159), was among the most innovative and influential (Dutton 1983; Struve 1978). John begins with the simple observation that the commonwealth

may be likened to a "body which is animated" (1909, vol. 1, 282; idem 1990, 66).[3] The differentiation of the offices of political society may thus be represented in a manner analogous to the distinction of the parts of the human anatomy. Like all bodies, the commonwealth is guided by a soul; John asserts that the place of the soul belongs to "those who direct the practice of religion" (1909, vol. 1, 282; idem 1990, 67). Yet the clerical soul of the polity is not, strictly speaking, a member of the commonwealth, just as the eternal human soul is not coextensive with the mortal physical organism it directs. The political creature is an essentially secular entity. Thus, the body politic, properly speaking, is ruled by the prince, who "occupies the place of the head" (1909, vol. 1, 298; idem 1990, 69). At the heart of the commonwealth lies the senate, composed of the counselors whose wisdom the ruler consults. The senses correspond to the royal judges and local agents such as sheriffs and bailiffs who exercise jurisdiction in the king's name. The financial officers constitute the stomach and intestines of the body, while the two hands are formed by the tax collector and the soldier. Finally, John compares the feet to the artisans and peasants "who erect, sustain and move forward the mass of the whole body" (1909, vol. 1, 282–83; idem 1990, 67).[4] Each of the parts of the organism, according to the *Policraticus*, has its own definite function, which is fixed by its location within the overall scheme of the body. None of the members may be excluded or removed without serious damage to the whole.

John's functional depiction of the community was not, as is sometimes supposed, primarily intended to justify hierarchy and division within society. Rather, the body politic is invoked in the *Policraticus* as the expression of a principle of cooperative harmony through which otherwise disparate individuals and interests are reconciled and bound together (see my earlier study, Nederman 1987a). John adopts a "physiological" approach to the political organism in the sense that he emphasizes "organs cooperating by virtue of voluntaristic categories such as common purpose" (Jung 1985, 172). Throughout his writings, he regards "reciprocity" as the salient characteristic of natural and social systems (John of Salisbury 1929, 5–8; idem 1955, 181). The *Policraticus* insists that "there can be no faithful and firm coherence where there is not a tenacious unity of wills and a virtual joining together of souls themselves. If this is missing, men harmonize their works in vain, since deceit advances into catastrophe without an attitude of helpfulness" (1909, vol. 1, 308–9; idem 1990, 77). All the parts of the body, in other words, must be truly dedicated to a common or public welfare which supersedes the aggregate private goods within the polity. The ruler and magistrates are advised to attend "to the utility of all" (1909, vol. 2, 73; idem 1990, 136); the feet are counseled "to concentrate on the public utility in all matters" (1909, vol. 2, 59; idem 1990, 126); and in general, "all the members" are expected to "keep watch over the public advantage" (1909, vol. 2, 71; idem 1990, 135). The security of the body politic can only be maintained by means of a joint commitment to a public good that benefits every part without distinction, so that "each individual may be likened to a part of the others reciprocally and each believes what is to his own advantage to be determined by that which he recognizes to be most useful for others" (1909, vol. 2, 59; idem 1990, 126). John's political body is one in which, beyond all social differentiation, there is "mutual charity reigning everywhere" (1909, vol. 2, 86; idem 1990, 142), because all segments are attuned to the same enduring common purpose encompassing the valid interests of the whole. Unity follows from cooperation, and cooperation stems from the existence of a good shared by the entire community and each of its members.

What ensures the presence of a cooperative spirit within diverse sections of the community? How is fragmentation to be avoided? The answer stems from John's identification of the "health" of the body politic with the practice of justice by the organs and members. Indeed, his definition of the common good in terms of justice contains a recognition of a correlative obligation on the part of all members of the commonwealth: "Inasmuch as the duties [*officia*] of each individual are practised so that provision is made for the corporate community, as long as justice is practiced, the ends of all are imbued with the sweetness of honey" (1909, vol. 2, 63; idem 1990, 131). Every organ of the body must conduct itself according to the dictates of justice if the polity is to exist as a corporate whole. This is implicit in John's conception of justice. Following Cicero's formula in *De officiis* (1913, 25), the *Policraticus* asserts: "Justice consists chiefly in this: do not do harm and prevent the doing of harm out of duty to humanity. When you do harm, you assent to injury. When you do not impede the doing of harm, you are a servant of injustice" (1909, vol. 1, 277; idem 1990, 62). The essence of justice pertains to a responsibility toward others; this responsibility is not simply constituted by a negative obligation to refrain from the commission of injury but entails a positive duty to protect others from harm as well. Justice is inherently productive of social cooperation, whereas injustice necessarily tends to human disharmony and social disintegration. Thus, John believes that justice is a generalized virtue; for since justice is the salient characteristic of the common good, it determines how each of the bodily members performs its functions. Not only kings and magistrates but even the lowliest of parts are viewed by John as potential agents of public justice (see Nederman 1987a, 220–21). This is established by the very fact that the function of each segment of the organism is absolutely necessary for the well-being of all the others.

BODY AND INDIVIDUAL

Supporting John's argument for the wide diffusion of responsibility for the maintenance of justice is the view that all members of the body politic possess the

basic faculties necessary for guarding and protecting the common good. John upholds the ability of each part of the community to discover for itself what is beneficial and just and to act thereupon. This principle accords with the general terms of his account of moral decision making. The *Policraticus* claims that "discretion with regard to place, time, manner, person and cause . . . most readily separates out" virtue from vice (1909, vol. 2, 316; idem 1990, 187). In deciding how to conduct oneself, each individual must consider all relevant conditions and choose the course of action which is appropriate in its context. Thus, John believes that moral reasoning is ultimately a matter of individual calculation and determination (Nederman 1986, 133–37). To do what is just, one must apply one's general knowledge of justice to the particulars of the case and decide upon the correct action. As applied to the political community, John's prescription of moral autonomy means that all organs and limbs (rather than simply a specialized few) enjoy the capacity to engage independently in the process of moral reasoning about matters of justice.

In turn, independence of moral judgment depends on personal freedom of thought and expression. The *Policraticus* claims that the very precondition for rational decision making is personal liberty. Consequently, John posits an intimate connection between virtue and liberty. He remarks that "virtue does not arise in its perfection without liberty and that the loss of liberty demonstrates irrefutably that virtue is not present and therefore that anyone is free according to the virtue of his dispositions" (1909, vol. 2, 218; idem 1990, 176).

Specifically, the relation of liberty to virtue stems from the need for individuals to be free to make their own circumstantial determinations about morally good actions. Liberty thus, according to John, consists in the careful formulation of sound rational judgments about the most appropriate route to virtue: "Liberty, therefore, judges in accordance with the free will of the individual" (1909, vol. 2, 217; idem 1990, 175). As applied to matters of justice, this doctrine teaches that only people able to make free use of their rational faculties can perform their duties toward the body politic; and since the health of the organism requires that every limb and organ must share full membership in the body, the free judgment of each segment of the community must be encouraged and defended. Hence, one of the prime functions of the good prince is the defense of the liberty of his subjects; and the tyrant is characterized as the ruler who enslaves the other parts of the community by denying to them their independence of judgment (1909, vol. 2, 345; idem 1990, 191).

John takes this freedom of judgment quite seriously. He argues that liberty of expression and action is only meaningful when the opportunity exists to make it effective. Therefore, he encourages virtuous men to denounce the wrongs and injuries committed by others: "Man is to be free and it is always permitted to a free man to speak to persons about restraining their vices" (1909, vol. 2, 224–25; idem 1990, 180). Likewise, he urges wise men to heed patiently the criticisms offered by their fellows (1909, vol. 2, 219, 223; idem 1990, 177, 179). Liberty of judgment is to be extended without regard for rank: the *Policraticus* praises rulers and great men who allow social inferiors to vocalize condemnations of the vices of their superiors (1909, vol. 2, 219–23; idem 1990, 177–80). John even recounts his own highly censorious comments to Pope Adrian IV about the evil conduct of the Church and the papal curia (1909, vol. 2, 67–71; idem 1990, 132–35). In sum, John ties the good order of the community to the personal freedom of its members. In his view, the protection of liberty of thought safeguards against the rise of tyrants and enemies of the common good.

John is willing, at least under exceptional circumstances, to extend this individual discretion into the realm of direct political action against evil rulers. He distinguishes between two different circumstances that warrant different types of public concern, namely, the commission by rulers of minor offenses (which can be tolerated by the community) and flagrant crimes, which endanger the well-being of the body politic (1909, vol. 2, 78–79; idem 1990, 140–41). In the first instance, citizens should freely express their disapproval and recommend corrective measures but should not challenge the position of the governor. In the second case, when the common good is threatened by a tyrant, members of the political organism ought—indeed, are bound by the functionalist terms of their inclusion within the political order—to take it upon themselves to deflect injury to the public welfare. This claim forms the basis for John's famous doctrine of tyrannicide (Nederman 1988). The *Policraticus* regards tyranny to be a crime against "the body of justice" (*corpus justitiae*). Consequently, inasmuch as one enjoys membership within the political community, one has an ultimate responsibility to eradicate the incorrigible tyrant. John asserts that "whoever does not prosecute [the tyrant] transgresses against himself and against the whole body of the secular republic" (1909, vol. 1, 233; idem 1990, 25). No overt limits are set on the social position or station of the tyrant slayer. Rather, because action against a tyrant stems from the general duties grounded in one's functional position within the community, any of the members is equally authorized to act. The example of a duty to kill the tyrant may be the most extreme case of a participatory duty that nonetheless requires individual freedom of judgment; but it illustrates the strength of the link between personal liberty and the active involvement of each and every member of the body in defending the good of the political organism.

That John seeks to allow for meaningful individual choice in the context of an argument for a high degree of political cooperation is perhaps the most striking feature of his argument. This is rooted firmly in his communal functionalist outlook. Inasmuch as everyone has a task within the body politic, each must be free to act as is seen fit for the sake of—or at least in a manner commensurate with—the common good.

Likewise, one is prohibited from acting against the public welfare. Liberal individualists should derive some satisfaction from this approach because it permits each person to deliberate autonomously about how the common good is best to be served and leaves it to each to act accordingly; yet this approach vindicates the central tenet of the communitarian cause by insisting that members of the body politic have a duty (founded on the reciprocal benefits that they and the community receive from each other) to exercise their discretion with regard to the utility of the whole. Members are not free to abdicate their responsibility to judge for themselves. Indeed, the abdication of such autonomy is for John the sign of a servile populace, one incapable of virtuous conduct (which must be freely chosen) and ripe for submission to a tyrant. John shares with liberal thought a strong distaste for tyranny but views tyrannical government itself as often the product of tolerance for withdrawal from the public sphere and refusal to consider the common good. On John's physiological account, such repudiation of responsibility toward the community is not merely self-regarding. It means that the functions one performs may no longer be counted on to augment the welfare of the rest of the community. It is exactly in this sense that the primacy of function serves to mediate between individual and community: it fixes both the legitimate limits of the public authority over personal choice and the nature of the contribution that the parts of the body may rightfully expect of one another.

A COMMUNITY OF PARTS

It should not disturb us too greatly that John of Salisbury does not employ a more overtly civic language in his account of the body politic and its parts. The vocabulary of citizenship was not so familiar to him as it would be to thinkers in later centuries. It seems clear that the features of membership in the organic community as described by the *Policraticus* are largely coextensive with a conception of civic identity. More disturbing, perhaps, is the absence from John's theory of any formal or regularized institutional mechanisms for the expression and discussion of individual judgments in regard to the common good. He takes for granted an entirely personalized framework within which individual discretion translates solely into individual action. Collective decision making, based on rational discourse or persuasion, does not enter directly into his scheme.

By contrast, the version of communal functionalism advocated by Marsiglio of Padua in his major political work, the *Defensor pacis* (completed in 1324), is not susceptible to the same criticism. With the benefit of more thorough knowledge of ancient political ideas and practices, as well as direct experience with the communal governments of his native Italy, Marsiglio presents a theory oriented more self-consciously toward the concepts and language associated with the civic body (*civitas*); yet Marsiglio shares certain fundamental premises about the composition of the community with John of Salisbury. In particular, Marsiglio's *Defensor pacis* gages the level of the "development" or "perfection" of a community according to the extent of the differentiation of its parts, where such parts are understood to be the specialized functional divisions within society. It describes a gradual process through which human beings, acquiring experience and improving their reason, discover all the tasks necessary for a satisfactory existence (1927, 10–11). Once this is achieved, it is possible to speak of the "perfect community, called the civic body, with the differentiation of its parts" (p. 11). The variegation of functions typifies the mature community in comparison with more primitive forms of association.

Marsiglio thus places a premium on reciprocity. The intercommunication of functions should be the goal of the multiplicity of parts: "Since diverse things, which cannot be procured by men of one order or office, are necessary to those who desire to live sufficiently, there needed to be diverse human orders or offices within this association, exercising or procuring such diverse things which humans require for sufficient life. And these diverse human orders or offices are none other than the many and distinct parts of the civic body" (1927, 14). The final cause of each member is the well-being of the whole community, rather than simply its narrow self-interest (p. 25). Marsiglio enumerates (in imitation of Aristotle's division in *Politics* 7) the six basic segments of the perfected community, namely, the agricultural, artisan, military, commercial, religious, and judicial (or ruling) parts (p. 15). Every one of these functions is revealed to be indispensable for the sufficient communal life which all human beings naturally desire (pp. 15–20). The parts are consequently regarded as parts *of the civic body*: they "are properly called offices [*officia*], as though services, since, considering that they are established in the civic body, they are ordered toward human service" (p. 27). These parts do not perform their functions in isolation but, rather, in the context of, and in relation to, the other elements of the civil community (pp. 8, 100–101).

Therefore, Marsiglio declines to draw the Aristotelian conclusion that the performance of certain types of functions (i.e., the manual tasks associated with farming, the crafts, and commerce) disqualifies persons from membership and participation within the civil order (Aristotle *Politics* 1328a; cf. Marsiglio of Padua 1927, 15). Instead, he infers from the need for diversity within the community that all the parts must be accorded a basic civic identity: this is the only way to avoid the disordering of the communal whole. The status of citizen encompasses "mechanics," craftsmen, and artisans just as surely as it does the leisured and educated elites (Marsiglio of Padua 1979, 182; see also Black 1984, 92–93).[5] The salient criterion for citizenship is one's contribution to the community judged along functional lines.

In order to ensure the smooth and harmonious

operation of the various parts, it is necessary to establish laws and to appoint rulers who will enforce the standards which have been legislated; for otherwise, should conflict occur among the parts of society, there would be no fixed procedure for resolving it, and the community would dissolve into quarreling factions (Marsiglio of Padua 1927, 13, 73–74). Such laws and their enforcement must be entirely conducive to the common benefit lest some segment of the communal whole regard itself to be slighted or oppressed and withdraw its contributions. This means that every effort must be made to guarantee that public decision making is not inclined to favor or advantage one part at the expense of others (pp. 53, 58). In Marsiglio's view, the appropriate means of assuring this equity (and thus of harmonizing the disparate interests within the community) is the active participation of all citizens in the selection of rulers and the authorization of laws. Of course, the *Defensor pacis* does not deny that some parts of the civic body are better prepared to perform certain public tasks. For instance, he leaves the framing of laws to those whom he terms *prudentes*, that is, wise men of leisure (pp. 48–49); yet he explicitly rejects arguments that such men are competent to impose laws upon or govern the community in the absence of the universal assent of the citizens.

COMMUNAL CONSENT

The exercise of consent forms the very heart of the Marsiglian conception of citizenship (Nederman 1990, 1991). The community must be the final and binding determinant of its own welfare; thus, it must ultimately approve all laws by which it is governed, as well as the rulers who enforce those statutes. When the body of citizens enacts a law communally, through the consent of every (or virtually every) citizen, there is no question about whether the legislation expresses and accords with the public welfare. Marsiglio's theory of consent leads him to deny the claim that the vast mass of the citizen body is bound to be utterly vicious and incapable of discovering its own best interests. On the contrary, the *Defensor pacis* insists that "the entire assembled multitude can discern and will the common justice and benefit with greater prudence than any part taken separately" (1927, 58–59). There are no grounds for circumventing the mechanisms of consent: all decisions about public affairs, such as the implementation of new laws, must be placed before the whole citizen body in order to receive authorization. While acknowledging the usefulness of the law-framing function of the *prudentes*, Marsiglio regards this skill as a specialized one and therefore not comparable to the general capacity of each citizen to review proposed legislation for himself (p. 60). The citizen's place in the legislative process is comparable to the audience's position in relation to a work of art or technical endeavor. While only a few enjoy the creative or intellectual prowess and skill required to paint a canvass or design and build a house, it is within the grasp of almost every person to appreciate and judge the final product (p. 56). Although most individuals possess neither the leisure nor the education to discover and frame legal standards, Marsiglio believes that they "nevertheless participate in the understanding and judgment of practical matters" (p. 58). To deny such a full rational capacity to citizens would be to subscribe to the view (denounced by Marsiglio) that some segment or group enjoys privileged access to knowledge of the common good and thus is competent to rule and legislate without general consent.

The exercise of this basic power of reason must be matched by the presence of personal liberty if the consent of the civic community is to be effective. For consent itself assumes that the citizen is completely free to judge for himself the potential defects or inadequacies of proposed laws or magistrates. If a citizen is denied such liberty to formulate his own opinions and to express them, then genuine consent will not occur and statutes will be enforced that do not reflect the actual determinations of the community. The *Defensor pacis* proclaims: "Every citizen must be free and not endure the despotism of another, that is, servile lordship. This would not happen if some one citizen or a few of them made the laws according to their own authority above the corporation of citizens" (1927, 52). In the absence of consent, the governance of the polity would be reduced to the domination of some partial segment of the community and the freedom of citizens would be denied. Indeed, civic status disintegrates in the absence of freedom, given that citizenship itself for Marsiglio is constituted primarily by the active exercise of the public duty of consent. Each citizen is the necessary bearer of a capacity for autonomous rational judgment that must be freely exercised if the community is to be properly and peacefully ordered.

At the same time, the liberty underlying civic assent is not purely arbitrary: when approving law, citizens must consult not their own private wills but only the good of the communal body. Here, the duty of citizens becomes more obvious in Marsiglio's account. He views the original creation of civic institutions as a cooperative process in which humans came together in express recognition of their own naturally sociable propensities (1927, 353). Because political society was created by such consent, its members must perpetually accede to the terms of their own continued association (including their laws and rulers) in a sort of recapitulation of their initial entry into society (Nederman 1991, 32). Thus, the duty to engage actively in the consenting process stands at the heart of the existence and perpetuation of civil institutions and relations. Should citizens permit their private wishes to take precedence over the needs of the community, the very fabric of the political order itself would begin to come unraveled. Indeed, a "citizen" who prefers private aims to the public welfare ceases to be a citizen at all, by refusing to acknowledge that basic duty toward the common good that is the defining quality of citizenship.

Hence, just as in the organic account of John of Salisbury, Marsiglio posits a notion of liberty that is inalienable yet communally grounded. No one may deny freedom of judgment to the individual citizen. To do so would be to harm the well-being of the community by excluding some of the contributions that are constitutive of its perfection. At the same time, however, the liberty that rests on function is not essentially private or self-regarding. The exercise of free choice, instead, reflects public needs and goods, so that citizens are not free to remove themselves from the political realm while still enjoying the other advantages of civil life. In a sense, there would be no liberty if there were no community; but the reverse is also true.[6] Thus, personal freedom of judgment and communal duty are both complementary and mutually reinforcing in Marsiglio's thought. They receive a formalized and institutionalized expression in the process of civic consent to laws and rulers. This seems to be the crux of the divergence between a Salisburian and a Marsiglian account of the functionally based community. Where John leaves the decision-making process entirely up to the individual's reflection and discretion, Marsiglio permits—indeed, encourages—interaction and discussion as a prelude to consent. The members of John's polity are essentially moral agents whose scope of concern is personal virtue as it impinges on the body politic. Marsiglio's parts are more fully citizens in the sense that they assemble to speak and listen to one another prior to determining matters of public welfare.

LESSONS AND LIMITATIONS

In their careful attention to the functional bases of human diversity, both John and Marsiglio are attuned to the important implications of difference for the life of the community. They realize how easily the distinct elements of the communal whole can lose sight of the common good that binds them and begin to concentrate upon the realization of purely private goods, which inevitably has a disintegrative effect on civic identity. On the one hand, their essential approach admits of the permanence of diverse experiences and orientations. Distinctions of function (coextensive with divisions of wealth, status, leisure, etc.) are deemed to be fixed features of human existence, underlying all "ways of life" that a community might seek. Those who look to the community to break down the division of labor (or the social consequences of that division) will not find the communal functionalist framework rewarding. On the other hand, by starting with the concrete basis for the life experiences of most people, John and Marsiglio are better prepared than many communitarians to address the real foundations of divergence between differing perceptions of interest (common or private) within a community. After all, "the citizen" is as capable of being rendered an abstraction as "the individual." By occasionally overlooking the extent to which the boundaries of the self are set by functional circumstances (modes of employment, education, status and culture), communitarians readily open themselves to the charge of formulating "civic virtue" or "citizenship" as a universal category standing outside the historical and empirical situation of individuals within specific civic bodies.

Communal functionalism resists this tendency to abstraction by taking as its point of departure the tasks and activities which make possible a given society at its particular level of development. Citizenship is rooted in what individuals *do*, rather than what they are. A person is a citizen by virtue of the performance of certain functions that contribute to the welfare of the whole. (A person is a *good* citizen when these functions are performed in accordance with the needs of the community and when concern is evinced for the communal good by way of other sorts of public behaviors.) The duties of citizens are consequently not static, but are contextualized according to the immediate requirements of the public utility as recognized and accepted by their own free judgment. The community (and therefore its good) is not a simple unity but is, instead, a multiplicity ordered toward a single end—as Marsiglio, indeed, tries to explain (1927, 94–96). Without surrendering a doctrine of substantive common good, communal functionalism permits the communitarian to construct a framework within which to understand the diversity of interpretations of that good and to appreciate the necessity of the diversity itself.[7]

Thus, a robust theory of participation is implied by communal functionalism; for since every distinct function within society generates a unique and valuable point of view regarding the common good, there must be some mechanism for the expression and harmonization of these visions—in essence, an outlet for sharing perspectives and appreciating the totality. Communal functionalism counsels tolerance for divergent interpretations but also an openness to the realization of one's interdependence in relation to other segments of the community. The participatory process ensures some exchange of alternate visions in a fruitful manner, in the sense that it will encourage a cooperative consensus, to which the viewpoint of every part or member contributes. Such participation may be informal (the freedom of speech and criticism proposed by John of Salisbury) or rigorous (Marsiglio's insistence on individualized consent); but it cannot be foresworn. The liberty of judgment founded on the diversity of functions relating to the common good necessitates, for both John and Marsiglio (and surely for all accounts of communal functionalism), some effective avenue for its communication and realization.

It follows that communal functionalist theory simultaneously strengthens the concepts of the individual and the community. This may appear self-contradictory, in light of our automatic tendency to view any reinforcement of the status of the individual as a challenge to the community and any bolstering of communal values as an infringement on the individual; but for the medieval world, these two factors

were not mutually exclusive. We have seen that John and Marsiglio conceived of the governance of the well-ordered community as subject to evaluations of goodness, knowledge of which was accessible to every member of the community in virtue of one's function therein. Consequently, it followed for them that the more freedom enjoyed by individuals and the more they were allowed to employ their powers of reason, the stronger would be their commitment to the communal good and to the duties entailed thereby. In other words, John and Marsiglio were satisfied that free individuals, left to the devices of their own rational powers, would generally reach conclusions consistent with, and conducive to, the public welfare.

The contrast between these medieval ideas and the liberal individualist framework is not only striking but instructive. Beyond the inclination of liberalism to doubt the existence of a determinate common good apart from the aggregate goods of individuals, the liberal emphasis upon private rights and rational egoism reverses the medieval concentration upon public duties and moral reason. It might be argued that liberalism is better equipped to protect the individual from domination by the community; but the case for this is weak—empirically, as well as theoretically. On the communal functionalist account, a well-ordered political system must protect and encourage the liberty of its subjects to reason and judge for themselves—and even to judge wrongly, provided that the public good is not harmed thereby. By contrast, for a philosophy that lauds the individual, liberalism demonstrates a remarkable lack of confidence in the ability of each person to employ reason in order to form political judgments. In sum, liberalism's claim to be the unique defender of the individual against the community is difficult to sustain in light of the medieval stress on personal liberty and individual judgment as necessary concomitants of civic life.

It may still be objected that in contrast with liberal individualism, the communal functionalist approach remains far too restrictive in its conception of the diversity of human goods. For example, both John and Marsiglio adopt purely public definitions of function: what counts as a function is whatever contributes to the socioeconomic well-being of the community. This would seem to exclude *private* roles—in particular, activities associated with the family—from the arena of the common good and thus to separate those who perform private functions from a place within the political arena. That the upholding of the public/private distinction and, with it, the maintenance of patriarchal beliefs both about the family and the role of women within it was intended by both John and Marsiglio is clear (Nederman 1990; Nederman and Lawson, 1987). Thus, to make communal functionalism viable in a late-twentieth-century context, it is necessary to rethink the distinction between public and private realms as it relates to the definition of the common good. My own judgment is that one can construct a plausible case that so-called private functions in fact fall within the ambit of the common good and hence that they ought to be included within the range of functions that form the basis for the assignment of civic identity.

More troublesome, perhaps, is the specification of how a function contributes to the common good and whether ostensive absence of function is adequate to remove a person from involvement in communal life. Most obviously, this pertains to the person who is unemployed or homeless or who otherwise does not perform any of the functions necessary for the sustenance and health of the social unit. Is such an individual thereby rendered unfit for the exercise of civic responsibilities? The same sort of question can be posed for severely impaired or disabled persons who are unable to undertake the activities which contribute to the common good. Just as significantly, by what or whose standards are determinations to be made as to whether a person (or the function a person performs or can perform) contributes to the benefit of the community?

No more than a tentative response can be offered at present to this complex set of problems. It seems unreasonable to maintain the view that only when actually engaged in some activity that contributes to communal well-being is a person to be counted as a member of the community. Indeed, this would be rather like saying that one only possesses mathematical knowledge when one is performing some mathematical operation. Knowledge is more profitably regarded as a disposition to know rather than as an act of the knower. In an analogous manner, one's status as a member of a political community may be treated as a disposition to engage in some function that contributes to the common good. Indeed, Marsiglio of Padua expresses the matter in essentially this way when he defines the different parts of the civic body as *habitudinem*, that is, dispositions to perform the various functions necessary for the health of the community (1927, 26–27). Consequently, anyone who has a *capability* or *potential* to add in any way to the good of society cannot be placed outside the processes attached to the "politics of the common good." Moreover, only the community itself (either directly or by means of its authorized government) can decide which functions contribute to its well-being. Generally speaking, those which have not been deemed illegal constitute the functions that a communal body accepts as conducive to its own good. This is not to say that mistakes cannot be made in the enforcement of the values common to the society, but such errors have a way of being rapidly overturned and the functions associated with them reinstated. (One thinks of Prohibition Era America, where the legal abolition of the activity of liquor production did not conform to the public perception of its own good and was ultimately negated—in practice by bootlegging and in law by repeal of the Twentieth Amendment to the Constitution.) Communities and their members are quite able to judge the functions necessary for their own welfare. Ironically, it tends to be liberalism, the self-proclaimed

proponent of the individual, that doubts this competence.

CONCLUSION

The Latin Middle Ages was by no means the only period of Western history to make use of a functionalist approach to political community. Functionalism is at the core, for instance, of the venerable "guild" tradition of thought (Black 1984; Nederman 1987b). But concentration on diversity has tended to lead in one of two directions antithetical to community: (1) the conflation of function with narrow self-interest, so that different parts are regarded to be essentially in conflict, or (2) the equation of function with hierarchy, so that distinction of task is employed as a principle of subordination and rule. By contrast, medieval communal functionalism as articulated by John of Salisbury and Marsiglio of Padua looks to the diversity of activities as the logical foundation of a community of free individuals. They view function as neither inherently self-regarding nor hierarchical. Rather, reciprocity and interdependence, the necessary foundations of a self-sustaining community, flow from a diversity of members or "offices" within the polity.

That this position forms a distinctive feature of medieval thought may result from the conjunction of a series of largely incongruent intellectual and historical factors. By the twelfth century, the classical and "Aristotelian" (MacIntyre 1985, 146) notion of the common good as the primary and animating feature of public life was in wide circulation among medieval thinkers, one by-product of a general reawakening of interest in ancient philosophy, history, and law (Benson and Constable 1982). This was only reinforced by the recovery and translation of Aristotle's *Politics* in the midthirteenth century. The learned person of the Middle Ages confronted a range of classical sources that focused upon communal identity and the dependence of virtue upon community. At the same time, Christian teaching about the individual's will and the centrality of one's personal relationship with God pulled in the opposite direction: ultimate virtue and happiness arose out of individual judgment and choice, rather than out of the dictates of any common good. Thus, a command based on the public welfare to violate the tenets of one's religious faith was to be met with refusal and (passive) resistance. The individual's will or discretion was deemed to be sovereign in relation to the external pressures and dictates of the community. As MacIntyre has recognized, medieval authors were confronted with "a culture in which human life was in danger of being torn apart by the conflict of too many ideals, too many ways of life" (1985, 165). This cultural situation was compounded by the diversity of social and political arrangements, of economic activities and legal powers (the particularization, or "parcellization," of authority, as historians often call it), which produced tensions that no thinker of the Latin Middle Ages could ignore (Fasolt 1991, 80–83). It was unthinkable to sweep away the divisions within the medieval world; rather, if a civic identity was to be fashioned, it had to start with the historical reality of disparity.

The attraction of the communal functionalist framework was its capacity to cope coherently with these demands upon political and social thought. It inserted the individual into a communal setting while maintaining a meaningful role for personal volition and achieved this precisely by turning diversity of function (divergence in "ways of life") into a virtue—indeed, a necessity. In a certain fashion, the problems confronted by contemporary political theory are not that distant from those which faced John or Marsiglio. Individualism (albeit of a secular sort) constantly resists efforts to identify a common good capable of stimulating expressions of civic virtue; yet the appeal of individualism is spurred on by the unhappy collectivist consequences of too great a concentration upon communal needs at the expense of personal choice and judgment. This similarity of predicament, as well as the scope and power of the communal functionalist model itself, commends a reading of authors such as John of Salisbury and Marsiglio of Padua to current communitarian theorists. Such a reading may bear surprising fruit.

Notes

Versions of this research have been presented to the 1992 conference of the Western Political Science Association and the 1992 meeting of the Canadian Political Science Association, as well as to a philosophy department staff seminar at Siena College. The comments and suggestions of Kate Forhan, Mary Meany, Paul Santilli, and Sara Monoson have been invaluable in sharpening my claims.

1. The term *communitarian* has been applied to theorists whose ideological and philosophical commitments vary so widely that those included under the label resist treatment as members of a "school of thought" advocating a core set of doctrines. See the overviews by Gutmann (1985) and Lasch (1988). Communitarianism most accurately denotes a theoretical concern for the community as a significant force in the political experience of individuals or as a constitutive feature of human identity. Beyond this and a consequent aversion or opposition to liberal individualism, few generalizations seem possible. Indeed, Charles Taylor suggests that it will probably be necessary to dispense entirely with such labels as *communitarianism* (as well as *liberalism*) before the range of philosophical issues at stake can become fully transparent (1989, 163).

2. Essentially the same doctrine, for instance, has recently been ascribed to William Durandus the Younger, an early fourteenth-century theorist, by Fasolt (1991, 179–84).

3. The first citation is to the Latin text, the second to my translation of it.

4. John, in fact, recognizes that the comparison of the feet to the trades and professions associated with artisans, craftsmen, and workers generally is imperfect if only because of the diversity of these activities: "There are so many of these occupations that the number of feet in the republic surpasses not only the eight-footed crab, but even the centipede; one cannot enumerate them on account of their large quantity . . . because there are so many varied kinds that no compiler of duties ever produced special precepts for each individual type" (1909, vol. 2, 59; idem 1990, 126). He is thus far more appreciative of, and sympathetic to, the actual functions and importance of the lesser members than is sometimes credited.

5. Part of the explanation for this may be Marsiglio's class self-identification. Trained as a physician, he counts his own occupation among the trades associated with the "mechanical" or "artisan" part of the civic body, albeit perhaps the "architectonic" of that part (1927, 17). In turn, mechanics fall within the Aristotelian classification of the *vulgaris*. Since Marsiglio deems himself to be competent to give advice about the good order of the community, it seems unlikely that he would place the *vulgaris* outside of the body of those qualified for citizenship.

6. As Quentin Skinner has argued, some such notion of the connection between liberty and the maintenance of community was at the core of much medieval political discussion (1978, vol. 1, 49–65; idem 1990, 128–34). But Marsiglio perhaps needs to be distinguished here, since he regards liberty in a quite specifically individual sense that is not fully compatible with the more communal, republican-oriented meaning of his contemporaries.

7. Thus, in some ways, communal functionalist theories take over aspects of the pluralist project. The potential for a fruitful relation between pluralist and communitarian thought has been examined by Eisenberg (1991a, 1991b).

RESEARCH NOTES

POLITICAL BUSINESS CYCLES IN THE PUBLIC MIND

MOTOSHI SUZUKI *University of North Texas*

Numerous studies have sought to discover political business cycles in macroeconomic variables. Although voters' subjective economic expectations have been shown to influence their electoral decisions, no existing research has attempted to uncover cyclical patterns in citizens' economic expectations. Using survey data, I seek to determine whether expectations shift to benefit the incumbent president's electoral interest. The analyses show that the percentage of the public predicting an economic upturn increases before a presidential election. One explanation for the findings is that voters might extrapolate cyclical expectations from macroeconomic conditions that contain election-driven cycles. Yet the analyses show that expectational cycles still appear when the macroeconomic conditions are held constant. I conclude by drawing an explanation without recourse to macroeconomic cycles.

The topic of the political business cycle (PBC) has attracted continuous attention in the field of political economy. Analysts have examined whether and how the incumbent president manipulates the macroeconomy in order to maximize his (or his party's) probability of reelection.[1] Yet few have analyzed whether there are election-driven cycles in voters' expectations that political scientists think have direct effects on their electoral decisions (Kuklinski and West 1981; Miller and Wattenberg 1985). Many economists dismiss analyses of expectations based on the belief that expectations are not directly observable. Thus, they typically work with *assumptions* about expectations. This tendency has also been apparent in existing PBC studies that have focused primarily on election-driven changes in macroeconomic variables, or macroeconomic PBCs. In contrast, political scientists believe that voters make electoral judgments based on expectations that are subjective and more complex than a single assumption postulates. From this perspective, the PBC literature has offered very few clues to understand the linkage between political manipulation and voters' economic expectations. Thus, by examining expectations directly, we can hope to improve our understanding about the public's expectational behavior pertaining to a presidential election.

My chief objective here is therefore to ask whether there are electoral cycles in citizens' economic expectations, or expectational PBCs. I begin by outlining prominent PBC models and show the dynamics of voters' economic expectations under alternative rationality assumptions. Then, I offer empirical analyses of voters' economic expectations, including unemployment and personal financial expectations and consumer sentiment. The analyses find that expectational PBCs do exist and behave in such a way to benefit the incumbent party.

EXPECTATIONS AND POLITICAL BUSINESS CYCLE MODELS

While the casual idea of political manipulation had been around for some time, Nordhaus (1975) was the first to formalize a nonrational model of the PBC on the bases of traditional Keynesian macroeconomic theory and the median voter theorem. The Nordhaus model assumes that the incumbent administration tries to maximize votes and that voters are not fully rational in evaluating the performance of the incumbent administration. Since voting has little economic value to the individual and the reliable forecasts about the future are costly to acquire, retrospective evaluation based on simple facts (e.g., unemployment, GNP growth, and inflation) may be a reasonable way for many voters to make electoral decisions (Nordhaus 1989, 39). In an election, voters reward the incumbent administration for low unemployment (or high growth) and punish it for high unemployment (or low growth).[2]

Given these assumptions, the model predicts that the incumbent administration engages in antiinflation policy early in the electoral term and stimulates the economy as an election approaches. The results are four-year cyclical patterns for key economic variables: unemployment decreases prior to a presidential election and increases early in the next term, whereas inflation rises only after an election (Thus, such inflation has no adverse electoral consequence for the incumbent.) In the Nordhaus model, voters' economic expectations move in parallel with cycles in macroeconomic variables as voters extrapolate "adaptive" expectations from current and immediate past conditions. Because adaptive expectations adjust slowly to changes in environments, expectations revert gradually to the mean from a cyclical peak and trough.

Notwithstanding the popularity of the Nordhaus model, its nonrationality assumption has been called into question by scholars who believe that voters are essentially prospective and sophisticated and use all available information in evaluating the incumbent and forming expectations. According to Chappell and Keech's (1985) path-breaking study on the subject, voters are able to infer a government's economic policy stance from economic outcomes and judge whether policy is too tight (deflationary) or too loose (inflationary). Such policy inferences can help voters

punish the incumbent if preelection policy is too loose. This sensible evaluation of incumbent behavior can effectively eliminate an incentive to manipulate the economy because a cyclical boom manufactured by policy manipulation will be viewed as transitory and will not be rewarded by sophisticated voters.

Yet several theorists have shown that PBCs may not be inconsistent with voter rationality. Although a number of models have been developed in line with rational expectations, the assertion common to these models is that a PBC may occur stochastically if informational deficiency prevents the electorate from correctly forecasting political manipulation. For example, Backus and Driffill (1985) argue that there are two types of administrations defined in terms of the proclivity to stimulate the economy: a "wet" administration that stimulates from time to time and a "hard-nosed" administration that never stimulates. The electorate tries to judge the true preference of the incumbent administration based on its past policy behavior (or reputation). Under these circumstances, the incumbent administration has an incentive to appear to be hard-nosed by not stimulating early in its term and then stimulate in a preelection period. This "unanticipated" policy can generated significant effects on employment and real output prior to an election. Since the electorate learns about the stimulative proclivity of an administration from being tricked once, the administration cannot produce effective political manipulation in two consecutive elections. Hence, a macroeconomic PBC can occur probabilistically, rather than systematically. Another feature of the Backus–Driffill model is that unlike adaptive voters assumed in the Nordhaus model, rational voters can perceive an economic boom as transitory immediately after the actual growth rate accelerates above the natural (or equilibrium) growth rate. Thus, the expectation of a cyclical boom, if it occurs because of stochastic manipulation, will not persist and will quickly dissipate.

Similarly, Rogoff (1990) and Rogoff and Sibert (1988) have developed alternative rational expectations models in which a PBC may occur in government spending and taxes if the incumbent administration has an incentive to manipulate the public's view of the administration's *competency* (defined as the efficiency of providing large amounts of government service at low tax rates). Because such competency can be observed by the public only after a time lag, the incumbent administration has a chance to manipulate fiscal policy before an election in order to appear more competent than it really is. The Rogoff models imply that there may be a real expected (transitory and noninflationary) boom in proximity to an election explainable by a real supply-side effect of a marginal tax cut.

In sum, these PBC models present different scenarios of expectational dynamics under alternative assumptions about voter rationality. Assuming systematically deficient voter information, the Nordhaus model predicts that macroeconomic PBCs may occur frequently in election years. And expectational PBCs may be extrapolated from macroeconomic cycles. In the rational models where voter information is incomplete but only stochastically deficient, macroeconomic PBCs may occur probabilistically, depending on the availability of the information regarding the administration's true objective function. Accordingly, stochastic and transitory cycles may arise in expectations.

EMPIRICAL ANALYSES

Survey data are used to observe citizens' economic expectations directly. The Survey Research Center (SRC) at the University of Michigan regularly asks respondents questions concerning their expectations about future economic conditions.[3] For instance, the SRC has asked the question "Now looking ahead—do you think that a year from now you (and your family living there) will be better off financially, or worse off, or just about the same as now?" and "How about people out of work during the coming 12 months—do you think that there will be more unemployment than now, about the same, or less?" Also, the SRC has produced the Index of Consumer Sentiment, a composite indicator of citizens' general economic outlook, based on multiple questions about their consumption attitudes and various aspects of economic conditions. (The larger the value of the index, the better the economic outlook.) These surveys yield aggregate time series data on citizens' economic expectations, enabling one to observe whether expectational PBCs exist in the recent past.[4]

These expectational series have been chosen because of their electoral significance. Such macroeconomic variables as real personal income and unemployment corresponding to the SRC financial and unemployment expectations series are found to be significantly related to votes in presidential elections or to presidential popularity closely associated with votes (Chappell 1990; Erikson 1989; Fair 1978; Monroe 1984; Hibbs 1987). Also, the consumer sentiment index is shown to be related to presidential popularity (MacKuen, Erikson, and Stimson 1989). Should there be expectational PBCs, such cycles would appear in these three expectational series.

The general equation used to analyze expectations contains predictor variables, including (1) the lagged dependent variable, (2) a partisan variable, (3) economic variables, and (4) an election variable. The lagged dependent variable represents various inertial forces in expectation formation and also justifies serial independence in estimation. The inclusion of a partisan dummy variable is intended to distinguish an election-driven cycle in expectation from a cycle that may be created through partisan alteration in the presidency. Conventional wisdom states that a Democratic administration prefers to reduce unemployment rather than inflation and is willing to accept higher rates of the latter to achieve the former, whereas a Republican administration prefers lower rates of inflation and is willing to pay the price in

terms of higher unemployment (Hibbs 1977, 1987). Such a partisan effect is specified as a dummy variable that equals 1 when a Democratic president is in office and 0 otherwise.[5]

Expectations may well depend on current and past economic conditions. The equation includes "information variables" that may be used by the public to form expectations. Unemployment change and inflation are chosen as the information variables because they are frequently reported in media and are matters of considerable public concern.[6] Lags 0–3 of the variables are entered in distributed lag form into the equation without imposing a restriction on the lag structure.[7]

The most important election variable equals 1 for an election quarter and 0 elsewhere. Following Grier (1989), the election-quarter dummy variable takes 15-quarter, second-order Almon polynomial distributed lag (PDL) to estimate a cycle.[8] The PDL technique imposes a smoothing restriction on the shape of a cycle; and the coefficient estimates for the distributed lags represent the values of the mean innovations in a dependent variable for each quarter of a presidential term. The PDL equations for consumer sentiment and personal financial expectations were estimated for the quarterly period between 1961.1 and 1988.4. The equation for unemployment expectations covered a somewhat shorter period between 1965.1 and 1988.4 due to many missing values in the SRC unemployment data in the early 1960s.

Table 1 presents the regression results. In the three equations, the regression fit is reasonable; and, importantly, all individual electoral coefficients are statistically significant by normal standards and appear to constitute a cycle. One relevant issue is whether the seemingly cyclical pattern is significantly different from a single, fixed intercept (or whether the 16 electoral coefficients are equal). To examine this point, the fit of the PDL model was compared with that of an ordinary least squares model that replaced the election-quarter dummy and the distributed lag structure with a single intercept. For the personal finance and the consumer sentiment models, the F-tests could reject the equality restrictions; but, for the unemployment model, the F-test failed to reject the equality restriction.[9] Thus, the interpretation of the unemployment results requires caution.

Figures 1–3 graph the shapes of the electoral dummy variable's lag distributions derived from the three PDL models. In each figure, a presidential term starts at the first quarter, and an election is held at the sixteenth quarter. Each figure is drawn to represent the mean value of a dependent variable for each electoral quarter computed from the estimates of a distributed lag coefficient and the adjustment coefficient for the lagged dependent variable.

The flexible estimates provide comprehensive pictures of shifts in expectations that are consistent with the PBC story. Financial expectations trough at 38.70% in the eighth quarter and peak at 42.81% in the sixteenth, or the election, quarter, whereas unemployment expectations peak at 23.80% in the sixth quarter and trough at 13.83% in the election quarter. Notice that the measurement unit of the two series is the percentages of the public expecting the improvement in personal financial conditions and declines in unemployment, respectively. These movements are electorally significant in creating crucial effects on contemporary presidential elections (e.g., the 1960, 1968, and 1976 elections) where the winners were determined by a few percentage-point differentials in popular votes. Consumer sentiment shows a similar electoral pattern (troughing at 96.27 in the seventh quarter and peaking at 103.89 in the election quarter). Because the consumer sentiment series is a composite index, it is difficult to interpret the precise electoral effect of the change.[10] Equally important, in the three equations, an anticipated economic upturn appears to last for at least six quarters before a presidential election. The persistence of an anticipated boom seems to suggest that citizens' expectations contain substantial inertial forces. This accords with the Nordhaus nonrational PBC model, rather than with the rational models predicting swift mean-reverting expectational behavior.

None of the coefficients for the partisan variable in Table 1 are statistically significant. As far as people's expectations are concerned, an election seems to have a larger effect than partisanship, contrary to the macroeconomy, where partisanship has been shown to exert a strong disturbance (Hibbs 1987). This result should not be too surprising. It seems logical that in an era when partisan loyalty has been on the wane (P. Beck 1984; Clarke and Suzuki 1991), voters might perceive that incumbency-based electoral politics plays a relatively important role in economic affairs. The scope of this argument, however, is limited only to public economic expectations. Suggesting the relative importance of electoral politics in people's subjective expectations does not reject the utility of the partisan theory in explaining political influences on macroeconomic conditions.[11]

As for economic variables, the linear combinations of lagged coefficient estimates are presented because our interest is in the total effects of the variables on expectations, rather than in the precision of each coefficient estimate. The estimates are largely sensible: unemployment change has a negative effect on consumer sentiment, while inflation has negative effects on financial expectations and consumer sentiment. Inflation also has a positive effect on unemployment expectations due to the stagflation of the 1970s, in which inflation and unemployment accelerated together. In the auxiliary analyses, (not shown), where all economic and partisan variables have been dropped from the PDL models in order simply to describe shifts in expectations, the shapes of expectational shifts have remained virtually unchanged. Expectational PBCs still appear, even controlling for economic conditions that may involve electoral cycles. These results imply that expectational PBCs may not necessarily be extrapolated from current economic conditions. Part of the expectational cycles

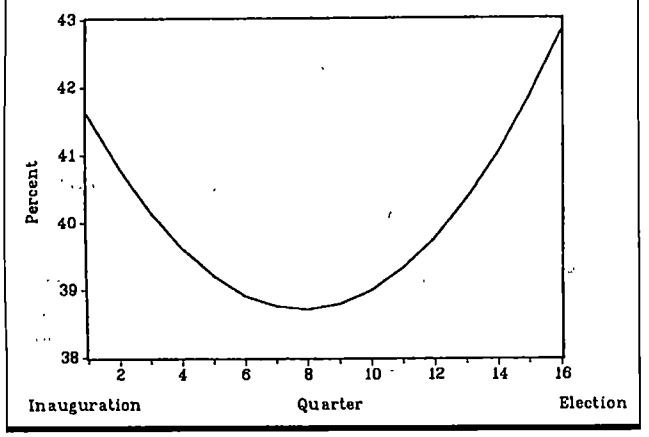
FIGURE 1

Cycle in Personal Financial Expectations



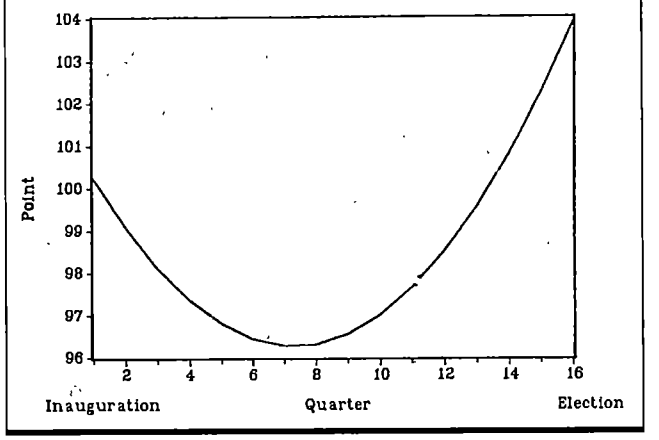


FIGURE 3

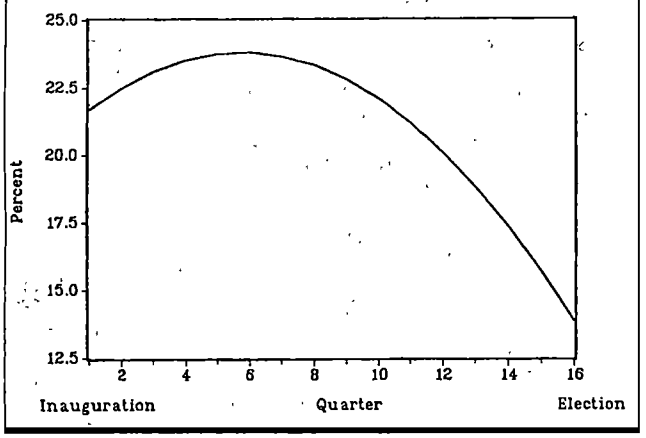
Cycle in Consumer Sentiment



may be attributable to public cognition, independent of outside environments.

To deal with the possibility that these results are an artifact of the statistical techniques employed, I estimated expectational PBCs without distributed lags, using the conventional restrictive specification that models an election impulse, with the *election-year* dummy variable taking the value of 1 for an election year and 0 elsewhere. The ordinary least squares estimates reported in Table 2, columns 1, 3, and 5, support the presence of electoral impulses in the three expectational variables. In all equations, the coefficient for the election-year dummy variable is properly signed and statistically significant, indicating that the electoral patterns in citizens' expectations are insensitive to alternative model specifications.

Both PDL and ordinary least squares analyses involve one potential ambiguity, however. It is not clear whether the expectation of an economic boom is made based on the prospect that the incumbent president (or his party) will stay in power after an election. In contrast, voters may expect such a boom to occur under a new president from the opposition party. To clarify this ambiguity, I have modified the ordinary least squares model by replacing the election-year dummy variable with an interactive term between the election-year dummy and the incumbent party's win probability,[12] predicting a positive sign for this term in the personal financial and consumer sentiment equations and a negative sign in the unemployment equation. The ordinary least squares estimates reported in Table 2, columns 2, 4, and 6, indicate that the coefficient for the interactive term is properly signed as predicted and is statistically significant. The result upholds the hypothesis that the anticipation of an economic upturn can be linked to the incumbent party's win probability.

FIGURE 2

Cycle in Unemployment Expectations

CONCLUSIONS

Unlike previous political business cycle studies examining aggregate macroeconomic variables, my analysis has focused on people's subjective economic expectations that have been shown to influence voting behavior. The search for cycles has been made with SRC survey data using both restrictive and flexible specifications. The results show that financial and unemployment expectations, as well as consumer sentiment, contain four-year cycles adequately timed with a presidential election calendar. And the incumbent party is likely to be an electoral beneficiary of such cycles.

The question is thus, Which political business cycle model can explain these findings best? Because of the limited number of elections examined here, the analyses do not allow us to conclude confidently that the electoral patterns in citizens' economic expectations are either systematic or stochastic or accord either with the Nordhaus nonrational model or the rational models. Nonetheless, slow mean-reverting tendencies found in expectations seems to favor the Nordhaus model. If voters rely on retrospective economic judgments, cycles in their economic expectations may be extrapolated from observations of macroeconomic

Note: Standard errors are in parentheses.
[a]The estimate is the linear combination of the coefficients for lags 0–3.
[b]The dummy variable equals 1 for the four quarters of the election year and 0 otherwise.
[c]The dummy variable equals 1 when a Democratic administration is in power and 0 otherwise.
[d]Election-year dummy times incumbent win probability.
*$P \leq .05$, two-tailed test.
**$P \leq .01$, two-tailed test.

PBCs that are shown to exist by Haynes and Stone (1989) and Grier (1989). The troubling point, however, is that expectational cycles exist independent of any cycle in economic outcomes.

This leads us to believe that expectational PBCs may be driven not entirely by macroeconomic PBCs but, in part, by sources other than policy manipulation. It can be suggested that part of the expectational cycles may be attributed to voters' preelection psychologies. Because of widespread preconceptions about reelection politics and the related media barrage, some voters may anticipate that the incumbent party will try to stimulate the economy before an election, even though they have not yet actually observed an economic upturn. Then, the incumbent party may, in turn, be forced to stimulate, since the failure to do so might result in a recession that is electorally detrimental.[13] Accordingly, such preelection anticipation may drive the electoral manipulation of macroeconomic policy, which, if there is sluggishness (e.g., price stickiness) in the economy, can create cycles in macroeconomic conditions.

I have suggested a new way of thinking about political economy. Political business cycles can, and should be analyzed in conjunction with voters' subjective perceptions that count in elections. I have shown that the politicoeconomic forces that influence voters' political decisions are vigorous and are here to stay.

Notes

An earlier version of this paper was presented at the annual meeting of the Midwest Political Science Association, Chicago, 1991. I thank Henry Chappell, Harold Clarke, John Londregan, and William Mishler for constructive comments.

1. Researchers made numerous efforts to search for PBCs in a variety of economic variables, including inflation, unemployment, real gross national product, and monetary and fiscal aggregates. Their analyses have produced mixed results regarding the presence of macroeconomic political business cycles in contemporary U.S. history. (Negative results are found in N. Beck 1982; Golden and Poterba 1980; Hibbs 1987, chap. 8; and McCallum 1978. Positive results are found in Grier 1987, 1989; Haynes and Stone 1988, 1989; Laney and Willett 1983; Maloney and Smirlock 1981; and Tufte 1978. See Alt and Chrystal 1983, chap. 5 and Nordhaus 1989 for reviews of empirical political business cycle studies.)

2. Econometric studies of votes in presidential elections initiated by Fair 1978 and subsequently replicated (Brody and Sigelman 1983; Hibbs 1987, chap. 6; Lewis-Beck and Rice 1982; Tufte 1978) found that voters reward the incumbent party for high economic growth and punish it for low growth. More recently, using improved model specifications Chappell (1990) and Erikson (1989) show that economic effects on votes are even stronger than Fair originally reported. These results

provide a rationale for the party in power to manipulate the business cycle for electoral advantage.

3. Using an equal probability sample design and telephone interviews, the SRC surveys over one thousand adults every month. Based on these data, the SRC produces the quarterly series employed in this study. The SRC notes that its survey involve sample errors of ±5%. Sample errors do not confound the time-series analyses presented in the text because errors remain relatively constant across samples.

4. The literature on voting behavior is not clear about how far ahead voters look in making electoral decisions. The one-year time horizon used in the SRC data seems reasonable because it is very difficult to predict future economic performance beyond this time horizon.

5. Alesina (1987); Alesina, Londregan, and Rosenthal (1990); Alesina and Sachs (1988); and Chappell and Keech (1988) claim that partisan effects may be transitory because markets are presumably able to return quickly to equilibria in a rational expectation environment. Rational voters may predict a partisan-driven economic boom based on the likelihood of the Democratic party's winning a presidential election. Thus, the rational partisan variable equals Democratic win probabilities that were computed from presidential approval. This computing procedure is similar to the one used to calculate incumbent win probabilities (see n. 12). The equation replacing the Hibbs partisan dummy variable with the rational variable also was estimated. The results showed that the rational partisan variable is not statistically significant.

6. Unemployment change is measured as percentage change in the seasonally adjusted quarterly unemployment rate (HURR). Inflation is measured as percentage change in the seasonally adjusted quarterly consumer price index. These economic data were obtained from the CITIBASE data tape. Other than the economic variables included in the model, I also tested macroeconomic policy measures such as M1 money supply growth and change in cyclically adjusted fiscal surplus/deficit. Neither policy measure was significantly related to the dependent variables. Thus, these variables were not included in the equations estimated in the text.

7. This particular lag length was chosen because people are shown to use approximately a one-year backward time horizon in forming their expectations (Feige and Pearce 1976; Figlewski and Wachtel 1981; Gramlich 1983).

8. Using a grid search over 1–4, the second-order polynomial distributed lag was chosen as the value that could maximize the adjusted R^2 of the regressions. The use of the second-order PDL model turned out to be consistent with Grier's (1989) estimated macroeconomic PBCs.

9. For the personal finance and the consumer sentiment equations, the test statistics were computed as $F_{2,99} = 4.70$ and $F_{2,99} = 4.34$, respectively (both are significant at the .05 level), rejecting the null hypothesis that the 16 electoral coefficients are equal. For the unemployment model, the test statistic was calculated as $F_{2,83} = 1.80$ and was not significant, failing to reject the null hypothesis at the .05 level.

10. In the working paper version of this article, I examined whether, on average, the public underestimates inflation that might rise after an election due to preelection policy stimulation. Using the SRC question about the 12-month-ahead expected inflation rate, inflation expectation errors for the average public were calculated as the deviations of the mean expected rates from the actual inflation rates. Then, a cycle in the errors was estimated via the PDL technique. The results indicated that the distributed lag coefficients are consistently positive and are significant during the first eight quarters of a presidential term. This implies that in a postelection period, actual inflation rises faster than the electorate expects but subsides and converges gradually to public expectations as an election approaches.

11. Nordhaus (1989) argues that electoral and partisan manipulations may well coexist in macroeconomic conditions.

12. The incumbent win probabilities were calculated using the procedure developed by Chappell and Keech (1988). I first regressed the actual shares of votes gained by the incumbent party on presidential approval shares in election quarters. From this regression I constructed a predicted vote share. I next calculated the forecast error for the prediction. Given the prediction and its forecast error, I calculated the incumbent's win probability, which was assumed to equal the probability that the incumbent vote share would exceed one-half. I proceeded in similar fashion to compute one-quarter-ahead win probabilities, using approval shares in various quarters before election quarters.

13. See Barro and Gordon (1983) for a theoretical treatment of the reputational game between the government and the public.

COURTING CONSTITUENTS? AN ANALYSIS OF THE SENATE CONFIRMATION VOTE ON JUSTICE CLARENCE THOMAS

L. MARVIN OVERBY, BETH M. HENSCHEN and MICHAEL H. WALSH *Loyola University Chicago*
JULIE STRAUSS *Northwestern University*

The increasing public attention paid to Supreme Court nominations has elevated the salience of Senate confirmation battles, raising interesting questions about the impact of constituency preferences on senators' voting behavior. In this article, we explore this relationship using a logistical regression model to examine the impacts of African–American constituency size and the proximity of reelection on the roll call behavior of senators on the Clarence Thomas confirmation vote. Our analyses indicate that these factors were both statistically and substantively significant in the Thomas case. We conclude by discussing the theoretical and practical implications of such findings.

The factors that contribute to Senate confirmation votes on Supreme Court nominees have long fascinated scholars of both institutions. While partisan, ideological, and institutional variables are those most often cited, recent events suggest that some senators under certain circumstances are influenced by the preferences of their constituents. In this article, we take advantage of events surrounding the 1991 nomination of Judge Clarence Thomas to test this hypothesis. Our findings support the conclusion that constituency concerns played a significant part in Thomas's eventual confirmation and imply that further scholarly investigation of this constituency connection is warranted.

PREVIOUS RESEARCH

As a major player in the political process, the U.S. Supreme Court renders decisions that often have considerable impact on major areas of American life. While its decisions are periodically reversed, sometimes limited, and occasionally ignored by the other branches, the court wields significant power, particularly for an institution comprised of so few individuals.

Because the court's composition is a critical determinant of the policies it produces and because justices enjoy a life tenure on the bench, presidential nominations and Senate confirmations are important decisions whose repercussions echo for decades. Moreover, the appointment of Supreme Court justices takes on added importance in an era of divided party government, when representatives of the two parties struggle for control of the judicial branch. In such circumstances, the composition of the court is not only substantively important in terms of policy outputs, it is also a matter of considerable political interest.

Over the years, scholars have paid considerable attention to both the criteria upon which presidents base their nominations (e.g., Abraham 1985; Ackerman 1988; Daniels 1978; Fish 1988–89; Hulbary and Walker 1980; Perry 1991; Schmidhauser 1979; Scigliano 1971) and the "advise and consent" powers of the Senate (Grossman and Wasby 1972; Lively 1986; Nagel 1990; Rader 1988–89). Much related literature has addressed this branch interaction, seeking to illuminate the conditions under which presidents are likely to win Senate confirmation of their judicial nominees. Some examinations have focused on the overall political environment, especially factors related to the partisan balance of power. Halper (1972), for example, concluded that the Senate's opposition to a nominee is usually part of a larger pattern of opposition to the president, making the Senate more likely to reject a nomination put forth by an electorally weak or unpopular president. Others have expanded on this point, arguing that presidents who are late in their terms of office or who lack strong party backing in the Senate have more difficulty winning confirmation of their nominees (Palmer 1983; Scigliano 1971, 97–99; Segal 1987; Segal and Spaeth 1986). It has even been suggested that during periods when the court itself is unpopular, the Senate is more likely to reject nominees, particularly if such unpopularity coincides with presidential weakness (Halper 1972, 111–12; Schmidhauser and Berg 1972, 128).

In addition to examining the Senate's decisions on judicial confirmations, scholars have also scrutinized the votes of individual senators. Much of this research has substantiated the link between senators' ideologies and their voting behavior, especially on controversial nominations (Rohde and Spaeth 1976, 105–6; Songer 1979; and Sulfridge 1980). While partisanship and region have also been shown to have an impact on some confirmation voting, most recent work has concluded that ideology consistently has a larger effect on senators' voting behavior on controversial nominations (see Felice and Weisberg 1988–89).

Building on such work, Segal, Cover, and Cameron (1988–89) have suggested that senators' ideologies

interact with environmental factors to affect nomination outcomes. Specifically, they concluded that ideological distance between a senator and a nominee plays an important role in the senator's voting decision only when the nominee's qualifications have been questioned or when the political environment works against the president (i.e., when the opposition party controls the Senate or when he is in the fourth year of a term). They have also suggested that the behavior of electorally-minded senators is sensible and predictable: "When a strong president nominates a highly qualified, ideologically moderate candidate, the nominee passes the Senate in a lopsided, consensual vote"; on the other hand, when a weak president nominates a "less well qualified, ideologically extreme candidate," a closer, more conflictual Senate vote is likely (Cameron, Cover, and Segal 1990, 532; see also Massaro 1990).

Recently, some scholars have begun to suggest that there is also a "constituency perspective" to Senate voting on Court nominees (Felice and Weisberg 1988–89). This point has been articulated most forcefully by Caldeira, whose review of the literature in this area concluded that "more attention ought to be given to the influence of constituencies and mobilization by organized interests" (1988–89, 532).[1] Segal, Cameron, and Cover have recently addressed one aspect of the constituency connection; examining the relationship between constituents' ideological characteristics and the ideologies of Supreme Court nominees, they conclude that "confirmation voting is decisively affected by the ideological distance between senators' constituents and [Supreme Court] nominees" (1992, 109).

Such findings, of course, comport well with much general research on the Congress, where the received wisdom has long held that constituency preferences influence many aspects of congressional behavior (for authoritative statements see Fenno 1978; Fiorina 1977; and Mayhew 1974). Although some have questioned the impact of constituency on issues where members have strong ideological predispositions (Bernstein and Anthony 1974; McCormick and Black 1983; Moyer 1973), the weight of legislative research seems to agree that strong constituency preferences on salient issues will significantly affect congressional action either at the roll call stage or at some earlier, agendasetting stage (Arnold 1990; Overby 1991). In the area of judicial confirmations, attention to such a constituency dimension has been limited, Caldeira argues, due to difficulties in operationalizing measures of constituency effect and to the fact that court nominations have only recently been the subject of widespread public interest (1988–89, 537).

For several reasons, the 1991 confirmation battle over Clarence Thomas provides an excellent occasion to extend the insights of these researchers and explore in some depth the effects of constituency preferences on Senate confirmation votes. In addition to being a contested, nonconsensual nomination, the struggle over confirmation was of particular interest to an easily identifiable constituency, namely, African Americans. The fact that the size of this constituency varies considerably among the states (from .22% of the population in Vermont to 35.2% in Mississippi) permits testing its effect in a multivariate regression model. What is more, the fact that most organized African–American interest groups opposed the nomination (Biskupic 1991, 2692) while polls showed clear majorities of African–American respondents supportive of Thomas (Moore 1991) permits us to differentiate between the effects of organized interests and unorganized interests (constituencies).

Before turning our attention to the test of the constituency hypothesis, however, it is worth briefly reviewing the details of the Thomas nomination and confirmation.

THE THOMAS CONFIRMATION

On 1 July 1991, President George Bush nominated Clarence Thomas to fill the Supreme Court seat left vacant by the retirement of Associate Justice Thurgood Marshall. At the press conference announcing the nomination, Bush characterized Thomas as the "best person for this position" and denied that the nominee's race or his desire to fill a racial quota on the court had played any part in his choice ("Bush Announces" 1991).

A graduate of Yale Law School and a former chair of the Equal Employment Opportunity Commission (EEOC), Thomas was a judge on the U.S. Court of Appeals for the District of Columbia Circuit when Bush nominated him for the high court. Given his conservative political ideology and his rather turbulent tenure at the EEOC (where he had been criticized for allowing hundreds of age discrimination complaints to lapse without action), it was not surprising that there was significant opposition to his nomination from the beginning. In the Senate, some Republicans and many Democrats indicated they were unlikely to support a nominee who evaded questions or remained silent on the abortion issue (Biskupic 1991b, 1826). Outside the Senate, groups advocating abortion rights, women's rights, civil rights, and senior citizens rights urged the rejection of the Thomas nomination.

Thomas, however, was not without considerable advantages and support. His background, frequently characterized as a self-motivated ascent from childhood poverty in rural Georgia to the corridors of political power, evoked considerable national admiration. Likewise, his genial and composed personality mitigated the fears of some that he was ideological, extreme, and insensitive—another Robert Bork. Moreover, he enjoyed the strong support of Senator John Danforth (R-MO), a powerful figure in the chamber, for whom Thomas had once worked. Heading into the Judiciary Committee's hearings, Senator Dale Bumpers (D-AR) seemed to capture the Senate's emerging consensus when he noted, "Regardless of how I'm going to vote on [Thomas], I feel comfortable

he's going to be confirmed" (quoted in Biskupic 1991c, 2169).

Although he clearly did not please many liberal members of the Judiciary Committee, five days of hearings provided little reason to question the wisdom of Bumpers' assessment. The majority of questions concerned Thomas's views on abortion (he acknowledged a right to privacy but refused to commit himself on whether or not it extended to abortion), natural law (he indicated that his interest was political and did not affect his judicial philosophy), and civil rights (he testified that he preferred individual incentives to group remedies) (Biskupic 1991a, 2621–23).

On 27 September the committee split evenly (seven to seven) on its vote regarding the Thomas nomination. With one exception (Democrat Dennis DeConcini of Arizona), the vote cut along party lines. The Democrats who voted against him cited Thomas's reluctance to discuss *Roe* v. *Wade* and his equivocations on natural law as critical to their decisions. Although the split vote meant that Thomas's name would be forwarded to the full Senate without a recommendation of confirmation, most observers concluded that Thomas had gained momentum during the hearings and that the full Senate was likely to vote in favor of his appointment in early October.

Before the full Senate could act, however, the confirmation process took a very unusual turn. Reporters learned the identity of a woman who had accused Thomas of sexual misconduct during his service at the EEOC; the leaking of the story persuaded her to come forward and convinced the Senate to delay its vote. On 11 October, in front of the Judiciary Committee and before a nationwide television audience, Anita Hill, a professor of law at the University of Oklahoma and a former aide to Thomas at both the EEOC and the Department of Education, accused the nominee of sexual harassment. She alleged that Thomas had repeatedly made unwanted sexual advances to her and regularly included graphic sexual references in their workplace conversations. In his rebuttal, Thomas angrily denied these allegations and accused the committee of engaging in "a high-tech lynching for an uppity black who in any way deigns to think for himself" (quoted in Biskupic 1991d, 2948).

In the end, Hill's testimony failed to derail the Thomas nomination. After several days of extra hearings notable for their tension and a day full of angry floor speeches, on 15 October, by a 52 to 48 vote, the Senate confirmed Thomas to the Supreme Court. In the closest confirmation vote in over a hundred years, only 2 Republicans voted against Thomas, while 11 Democrats, mostly Southerners, voted in favor of his appointment.

MODELS AND ANALYSIS

With that background, we are now ready to examine the struggle over the Thomas nomination from the "constituency perspective," testing to determine whether the preferences of African–American constituencies in the states affected the confirmation voting behavior of senators.

Since the dependent variable we are interested in—the confirmation vote on Clarence Thomas—is dichotomous, we employ a logistical regression model to test the influence of constituency pressure. To control for the effects of senators' partisan and ideological predispositions, our independent variables include a dichotomous variable for PARTY (coded 1 for Democrats, 0 for Republicans) and each senator's Americans for Democratic Action (ADA) score from 1990.[2]

To test for constituency effects, we consider three variables. The first (RACE) is demographic—percentage of the state population that is African–American based on 1980 census data. Second, since previous research has shown that senators tend to pay greater attention to constituency matters as their reelection dates approach (Fenno 1982; Thomas 1985) and it is reasonable to assume that senators from states with large African–American populations might be especially sensitive to constituency opinion on the Thomas nomination, we include both an electoral proximity variable (REELECT, coded 1 for senators facing reelection in 1992, 0 otherwise) and an interactive variable (RACE AND REELECT) calculated by multiplying the state racial percentage variable by the REELECT variable. Together, these variables will allow us to test several components of possible constituency effects.[3]

Since we know from the literature that party affiliation and ideology should both have a large impact upon senators' voting decisions, we first model those two independent variables alone:

$$\text{Log (VOTE/1 - VOTE)} = a + b_1(\text{ADA}) + b_2(\text{PARTY}). \quad (1)$$

We regress the log odds of each senator's vote on ADA score and party affiliation, allowing for an intercept (a). The results of this test (reported in Table 1, col. 1) are predictable. The coefficients for ideology and partisanship are in the predicted direction (negative, indicating that Democrats and those with liberal ideologies tended to vote against confirmation); and when compared to their standard errors both are statistically significant at the .01 level.[4] In terms of model fit, these two variables permit the correct prediction of 88% (85/97) of the votes and reduce the error in predictions by 74.5% over a "naive" model that uses the modal vote as its prediction for all votes.[5]

To test for the direct effect of state racial composition on the confirmation vote, we add the racial demographic variable:

$$\text{Log(VOTE/1 - VOTE)} = a + b_1(\text{ADA}) + b_2(\text{PARTY}) + b_3(\text{RACE}). \quad (2)$$

While the results (Table 1, col. 2) are not dramatic, they are significant. The coefficient for race is in the

predicted direction (positive, indicating that senators from states with large African–American populations tended to vote in favor of confirmation); and when compared to its standard error, it is statistically significant at the .05 level. More importantly, there is improvement in model fit, as the percentage of votes predicted correctly rises to 90% (87/97) and the error declines.

Finally, we construct our most sophisticated model of constituency influence in equation three by adding the reelection term and the interaction variable between race and electoral proximity, in effect testing whether or not state racial composition is most important to senators facing an impending reelection campaign:

$$\text{Log (VOTE/1 − VOTE)} = a + b_1(\text{ADA}) + b_2(\text{PARTY}) + b_3(\text{RACE}) + b_4(\text{REELECT}) + b_5(\text{RACE AND REELECT}). \quad (3)$$

As before, this more sophisticated model of constituency effect enhances the fit. Not only is the coefficient for the interactive term in the predicted direction (positive, indicating that senators facing a large African–American constituency in an impending campaign were more likely to vote in favor of confirmation), it is also significant at the .05 level. Interestingly, while the interactive coefficient is positive and significant, the coefficient for REELECT alone is negative and significant. This is perhaps an indication of the cross pressure many senators—especially those up for reelection—must have felt, caught uncomfortably between African–Americans, many of whom saw in Thomas a role model facing a "high-tech lynching", and others who were concerned about his suitability for the Court because of both his policy stances and Anita Hill's allegations of sexual harassment. Taken together, these additional variables improve the fit in comparison to the naive model, contributing to a better predictive capability of 94% (91/97) and a reduction of error value of over 87%.

Viewed together, the three equations summarized in Table 1 show that racial constituency characteristics consistently exercised a predictable, independent, and significant effect on senators' voting behavior and that there is a steady improvement in model fit as we treat the constituency effect in an increasingly sophisticated fashion. In comparison to equation 1, equation 3 cuts the number of incorrectly predicted votes in half (from twelve down to six) and reduces the error over the naive modal model an additional 12.7%.

Since the interpretation of logistic regression output can be difficult, we also modelled the equations using ordinary least squares. Although we technically violate this method's assumptions by using a constrained dependent variable, the closeness of the vote (52 to 48) mitigates the seriousness of this problem. The recalculations of each equation are presented in Table 2.

While we can have less confidence in the actual significance of the coefficients reported here, these findings generally reinforce those reported in Table 1. Race and the interactive race–reelection variables add to the explanatory power of the model in equations 2

Table 3.

Mean Probability of Vote to Confirm for Moderate Democrats* Under Certain Constituency Conditions

%AFRICAN-AMERICAN IN POPULATION	EQUATION 2 (RACE Alone)	EQUATION 3 (RACE AND REELECT) FACING REELECTION	EQUATION 3 (RACE AND REELECT) NOT FACING REELECTION
0	.19	.01	.07
10	.39	.15	.08
20	.64	.78	.11
30	.83	.99	.12

*For illustrative purposes, a "moderate Democrat" is defined here as one with an ADA score of 50.

and 3, respectively. Compared to equation 1, equation 3 increases the proportion of variance explained (adjusted R-squared) from .68 to .73.

The substantive impact of constituency concerns can better be understood by examining the behavior of specific senators. Compared to equation 1, equation 2 (which adds race) correctly predicts the *yes* votes of senators Ernest Hollings (D-SC) and Sam Nunn (D-GA), both moderately conservative Southern Democrats representing states with sizable African–American constituencies (30% and 29%, respectively). Likewise, compared to equation 2, equation 3 (which adds the reelection and the interactive race–reelection variables) correctly predicts the *no* votes of senators Wendell Ford (D-KY) and Robert Packwood (R-OR). Both of these senators are up for reelection in 1992, yet represent states with relatively small African–American constituencies (7% and 1.5%, respectively), suggesting that they responded to constituents mobilized against Thomas's confirmation. In addition, equation 3 correctly predicts the *yes* votes of senators Wyche Fowler (D-GA) and Mark Hatfield (R-OR). While Hatfield's case is difficult to understand, Fowler's is not. He is predicted correctly by this equation because, although he is a moderately liberal Southern Democrat (ADA = 72), he stands for reelection in 1992 *and* represents a constituency that is 29% African–American.[6] In short, adding constituency variables to the model not only aids in the prediction of votes, but does so in ways that are generally substantively interesting.

The substantive impact of constituency preferences is also highlighted by Table 3, which recalculates the logit regression coefficients generated in Table 1 for a hypothetical moderate Democrat under a variety of constituency circumstances and generates the probabilities of a *yes* vote under such conditions.[7] In the second column, the effect of race is considered alone; and the results are marked. A moderate Democrat from a state with an African–American population approaching zero had only a one-in-five probability of voting for confirmation. As the percentage of African Americans in the population rises to 10%, 20%, and 30%, the senator's likelihood of voting for Thomas increases to 39%, 64%, and 83%, respectively.

The third and fourth columns of Table 3 compare the hypothetical moderate Democrat's probability of voting to confirm, given the significant interactive effect between race and reelectoral proximity. For the senator facing reelection, the effect of race is striking. Such a senator's likelihood of voting for Thomas increases from 1%, to 15%, to 78%, as the percentage of African–Americans in the state constituency rises from 0%, to 10%, to 20%. At 30% African–American population, a moderate Democrat facing reelection is 99% certain to vote for Thomas.

CONCLUSIONS

While the centrality of constituency concerns has long been acknowledged in much literature on the Congress, only recently have scholars suggested that such concerns might affect one of the most important arenas of congressional decision making—Supreme Court confirmations. Moreover, until recently, the historical coincidence of reasonably noncontroversial votes and constituency connections that were difficult to operationalize conspired to make the testing of such a hypothesis nearly impossible. The nomination of Clarence Thomas, however, changed that. With the closely contested, highly controversial confirmation vote and the easily identifiable constituency groups interested, this nomination struggle provides an excellent opportunity to investigate the impact of constituencies on senators' voting behavior.

Our findings in this study extend previous research along an important new dimension that has both theoretical and practical consequences. By demonstrating how, and under what circumstances, constituency characteristics influenced the voting behavior of senators, we have substantiated Caldeira's claim and established that constituency considerations can significantly affect confirmation outcomes, at least in highly salient cases. This suggests that our general models of the process need to be amended to account for this factor. In the absence of such emendations, current models limited to institutional, ideological, and partisan variables will systematically fail to predict the behavior of certain senators—those who for electoral and demographic reasons have cause to be

most sensitive to constituency opinion. Furthermore, we extend the analysis of Segal, Cameron, and Cover (1992) by demonstrating that constituency preferences can influence confirmation voting behavior without working through the intervening factor of ideological distance from the nominee.

These findings carry at least two practical political implications. The first concerns the "representative" nature of the court. In an era of divided party government, Republican presidents and their judicial nominees are likely to face greater hostility and closer scrutiny from Democratic Senate majorities than ever before. Facing such a situation, strategic considerations counsel in favor of recommending nominees who have the support of a political constituency important to key, "swing" senators. Such was clearly the case with Thomas, a conservative African–American who had considerable appeal to several constituencies critical to the electoral fortunes of moderate, Southern Democrats. Whether other demographic groups could exercise the same pressure on the Senate is unclear, but certain groups (especially Hispanic Americans) at least have that potential. More generally, our findings raise the interesting possibility that in an age of televised confirmation hearings and glaring public scrutiny of nominees, "going public" to raise widespread popular interest and bring constituent pressure to bear on wavering senators might be one of the more productive strategies available to the White House in confirmation struggles with the Senate.

Second, in terms of the Thomas confirmation itself, knowledge of the constituency dynamic would have been—or, indeed, probably was—of considerable help to the White House in terms of predicting the outcome of the Senate vote. Operating with just the knowledge of individual senators' ADA scores and party, the White House could have predicted that Thomas would have been confirmed but only by the slimmest of margins—49 to 48, perhaps a close enough call to pull the matter from consideration, at least cause enough for extraordinary White House lobbying pressure or Republican parliamentary delays. With knowledge of the constituency effect, however, the Bush administration could rest easier, more confident of victory. Our full model of the confirmation vote, including ideology, party, race, electoral proximity, and the race–proximity interaction, predicts a 51-to-46 final vote, which is very close to the actual vote of 52 to 48.

In the final analysis, it is unlikely that constituency concerns will ever replace ideological predispositions and partisan loyalties as the principal determinants of Senate confirmation votes. In an age of divided party government, however, when such votes promise to be less consensual, constituency concerns may be of considerable significance in terms of the results of close contests. Given the outcome of the Thomas nomination, it seems likely that both strategic presidents and rational senators will pay close attention to constituency angles in future nomination battles.

Notes

We would like to thank Mark Chaves and John Frendreis for their insightful suggestions on earlier drafts of this article.

1. Caldeira differentiates between constituencies and "organized interests" by noting that the former are "unorganized interests, such as blacks, farmers, women, etc." (1988–89, 532n.).

2. In the case of Senators Brown (R–CO), Craig (R–ID), and Smith (R–NH) we employ 1990 ADA scores from the House of Representatives. Senators Seymour (R–CA) and Wofford (D–PA), both recently appointed, and Wellstone (D–MN), recently elected, without prior congressional service, have no ADA scores, and hence are generally excluded from the analysis, rendering the total number of cases 97 votes. We do not include a measure of presidential support in the model because it correlates highly with ADA scores (at approximately .8) and therefore produces multicollinearity problems in the model. In addition, the most readily available measures of presidential support are widely criticized in the literature (see Edwards 1989, chap. 2, for a summary).

3. We do not include a regional variable in our model, since such variables, especially in regard to southern senators, are often used merely as surrogates for ideology or constituency composition, factors we measure more directly with ADA scores and demographic characteristics.

4. As is usual in such models, determining statistical significance can be difficult and is open to some debate. We follow one standard practice, which is to interpret slope coefficients roughly as t-scores and evaluate them, in this case using a one-tailed test. The utility of such measures of significance is further complicated by the fact that the vote here is a population, not a sample, rendering the substantive interpretation more interesting than the statistical one.

5. In calculating the reduction-of-error (ROE) figure, which serves as a test of goodness of fit, we follow Lindsay 1991 and Hagle 1989:

$$\text{ROE}(\%) = 100 \times (\text{predicted } \% - \text{modal } \%)/(100 - \text{modal } \%).$$

6. In addition, not only is Clarence Thomas a native of Georgia (and, therefore, in a sense, a constituent), but Fowler depends heavily on the African–American community for reelection support. In his 1986 election, Fowler carried 75% of black votes, while winning only 39% of white votes (Petrocik 1987).

7. Moderate Democrats are, of course, the most interesting category in this regard. As "gettable" swing votes whose ideological predispositions had not already made their support virtually impossible, they seemed to be the focus of administration lobbying efforts in the days and weeks before the confirmation vote (Moore 1991).

CONTROVERSY

GOING BEYOND THE STATE?

Timothy Mitchell's article "The Limits of the State" in the March 1991 issue of this Review *stimulated an unusual variety of interested comments. John Bendix, Bartholomew Sparrow, and Bertell Ollman offer critiques and suggestions from quite different points of view. In response, Mitchell clarifies further the distinctiveness of his own approach and its implications.*

COMMENT

The conceptualization of state and society remains troubling. We are dealing not with mutually exclusive categories but with a social and political relationship whose contours and definitions change over time and space. There is an unclear separation between the abstractions and the actual institutions said to be part of the state or society. We hold exaggerated, even romanticized, images of the total domination of state over society (absolutism, fascism) or the total domination of society over state (Marxism, anarchism). When we speak of the limits of the state we imply some point beyond which the state cannot go. Timothy Mitchell's "Limits of the State: Beyond Statist Approaches and Their Critics" (1991) has renewed this central debate for political science; and the neglect of the state that he attributes to the rise of behaviorism and systems approaches in the discipline echoes other critiques (Almond 1990; Caporaso 1989).

Mitchell argues that if we understood the state as "the powerful, metaphysical effect of practices" (p. 94) arising from internally erected distinctions in both state and society, rather than as an actual structure, we would come closer to the concept of the state. While this clever definitional solution owes something to Foucault, Mitchell's treatment of the "essentially idealist" approaches to the state taken by Nordlinger, Krasner, and Skocpol is disembodied, as though they, too, were not responding to previous concepts of the state. The historical development of state structures needs discussion if the "actual state structure" is not to become a straw man. Most importantly, Mitchell's contribution to the debate neglects how the state and society influence one another (Almond 1990).

The traffic across the border between state and society is more interesting than where the ultimately somewhat arbitrary demarcation line is drawn. Already in 1931, one observer claimed to have found 145 different definitions of the state (see Caporaso 1989, 28). States exist by virtue of, and together with, societies. The boundary is defined and contested; but *who* is delineating, negotiating, and crossing that boundary for what purpose is more important to investigate. The interactive elements complicate this pair of terms and make it interesting. To focus on the appearance of the boundaries imposes a definitional separation about which there is great disagreement. Recent analyses of interpenetration and mixed modes (corporatism, intermediate associations with both public and private functions, the interaction of bureaucracies with private interests) seems a more fruitful means to find the "limits of the state."

I suggest an expansion of Mitchell's argument by reviewing the state as concept, as law, and in its historical development. I suggest that we look at the state less in terms of its limits than in terms how it has been conceptualized and put into practice.

THE STATE AS CONCEPT

Max Weber's definition of the state as possessing the monopoly of the legitimate use of force is well known, as is his notion that the system of order of the state claimed binding authority over both citizens and territorial jurisdiction. Less well known is that Weber's state was based on the idea of a powerful corporate group whose membership either closed or limited outside access and whose functioning accorded with norms that corporate groups regarded as valid. While a person or persons were in authority to carry out the order that governed the corporate group, the state as an administrative and legal order was regulated and restricted by legislation (Weber 1947, 145, 156). Weber's definition was neither teleological nor idealistic; and he was aware that the combination of bureaucracy, legally based order, compulsory territorial jurisdiction and monopolization of the legitimate use of force rarely occurred (Bendix 1977).

Two major categories of objections to this definition of the state have been made. The first denies that the state is either unique (as legitimizer of associations, as claiming binding authority over its citizens, or as having a special life-long concern for its citizens) or omnipotent (Weldon 1960, 48–50). I am neither sanguine about the state nor convinced that the state is an association like other social groups. If one applies Hirshman's exit, voice, and loyalty typology to social groups, then state membership is of a rather different order than societal membership (Bendix, Bendix, and Furniss 1990; Skowronek 1982).

The second objection is that states act in class interests. Claus Offe's state sees the bureaucracy as the mediator of a class struggle in the capitalist accumulation process, Nicos Poulantzas' (and Antonio Gramsci's) state reflects the issues of the dominant class and becomes the "materialization and

condensation of class relations" (Carnoy 1984, 107, 130, 254; Chilcote 1981, 366). Yet there are "serious (empirical) questions about the plausibility of a theory of state autonomy for any advanced capitalist country" (Domhoff 1990, 28).

But pluralist, elite, and Marxist views of the state may not be incompatible. Each theory equally permits its adherents to assert a *cipher* image, where the state is passive and ultimately controlled by civil society; a *guardian* image, where the state is an autonomous force that can balance out the social pressures being put on it; or a *partisan* image, where the state advances the interests of its constituent parts, whether organizational or individual, though under constraints and through bargains struck with other social groups (Dunleavy and O'Leary 1987, 327–31).

One cannot understand states without making reference to society, and our confusion about their interaction must be laid at the feet of Hegel. Hegel's universalist state is an impossibility of enlightened absolutist guardianship bound to personal independence anchored in an internalized Kantian sense of duty. The state is the evolutionary high point of the development of the universal; civil society is private, filled with individual interests and activities, and by its very nature cannot achieve the necessary universal freedom (Chilcote 1981, 189). Society incorporates certain universal qualities but has to be guarded by the state; for the two are mutually dependent, interfused, and interacting, though society is clearly subordinate to the state (Barker 1961, 48–50). Hegel's argument permits both state and civil society to be *relatively* autonomous from one another while still exercising reciprocal influence.

Marx's reformulation is intended to undermine what he saw as a "separation of state from civil society" in Hegel (Marx 1977, 33). Marx believes that class domination would lead to a society subservient to the state, which is unacceptable (Chilcote 1981, 421; Giddens 1985, 20–21). Marx's *Critique of the Gotha Program* states that "freedom consists in converting the state from an organ superimposed upon society into one completely subordinate to it" (1977, 564). Hegel had not acknowledged that "developed civil society" remained hampered by the fetters of the privilege system, Marx felt; and civil society was "political society because the organic principle of civil society was the principle of the state" (quoted in Chilcote 1981, 190).

Interpreting the state as subservient to society—in part a legacy of Marx and in part a legacy of legitimizing popular sovereignty—has created an interesting problem. To many observers today the state has no other role to play *but* to serve the citizenry. "If the state has a proper realm," Harry Eckstein wrote, "then it surely is the redistributive" (1979, 16–17). We are left with the illusion that the "state is hard to distinguish from the citizens in whose name . . . its authority is being exercised" (Watkins 1968, 152–53).

The state should be responsive to society, but total societal dominance would make it impossible to meet citizens' needs. No one would guarantee distributive justice, protect the health of citizens, secure national defense, or even provide an alternative to a massive private market (Hague and Harrop 1987, 20–22). The inadequacies of a weak civil society, by contrast, have been very evident in Eastern Europe in the last few years.

Weber's conceptualization is firmly anchored in his ideas of society. The state stands at some remove from, but us ultimately under the control of, social forces; and it cannot avoid interacting with society. Weber reformulates Hegel's state-dominant, universalist interpretation, while maintaining a good portion of the interactive character of civil society with the state. Such a view also emphasizes the importance of popular sovereignty—a notion not easily reconciled with Hegel's emphasis on the guardianship role of the state. Marxist and neo-Marxist visions, on the other hand, have tried hard to eliminate the dynamic tension between state and society. Marx's attempt to undermine an artificial separation of state from civil society is commendable (if a misreading of Hegel); but his solution of favoring society over state to right past wrongs is not. The answer cannot lie in replacing state dominance with societal dominance. The neo-Marxist reinterpretation of the state distorts even Marx's reinterpretation of Hegel. The interaction between state and society is not made clearer by treating the state as a cipher and the power of society as emerging from a single class. Dunleavy and O'Leary's (1987) partisan image at least allows the possibility that both state and society may have their interests, bargains, and constraints.

THE STATE AS LAW

A different answer has been provided by those who see the state as law or popular sovereignty. Modern sovereignty implies both an older supreme power (the monarch's) and a newer legitimation through institutions (legislature, cabinet, executive, citizenry) tied to a constitutionalism that marks state institutions off from society. Social groups are inferior to the sovereign state, yet sovereignty based on popular legitimation makes the state ultimately subservient to society.

Modern sovereignty implies legally sanctioned institutions. The state today is defined as a legal association organized under, and by virtue of, a constitution operating under a rule of law that guarantees the rights, and establishes the duties, of citizens. The state is the "sovereign safeguard" that secures an "external framework for the inward movement of a good life" (Barker 1945; Barker 1961, 47; Benn and Peters 1968, 296).

Government in contemporary democracies is formally accomplished in accordance with written constitutions and administrative procedures that rest upon a system of laws. Yet legal systems differ. In

Continental European Roman law a set of transmitted written codes depended for its authority "on the powers inherent in the person or persons promulgating it" (Hall 1989, 10). Code law implies a subservient judiciary (to emperors, legislatures, legal experts) and thus a state above society, guiding and regulating it and distinct from it. Anglo-American common law, with its independent judiciary and constitution legitimated from below, places society above the state, making law and government the product of the customs and habits of its people. Such legal differences affect how state or government and its relation to society are analyzed.

THE STATE AS THE PRODUCT OF UNIQUE HISTORICAL CIRCUMSTANCES

The Europe of 1500 had 500 political units, the Europe of 1900 only 25 (Tilly 1975, 15). The fragmentation of the medieval era—with its array of economic institutions (guilds, merchant leagues), ecclesiastical power (churches, monastic orders), secular centers (cities, universities) and hereditary rule over bits of territory (aristocrats), all struggling for dominance and autonomy (Eckstein 1979, 6)—allowed for a consolidation by particular hereditary leaders through force, fraud, and alliance. Initially, there was little distinction between the monarch's state, family, property, and society: the French king governed with a family council; Frederick William I of Prussia in 1740 earned as much from his royal domains as he gathered in taxes; and in England the law of property encompassed the rules about public office (Barker 1945, 4–6). Yet increasing central control diluted the monarch's power—Frederick the Great claimed he was only "the first servant of the state" (Dyson 1980, 28)—because a larger territory needed to be defended. Defense meant armies and the development of an efficient, nationwide system of administration to raise the money for the army through taxes. "The business of administration," Ernest Barker notes, "becomes the business of providing and equipping an army" (1945, 39).

The alternatives to paid mercenaries—universal conscription and reliance on local nobility for troops—involved political challenges to the monarch. The first implied functional equality through equal obligation, at odds with the social hierarchy of absolutism; the second led to demands by local notables for favors or representation in return for providing men or money to the king. Yet the king's need nevertheless ushered in the functional equality of treatment through the formally uniform application of obligations across territory and subjects by a national administration.

Society had to become an entity free of the king and the estates that supported him, to move away from its connotation as "high society" and toward a politicized sense of groups organized for collective action. The French Revolution ushered in the new category of citizens and, with it, a politicized society that legitimated self-selected institutions. To the centralized, administrative state was added the new nation and a more inclusive society. Yet the newly legitimated state used the model of central penetration and standardization pioneered by absolutism (Tilly 1975, 66). The rise of market economies had undermined the privileges of estate, and the extension of suffrage made political participation increasingly inclusive and oriented toward collective action. Society came to mean the articulation of political and economic interests from below, even while the economic imperatives of nation-states necessitated continued involvement in the economy from above, particularly in the state regulation of property, status, and money (Fried 1968). In this history one begins to see a sense of the state as a commonwealth, rather than a paternalistic fiefdom, though the vestiges of a sense of the state imbued with idealistic "ennobling sense of purpose" remain as one of the more benign legacies of absolutism (Dyson 1980, 3, 6).

Absolutist rule bore within it the seeds of its own destruction, yet institutional structures established under the aegis of monarchical rule were not entirely abandoned. The role of the state now to guarantee the well-being of the citizens, combined with changes within the market, as well as the rise of nation-states, gave the new institutions of government a role to play in the regulation of property and rights, as well as continuing the older roles of defense of territory and collection of money. The participatory and arbiter sense of state arose with the civil society of the French Revolution, with its functional representations of interest and its competition among organized societal groups (Benn and Peters 1968, 348).

CONCLUSION

I agree with Mitchell that analyzing the state as a free-standing entity is not helpful, but I do not agree that the solution is to treat the distinction as a matter of appearance or the reproduction of a "line of difference." It too readily turns what should be a dynamic interaction into an issue of postmodern semantics.

Understanding the state-and-society boundary better is akin to asserting that the crucial problem in Eastonian systems theory is understanding where "the political system" ends and "the environment" begins. If, as Mitchell implies, the conceptualization of politics in terms of a "system" is flawed, what have we gained by better understanding the external and internal boundaries of that system? American political science has found it easier to study the outputs of institutions than to dwell on the public purposes that motivate state actions and easier to examine welfare policy than the concept of what the general welfare of the citizenry might be. Other intellectual and legal traditions indicate that this need not be the only way

to understand government, though it may be a distinctive feature of British pragmatists and American empiricists to analyze parts, rather than wholes (Dyson 1980, 17). However, organic or cybernetic models, with their use of the "political system" as a substitute for the state (with its inputs, throughputs, and outputs) may not be the most appropriate means to study how history, ideas, and law have interacted in the modern state.

Our conceptual problems come from replacing a static but interdependent Hegelian conception of state dominance and civil society subordination with a relatively dynamic Marxist idea of the development of societal dominance over a state compromised by class forces. The Weberian focus on the binding authority exercised by an exclusive corporate group gets lost in the shuffle. Neo-Marxist instrumentalist views only reinforce the dominance of society *over* state, rather than the interaction of society *with* state. The fusion of state and society provided by deconstructionist orientations does not aid our understanding of the relationship but merely comments on the relationship.

Boundaries do have meaning, whether in the empirical world of keeping undesirables out and citizens in, in the psychological and cultural sense proposed by Fredrik Barth, or in the abstract imperial claim to render unto Caesar that which is Caesar's. But boundaries are crossed, contested, opposed, and acquiesced in by those whom they affect. Boundaries are porous and changeable; and it is in the analysis of migrations across such boundaries that the state and society negotiate their relationship.

But we cannot escape the contradictory tradition of the European state. The modern state emerged from a history of absolutist guidance from above and overarching purpose, combined with a stratification that demarcated who had political and economic power and who did not. Its evolution into a benign guarantor of individual rights and policer of contracts makes us forget that it remains the authoritative definer of the public interest.

Jacob Burckhardt argues that it is an arrogance for the state to "attempt to fulfill moral purposes directly, for only society can and may do that"; the state is the guardian of the law and its business is to "prevent the various conceptions of civil life from coming to blows [so that the] various egoisms but also the various metaphysics shall carry on no blood feuds" (1943, 118–19). Burckhardt's state is custodial, protective, and based on law, rather than social contracts—a union based on conscious reciprocity (Dyson 1980, 11). This humane, functional characterization emphasizes what can be best about a state—not its limits or its definition but how it may interact with what is best in the society it is responsible for.

COMMENT

Timothy Mitchell (1991) attributes to its elusive boundary the difficulty in defining the "state." One group of scholars, including Gabriel Almond and David Easton, finessed the problem of the state–society boundary by abandoning the state as a concept. But their "political systems" approach could not wholly avoid the issue of what constituted the "edges" of the political system—so the boundary question remained, as salient as ever. Other scholars, such as Eric Nordlinger, Stephen Krasner, and Theda Skocpol, resurrected the state as a subject of study but perpetuated this boundary ambiguity by (unhelpfully) restricting the state to a subjective arena of autonomous decision making.

Using the relationship between the U.S. government and the Arabian American Oil Company (Aramco) as an example, Mitchell argues that the state does not mark a "real exterior." Rather, the distinction between the state and society (i.e., among the institutions maintaining societal order) is *itself* a part of a "larger political order"—an order in which Aramco's "nonstateness" is also a resource. Mitchell finds the state–society boundary to be a "structural effect" that identifies which institutions constitute society and which, the state. Central in the creation of this structural effect is the production of *disciplines*, exemplified by the formation of the French Army as it became separate from society. Mitchell concludes that the production and reproduction of the definition between the state and society is "the essence of modern politics" (p. 95).

Mitchell's provocative thesis prompts a two-part response. The first part concerns the primacy of the boundary problem in the study of the state; the second part addresses Mitchell's alternative to a direct study of the state, the study of disciplines.

PROBLEMS WITH THE STATE

Since "a definition of the state always depends on distinguishing it from society," Mitchell holds that the "difficulty in drawing the boundaries of the state" is the fundamental issue for the state, explaining its controversial acceptance in American political science (p. 77). But to implicate the boundary problem as the cause of the "ill-defined" modern state ignores other, important causes for the state's imprecise definition. The presence of these additional reasons casts doubt on the centrality of the state's boundary-drawing problem.

One reason for an imprecisely defined state is the shadow that the distinct conditions of the United States cast on American and international scholarship on the state, granting the international impact of American political science. Whether for reasons of universal (white male) suffrage preceding industrialization, the lack of a feudal heritage, the self-selection of its inhabitants (with the important exceptions of

African Americans and Native Americans), the establishment of a federated and fractioned system of national government, or other factors, the United States has been less amenable to the state label compared to other states (especially relative to a Bismarckian Germany or an absolutist France). After all, Philippe Schmitter's corporatism, applied frequently to studies of European or Latin American governments, for instance, is scarcely used in research on the American government (Schmitter 1974, 1986). But an application of *the state* both to the United States and to other nations is explicit in the work of J. P. Nettl, Krasner, and Skocpol and implicit in the work of Easton, Nordlinger, and others. The different development of the American and non-American states ("American exceptionalism") has played a key role in the troubled concept of the state.[1]

A second reason for an ill-defined state comes from deficiencies in its specification, a problem that is more the consequence of method and less the product of the boundary issue. American political science, with its emphasis on positive research, has been not particularly receptive to the Marxian states of Fred Block (1977), Ralph Miliband (1969), Claus Offe (1974), or Nicos Poulantzas (1973), to name a few.[2] But the work of Krasner, Nordlinger, Skocpol, Stephen Skowronek, and others—work that succeeded the Marxian scholarship and that has been instrumental in bringing about the resurgence of interest in the American state—has conceptual and methodological ambiguities of its own. Three problems, in particular, attend this recent scholarship.

One is simply *defining* the state, as noted by Mitchell. Krasner defines the state as "the President and those bureaus relatively isolated from societal pressures" (1978, 62), a definition that allows for such an insulated state to take a variety of forms over time.[3] Nordlinger, on his part, defines the state as all public officials, federal, state, and local.[4] But Nordlinger's argument on the state's potential autonomy depends on state officials having subjective and independent preferences. Meanwhile, Skocpol's analysis of state autonomy includes state–society relations in its explanation, as Mitchell recognizes (pp. 87–88). Not only is there little agreement by those studying the state on what comprises the state, but those studying the state present problematic definitions of their own. The state has to be pinned down.

Second, there is the problem of determining the status of the state as an *explanatory variable* (see my earlier work, Sparrow 1991). Mitchell writes of the state exclusively as a dependent variable, for example, while Nordlinger considers the state solely as an independent variable.[5] Skocpol uses the state at once as an independent variable, an intervening variable, and a dependent variable.[6] But the status of the state as a variable is of obvious importance in assessing the validity of a state-centered explanation and in evaluating the salience of the state-society boundary. The explanatory role played by the state has to be made clear.

Then, there is a third problem—uncertain *explanation of change* in the state. Change in Krasner's state comes about through an indeterminate convergence of political forces (president, Congress and congressional committees, federal bureaucracies, pressure groups, and even public opinion) on particular policies (1978, 61–66).[7] Skocpol, on her part, does not present a consistent theory of state building (Burawoy 1989).[8] Neither does Mitchell provide the reader with the mechanisms of state change save for a discussion of disciplines (which I take up later). In short, the mechanisms of state change—taking the state as a dependent variable here—are often inexact.

These problems of specifying the mechanisms of change in the state, revealing the status of the state as a variable, and offering precise and consistent definitions of the state raise serious questions for scholarship of the state. These questions are separate, for analytic purposes, from those that address the state–boundary issue directly. The problems in conceptualizing the state warrant separate consideration. Likewise, the problematic application of the state to the American polity and to other (particularly non-Western) polities is an issue that merits serious attention in its own right.

INDETERMINATE DISCIPLINES

The other part of my response to Mitchell concerns his implications for studying the state and the state–society boundary. Mitchell's conclusions are that (1) the state should not be seen as distinct from society, (2) the state-society boundary should be the point of focus in the study of modern political order, (3) the study of the state as the locus of decision making and the policy process cannot suffice, (4) the state should be addressed as the effect of detailed processes that divide the state from society, and (5) the separate structures of the state should be recognized for their abstracted and constructed nature. The crux of Mitchell's project centers on the last two points, however—that the processes dividing the state from society should be seen as part and parcel of the use of power and that perceptions of such processes are themselves resources for political control. It is Mitchell's ambition to reveal that state and society are constructions and that existing institutions contain hidden imbalances of power. Yet this deconstructionist project amounts to an indeterminate and ultimately unfalsifiable political science.

Consider Mitchell's language: "The appearance that state and society are separate things is part of the way a given financial and economic order *is maintained*" and "The *arrangements that produce* the apparent separateness of the state create the abstract effect of agency, with concrete consequences. Yet such agency will always be contigent upon *the production of difference*—upon those practices that create the apparent boundary between state and society; his ultimate object of study, "disciplinary power," operates "not from the outside but from within, not at the level of an entire society but at the level of detail, and not by

constraining individuals and their actions but *by producing them*" (pp. 90–91, 93; emphases mine). The study of power-wielding, boundary-making institutions is typified by the absence of agents acting on behalf of any dominant interests and the omission of mechanisms connecting individual and organizational behavior to systemic outcomes.

The reader is left with little notion of the particulars of such discipline production, however. Take Mitchell's example of the creation of the French Army: "Of course, this apparatus [the French army] has no independent existence. It is an effect produced by the organized partitioning of space, the regular distribution of bodies, exact timing, the coordination of movement, the combining of elements, and endless repetition" (pp. 93–94). Space *is partitioned,* bodies *are distributed,* timing *is made exact,* movements *are coordinated,* elements *are combined* and effects *are repeated,* all to the perpetuation of existing power relationships. This is nothing more than systemic functionalism: "State *practices* define and help constitute a national entity . . . by establishing a territorial boundary and exercising absolute control over movement across it" (p. 94; emphasis mine). Mitchell nowhere provides the reader with the subjects who produce difference or maintain order.

The use of the term *disciplines* follows from Michel Foucault, of course. But Foucault's (1987) *Discipline and Punish* reveals the same agentless explanation of the penal system: "And, if one can speak of justice, it is not only because the law itself or the way of applying it serves the interest of a class, it is also because the differential administration of illegalities through the mediation of penalty forms part of those mechanisms of domination" (p. 272). Law, or its application, serves class interests; and the differential enforcement of the law is part of the same class dominance. Foucault continues, "Deliquency, solidified by a penal system centred upon the prison, thus represents a diversion of illegality for the illicit circuits of profit and power of the dominant class" (p. 280). As Foucault summarizes the penal system, "A whole series of illegalities *was inscribed* in struggles in which those struggling knew that they were confronting both the law and the class that had imposed it" (p. 274; emphasis mine). The outcome (maintained class division) explains individual and organizational behaviors (delinquency and the particular characteristics of the penal system). Again, this is the logic of systemic functionalism.

Raymond Boudon observes that Foucault ends up positing that the ruling class has absolute power, can conceal this power, and can at once exploit the penal system to its own advantage while criticizing imprisonment. As Boudon puts it, "Prison is useful to the police, and the police are useful to the ruling class" (1987, 136–37). Mitchell appears to take this same position: "The appearance that the state and society are separate things is part of the way a given financial and economic order is maintained" (p. 90). The creation of disciplines allows the state to act, directly and indirectly, in the interest of existing power relationships. Only we are not told how to study the detailed processes that actually produce the state–society boundary.

Yet there exists a body scholarship that could serve as a point of departure for a detailed study of institutional behavior and social processes—the work on organizations and institutions coming out of the Carnegie school (e.g., Simon 1948, 1957; March and Simon 1958; Simon 1962; and Cyert and March 1963—and, more recently, March and Olson 1984 and Moe 1984).[9] "Neoinstitutionalists" share a focus on individuals precisely *not* for establishing an independent "set of intentions or preferences, just as persons are thought of as units of autonomous consciousness and desire distinct from their material or social world," as Mitchell has it (p. 88) but, rather, for establishing the cognitive bases of organizational and institutional action.[10] This new institutionalism also pays heavy attention to an organization's environment, acknowledges the loose coupling among organizational components, and emphasizes the reflexive aspect of individual behavior (Powell and DiMaggio 1991, 11–19). By examining the embedded and uncertain qualities of individual action, such an approach is able to provide the microfoundations of organizational and institutional behavior.

Not only is organizational and institutional behavior the product of individual action, but the reverse holds, as well: standard operating procedures, organizational routines, classifications, and framing may determine individual actions and, hence, aggregate outcomes. Once habits, roles and labels become established and taken for granted (even if themselves human creations), they may reciprocally affect individual actions. The preferences of corporate, associational, and governmental actors are not developed autonomously or in distinction to material or social context but are *learned.*

BEYOND THE STATE?

The state may be defined inexactly for reasons apart from its boundary problem. One reason is that the distinct qualities of American political institutions, less amenable to the state label for reasons indigenous to the United States, has hindered the specification of the state in American political and social science. Another reason for the troubled concept of the state has been the methodological imprecision of scholarship on the state, imprecision that has taken at least three forms: (1) those researching the state offer problematic definitions of it and thereby obscure its conceptualization; (2) scholarship on the state has often been inconsistent or ambiguous on the status of the state as a variable; and (3) an inattention to the mechanisms of state change has made the state difficult to study. It is by no means clear that the state–society boundary is the primary difficulty in defining the state or that the troubled boundary

between the state and society in fact defines the modern political order.

We might be cautious before going "beyond statist approaches." A focus on disciplines provides little assurance that research on the state will be other than nonfalsifiable or externally invalid. Neither is Mitchell's attention to microprocedures (the processes that create the institutions constituitive of the state and society) novel. And the recourse to functionalist explanation may be a step backward for political inquiry. When Mitchell says that the state "should be addressed as an effect of detailed processes of spatial organization, temporal arrangement, functional specification, and supervision and surveillance, which create the ap[p]earance of a world fundamentally divided into state and society" (p. 95), we may wonder (1) *to whom* the state and society appear so fundamentally divided, (2) what is *new* about turning scholarly attention to organizational configurations and microprocesses, and (3) *who or what* are effecting such divisions between the state and society through the creation and nurturing of these discipline processes.

In consideration of these remarks and in view of Mitchell's own telling arguments—arguments that debunk the attributed coherence of the state and that explain that the boundary of the state does not actually separate between the mechanisms facilitating social and political order—what may we conclude about the study of the state?

CONCLUSION

It may be hard to do better than recommend a return to the work of Max Weber. Weber defines the state as "an administrative and legal order" with "binding authority" over "the area of its jurisdiction." For Weber, the state "is thus a compulsory association with a territorial basis" (1978, 56). A Weberian definition of the state would identify the state with legal–coercive bureaucracy. But Weber also remarks upon the *zweckrational* behavior of modern business and public administration. The study of the codification, standardization, centralization, and specification of authority in governmental administration—an interest shared by Mitchell—is also included in Weber's analysis (1946, 196–244). Statist research would examine these instruments of administration and policymaking.

But to study the bureaucracy and the means of administration by themselves would still be to restrict the study of the state; for if we are to study the state as a political association claiming a monopoly of legitimate violence (Weber 1978, 54), we need to consider the institutions exercising a monopoly of authority, whether autonomously or through the joint operation of governmental and societal actors. Recall that Weber places primary emphasis on the explicit or implicit coercion of the state (pp. 903, 909). In the terms of Nettl's four ways of defining "stateness," it may be possible for the state to be an institutionalized collectivity (dimension 1), and international unit (dimension 2), and a sociocultural phenomenon (dimension 4) but not have sectoral autonomy (dimension 3). Nettl (1968) omits a consideration of coercion (or nonvoluntarism) in discussing the state, even though he cites Weber in multiple instances. Similarly, Mitchell mentions coercion once (when discussing power and the institutions creating and reproducing power, p. 82) but does not touch on the *monopoly* of power.

The monopoly of power is crucial for any definition of the state, however; for the presence of such a monopoly may implicate nominally private actors, such as professional associations, business corporations, labor unions, and even individuals, in the state. Consider the government–societal ties implicit in extensive transactions in the receipt of retirement benefits and government pensions, the sale of government securities, the payment of income taxes, and military spending. Indeed, Mitchell's reference to investigating "the relationship between state and private institutions in the financial sector, in schooling and scientific research, or in health care and medical practice" suggests precisely this focus (p. 90). This focus is explicit in the work of Laumann and Knoke (1987), who define the state as the networks of interaction between governmental actors (congressional committees, federal bureaus and agencies, and the White House office) and societal actors (trade associations, business corporations, labor unions, and other pressure groups). It is implicit in the work of Skocpol (1979, 1981, 1985) and Ikenberry (1988), who look at state–society relations as part of a statist analysis but do not include such relations as part of the state. The state–society boundary *is* problematic; but it may not be so much a "boundary" as a sector of coordinated, and possibly conflictual, government–society interaction that exercises degrees of jurisdictional monopoly.

A *fourth* response to the problem of the state may be added to Mitchell's three. Besides eliminating the state from study (Almond, Easton); confining it to an autonomous existence (Nordlinger, Krasner, Skocpol); or studying it as a structural effect (Mitchell), we could expand its definition to include the societal actors that—either in direct conjuction with, or tacit agreement with, governmental actors—are able to exercise effective monopolies of authority. Indeed, the literature on "policy networks" and "iron triangles" addresses this very overlay of the "public" and the "private." To study the state defined along this line demands a respecification of the state, however, rather than its relegation to the realm of a "metaphysical effect."

It may be true as Mitchell says, that Weber's definition of the state "does not tell us how the actual contours of this amorphous [state] are to be drawn" (p. 82); but it is also true that Weber never finished his analysis of the state (Bendix 1977). Studies of the state, just like those of the frontier, the law, or army building (subjects suggested by Mitchell) no doubt *can be* specified. Such a program for examining bu-

reaucracies, the means of policy administration, and the relations between the government and society calls for innovative research able to provide indicators of the multiple dimensions of national power—the composite, fractioned, and aggregate qualities of a state—and to test propositions on these constructions of national power. It is incumbent on students of national political authority to do so—to attempt to update Weber's work on the state.

BARTHOLOMEW H. SPARROW

University of Texas, Austin

COMMENT

To his credit, Timothy Mitchell (1991) does indeed go "beyond" the boundaries that have been drawn in most debates among political scientists on this subject, but he leaves us with the question whether he has gone far enough. After effectively criticizing various writers' attempts to establish a clear division between state and society, Mitchell offers a version of their union that emphasizes people's numerous everyday activities that constitute the forms and hierarchies of order and control (our political institutions), while simultaneously making these institutions appear separate from, and independent of, the larger social context. In this way, the same practices that give rise to the state are held to be primarily responsible for the widespread misunderstanding of its nature—in particular, its limits.

But why do we want to understand what the state is in the first place? Primarily, I would have thought, because we want to understand better what the state does. This suggests that most people already have a rough idea what the state does: it makes laws, administers and enforces them, adjudicates disputes on the basis of such laws, and represents people who live under the rule of one state in their dealings with other states. Until greater clarity is attained regarding who and/or what does all this, however, it is difficult to distinguish the state from such kindred phenomena as the government and the nation or to understand why setting the boundaries of the state should be such a problem. Worse, it is impossible to explain the patterns observed in the state's conduct of its work and the effects resulting from there, namely, that some groups in the country consistently play a greater role in the higher reaches of the state and benefit to an inordinate degree from most of what the state does. Well, who are they, and why should this be so? And does it have anything to do with the nature of the state as such? These would seem to be reasonable, and even obvious, questions.

While all the writers that Mitchell criticizes are indeed guilty of setting up the state as an independent entity, they do at least provide us with answers to these questions if only to deny the accumulated evidence—though it is usually more than that, like attributing the observed bias to the decisions of politicians. Mitchell, on the other hand, offers no answers whatsoever. The Foucault-inspired micro practises of "organization and articulation" (p. 92) that constitute the state in his account are disembodied, depoliticized, declassed, and, despite a couple of vague references to history, ahistorical. Emptied of all social content, they can tell us nothing about why the state acts as it does.

Yet there is much in Mitchell's essay that suggests he really knows what the answers are. He says, for example, that the spillover of society into what is ordinarily taken to be the state, their internal relation, has to do with how a "social and political order is maintained" (p. 90). But we never learn who benefits most from maintaining the present social order or how, exactly, the state helps them. The social order itself is never named. Capitalism is nowhere mentioned in his article.

Further, Mitchell is aware that a major effect of the attempt to remove the state from society is that it reinforces the view that the state and/or officials acting on its behalf are free and independent agents, only occasionally influenced—and then only to a minor degree—by larger social forces. From this, it is but a short step to recognize (as I believe Mitchell must, although he nowhere makes it explicit) that there are few beliefs more important to the health of the status quo than the one that treats state institutions as neutral in the political and economic clashes between different groups, implying that each of them has a more or less equal chance of winning the support of these institutions. To believe that the state has special ties to one group, ensuring that its major interests always come on top, would cost the state a great deal of its legitimacy and make it far more difficult for it to do whatever it does on behalf of the favored group.

Finally, Mitchell's own examples suggest to us that he knows more than he says. Respecting the division between state and society, he says, "The essence of politics is not politics formed on one side of this division being applied to or shaped by the other, but the production and reproduction of this line of difference" (p. 95). Do the Aramco Oil Company and American banks, two of Mitchell's main examples (pp. 89–90), engage in politics to establish a clear separation between the state and society, or to promote their own money-making interests? The question should answer itself. If, in the process of promoting their interests, they make use of means that disguise their integration into the state—chiefly as a way of avoiding democratic accountability—this certainly deserves to be mentioned; but it should not require that we exchange one disguise for another. While Mitchell isolates a major ideological distortion that emerges from the particular means by which a favored group helps constitute the state in the very process of using it, he does so in a manner that further mystifies who, exactly, is acting and why they are acting in just these ways.

Why such hesitancy? After criticizing various thinkers for setting the state out from society, Mitchell seems unwilling to investigate the systematic bias that he clearly suspects is present in state practices because he fears falling into the same trap as those he criticizes. To present the state as consistently acting as it does due to pressures (whatever their form) located in society would be to reestablish, he seems to believe, the very separation between state and society that he took such pains to demolish. In short, Mitchell's explanatory framework and commitments keep him from recognizing what, at some other level, he knows to be there.

Is there another way of treating this matter that would avoid this dilemma? Mitchell's own approach suggests that there is. The key to his approach involves extending the notion of the state back in time to include the wide variety of practices by which the institutions of the state came into being. Having stretched the boundaries of the state so far, there can be no objection, in principle, to stretching them a little further in order to include who and/or what are primarily responsible for these practices. Mitchell's conception of the state, in other words, could—and, in my view, should—include the group or groups whose special ties to the state give its forms and practices their distinctive character. This would enable us to explain the patterns we observe in the effects of its forms and practices without introducing a split between state and society. If the everyday activities of citizens helps explain how the state is constituted, it is only the connection between these activities and the requirements of the favored group or groups that can account for why it is constituted in just these ways at just this time. An adequate conception of the state must contain answers to the questions *why* and *when*, as well as to the question *how*.

There is no single answer to where the state ends and where society begins, because these are not neighborhoods separated by broad avenues. Rather, the one performs a range of essential functions within the other. The ways, and even the forms, through which these functions are performed, however, vary considerably depending on both the nature and the stage of development of the society in question. They also vary depending on which group has enough power based on its structural position in society to ensure that its interests generally emerge on top and that the requirements rooted in these special interests get taken as society's requirements. Such a group is more accurately referred to as the "ruling class." With changes in society, in its ruling class, and in what this class requires in order best to serve its interests, the functions of the state will also vary and, along with them, the boundaries that establish state limits, as well as the very meaning of the concept "state" in our discourse.

Functions imply a system, however; and our quest is complicated by the fact that the functions performed by the state belong to three different, though overlapping, systems. These systems are class society, capitalism, and modern American democratic capitalism. They differ from each other in the degree of generality that mark all their qualities—which is to say, our society is a class-divided society and, as such, possesses a host of interacting qualities that are similar to those found in other class-divided societies during the whole period that they have existed on earth (roughly 5,000 to 10,000 years). Ours is also a capitalist society and has many systemic qualities distinguishing it as such, which it shares with all the capitalist societies in the five to six hundred years that this social formation has existed. Finally, our society is a stage of capitalism that has come to the fore under the special conditions that have developed in America in recent years (say, the last twenty to fifty years). What we call "our society," then, is a layered construction composed of sets of internally related qualities that fall on these three different levels of generality, indicative of three different time frameworks.

While the qualities that belong to these three systems are often treated together, we can also distinguish between them; and for certain purposes, it is essential that we do so. As regards the state, it is clear that what is meant by the ruling class, as well as by its requirements, varies somewhat as we move from viewing the United States as a class society, to viewing it as a capitalist society, to viewing it as modern American democratic capitalism.

At the level of class society, the dominant economic class requires political help in reproducing the conditions that underlie its position of dominance. Such help involves various means of socializing the population (especially its most oppressed sections) into an acceptance of the status quo and a repressive apparatus (chiefly, police, soldiers, and courts) that can be called upon when the former do not wholly work. Socialization is aimed primarily at gaining popular acceptance for the institutions of private property, for the basis (whether by divine will, birth, or money) of the prevailing division of labor, and for the idea that the special interests of the dominant class are the same as the interests of the nation. The mystification involved in the latter leads Marx to refer to the state during the entire period of class history as an "illusory community" (1942, 74). It is a "community" because it tries to reproduce the conditions underlying the mutual dependence of all people living in a given geographical area; it is "illusory" because it privileges the interests of one class under the guise of serving the interests of everyone. So much is true of the state in all class societies.

But (as we said) ours is also a capitalist class society; and, as such, it requires political help tailored to the peculiar character and interests of the ruling capitalist class. Perhaps the most distinctive feature of the capitalists as a ruling class is their contant drive to accumulate, to treat wealth primarily as a means to produce still more wealth. While socialization and repression remain essential state functions for capitalism, the nature of accumulation in this period requires certain modifications in the forms through which these functions are carried out. To cite just one

example, workers perform their roles in accumulation more effectively if they feel they have had some freedom in choosing jobs and at least the possibility of influencing state policy in so far as it affects their jobs. All of this gives to the production of capitalist ideology—and to the institutions devoted to this activity—a much more important place in capitalism (and therefore in the capitalist state) than it has in other class societies and their states.

The centrality of accumulation in capitalism also forces the state to undertake a function that does not exist in other class societies and that is helping the capitalists realize the value of their products. Given how capitalism works, capitalists simply require more direct political help in their efforts to enrich themselves than did feudal aristocrats or the slave-owners of antiquity. They require what amounts to state planning on their behalf—and they get it. While rendered mostly invisible by their ideology, such planning covers everything from investing, to borrowing, to keeping production costs down, to buying, to selling the finished products. Most of our tax, trade, monetary, and labor policies (including both laws and their administration) come under the rubric of state planning in the realization of value. The political institutions and practices that serve capitalist interests in these ways are essential parts of the capitalist state.

While Mitchell's examples show corporations and banks only interested in making money (an interest aided by "appearing" private, outside the state), he never examines the system in which this occurs. Consequently, there is no mention of capital accumulation and the kind of help this requires from the state. Had he placed his analysis squarely within a capitalist framework, he would have noticed that appearing separate from society is but one of the ways (though perhaps, ideologically, the most important) in which the state serves the interests of the capitalist ruling class.

Just as ours is a class society and a capitalist society, it is also (as I have said) the modern American democratic capitalist society, and some of what our state is and does pertains to the special interests of the American capitalist class, given its place and role in world capitalism at this stage of its development. If the first set of qualities we examined are shared with all societies within the period of class history and the second with other capitalist societies for the entire period that they have existed, these qualities apply only to the American democratic capitalist state of recent times. Among the new developments that have had a major impact on the character and practices of the state on this level of generality, three seem to stand out. First, the enormous increase in the gross national product, together with the intensification of competition between capitalist societies in the last few decades, has led to the state's taking on a larger and more direct role in the realization of value while, for good ideological reasons, insisting ever more loudly that nothing of the kind is happening. Second, the Cold War has given us the national security state, including the "military–industrial complex," which has greatly facilitated the capitalists' effort to repress internal opposition and bolster their profits by draping both with the mantle of national security. Finally, the development of communications technology has made it possible for the American ruling class to extend the political work of socialization in capitalist ideas and values to the entire globe, transforming the media into an indispensable arm of the state—which is to say, into an aspect of the state itself (or what Louis Althusser dubbed an "ideological state apparatus" [1976, 67–126]).

As our American capitalist class becomes increasingly international, with more foreign capitalists investing in the United States and more U.S. capitalists investing abroad, the political help required to realize value has led to the development of world institutions such as the International Monetary Fund, World Bank, and the General Agreement on Tariffs and Trade, whose economic labels disguise their important political functions. They are the beginnings of a world capitalist state, whose origins and development (as with the rise of the national states that occurred earlier) are best understood as political responses to the changing requirements of the ruling capitalist class on the level of generality of modern capitalist society. The national state in the United States is also losing some of its power to regional political forms, such as the New York Port Authority and the Appalachian Regional Commission, and for similar reasons: the interests of the capitalist class in this period are better served by having certain political functions performed in this way and on this scale. With no democratic accountability to worry about, the technical intelligentsia operating in these arenas can play the role of farseeing statesmen for the capitalist class as a whole.

Barring a socialist transformation, what we also have here is a preview of the next stage of the "American" capitalist state, with the national forms of the state being reduced to performing mainly repressive and socializing functions, while most of the help rendered to capitalists in their drive to accumulate and maximize profits is provided at the world and regional state levels. If we were describing a European country, we would have to add still another level, the multinational level of the European Community, which does not yet exist in the case of the United States but may soon, as the new economic treaties with Canada and Mexico begin to take on a life of their own. How all this will affect the national state's ability to perform its repressive and socializing functions remains to be seen.

Viewing political institutions and practices as internally related to the ruling economic class, as equal and necessary aspects of a more broadly conceived notion of the state, and as falling on three different levels of generality does not keep us from recognizing occasions when a set of unusual circumstances allows some government officials, political parties, and even whole institutions to operate in relative autonomy from ruling-class imperatives. The point is that this is

the exception (and a relative exception at that, meaning short-term and for limited purposes) and not the rule, as is the case in most non-Marxist interpretations of the state. Such exceptions are also largely explainable in terms of the special circumstances that apply. These exceptions also become increasingly rare as we move from the more specific level of modern American capitalism, to the more general one of capitalism, to the still more general one of class society—which is to say that it was easier to have a New Deal (the part of it that favored the interests of workers) than it is to interfere with the structures that underly capitalist—and, more generally, ruling-class —domination.

Nor do I mean wholly to dismiss the struggle by subaltern classes, taking advantage of the problems and contradictions that come with the territory, to use some part of the state to promote their interests. While the cards are carefully stacked against such efforts, it is sometimes possible to win a little or temporarily or to keep a capitalist initiative from succeeding as much as it otherwise would. And by reordering power relations even slightly, every victory resets the odds for the major confrontations up ahead, when the problems inherent in the normal functioning of the system have reached the explosion point. The larger goal of these confrontations can only be to socialize the means of production and in this way deprive the capitalist ruling class of the basis of its power. Should the effort succeed, a new ruling class, representing now the great majority, would organize the state in a way that would best serve its special interests, once again altering the boundaries of the state in the process. The internal relations between state and society (a very changed society, hence a very different state) would remain the same.

If many political scientists treat the state as a kind of "ghost in the machine" (David Easton's not altogether friendly observation, quoted by Mitchell, p. 91), it is only because the machine acts in ways that belie all attempts at explanation that are restricted to the decisions of the people who sit at the controls. Something more and different has to be introduced to help account for the persistent patterns found in how the machine works. Until this is done, all attempts to kick the state out the door (e.g., in the manner of the political systems theorists) will only result in its climbing back in through the window. Recognizing this, Mitchell seeks to highlight the numerous everyday practices that constitute the state in its present form and enable it to function as it does. In so far as these practices are themselves left unaccounted for, however, he has just substituted one ghost for another. It is only by extending the connections that Mitchell *started* to trace back further, in order to take account of the political requirements of our ruling class—grasped as a ruling class in general, as a capitalist ruling class, and as the modern American capitalist ruling class—that the otherwise inexplicable movements of Easton's ghost (and Mitchell's) become comprehensible.[11]

BERTELL OLLMAN

New York University

RESPONSE

In "The Limits of the State" I argued that the state should be approached not as an object, site, or agent, but as a set of powerful yet elusive methods of ordering and representing social practice. These methods create the effect of an agent or structure—the state—that stands outside the social. Most theories of the state respond to this phenomenon in one of two ways. One response is to mistake the effect for something real and reify the state as a self-contained entity. Without grasping the discursive strategies that generate the state effect, such responses merely add to existing representations and become a part of the effect. The other response is to dismiss the effect as illusory and turn attention to the real political forces that stand behind. This overlooks the power and complexity of a discursive order and tries to substitute a simpler, less ambiguous, nondiscursive reality. These alternative responses are illustrated by the two different kinds of reaction to my article published here, Bendix and Sparrow on one side and Ollman on the other.

I first argued that political science had always failed to reach an adequate definition of the state, one that can distinguish it from the social world it seems to order. This is because the boundary between the state and society is elusive, porous, and mobile. I suggested that this elusiveness should not be eliminated by sharper definitions but explored as a clue to the nature of the state. Rather than assuming the existence of a distinct object, we need to bring to light the everyday techniques of difference that create its apparent distinctness.

Sparrow responds with the traditional view that the elusiveness of the state is more a question of "conceptual and methodological ambiguities." He imagines these problems of method to be a separate issue from the discursive ambiguity of the state and offers three solutions:

First, Sparrow says, we must find a definition to get the state "pinned down." This misses the point. A set of practices whose effectiveness lies in making what is elusive, incoherent, and open-ended appear as an object that is ordered, bounded, and univocal cannot be pinned with a singular definition. A definition that is "precise and consistent," such as Sparrow demands, will not capture political relationships whose very nature is to be imprecise and inconsistent.

Second, is the state in relation to society an independent, dependent, or intervening variable? Sparrow claims that I present the state exclusively as a

dependent variable. I do no such thing. The question presumes what my argument denies, namely, that state and society are separable units or spaces. It assumes that each unit has an essence independent of the other and that their relationship can be imagined in the language of nineteenth-century mechanics, in which cause-and-effect is a unidirectional movement between self-contained, externally related objects.

This problem is also found in slightly different terms in Bendix's critique, which faults my article for neglecting "how the state and society influence one another" and complains that I am advocating "the fusion of state and society." He argues, instead, for a study of the dynamic interaction through which "the state and society negotiate their relationship." As with Sparrow, Bendix's argument conceives these constructions of language, cultural representation, and organizing strategy not as aspects of discursive practice but as independently existing objects that enter into relationship with one another. To criticize, as I do, the image of state and society as separate objects is not to advocate their "fusion" into a single object. Rather, it is to propose a less mechanistic and more discursive understanding of how social reality occurs—that is, an understanding that takes the constructed nature of the social seriously, rather than relegating such construction to some secondary realm labeled "culture" or "belief," and that acknowledges that social constructions are not bounded entities with singular identities but strategies and relations that often exceed their limits, become displaced, reverse themselves, or otherwise elude the descriptive realism that sees them simply as objects.

Third, Sparrow imagines the mechanical relationship of state and society to form a structure fixed in place, rather than a process that remains fluid, emergent, and incomplete. He says that we must decide how change affects the state, assuming change to be an exterior force visted upon an otherwise stationary object. All three of Sparrow's solutions to the problem of ambiguity start from the wrong place and end up reproducing the views that my article critiqued.

The second part of Sparrow's response, still picturing the state as a machine, complains that I have not named the operators that run it. He wants me to identify "the subjects who produce difference or maintain order." Why assume that every explanation must lead back to agents who stand outside the machinery and produce or maintain it? Why must our theories recreate the impression that subjects produce difference, never difference, subjects? Sparrow later on contradicts his own criticism by admitting that "procedures, organizational routines, classifications, and framing may determine individual actions." Yet for Sparrow, this relationship must be imagined as reciprocal (the machines running the people who run them), because he works within the dualism that takes the world to be divided into institutions versus individuals, structures versus actions, system versus behavior, and state versus society. He never asks how or why this dualism has come to be so taken for granted. My article attempted to bring these assumptions into view by suggesting that if we are to understand the state, we must see it as an aspect of the history of this dualism. The neoinstitutionalists Sparrow urges us to read cannot help with this.

Nor can Weber. His definition of the state as an organization that successfully claims to monopolize the legitimate use of coercion will not do. As I have argued elsewhere, it is problematic to approach the question of political order in terms of the Weberian distinction between coercive forms of power and the noncoercive, or between force and consent (Mitchell 1990). Too many aspects of the political order cannot be made to fit the terms of the distinction—such as forms of disciplinary, spatial, or institutional power that are physical yet not based on force or forms of violence that create frames of meaning for the language of consent. Weber himself seems to have recognized the difficulties in applying his definition to specific cases. His own writing on the state tends to leave the definition aside and focus, instead, on the professional organization to which it refers. Bendix rightly draws attention to Weber's extensive and important writings on bureaucracy. But this work represents not so much a part of the broader conceptualization of state power that Bendix describes as a narrower, institutionally focused substitute for a definition that Weber himself was unable to make work.

The other kind of response to the elusiveness of the state is to see the state as a fiction, whose apparent power and autonomy disguise the real power of the ruling class that controls it. Ollman proposes that we eliminate the fictional distinction between state and ruling class by stretching the loose boundaries of the state to include the ruling class within it. This would improve upon the prevailing view of the state as an autonomous entity (as my examples of the relationship between state and capital illustrate). But in rejecting the view of the state and the dominant social class as objects or agents independent of one another, one does not have to amalgamate them into a single entity. Ollman seems to acknowledge this by consistently distinguishing between the ruling class as the sovereign agent that rules and the state as simultaneously the instrument and the disguise for the agent's rule.

Yet Ollman's response leaves open some large questions. Nothing he says explains how a group so small as the ruling class can "use" an apparatus so large and amorphous as the modern state to serve so successfully its requirements. Nor does he suggest an adequate account of how this success is so consistently disguised. If the state is the "illusory community," then we need a theory of how such an artificial totality is produced. How do the partial, particular, localized practices of state power come to appear something universal, general and permanent? I argued that the state characteristically appears as a structure, in the specific sense of an abstract, enduring, architectonic frame. How can one explain this

effect of structure? Marx, for all his insight into the process of abstraction that underlies the fetishism of the commodity and the very phenomenon of capital, does not elaborate a theory of structure. He makes frequent use of the analogies of architecture and the machine; but to capture the modern illusion of a structural totality, he tends to fall back on the classical, premodern distinction between essence and phenomenon (cf. Althusser 1970, 184–93).

Offering no analysis of the methods of this illusion, Ollman runs the risk of overstating its effectiveness. His discription of the way the state is used to serve the processes of capital accumulation sounds like a hymn to capitalist efficiency. He admits that there may be exceptions to this ordered functioning of the power of capital but only under "unusual circumstances." The setbacks capital might suffer are never more than small or temporary. Capitalism is thus imagined in its own metaphors, as a complete and unified system whose energies are rationed and whose logic operates without flaw. Fissures are secondary, division is external and short-lived—until some future confrontation that destroys the entire machine. Why not imagine capitalism differently? Why not bring its incoherences and fissures to the center and see the state not as the tool of its efficiency but as a temporary and uncertain coherence somehow engineered?

By subordinating the state to the logic of capital accumulation, Ollman also implies that this accumulation process possesses a necessary and singular calculus. Yet it is far from clear that the variety of forms taken by state practice at different moments and in different places can all be deduced from the logic of accumulation. The work of the regulation school (see Boyer 1990), for example, has been exploring the recent history of different regimes of accumulation and opening up the complexity and variability of the relationship between state practice and methods of accumulation.

Ollman seems to be moving in an opposite direction, reducing five or ten thousand years of global history to just three levels of analysis. Yet even to use a single concept, the state, to cover such a range of historical experience seems liable to mystify as much as it illuminates. Is it appropriate to refer to a five-thousand-year-old requirement of "socializing the population" when even the concept of "the population" has a history of only two or three hundred years and relates to practices of a similar age? Is it appropriate to make the same historical reference to a "repressive apparatus" of police, soldiers, and courts when almost everything we mean by these institutions is equally recent in appearance? Ollman's second level of generalization, "capitalist" societies of the last five to six hundred years, also fails to correspond to the rise of these modern institutions. The innovation that Ollman associates with this time frame, state planning, is even more recent. Finally, Ollman's third level of analysis, American capitalist society of the last 20 to 50 years, corresponds neither to the origins nor to the decline of arguably the most distinctive feature of twentieth-century American capitalism, the Fordist regime of accumulation.

Although I agree with Ollman that it can be helpful to distinguish different levels of generalization and analysis, I find little correspondence between the logical levels he has chosen and the aspects of the state that he wishes to derive from each logic. Even if his three levels were differently or more accurately defined, moreover, it is not clear to what extent they represent separate "systems." At what moment in the last five or six hundred years, for example, and at which sites, does capitalism distinguish itself as a "system" from other systems around it? And why are there only three levels? Could we not discern additional, intermediate levels of analysis and numerous other systems and logics? Even then, might we not find that at each level and for each time frame state practice did not follow a unique pattern but developed a variety of forms and strategies—strategies that on occasion reverse themselves, fail, produce accidental side effects, or otherwise escape the kind of singular and mechanical logic that Ollman envisions?

These uncertainties do not imply that questions of capital accumulation and class power are to be ignored, as they are in so much of the political science literature on the state. Rather, they suggest the need to explain, rather than assume, the relation between larger logics of accumulation and the local mechanisms of state power.

It was in this context that my article emphasized the need to examine the micro, everyday practices that generate the effect of the state, drawing in part upon the work of Michel Foucault. Ollman and Bendix see this emphasis as an attempt to present an alternative to the macro analysis of the state; in fact, it was offered only as a place "to begin." The potential of Foucault's micro analysis of disciplines for developing a macro theory of the state is recognized by Nicos Poulantzas in his later writing, which is strongly influenced by works like *Discipline and Punish* (Foucault 1977). (American scholars tend to ignore the later work of Poulantzas; in fact, the English translation of *State, Power, Socialism* [Poulantzas 1978] has never been published in the United States.) But as Jessop (1990) points out in one of the best recent contributions to state theory, Poulantzas leaves unresolved the question of how the variety and incoherence one finds in disciplinary strategies at the micro level relates to the general pattern of power in the capitalist state. Foucault himself advocates what he calls an "ascending analysis of power," starting from its "infinitesimal mechanisms" and then examing how these come to be utilized, displaced, transformed, or maintained by "global mechanisms and the entire state system" (1980, 99–101). But he never actually conducts this examination, never explains how a global social order can be built out of such a diversity of infinitesimal strategies.

It was, in effect, to this gap in Foucault's work that the latter part of my paper was addressed. I proposed that the distinctiveness of those modern techniques of organization I termed "enframing" lay in the

power to create an effect of order, abstraction, and totality out of mundane methods of distribution and control, an argument I have developed at greater length elsewhere (Mitchell 1988). Rather than deriving these forms of political power from the logic of capital accumulation, as Ollman proposes, it would be more appropriate to consider how capital itself is a phenomenon that is generated from these same methods of abstraction—methods of creating a seemingly abstract, nonpersonal frame of order, meaning, or value out of a diversity of infinitesimal processes of arrangement, representation, and control. One could then explore the relationship between capital and the modern state not by reducing one to the possessor of political power and the other to its instrument but by treating both as aspects of a more general discursive process of abstraction. These are questions that the kind of mainstream conceptualization of the state to which Bendix and Sparrow wish us to return would never enable us to pose.

TIMOTHY MITCHELL

New York University

Notes

Sparrow thanks Mike Dennis, Laura Jackson, Bernard Silberman, and the members of the University of Chicago's Organizations and State-Building workshop and the University of Texas's American Politics workshop for their remarks.

1. This is not an argument for any particular variety of "American exceptionalism." For an overview of American exceptionalism, see Katznelson 1980, 3–17. See also the essays in Shafer 1991.

2. Miliband does not show why a state manager's individual actions need to be consistent with the collective dependence of the state on capitalist interests. Nor can Offe say why individual state actors should necessarily act in the collective interest of the state. Poulantzas, on his part, provides no microfoundations for the state's behavior, leaving the reader with a black-box state. Block, while providing for individual state actors, has difficulty in identifying "working-class pressures" and in dealing with the possibility that a state manager may default from acting in the general interest of capital. See Carnoy 1983 and Alford and Friedland 1984 for overviews of Marxian scholarship on the state.

3. Mitchell omits mention of Krasner's (1984) analysis of state-centered work. Krasner observes, "From the late 1950s until the mid-1970s the term state virtually disappeared from the professional academic lexicon" (p. 223). Krasner goes on to explore "the extent of state autonomy and the degree of congruity between the state and its environment" (p. 224). He proceeds to frame the statist approach in the context of the behavioralist revolution. Krasner thus not only touches on the boundary question but is also very much interested in the intellectual history of, and different perspectives on, the state.

4. Skowronek, on his part, defines the state to be at once composed by a coercive power settling class conflict at the national level; an "integrated organization of institutions, procedures and human talents" at the meso level; and individuals maintaining order at the micro level (1987, 11–12).

5. Nordlinger's (1981) *On the Autonomy of the Democratic State* is a thought experiment on state autonomy and intentionally omits empirical evidence.

6. Skocpol uses *the state* to refer to the societally autonomous cause of particular political outcomes—the state as an independent variable (Ikenberry and Skocpol 1987; Skocpol and Ikenberry 1983; Weir and Skocpol 1985). But *the state* may also refer to institutions mediating crisis or societal changes in order, again, to cause specific policies—the state as an intervening variable (Amenta and Skocpol 1988). Finally, the state may consist of the structures of government themselves, brought into being through preceding policies, particular alignments of political mobilization, and certain systems of representation—the state as a dependent variable (Skocpol 1979, 1981).

7. For Skowronek, "state building" consists of a convergence of tensions provoked by crisis, class conflict, and complexity—a convergence mediated by existing institutions and electoral politics.

8. See Burawoy 1989 for a criticism of Skocpol's (1979) methodology in *States and Social Revolutions*. Burawoy argues that Skocpol's inductivist method obscures the actual theory, that the method is unfalsifiable, and that it is ungeneralizable, that is, a summary of facts that subsequent, uncovered facts could disprove.

9. I say "point of departure" because research on organizations and institutions has gone in a number of directions: the transactions costs approach, with the economic transaction as the basic unit of analysis (e.g., Oliver Williamson, Douglass North); the study of law and economics, with a focus on the contract (Ronald Coase, Richard Posner); the new economics of organization, looking at principal–agent relations (Kenneth Shepsle, Barry Weingast, Terry Moe); and work in international relations (Robert Keohane, Stephen Krasner).

10. This "new," or "neo-,"institutionalism may be distinguished from the earlier institutionalism on the grounds of its response to the behavioralists' comparative neglect of social context and the durability of social institutions, an explicit concern with theory and methods, and a response to empirical anomalies—to wit, the lack of convergence between the study of organizations and politics and rational actor or functionalist accounts of these phenomena (Powell and DiMaggio 1991, 2–3).

11. For a more detailed exposition of this analysis see the chapters "Putting Dialectics to Work: The Process of Abstraction in Marx's Method" and "Theses on the Capitalist State" in my book, *Dialectical Investigations* (Ollman n.d.).

NOTES FROM THE MANAGING EDITOR

FORTHCOMING IN MARCH, 1993

The following articles, research notes and controversies have been tentatively scheduled for publication in the March 1993 issue:

James Q. Wilson. "1992 Presidential Address: The Moral Sense."

Alberto Alesina, John Londregan, Howard Rosenthal. "A Model of the Political Economy of the United States."

David P. Baron. "Government Formation and Endogenous Parties."

John Dryzek and Jefferey Berejikian. "Reconstructive Democratic Theory."

Paul Huth and Bruce Russett. "General Deterrence Between Enduring Rivals: Testing Three Competing Models."

James Johnson. "Is Talk Really Cheap? Prompting Conversation Between Critical Theory and Rational Choice."

William Mishler and Reginald S. Songer. "The Supreme Court as a Countermajoritarian Institution? The Impact of Public Opinion on Supreme Court Decisions."

Roger B. Myerson and Robert J. Weber. "A Theory of Voting Equilibria."

Robert Powell. "Intrinsic Ends and Instrumental Means in International Politics."

Stephen G. Salkever. "Socrates' Aspasian Oration: The Play of Philosophy and Politics in Plato's *Menexenus*."

Lee Ann Banaszak and Eric Plutzer. "Contextual Determinants of Feminist Attitudes: National and Subnational Influences in Western Europe." A Research Note.

Robert H. Durr. "What Moves Policy Sentiment?" A Research Note.

Manus Midlarsky and Ted Hopf. "Polarity and International Stability." A Controversy.

Statement of Ownership, Management and Circulation

Required by Act of October 23, 1962:
Section 4369, Title 39, United States Code

1. Date of Filing: October 13, 1992.
2. Title of Publication: *American Political Science Review*.
3. Frequency of Issue: Quarterly in March, June, September, December.
4. Location of Known Office of Publication:
   1527 New Hampshire Avenue, N.W., Washington, D.C. 20036.
5. Location of the Headquarters or General Business Office of the Publishers:
   1527 New Hampshire Avenue, N.W., Washington, D.C. 20036.
6. Names and Addresses of Publisher and Managing Editor:
   Publisher: American Political Science Association
   1527 New Hampshire Avenue, N.W., Washington, D.C. 20036.
   Managing Editor: G. Bingham Powell, Jr., *American Political Science Review*,
   Department of Political Science, University of Rochester, Rochester, NY 14627.
7. Owner: American Political Science Association
   1527 New Hampshire Avenue, N.W., Washington, D.C. 20036.
8. Known Bondholders, Mortgagees, etc.: None.
9. The purpose, function and nonprofit status of this organization and the exempt status for federal income tax purposes has not changed during the preceding 12 months.
10. Extent and Nature of Circulation:

	Average No. Copies Each Issue During Preceidng 12 Months	Average No. Copies Single Issue Nearest to Filing Date
A. Total Number Copies Printed	15,378	15,525
B. Paid Ciruclation		
1. Sales	0	0
2. Mail Subscriptions	14,497	14,763
C. Total Paid Ciruclation	14,497	14,763
D. Free Distribution by Mail, Carrier or Other Means	102	102
E. Total Distribution (C + D)	14,599	14,865
F. Office use, Left-Over, Uncaccounted, Spoiled after Printing	779	660
G. Total	15,378	15,525

BOOK REVIEWS

POLITICAL REGIME CHANGE: STRUCTURE AND PROCESS-DRIVEN EXPLANATIONS?

HERBERT KITSCHELT *Duke University*

The Faces of Fraternalism: Nazi Germany, Fascist Italy, and Imperial Japan. By Paul Brooker. New York: Oxford University Press, 1991. 397p. $69.00.

To Craft Democracies: An Essay on Democratic Transitions. By Guiseppe Di Palma. Berkeley: University of California Press, 1990. 248p. $35.00 cloth. $11.95 paper.

The Third Wave: Democratization in the Late Twentieth Century. By Samuel P. Huntington. Norman: University of Oklahoma Press, 1991. 366p. $24.95.

Liberalism, Fascism, or Social Democracy: Social Classes and the Political Origins of Regimes in Interwar Europe. By Gregory M. Luebbert. New York: Oxford University Press, 1991. 416p. $49.95 cloth, $19.95 paper.

Capitalist Development and Democracy. By Dietrich Rueschemeyer, Evelyne Huber Stephens, and John D. Stephens. Chicago: University of Chicago Press, 1992. 387p. $45.00 cloth, $19.95 paper.

Political regimes may be defined as the rules and basic political resource allocations according to which actors exercise authority by imposing and enforcing collective decisions on a bounded constituency. Over the past decades, profound political regime transformations in southern Europe, Latin American, East Asia, Eastern Europe, and perhaps now even Africa have revived political scientists' concern with the breakdown and replacement of political governance structures. The main theoretical division within this field is drawn between those who seek more "structural" and "configurational" explanations, on the one side, and those who focus on the process of change itself—the sequence of events and the strategic moves of the actors.

The differences between the two camps encompass theory, methodology, and research design. Structure-oriented scholars typically assume that historical actors face extremely narrow choice sets *or* that their rational choices are clearly constrained by the distribution of resource endowments and their exogenous interest to maximize income and/or power, in light of which they calculate optimal strategies. Process-oriented scholars, in contrast, are primarily interested in the actors' manipulation of their own and their adversaries' cognitive and normative frames. Such change may eventually bring about political regime changes that were neither anticipated nor desired by any of the participants at the beginning of the process.

In other words, the main division in the field of studies on regime transformation is *not* one between historical and political institutionalists, on the one hand, and economic institutionalists with rational choice models, on the other. These two currents represent only strands within the structuralist camp. At most, the two differ on the nature of actors' interests (self- or other-regarding) and the relationship between interests and structural constraints (exogenous or endogenous). What is at stake between structure- and process-oriented studies of political regime change is a more fundamental division concerning the *concept of choice in political action itself*. For structuralists, choices represent calculations in light of given preferences and institutional constraints.[1] For process-oriented scholars, choices are caught up in a continuous redefinition of actors' perceptions of preferences and constraints.[2]

I shall focus the debate within the structuralist camp and between structuralists and process-oriented approaches on the question whether Barrington Moore's seminal hypotheses about regime trajectories in *The Social Origins of Dictatorship and Democracy* (1966) can still be considered valid. In a nutshell, Moore argues that the deconcentration of political power and economic power before the advent of industrialization (precipitated by a commercialization of land, a rising bourgeoisie, and a fragmentation of state power) was beneficial to democratization. At least four of the five structuralist and process-oriented approaches I shall examine address these hypotheses directly or indirectly.

Structure- and process-oriented approaches also differ on methodological and design-related questions. Structuralists prefer systematic macroquantitative or conceptually disciplined qualitative comparison, with countries as units of analysis. As the books by Huntington, Luebbert, and Rueschemeyer, Stephens and Stephens testify, followers of the comparative case study methodology have also ventured to increase the number of cases they compare and thus to lend more credibility to their main theoretical contentions.[3] In contrast to structural approaches, the process-oriented literature revolves around descriptive diachronic reconstructions of individual cases of regime transition with very little systematic comparison across a wider universe of countries. Whatever comparison is brought in remains on the illustrative and impressionistic level. I know of no single process-oriented study that supplies a systematic comparative analysis of regime transitions for a large number of instances.[4]

I wish to argue that structuralist and process-oriented analyses do not directly compete with each other but focus on different objects of explanation with different research methods and comparative designs. Taken as absolutes, structuralist approaches tend to explain "too much," whereas process approaches explain "too little." Structuralist approaches are good at accounting for the general causes of

regime breakdown and the consolidation of new regimes. Process approaches may explain the timing of breakdown and transition as well as the specific trial-and-error process of searching for a new viable regime. Structuralists have little to say about timing and transitions; nor have process-oriented studies succeeded in predicting regime consolidation. As far as the probability of democratic consolidations is concerned, a modified version of Moore's arguments still appears to have considerable plausibility.

STRUCTURALIST APPROACHES

Gregory Luebbert concludes his study of regime change in the interwar period with an unabashed structuralist proclamation: "One of the cardinal lessons of the story I have told is that leadership and meaningful choice played no role in the outcomes" (p. 306). Drawing upon a wide range of cases essentially covering the entirety of Europe, including the Balkan states, Luebbert claims that it is class cleavages and class alliances articulated on the level of group and party mobilization that determined whether regimes became fascist, liberal democratic, or social democratic in the interwar period. In a nutshell, the strength of liberal democratic free-market-oriented parties before and after World War I is key. Such parties were furthered before World War I by the absence of religious, ethnic, or regional cross-class cleavages that could have divided nonsocialist voters. Dominant liberal parties were able to enter alliances with the emerging labor parties against entrenched conservative and antidemocratic elites and thus weakened and coopted the labor movement in a democratized capitalist order (Britain, France, Switzerland). Whereas strong liberalism with weak labor movements persevered during the interwar decades of economic crisis, divided bourgeois parties and strong labor mobilization before and after World War I led to fascist regimes where the peasantry threw in its lot with the reaction (esp. Germany, Italy, Austria, and, to a lesser extent, Spain) and to social democracy where the peasantry entered red–green coalitions (Scandinavia). In eastern and southern Europe, mass political mobilization, particularly that of the working class, had not proceeded far enough to yield anything beyond an authoritarian dictatorship, regardless of whether fascism, liberalism, or social democracy are considered (pp. 258–66).

Whereas Barrington Moore saw large landholders and labor-repressive agriculture as a key force promoting fascism in the twentieth century, Luebbert maintains that by the 1920s, the German Junkers no longer played a critical economic role and that the landed elite did not control the votes of rural laborers anyway (p. 309). Luebbert's argument, however, fails to recognize that an application of Moore's thesis to twentieth-century regimes must necessarily emphasize the imprints past class dominance had left on the political organization of the state and on the mobilization of the peasantry. In fact, where feudal and absolutist regimes based on large landowners had disappeared early, fascism had no basis for success because either the state organization (military, bureaucracy, judiciary) was inimical to a new authoritarianism or a class of family farmers had an independent political voice that usually favored democratization, or both.

The critical cases undermining Luebbert's arguments are Belgium and the Netherlands, included among the countries he classifies as without hegemonic liberalism before World War I; yet contrary to his theoretical expectations, they did not produce fascism in the interwar period. Both countries are, however, characterized by the early demise of feudalism, the dominance of family farms, and a large market-based middle class.

Luebbert's argument that late industrialization has nothing to do with the failure of liberalism (pp. 59–62) also rests on weak foundations. Timing may not be as important as the character of late industrialization in critical countries in order to account for regime outcomes. Late industrialization is often associated with an initially state-led process of industrialization yielding a highly "organized" capitalism with a bourgeoisie closely intertwined with an antidemocratic state apparatus. If there were no offsetting conditions, such as an independent liberal–democratic peasantry (Sweden), this pattern of industrialization favored authoritarianism (Germany, Japan). Again, this interpretation explains why Belgium and the Netherlands escaped authoritarianism in spite of cross cleavages dividing liberal parties. Both countries experienced a gradual and relatively spontaneous, decentralized process of industrialization.

Although Luebbert is a structuralist, he is forced to admit the contingency of political choice in at least one critical instance. He argues that whether or not farmers allied with the Left or with fascism essentially depended on the socialists' choice to mobilize farm workers. If socialists engaged in that strategy, they tended to unite midsized farmers and large landholders against the Left and thus prepared the way for a fascist coalition, whereas in other instances red–green alliances were feasible (pp. 277–95).[5] In the spirit of Luebbert's structuralism, however, it must be noted that countries where peasants coalesced with fascism had a different legacy of agricultural property rights than countries where they did not. Conversely, if historical patterns of landholding and their political consequences did not matter, political choice on the part of socialist party leaders is clearly critical in accounting for interwar regime outcomes. Luebbert cannot have it both ways, that is, both deny the political consequences of rural political economy and provide a structuralist account of interwar regime outcomes.

Overall, Luebbert's account convincingly demonstrates that structures matter, but he may push this point too far. For example, the *timing* of the antidemocratic relapse in Germany, Italy, or Spain could hardly be accounted for by his model. Moreover, structuralism yields no deterministic, but a probabi-

listic, prediction. Even if all the structural constraints were right, would there have been a rise of the German Nazi party to power in 1933 had it not been for the Depression and the unique form of elite politics ushered in by the provisions of the Weimar constitution?

Luebbert's historical account yields rather pessimistic conclusions for the future of democratization in the late twentieth century. Liberalism and democracy were compatible only before the working class acquired the capacity to mobilize and disrupt the operation of free markets early in this century. Liberal–Labor alliances, modeled on pre–World War I Britain or France, between the urban middle class and the working class are thus extremely unlikely (p. 315). At the same time, a rural middle class was critical in the past and does not appear to be present in most countries still facing the possibility of democratization. Luebbert also does not hold out much hope for a "tutelary," restrained democratization under elite control because it will only compound the problems of democratic stabilization (p. 313). Under these circumstances, he envisions instability as the only "stable" outcome, "a cycle of establishment of democracy and its collapse, military intervention, and withdrawal" (p. 315).

Luebbert's book is an impressive achievement in its comparative scope and its unrelenting, tenacious defense of a clear analytical thesis; yet it ultimately leaves too many empirical anomalies unaddressed, maybe because Luebbert did not take Barrington Moore seriously enough. In contrast, Rueschemeyer, Stephens and Stephens's *Capitalist Development and Democracy*, though analytically more complex and less tightly knit, incorporates more aspects of Moore's thinking and arrives at more plausible and valid explanations of an even wider range of cases than Luebbert considered. The authors' objective is to synthesize two hitherto antagonistic traditions in research on regime change and apply the synthesis to regime change in today's advanced industrial countries (Western Europe and British settler democracies), Latin America, and the Caribbean. Macroquantitative studies have consistently found that economic development furthers democracy. Comparative historical analyses in the political economy tradition from Weber to Moore, however, have emphasized class relations and political institutions. Rueschemeyer and his coauthors argue that comparative historical political economy provides the *mechanisms* that explain why, when, and how economic development translates into democracy. Moreover, political economy can explain the cases that remain "outliers" in macroquantiative analysis.

Greater explanatory specificity in accounts of regime transformation requires examination of three sets of variables. First, class interests and class alliances matter, but in ways that modify Barrington Moore's master thesis. Consistent with Moore, Rueschemeyer, Stephens and Stephens show that labor-intensive and labor-repressive agriculture under the direction of large landowners is inimical to democracy. They also demonstrate that in the late nineteenth and early twentieth century the political effects of long-term political hegemony of landowners on state structures (military, bureaucracy, judiciary) may be as important for political regime forms as the direct impact of agricultural property rights.

Contrary to Moore's thesis, Rueschemeyer, Stephens and Stephens argue that the bourgeoisie is generally inimical to democracy. The true source of persistent democratic drives is working-class mobilization, which, in combination with middle-class support, can bring about a political constellation favorable to democracy. The authors qualify their emphasis on the working class in several respects. When turning to Latin America, they note that the middle class is critical in bringing about full democratization (pp. 167, 181, 216–7). Even for advanced industrial societies, however, the subordinate role of the middle classes may be questioned. If the working class is mostly for democracy, it is really the middle class—a concept the authors define as "urban professionals, state employees and employees in the private sector, artisans and craftsmen, and small entrepreneurs, sometimes joined by small and medium farmers" (p. 185)—whose variable position determines regime outcomes. A good part of Rueschemeyer, Stephens and Stephens's middle class may be covered by Moore's concept of bourgeoisie, thus reducing the gap between the two accounts. Going beyond simple structural accounts of stratification, Rueschemeyer, Stephens and Stephens emphasize that class formation is an organizational process, rather than a political–economic configuration of property rights. But they might have further developed this insight in systematic comparisons of working-class, "middle"-class, and bourgeois-class formation to highlight their position vis-à-vis Moore.

The other two sets of variables explicitly theorized in Rueschemeyer, Stephens and Stephens's explanatory framework are state structures and transnational power structures. In general, the more resources state elites control independently of socioeconomic classes and the more they represent a hierarchically integrated and ideologically united state apparatus, the more likely it is that authoritarian regimes will take hold. The precise nature of state influence depends on the countervailing force of independent voluntary associations ("civil society") and the nature of the dominant class from which the state is autonomous. Also, transnational power structures have highly contingent effects. In general, dependency in the periphery of the world system involves mechanisms unfavorable to democracy (foreign direct investment, capital-intensive and sectorally constrained industrialization, or labor-repressive and labor-intensive agriculture). But the authors also show that British colonialism and its legacies in state structures also had indirect effects that kept the "British" Caribbean, with few exceptions, democratic in the post–World War II era, whereas the "hispanic" Caribbean under U.S. influence experienced some of the most repressive and exploitative dictatorships of

that era. In addition, other international factors, such as war, the Cold War, and alliance systems, have significant but varied effects on regime change.

Whereas these three sets of variables (particularly class structures and alliances) tend to account for democratization in advanced industrial countries very well and also cover the four cases of authoritarian breakdown (Italy, Germany, Austria, and Spain [pp. 99–121]), the discussion of Latin America and of the Caribbean requires a further set of variables, namely, the institutionalization of political parties. The authors discover that only where parties are institutionalized as lasting competitive organizational alternatives (whether based on clientelistic linkages or programmatic differences) do democracies survive for any length of time. It is somewhat unfortunate that the systemic role played by parties is not emphasized also for Western democratization. Characteristically, in Germany, Italy, and Spain the nonsocialist parties did not solidify around firm party organizations in the interwar period and were easily swept away by fascism. Austria is the exception, but here a full-fledged fascism was imposed only through Germany's annexation of the country. The importance of parties in twentieth-century political regime change would have allowed the authors to marry Moore's and Luebbert's central insights in a more encompassing framework.

The authors touch upon the role of ideology in regime change briefly but postulate that it is "linked to structural and organizational realities" (p. 50). In particular, this applies to religion. While the authors maintain that religious organization is more important than church doctrines (p. 275), the two elements are usually so highly intertwined that it is not clear in which direction the causal arrow runs. Moreover, lacking a close analysis of countries beyond the reach of Christian doctrines and church organizations, it is hard to determine how important either aspect of religion is for political regimes.[6]

Given the complexity of the variables Rueschemeyer, Stephens and Stephens take into account, what is the analytical bite of their study? What events and trajectories of regime change does it rule out? The discussion of the Latin American cases (preceded by a 12-page summary of the main argument), in particular, is so complex that it is not entirely clear in the end what has been achieved in terms of explanatory parsimony. Rueschemeyer, Stephens and Stephens do wish to argue against a facile modernization theory associating industrialization with democracy; yet at the same time, they embrace it as a partial explanation. They emphasize the role of the working class but do not get around the role of the middle class. The discussion of state structures and transnational relations leaves so many options and contingencies open that just about anything appears to be possible. One wishes the authors would have explored some less complex structural explanations, such as Ronald Rogowski's elegant and provocative account of political cleavages and regime alternatives in *Commerce and Coalitions* (1989) to show that a complex approach still combines the virtues of greater empirical verisimilitude and of discrimination between predicted, possible, and impossible pathways of regime transition.

At times, one has the impression that Rueschemeyer, Stephens and Stephens try to convert every contingency into a structural historical determinacy in order to exorcize the role of a process-oriented account of regime change. Particularly in Latin America, where it is often hard to say whether regimes ever "consolidated," this standard may be driving the structuralist approach too far. Rueschemeyer, Stephens and Stephens argue against the "presentism" of process-oriented explanations of democratic regime transitions (p. 35); but they do not confront these explanations with their own findings. The complexity of their account is rooted in the ambition to explain regime trajectories exhaustively and represent complex configurations and sequences of causation. In light of the result documented in their book, however, more than a few readers may conclude that the isolation of individual mechanisms affecting political regimes and the selective consideration of contingencies to account for outliers promises to provide a more manageable structuralist research strategy than explanatory holism. Nevertheless, Rueschemeyer, Stephens and Stephens have produced a splendid book that will definitely further theorizing on political regime change.

In the spirit of Moore, there is one very important hard-and-fast message that consistently comes across in Rueschemeyer, Stephens and Stephens's study: countries with labor-intensive and labor-repressive agricultures will not become stable democracies. This message also influences their concluding speculations about the future of democracy. In Taiwan and South Korea, the absence of a landlord class and rapid industrialization combined with the strength of autonomous states yields moderately favorable prospects for democracy. The decline of agriculture has also brightened hopes in Latin America; but the weakness of working-class organization, state and military autonomy, dependence on foreign capital, and the lack of strong parties cast dark shadows over the future of democracy on that continent. In Eastern Europe, finally, the *nomenklatura* may constitute the functional equivalent of a landlord class and the large autonomous state apparatuses within weak civil societies also do not bode well for democracy. Even in the early 1990s, structuralists like Luebbert or Rueschemeyer, Stephens and Stephens arrive at muted-to-pessimistic conclusions about the future spread of democratization.

PROCESS-ORIENTED APPROACHES

Whereas structuralists hold actors' preferences constant and focus on changing institutional constraints, process-oriented studies of regime transformation emphasize the contingency of all parameters of choice. In this regard, Paul Brooker's *The Faces of*

Fraternalism represents an analysis at the crossroads between the two perspectives. It is emphatically rooted in Durkheimian sociology in its emphasis on the changing role of a comprehensive collective conscience/consciousness for societal integration and regime stability. Yet Brooker is careful to explain in the first three chapters of his study that efforts to revive a communitarian spirit by "fraternal" political regimes in Germany, Italy, and Japan in the first half of the twentieth century cannot be explained in social-structural terms. Fraternal appeals did not initially inspire a mass following; nor did it necessarily come to the fore before, or even soon after, national socialism, fascism, and its Japanese military variant came to power. Thus, contrary to Durkheim, fraternalism does not grow out of a segmental division of labor with mechanical solidarity but somehow emerges in advanced, functionally differentiated societies with organic solidarity, something that would appear to be an anachronism to Durkheim. For this reason, Brooker offers a quasi-rational explanation of fraternalism in twentieth-century politics. In order to consolidate domestic regime entrenchment and to mobilize psychological resources for their external imperialist plans, totalitarian regimes decided to engage in fraternalist appeals and mass organizations (p. 74). Over more than two hundred pages, Brooker then provides a detailed account of the organizations and mechanisms each of the three regimes employed to instill fraternalism in the population. The concluding assessment argues that fraternalism was carried furthest in Japan yet remained more or less unsuccessful in Germany and Italy. In the most successful case, however, structural conditions for fraternalism were most conducive.

Brooker warns his readers on the first page of the preface that "most political scientists and sociologists will view the book as conceptually lightweight" (v); and this, indeed, is the book's major problem. Its conceptual apparatus and explanatory thrust could have been strengthened by engaging in a variety of related or competing theoretical approaches to fascism and to the rise of segmental or "pillarized" mass parties and reactionary social movements in order to explore why these, but few other, countries were vulnerable to the lures of a totalitarian order appealing to a new spirit of particularist (racist, nationalist) community. In terms of comparative design, Brooker samples on the dependent variable. Fraternalist regimes would appear in a much starker light if they were contrasted to regimes that failed to become fraternalist when faced with similar decision problems and political crises. Why is it that fraternalist appeals struck a resonant cord within elites primarily in Germany, Italy, and Japan but not in most other industrial countries? Brooker does not answer this question. In the end, Brooker provides an instructive description of the internal institutions of totalitarian rule in the three countries but little more. The book's greatest weakness, in fact, may be that it does not discuss alternative structuralist comparative accounts of regime change, such as the strand of analysis to which Barrington Moore had contributed.

Guiseppe Di Palma's *To Craft Democracies* has rather different ambitions and is firmly rooted in the "proceduralist" view of democratic regime change. Not structural conditions but human actions achieve democratic consolidation. At the center of Di Palma's concerns is the process of "democratic crafting" involving "negotiated agreements" between challengers of the old order and incumbent elites that move common perceptions of self-interest toward accepting democracy as the best possible regime form under given conditions. The establishment of democracy, unlike that of other systems, does not legislate a particular distribution of resources among social groups, but institutes uncertainties over outcomes as Adam Przeworski (1991) argued in *Democracy and the Market*. For this reason, Di Palma believes that the game between authoritarian elites and challengers can be more easily converted into a positive sum game, provided that the right steps in the process of regime transition are undertaken. Authoritarian elites must be assured of "coexistence" and fair play. For this reason, the transition should be engineered through negotiated agreements (pacts) that focus on rules of decision making, rather than outcomes. Demonstration effects and the diffusion of successful examples from abroad may be important in precipitating such steps. Careful crafting can exploit the elites' internal divisions on strategy and their sense of uncertainty about their own interests. Di Palma demonstrates these strategies of *garantismo* with an analytical reconstruction of the Italian and Spanish experience and contrasts it to the Portuguese case, where democratization almost failed.

Di Palma then discusses a number of tactical devices that facilitate the transition process. In addition to pacts, a speedy timetable of electoral reform and balanced concessions among all participating forces pave the road to democracy. Over time, the rules that are instituted generate their own support, once actors devise their strategies around the new opportunity structures. For this reason, "legitimacy," as a normative belief in the correctness of the system of rules, is certainly not a precondition of democracy. Institutional habituation of actors' strategies to democratic procedures is the overriding goal of democratic crafting.

While not denying that tactical moves on the part of democratic challengers and skilled techniques of converting games into positive-sum payoff structures facilitate a transition to democracy, we must ask how far such processes carry us in explaining democratic consolidation? Much of his attack on structuralism targets a vague modernization-theoretic version that stresses democratic values and elite attitudes yet not the more hard-nosed comparative studies in the tradition of Moore and others that focus on property rights, class relations, and state institutions. After Di Palma raises some rather strong claims for procedural analysis in the opening chapters of his book, he takes much of them back in chapter 8 where he begins to

compare, in a rather impressionistic and unsystematic manner, the structural conduciveness of different regions and countries to democratic crafting. Such crafting, taken by itself, is insufficient to explain democratic prospects in particular cases: "Even when we favored explanations that focus on the transition and its strategies, these in turn have begged for their own explanations—often of a deeper historical and structural nature" (p. 156). The final chapter of the book also raises the importance of international system configurations and concedes that hegemonic powers play a critical role in regime change.

In the end, Di Palma's book provides several interesting insights into transition techniques that may make a difference in countries characterized by roughly similar structural conduciveness to democratization. These observations, however, could be analytically sharpened. For examples, Di Palma's study puts a great deal of emphasis on pacts and agreements between incumbent and challenging elites yet never engages in a specific analysis of the different scope, bindingness, timing, and longevity of pacts in the transition process. More importantly, the book does not deliver a specification of the structural circumstances that may give significance to different techniques of crafting for the ultimate outcome. Di Palma delivers a timely reminder that economic, political, and cultural determinants are not everything when we try to understand regime change but does not present a sufficiently crisp and precise analysis, corroborated through systematic comparison, to advance the emerging field of "transitology" in significant respects. Whereas structural approaches explain too much, Di Palma's "transitology" explains too little. For this reason, Di Palma's optimism requires a more robust theoretical base.

COMBINING STRUCTURAL AND PROCEDURAL ACCOUNTS OF DEMOCRATIZATION

Samuel Huntington, in *The Third Wave*, lays out a broad, eclectic canvass that encompasses structural and procedural arguments. He also considers the most comprehensive universe of cases and treats them in a more rigorous comparative analysis than does Di Palma; but he is less systematic than Luebbert or Rueschemeyer, Stephens and Stephens in tracing the impact of different sets of variables on regime patterns. Huntington resists efforts to pigeonhole his account as "nomothetic" or "ideographic" from the very beginning (P. xiii). Democracies are complex phenomena, and they are caused by many forces' contributing to historical "waves" of democratization. In contrast to the first two waves following on the heels of the two world wars in the twentieth century, the third wave of democratization beginning with the 1974 Portuguese revolution appears not to be triggered by international political events but by a variety of domestic forces. It is important to note that that 23 of the 39 countries democratizing since 1974 had at least one previous democratic experience, whereas most countries that had never been democratic stayed authoritarian until 1990 (p. 44). This association reestablishes a linkage to externally induced democratization in previous waves.

Overall, Huntington sees five causes of the third wave—at least three of them structural but one unambiguously procedural. First, authoritarian regimes are unable to dissociate the regime's economic effectiveness from the legitimacy of rulers or the legitimacy of rulers from legitimacy of rules of governance. Hence, the oil shocks and the economic dislocations and structural transformation of the world economy in the 1970s and 1980s precipitated the downfall of many dictatorships. With the decline of communism, "outside of Africa and a few countries elsewhere, democracy had come to be seen as the only legitimate and viable alternative to authoritarian regimes of any type" (p. 58). Second, Huntington stresses the importance of economic development but sees it as neither a necessary nor a sufficient condition. Going beyond older modernization approaches, he argues that the source and distribution of wealth are important. Hence, the oil-rich, state-centered regimes did not become democratic; but countries that generate a broad-based urban middle class through a wide diversification of a growing industrial economy did. Huntington's analysis is here quite close to Rueschemeyer, Stephens and Stephens's main hypothesis and certainly consistent with the overall gist of Moore's earlier analysis. Third, however, Huntington emphasizes the independent effect of religious doctrine and religious change. Reversing Weber's causal chain, he notes the rise of Christianity—particularly an individualist and socially activist Christianity—in democratizing countries that has forced Catholicism to withdraw support from the political status quo. Fourth, beyond these structural changes, new transnational politics effected by the United States, the Soviet Union, the European Community, and the Vatican improved the atmosphere for democratic change in the 1980s. Finally, the democratic wave began to feed on itself. Demonstration effects and snowballing reinforced opposition efforts to bring about democracy in countries where structural conditions were even mildly conducive to regime change.

Huntington shows that the mode of transition interacts with the nature of incumbent political regimes (p. 133); thus, he goes significantly beyond the structuralism/proceduralism divide. Elite-initiated or elite-negotiated transitions are most typical in bureaucratic one-party or military regimes, whereas personal "sultanistic" dictatorships hold out less promise for change and often require the wholesale replacement of the ruling elite. For each of the patterns of transition, Huntington provides detailed descriptions of actors' moves and tops off each analysis with a set of lessons actors might draw. For example, reformers should always participate in elections, because even rigged elections, monitored by

foreign observers, weaken an authoritarian regime. In any case, rulers usually miscalculate their chances in open elections, except in cases where there is only a small urban middle class (p. 179).

Huntington finally discusses various aspects of democratic stabilization, such as how to decide on the prosecution of authoritarian elites and how to deal with the military. The most interesting segment deals with the prospects of democratization of countries that have made initial steps in the third wave of democratization (pp. 270–79). Based on their previous democratic experiences, economic development, location in the international system, and duration of democratization effort in the third wave, Huntington is least optimistic about Mongolia, Sudan, Pakistan, Nicaragua, Romania, Bulgaria, Nigeria, and El Salvador.[7] He remains especially pessimistic about democratic prospects in regions of the world that have not entered democratization, especially homegrown Marxist–Leninist regimes linked to nationalist appeals, sub-Saharan Africa, Islamic countries, and certain areas of East Asia. Huntington makes a special point to highlight the antidemocratic implications of Confucian and Islamic religious doctrines, a factor not considered by any of the other studies.[8]

Huntington's analysis is impressive in scope; but at times he is compelled to trade sophistication in conceptualizing critical variables for breadth of comparison. Rueschemeyer, Stephens, and Stephens's account of economic development, class structure, and democratization tends to go in the opposite direction. Clearly, Huntington's book does not provide as detailed an analysis of political institutions and regime structures preceding democratization (pp. 110–21). Huntington's global reach, however, has its own virtues; it encompasses structure and process and, due to its global reach, is able to say more on such contentious issues as the role of religion for political regime transformation.

Overall, the two studies from which most can be learned for the further analysis of regime change are Huntington's and Rueschemeyer, Stephens, and Stephens's. Luebbert's study is a close runner-up. All of these analyses in one way or another feature the importance of Barrington Moore's insights and of the tradition on which Moore built. All of them also refrain from extreme optimism or pessimism about the future avenue of global democratization. Huntington and Rueschemeyer, Stephens, and Stephens lead us to hypothesize that in the Middle East or sub-Saharan Africa, but also in some of the postcommunist successor regimes, chances for democratic consolidation are poor. Conversely, there are a number of countries and regions of the world that give reason for hope to those who welcome democracy.

Against the backdrop of these studies, what future avenues may be open for analyzing political regime change? Luebbert and Rueschemeyer, Stephens, and Stephens have probably pushed the case-oriented systematic historical–comparative approach as far as it can productively go. Conversely, Huntington offers a broad, variable-oriented comparison, which still remains bivariate in its consideration of causal elements. In the future, multivariate analysis or Boolean algebra, as proposed by Charles Ragin (*The Comparative Method* 1987) may help us to develop a more formal representation of casual complexity in pathways of regime transition. At the same time, it is desirable to spell out more clearly the precise mechanisms that make each causal force relevant if we are to see sharper analysis of regime transitions.

Notes

1. For examples, Ronald Rogowski's *Commerce and Coalitions* (1989) is an avowedly rational-choice-based account; yet it considers itself to provide a generalization of Gerschenkron's and Moore's comparative-historical class-based structuralism. Conversely, Theda Skocpol's *States and Revolutions* (1979) is explicitly based on structuralist premises yet implicitly assumes rational actors who maximize wealth or power and are not driven by more illusive ideas.

2. Sometimes contributors to studies of regime transformation misunderstand their own accomplishments. In this sense, Adam Przeworski in *Democracy and the Market* (1991) wishes to offer a rational-choice-based explanation of regime change yet really falls back onto a historical institutionalism *plus* a process-oriented reconstruction of actors' changing cognitive frames.

3. Rogowski's book (see n. 1) is the other major examples of this more comprehensive comparative approach.

4. Probably closest to the systematic and encompassing comparison of transition processes I am looking for are Terry Karl's articles, especially "Dilemmas of Democratization in Latin America" (*Comparative Politics* [1990]) and (with Philippe Schmitter) "Modes of Transition in Latin America, Southern and Eastern Europe" (*International Social Science Journal*, May 1991). In these and other examples, however, the conceptualization of the main independent variable, modes of regime transition, is not sufficiently refined.

5. I am setting aside here the question whether it is still adequate in light of recent historical research to refer to the rise of Scandinavian social democracy as a "red–green" coalition of workers and farmers against the bourgeoisie. As Swenson's research makes clear, there emerged, if anything, a sectoral coalition in which parts of Labor and business cooperated with agriculture against Labor and business in other sectors. See Peter Swenson's "Bringing Capital Back In" (*World Politics* 43[1991]).

6. To explore the influence of religion, see especially the broad comparative neo-Weberian account in John Hall's *Powers and Liberties* (1985).

7. I have added up rankings of the countries on each of Huntington's four criteria and singled out countries with the four lowest rankings. At the top of democratic promise are Spain, Greece, Portugal, Turkey, Uruguay, Chile, Ecuador, Czechoslovakia, Hungary, Bolivia, Brazil, Peru, Philippines, and South Korea.

8. According to Huntington, even formal democracies in predominantly Confucian countries are characterized by the absence of government turnover (p. 304).

POLITICAL THEORY

Nietzsche Contra Rousseau: A Study of Nietzsche's Moral and Political Thought. By Keith Ansell-Pearson. New York: Cambridge University Press, 1991. 284p. $49.95.

A considerable number of specialized scholarly studies of Nietzsche's political thought have appeared in the last few years, a growth of interest in the subject that clearly reflects the recent revival of Nietzsche's reputation among contemporary scholars. *Nietzsche Contra Rousseau* stands out among these studies for the clarity and soundness of its interpretations, as well as for its greater familiarity with the best of German language scholarship on Nietzsche.

Ansell-Pearson uses Nietzsche's critique of Rousseau as a way of identifying and exploring the central issues in Nietzsche's moral and political thought. This dialogic approach to interpretation has many advantages, especially since Ansell-Pearson gives Rousseau a chance to respond to Nietzsche's criticisms and thereby help us identify Nietzsche's own limitations. It is particularly helpful in identifying the most important features of Nietzsche's understanding of the relationship between resentment and democratic politics. As Ansell-Pearson shows, Rousseau's obsessive and self-dramatizing moral indignation represents for Nietzsche the hidden core of democratic moralism: resentment against the fundamental conditions of human existence.

Ansell-Pearson develops this point in his excellent chapter on Nietzsche's *The Genealogy of Morals*. He presents in this chapter an especially interesting and original account of Nietzsche's understanding of justice and community. This account effectively demolishes the widespread image of Nietzsche as an ethical and political individualist.

Bringing Nietzsche into dialogue with Rousseau also helps Ansell-Pearson identify the sources of Nietzsche's own resentment against the world. Nietzsche, of course, preached the overcoming of resentment and the birth of a "second conscious innocence" toward the cruelties of human existence. But as Ansell-Pearson effectively shows, Nietzsche's own bitterness toward modern individuals and society led him to delude himself in many ways. In particular, Nietzsche's hatred of the modern world led him to believe that modern degeneration and corruption might itself provide the basis for the greatest and most life-enhancing transformation of human culture. Rousseau, by contrast, was far more realistic. He recognized that if society had completely corrupted human character, then there was little to hope for from revolutionary upheavals but grand displays of vice and cruelty.

This Rousseauian response to Nietzsche can be pushed even further. Rousseau had the great advantage over Nietzsche in being quite self-conscious about his own resentments. The contrast between Rousseau's *Reveries* and Nietzsche's *Ecce Homo* as autobiographical testaments is quite instructive and none too flattering to Nietzsche.

Ansell-Pearson's dialogic approach to interpretation does not, however, serve him as well when he begins to assess the value of the arguments explored in the book. Building on the Rousseauian critique of Nietzsche just mentioned, he points us toward a synthesis of Rousseauian and Nietzschean politics, "a Dionysian politics that is both agonistic and democratic" (p. 18). But in order to consider this vision of politics seriously one would have to step further outside of the Nietzsche–Rousseau dialogue than Ansell-Pearson seems willing to do.

Other political thinkers have explored the possibility of a "politics that is both agonistic and democratic." Hannah Arendt, in particular, springs to mind. Her efforts, as well as the internal tensions within such a view of political life, suggest a number of critical questions about the possibility of realizing such a goal.

How, for example, can one maintain an "agonistic" view of politics without developing aristocratic contempt for the mass of the people who are unable or unwilling to participate in political struggles for recognition? Many would argue that Arendt's attempt to synthesize Rousseau and Nietzsche fails precisely because she ends up expressing such contempt. Alternatively, how can one value all members of a democratic community without developing moralistic resentment toward the most creative and powerful individuals, the kind of resentment that Nietzsche argues poisons the minds of Rousseau and all other democrats? Is there a nonmoralistic way of defending the view that every individual deserves a certain basic level of respect and dignity? *Nietzsche Contra Rousseau* would have been a much more interesting book had Ansell-Pearson stepped back a little from his dialogue between Nietzsche and Rousseau to consider these important questions more fully.

Nevertheless, Ansell-Pearson's reconstruction of that dialogue makes for interesting reading. It provides a very stimulating and useful way of identifying some of the most important questions raised by Nietzsche's political thought.

University of Wisconsin, Madison BERNARD YACK

Justice, Law, and Violence. Edited by James B. Brady and Newton Garver. Philadelphia: Temple University Press, 1991. 368p. $44.95.

Violence, Terrorism, and Justice. Edited by R. G. Frey and Christopher W. Morris. New York: Cambridge University Press, 1991. 319p. $54.50 cloth, $17.95 paper.

Almost everyone condemns violence, but there agreement ends. There is a broad consensus among writers on the subject that unlike "force," which may be used for good or ill, "violence" is necessarily objectionable, at least prima facie. Violence has a case to answer. Beyond that narrow strip of common ground, disagreements multiply. Whether violence can ever be justified—and if, so how; whether some forms of violence are worse than others; whether violence is, on the whole, diminished or exacerbated by governments and legal systems; and even what, exactly, "violence" is—these are questions that excite vigorous and sometimes partisan dispute.

This diversity of opinion is well (although no doubt not comprehensively) reflected by these two volumes.

Of the two, Brady and Garver's *Justice, Law, and Violence* casts the wider net, grouping its contributors under three major headings. "Violence" deals with the nature of the beast and attempts to define it; "Law and Legitimation" examines putative justifications of violence, especially as used in the service of law; and "Controversial Instances of Allegedly Legitimate Violence" raises issues concerning punishment, terrorism, and domestic violence. Individual contributions are consistently thoughtful and interesting, although they vary in length and clarity. The presence of writers in the Continental tradition, as well as the Anglo–American, is, predictably, a mixed blessing, providing the usual combination of challenging extremes and murky prose.

Two such writers give some idea of the range of views to be found here. Sergio Cotta argues that violence is "the absence of measure," whose content is given by natural law. Although objective moral standards may sanction the use of force, "violence" consists in force that goes beyond what is permitted by such standards. The perceived increase in violence in the contemporary world (Is there really such an increase?) is due, most importantly, to the abandonment of objective norms in favor of a cult of subjectivity that takes the individual self as the sole author and judge of value. For Bernard Waldenfels, on the other hand, violence is *not* fundamentally opposed to legal and moral norms. On the contrary, violence is inextricably intertwined with law and, indeed, with justification itself. In exactly what sense this is so is not entirely clear. Does he mean that since justifications are always incomplete, remaining open to objection, laws will always require enforcement? But Waldenfels seems to want to go further, to the idea that justifications can be violent in themselves. How this might be is quite mysterious, especially since Waldenfels sensibly rejects Lyotard's absurd conflation of coercion and reasoned argument.

While few writers would join Cotta in his appeal to natural law, most would share his general goal of fixing on a distinction between justifiable force and objectionable violence, in preference to Waldenfels' sanguine thesis that violence is absolutely everywhere. The general view is that violence is often difficult to separate from legitimate force but that some such distinction is surely needed. To this end, attempts are often made to argue that certain kinds of force or violence are intrinsically worse than others. In Brady and Garver's collection, for example, John Ladd distinguishes "collective" from "individual" violence as especially offensive. But the species most often singled out for special attention in this way is terrorism, the focus throughout of Frey and Morris's *Violence, Terrorism, and Justice*. One of their contributors, Loren Lomasky, articulates what is probably the mainstream of public opinion in the West when he argues that the mark of terrorist violence is the rejection of civilized constraints. Terrorism is unjustifiable, it seems, by definition.

The trouble with this sort of approach, as Virginia Held points out (her excellent paper appears in both collections), is that it rules out by definitional fiat a question that still seems to make sense, namely, whether terrorism might be justified in some circumstances. As Alan Ryan shows (in Frey and Morris's collection), a broadly utilitarian perspective implies that terrorism may indeed be justified if the anticipated benefits are great enough in relation to the costs. From such a perspective, there is nothing *intrinsically* evil about terrorism; terrorism is merely an extreme and especially frightening application of force. To resolve whether terrorism might be justified, we need to look beyond the concept itself to its consequences.

Here Ryan makes a methodological point that suggests an important criticism of many contributions to the field: "It is not enough merely to stare at such terms as 'force', 'violence', and 'terror', as if we might divine their essences." Too many writers in both of these collections give the impression that conceptual analysis is sufficient—that once we have isolated the salient features of "terrorism," for example, we will automatically know what judgments to make about it. In fact, identifying the features of terrorism is no more than a start; it remains to be explained why those features should be judged in one way rather than another.

When it comes to judging violence and terrorism, we should recognize that the evaluative perspectives open to us now (given the complexity of our moral culture) have the appearance, at the very least, of plurality. Thus, Frey and Morris note in their introduction that ethical consequentialists are more likely to justify violence than are Kantians and that the latter will be less inclined than contractarians to argue that acts of violence place the perpetrators beyond the moral pale. In the Brady and Garver collection, the essays most sensitive to value pluralism are those by Elizabeth Wolgast and Garver himself, the latter drawing on the work of Isaiah Berlin. (On the relevance to this field of historical and political perspectives, as well as moral–theoretical, see Martin Warner and Roger Crisp's edited collection *Terrorism, Protest, and Power* (1990).) These contributions apart, the question of perspective is little discussed in either of these collections. That is a pity, since it is arguably more fundamental than any other. Still, the two books contain much that is stimulating and original; and both make important contributions to the literature.

University of California, Berkeley GEORGE CROWDER

Tragedy and Denial: The Politics of Difference in Western Political Thought. By Michael Brint. Boulder: Westview, 1991. 181p. $38.95 cloth, $12.95 paper.

Michael Brint's first book is at once highly ambitious and curiously modest. It is ambitious in that it proposes nothing less than a new way of reading the Western tradition of political thought, as a succession of *antitragic narratives*, and discusses a wide range of theorists: Plato, Rousseau, Constant, Hegel, Sartre, Derrida, Arendt, and Rorty. This is a daunting list for a mere 168 pages. The modesty of Brint's book lies not in its length, however, but in its pedagogical purpose: it is clearly designed to offer relative newcomers to the field of political theory a narrative "hook" to facilitate their grasp of a large and unwieldy canon. If, as Brint puts it, our tradition of political thought offers "some of the greatest stories ever told" (p. 1), his own work is similarly narrative in character. Like Voegelin, Arendt, or Strauss, he wants to provide a story about Western political theory that uncovers its driving force. Brint's story, in keeping with the book's pedagogical task, is a good deal simpler than these more familiar narrativizations of the tradition. Despite the simplicity of his story,

however, Brint clearly intends his work as a contribution to current debates about political theory and the "politics of difference." In my view, *Tragedy and Denial* is more effective as pedagogy—as an "edifying story"—than as an argumentative intervention.

Brint's central thesis is straightforward. He argues that human existence is beset by irreconcilable ("tragic") conflicts between the goods and values of competing life spheres. A "tragic" conflict is, he points out, one between not good and evil but good and good (e.g., the private good of the family represented by Antigone vs. the public good of the state represented by Creon). Such conflicts, Brint argues, constitute an "essential fact" of life, one that political theory has had a difficult time acknowledging. Indeed, Brint suggests that we view the Western tradition of political thought as a series of attempts aimed at "banishing tragedy itself from the human domain" (p. 2). The "denial" referred to in the title is Western political theory's denial of the "essential fact" of tragedy, a denial that ignores "the significance of relevant moral differences" (p. 2). Its "desire to eliminate human tragedy" leads Western political theory to efface the reality of difference, and tragic conflict, by a series of antitragic narratives. In Brint's account, political theory is a succession of stories about political community, stories that hold out the possibility of overcoming or sublating the ethical differences that produce tragic conflict. Brint's paradigmatic examples of such antitragic narratives are, unsurprisingly, the political theories of Plato and Rousseau (two theorists who had little use for difference).

The theoretical point of this perspective on the tradition is also clear. In picturing Western political thought as fearful of tragedy and difference, as seeking an escape from the irreducible plurality of values and spheres of life, Brint echoes a pervasive theme of poststructuralist criticism. Like the poststructuralists, he views the tradition as animated by the desire to efface difference in its most fundamental and intractable forms. Also like them, he makes a plea for preserving and respecting difference as a constitutive fact of our humanity and moral–political life (pp. 3, 11, 164). Brint's vision of the "politics of difference," however, is rooted in an "ethical pluralism" that clearly has a lot more in common with liberalism than with poststructuralism or identity politics (p. 6). Indeed, Brint can be seen as representative of that small but growing species, the liberal who has read Derrida (a species that originates with Rorty).

Within this broad framework, Brint offers a set of readings that constitute the heart of his text. These readings are divided between "pure" exemplars of the antitragic impulse (Plato and Rousseau) and an eclectic group of modern theorists who, according to Brint, attempt to resolve the conflict between individual liberty and democratic freedom through three narrative strategies: comedy (Hegel), satire (Sartre and Derrida), and romance (Arendt and Rorty).

The readings, while intelligent and well informed, are uneven. Brint makes a strong and subtle case for the antitragic impulse behind the *Republic* and Rousseau's political theory; but few readers will be surprised to learn that Plato (or, as Brint would have it, Socrates) and Rousseau were hostile to ethical pluralism. Brint raises a number of intriguing issues (e.g., the narrative structure of the *Republic*, the Socratic inversion of Homeric morality, how irony makes Plato's text a self-deconstructing artifact, the question of Rousseau's subjectivism and theoretical narcissism); but these have all been treated in greater depth by Voegelin, Arendt, and Starobinski. While the treatments here are not exactly original, they are nevertheless concise and thought-provoking; and they are fairly free of plotted "plot summary." The same cannot be said, however, of the readings in part 2, "The Politics of Tragedy." Here, one theorist after another steps on stage just long enough to be typecast (as comedic, satiric, or romantic) and sent packing. Brint's point is to reveal the more insidious forms taken by the antitragic impulse as the threshold of modernity and postmodernity is crossed. This threshold is marked, as Lyotard has claimed, by "incredulity toward metanarratives." While Brint does not mention Lyotard, his point is similar: Hegel's "comedy" of reconciliation was political theory's last "big" story, a story succeeded by Sartre's and Derrida's parodies of metaphysics and, finally, by the reemergence of political theory as "romance,"—as a storytelling that knows itself to be such (Arendt, Rorty). The problem is that the readings in this section, designed to support Brint's narrative typology, are necessarily in broad strokes and not very illuminating. But the reader can hardly expect an original interpretation of a major theorist in 6–10 pages.

Brint does have a point in rushing so many theorists on and off his stage. He wants to show how political theory, even when it takes up difference as its explicit theme and becomes self-consciously narrative in mode, nevertheless continues to evade the full force of tragic conflict. As narrative genres, comedy, satire, and romance evince the same "failure of political nerve" (p. 2), the same antitragic impulse, found in Plato and Rousseau. Brint's solution is to uphold tragedy as a normative model for political theory and to suggest (as the title of his last chapter phrases it) that we "put the 'e' back into *differance*." By this he means that we should break with dialectical or deconstructive treatments of otherness, treatments that in his view thematize difference only to sublate it or reify it into an "ineffable other." In other words, we should avoid the Hegelian temptation of reading difference back into sameness while at the same time resisting the Derridean temptation of simply inverting the "metaphysical" valorization of identity and difference.

I do not find Brint's alternative particularly persuasive. The moral–political thrust of his anti-Hegelian, antideconstructive stance is a plea for a renewed appreciation of the inner articulation of our pluralist polity, an articulation born of different "life spheres," of different "vocabularies, traditions, activities, and practices" (p. 165). Like Rorty and Walzer, Brint wants us to respect these differences and to resist seeking some standard of the just or the good that pretends to render the incommensurable commensurable. This is fine, as far as it goes; but it is (Brint's protests notwithstanding) simply good liberalism. There is no dishonor here: one of the virtues of Brint's book is that it clarifies the pluralist ethical vision of liberalism in a compelling way. He does this, as did Weber, by stressing the pathos, the tragic quality, of conflicts between rival values and goods. Despite the poststructuralist trappings of Brint's book, the result is not so much a *critique* of liberalism as a *restatement*.

Amherst College DANA VILLA

Action into Nature: An Essay on the Meaning of Technology. By Barry Cooper. Notre Dame: University of Notre Dame Press, 1991. 291p. $34.95.

Critical Theory of Technology. By Andrew Feenberg. New York: Oxford University Press, 1991. 235p. $35.00 cloth, $14.95 paper.

Barry Cooper and Andrew Feenberg are both dismayed by technology's assault on nature and human nature. Feenberg allows for minuscule openings in the deadly machinery of modernity while Cooper leaves us with a dispassionate so-it-goes ghetto journal, recording in depth that death is in season, implying (as Andy Warhol did) that one's talent can no longer be employed for anything but embroidering and inflating the products and fetishes of our era.

The world, as Cooper knows it, is in shambles. Its population has been dehumanized by Galilean mathematization, social science positivism, the triumph of light over the mysteries of darkness, and music that is rocking and rolling history to its end. Communists, liberals, fascists are all technicists using means which, in the purposeless whirl of modernity, are themselves ends. "All things," he echoes Marx, "are in movement . . . all is process and change" (p. 102). Global decomposition which Feenberg traces to the reification of ends, Cooper (*pace* Norman Mailer) attributes to the cancer of technicism. And yet Cooper's erudite trouble shooting and whistle blowing—his unrelieved complaints—are not a prophet's jeremiad—for however frequently he recalls Strauss and Voegelin, Cooper never interrupts himself to project a transhistorical order that might give credence to an indictment. He relates; he doesn't blame.

His narrative is a losely concatenated flow of declarations and pronouncements: "Today reality is sufficiently grotesque to make satire impossible: after all, how could it be exaggerated?" (p. 112). "Modern technological societies are not threatened by outbursts of revolutionary compassion" (p. 122). "Now that prosperity has been attained by nearly the whole population, any serious notion of the purpose of leisure has evaporated" (p. 250). And so on.

Cooper makes no claim that alterations are feasible. In the spirit of Heidegger, he envisages no basis for restoring a pre-modernist consciousness. As modest as one of Beckett's characters, he nonetheless goes on—goes on writing and quoting and footnoting while he knows that the ground for going on has eroded. Tenacious, deadserious, and gravely scholarly, it is a strangely reassuring performance: a case against suicide.

Feenberg's case, on the other hand, is explicitly one for healing the body politic, for recovering the marginalized abiguities of Marx so as to fulfill the promise of socialism. Implictly it is one for bypassing postmodernists whose gay science leads them to embellish industrial products, celebrate fast food, universalize irony, and deconstruct metanarratives all because they assume that it's far too late to reverse an increasingly autonomous technicism.

Feenberg does not feel, as Heidegger finally did, that "only a god can save us now," or that only a state apparatus can impose a new order, or that a simplified lifestyle will heal us, or that a consciousness-raising catastrophy will inspire an immortal phoenix to rise out of the ashes. It remains possible to weave repressed human needs into the stainless steel fabric of the dominant technology. Designed by variable cultures which harbor various desires, technology is neither autonomous nor value-neutral.

Only a metaphysical pathos (in Alvin Gouldner's phrase) of the elites of contemporary society stands in the way of transforming hierarchies of power, one-dimensional work by de-skilled workers, and meaningless consumption. The degradation of labor, liberal education, and the environment inheres not in technology but in the belief system that currently defines technological development.

Yet change can be generated by social movements guided not by Marx's pathetic determinism but by his open-ended vision of a process which can itself arouse and incorporate the latent "irrational" and "inefficient" impulses within individuals and nature. Thus the locus of technical control can be shifted—as in Feenberg's view it might have been in the 1960s—from a control-oriented technicism to a multitude of local social institutions and workplaces.

When Feenberg proceeds to provide examples of the impact of countercultural movements on the capitalist-military-corporate-media complex, he is poignantly evasive. It is disheartening to realize that he keeps himself from sharing his knowledge of the capacity of the technological imperium either to repair (or to embroider) the cracks in the hegemony of capitalism. Sadly, he decides to remain silent about how effectively *Rambo* incorporated the traits of the counterculture in the ideology and policies of the Reagan Era. Feenberg has reason to shy from discussing the limited effects of well-intentioned movements to stop environmental degradation, to free the world (and one's neighbors) from the threat of weapons, or, as in the 1960s, to transform society, its politics, its educational practices, its racism, its compulsions, its very epistemology. Contrary to Cooper, a sad necessity restrains Feenberg.

The reader who spends a month in Feenberg's and Cooper's company may finally come to realize that their books, and perhaps all artifacts patiently lived with, finally complement one another.

University of Hawaii HENRY S. KARIEL

David Hume and the Problem of Reason: Recovering the Human Sciences. By John W. Danford. New Haven: Yale University Press, 1990. 228p. $25.00.

With the possible exception of Kant and Mill, no modern political philosopher has had as much affect on all facets of current political theory as David Hume. Before I read this book, I was sure that Hume's story in relation to political science had been told; but now I am no longer certain.

The purpose of the book is to establish a role for reason, truth and the use of universal principle in the interpretation and reading of Hume's political thought. Danford asserts that we are now enmeshed in a "crisis of Western rationalism" but that Hume's political philosophy can be utilized to reestablish "the status of reason" (pp. 7–8) in political life. It is obvious to anyone who reads the literature in our field that there is a general skepticism about the role of reason and truth in our studies. Rawls, for example, doubts that metaphysics or truth have any place in "political" concepts of justice, while in other disciplines deconstructionism and radical relativism have built upon the ruins of positivism and

reinforced the idea that our task as theorists is indeed a limited one.

This book contends that a reading of Hume that moves away from dependence on the *Treatise* and toward reliance on *The History of England* and the *Dialogues Concerning Natural Religion* will produce a definition of reason and truth that is connected to experience and "common life" (p. 8). The author claims that "common life" acts as a basis of a political theory combining history, religion, and ethics into a bridge that connects the search for reason and truth with an "understanding of what is good for mankind" (p. 193). In this way, the application of reason to the search for truth departs from its dependence on the methods of natural science and moves to the specific framework of political life that defines its proper context. Here, Hume's approach is separated from those who established the use of scientific method in political theory (e.g., Hobbes) and becomes a counterargument to those who have since maintained that "relativism" and "interpretation" must replace "truth" in the theoretical analysis of politics (p. 19).

I had assumed that Hume's political theory rested in the ideas of passion motivating individual action, limited self-interest, convention, and the relative utility of justice and government. This interpretation would make Hume a champion of those who proclaim the death of reason and universal truth in political thought. If Danford is correct, however, the truth of Hume's political theory lies in reason, general principles, common life experience, religion and the historical process of social evolution. Seeking the core of Hume's politics outside the *Treatise*, Danford integrates "common life" with the evolution of individual liberty and the "general principles" of "usefulness and agreeableness" that together provide a framework within which reason and truth in political analysis are reestablished within a stable environment for human social interaction (p. 99).

The argument is elegant and concise (perhaps too concise). However, I am not sure it covers all the bases. Although I am willing to believe that the *Treatise* can be replaced as the core text of Hume's politics, I would maintain that it contains too many supporting beams of what is traditionally thought to underlie Hume's "relativism" to be dismissed without proper argument. I would propose that it is critical for the author to provide a complete transitional argument between old and new interpretations that would overcome the contention that Hume's politics is all about convention and cultural relativism. Danford needs to recast the central role of convention as a competitor for contract, property as a basis of justice/government and the connection between utility and preference that has come to play such a major role in current Hume scholarship (e.g., in both collective action theory and "preference" utilitarianism). Instead, I remain confused by such statements as that Hume rejects convention-based moral theory but maintains an "unblinking acceptance of the actual desires and preferences of mankind" (pp. 157, 160).

This book is one of the most interesting and unique renderings of Hume's epistemology and political and moral thought that I have ever come across. It is a must read for anyone interested in Hume's philosophy and its relation to political science or to anyone who is troubled by the relativism and positivism that provides the framework for most of what passes as social science these days. It is a perfect text for a seminar on Hume; and although I believe that more argument should have been provided as to how this "new" reading of Hume's politics can replace the "traditional approach," the uniqueness and creativity of this book, as well as its pertinence to current theoretical debate, is enough for me to recommend that anyone interested in all the dimensions of Hume's political thought ought to have this volume in their library.

Trinity College, Hartford JOHN MARTIN GILLROY

The Liberal Self: John Stuart Mill's Moral and Political Philosophy. By Wendy Donner. Ithaca: Cornell University Press, 1992. 229p. $35.00 cloth, $12.95 paper.

The Liberal Self proposes to "resolve some traditional puzzles" raised in the secondary literature on John Stuart Mill's thought (p. 2). Most of the book is devoted to a discussion of Mill's moral philosophy. However, since Wendy Donner maintains that "Mill's utilitarian philosophy unifies his ethics and his liberal political philosophy" (p. 1), *The Liberal Self* should be of considerable interest to those concerned with Mill's political thought. This interest may be tempered by Donner's interpretation of Mill's view of political theory.

According to Donner, Mill's system of ethics is grounded upon the preferences of knowledgeable agents, individuals who have developed their intellectual and moral capacities (p. 5). At the same time, she argues, "Mill's most fundamental commitment . . . is the promotion of human self-development and the happiness involved in the development and exercise of our higher human faculties" (p. 3). On the face of it, there appears to be an irreconcilable tension between the absoluteness of a universal right to self-development and the preferences of a privileged minority who have developed their capacities as an axis from which to evaluate competing moral claims. Nevertheless, Donner believes that Mill's "sophisticated form of hedonism," in which qualitative judgments supply the definition and measurement of value, can be defended as an objective and logically consistent expression of utilitarian moral theory (pp. 4–5, 9, 55).

Few readers are likely to be convinced by Donner's defense of qualitative hedonism. In this and in other instances throughout *The Liberal Self*, the problems she draws from the secondary literature on Mill are more profound than her responses to them. Still, she does have some valuable things to say regarding the social basis of rights in Mill's thought; and she quite rightly stresses the importance of self-development to Mill's moral and political theory. But to affirm truly that Mill is equally concerned with sociality as he is with individuality or that he defends a positive, as well as a negative, conception of liberty (pp. 148, 162) hardly constitutes a resolution to the puzzles various critics have discovered in Mill's thought. Indeed, to admit that Mill does not tell us how to employ the principle of utility to resolve a conflict of vital interests (as Donner does, p. 187), leaves us inhabiting a world characterized by social conflict where appeals to such vacuous propositions are not likely to provide any guidelines for practical action.

However, whatever the moral dilemmas confronted by individuals qua individuals, Mill does offer a specific political example of what would count as a successful application of utilitarian philosophy. "The test of Mill's

commitment" to the goal of human self-development, Donner notes, "is his stance on opportunities of development of the working class of nineteenth-century Britain" (p. 198). To appreciate the extent of Mill's "commitment" one should include (Donner surprisingly does not) the self-development of women. Still, if we consider this test as applied to the working class, both the tensions internal to Mill's thought and the difficulties with respect to Donner's interpretation of it will become apparent.

Assuming that Mill's political theory is simply the logical extension and practical application of his moral philosophy, Donner maintains that Mill's political thought expresses the preferences of knowledgeable agents (pp. 131, 202). To grasp the implausibility of such a view, one need only consider Mill's commitment to democracy and universal suffrage in the context of nineteenth-century British politics. Such a perspective was not espoused by Mill's intellectual contemporaries, the vast majority of whom sided with Macaulay in opposing democracy. In other words, it was the working class, not a developed or knowledgeable elite, who advocated political and economic democracy—the core of Mill's political thought. Moreover, Mill did not believe that political theory could be identified with the preferences of knowledgeable agents. Rather, following Alexis de Tocqueville, he maintained that observable empirical sociological tendencies at work in society provided the foundation for any political theory. The political theorist's task, Mill argued, was to ascertain the good and bad effects of these tendencies and to assist the extension of the former and inhibit the development of the latter. Not only was it possible for any perceptive observer, including members of the working class, to grasp the significance of the empirical tendencies favoring democracy or cooperative socialism, for example, but it was also possible for highly educated intellectuals to pay insufficient attention to such sociological evidence and thus to hold a seriously deficient political theory.

Donner maintains that Mill's elitism makes him "overly protective of the interests of the middle class at the expense of working class advancement." Thus, she asserts, "Mill assumes that the already competent members of the middle class who are to help others become competent are able to put aside their class interests and make social choices grounded on the interests of all" (p. 202). This is patently absurd, as any reader of *Considerations on Representative Government* knows. In that work, Mill argues for equal representation in Parliament of middle- and working-class interests precisely, he insists, because neither class is capable of "putting aside" its class interests. A tiny number of individuals from *both* classes, Mill suggests, will, with respect to a particular legislative proposal, be able to see beyond their class interests, thereby securing its passage (the majority of members on both sides voting in accordance with their class interests).

According to Donner, Mill is concerned only with the dangers posed by the working class's coming to power but not with the abuse of political power by the middle class (p. 203). But based on Mill's correspondence and his published writings, not only is it Mill's view that class-interested abuse of power is a danger in all forms of government (not merely a defect peculiar to democracy or to the empowerment of the working class), he also has some especially harsh criticisms to make of the British middle class, which, he argues, has already demonstrated its unfitness to rule. Far from being concerned with protecting a particular class's interest, the problem for Mill was to find a way to put an end to class conflict.

It is ironic that Donner accuses Mill of having little sociological knowledge of the workings of his society (p. 207). On the contrary, it is Donner who presumes that social, political, and historical context are useful merely as background information. The fact is that the philosophical problems as they appeared to Mill cannot be formulated correctly in the absence of such contextual knowledge.

University of California, Los Angeles RICHARD ASHCRAFT

Regarding Politics: Essays on Political Theory, Stability, and Change. By Harry Eckstein. Berkeley: University of California Press, 1992. 404p. $45.00 cloth, $17.00 paper.

This collection of Harry Eckstein's monographs and articles, reprinted from journals and books which have appeared over the last quarter century, is almost, but not quite, representative of the rich and varied body of his work. It includes three monographic essays which ensure Eckstein's membership in the small group of scholars who have made creative contributions to the definition and methodology of political science. Had he not reprinted them here, the obsolescence of the symposia and handbook in which they originally appeared, might have imposed prohibitive "search" costs for a contemporary scholarly generation indifferent to disciplinary history. His essay "Political Science and Public Policy" is still one of the best interpretations of Max Weber on these themes. At a time when the termination of the Cold War enables us to reconsider the politicization of our scholarship, Harry Eckstein's 1966 paper analysing Weber's writings on these topics and political activities during the late Wilhelminian Empire and the early Weimar Republic belongs at the top of the reading lists of our syllabi for introductions to political science. His "Historical Perspective on Comparative Politics," introducing the anthology that he and David Apter published in 1963, still has no rival in scope and erudition. His "Case Study and Theory in Political Science" is one of the most original methodological contributions of our time, bringing case studies into the world of scientific rigor and theory and turning the ideographic/nomothetic dichotomy into a continuum with five distinguishable degrees of theoretic–scientific sophistication. Drawing on work of Sidney Verba but pressing the argument to its full implications, Eckstein spells out the properties of the "ideographic–configurative" case study, which makes no claims to theory, at one extreme and the "crucial-theory-infirming," or "theory-confirming," extreme at the other. The three types in between—"the disciplined–configurative," the "heuristic," and the "plausibility probe"—take increasingly firm steps in the direction of self-conscious hypothesis testing and theory building.

Eckstein is a strong advocate of the crucial case study as the way to theory. While he does not denigrate statistically based theory, he makes a convincing case for the special value of clinical depth in avoiding the loss of important information. It has been an only partially fulfilled aspiration of Eckstein's to conduct a crucial case study of his "congruence theory" of political stability (his study of Norway); and he has not as yet done the

study that might settle the rivalry between the political culture and rational choice approaches to explanation. Eckstein takes political science very seriously indeed. His model for crucial case studies in political science is the series of natural observations that have confirmed (or failed to falsify) Einsteinian relativity. Michel's theory of political oligarchy based on the study of the organization of the Social Democratic party of Germany is Eckstein's strongest example of a crucial case study in political science. While a program of accumulating a large collection of crucial case studies in political science may turn out to be visionary, Eckstein's exhortation to carry out case studies with theoretical insight and discipline and his systematic elaboration of the various ways this can be done is wholly constructive and admirable.

Creative scholars are risk-takers; they have the courage to propose new approaches and theories even though they may fail. In the early 1970s Eckstein made the bold proposal that political scientists redefine the focus of their discipline from the state and government to authority relations in general (family, church, school, economic enterprises, associations, etc., as well as government and the state). This initiative had its origin in Eckstein's congruence theory of political stability, that is, the hypothesis that a political system with organizational characteristics similar to the main nongovernmental structures would be stable, whatever that organizational structure might be. His theory of stable democracy—now more than three decades old and republished here as part 3, "Political Stability"—added to the organizational congruence requirement for generic stability the "balanced disparity" requirement for governmental–political institutions. In other words, democratic stability would require not only organizational congruence but limits on democracy. Such are accomodativeness to authority; deferential attitudes, as well as egalitarian and achievement values; and consensualism, as well as conflict. Having formulated this theory in the late 1950s on the basis of an informal comparison of England, France, and Germany, he carried out what approximates a "crucial case study" of Norway in the mid-1960s. His essay on case studies came after his theory of democracy had been formulated and tested in the case of Norway—a country about which Eckstein at the outset knew little save that it was a good democratic performer on all counts and stable in all aspects. His book, *Division and Cohesion in Democracy* showed that that country had both organizational congruence and balanced disparities.

Eckstein's theory of political stability was the high point of a research program that had begun most auspiciously in his early work on the British Medical Association, on interest groups, and on empirical pluralist theory. A member of the scholarly generation that lived through (in Eckstein's case most personally) the traumatic years of the fall of the Weimar Republic, the crisis and fall of the Third Republic, the rise of fascism and nazism, and World War II, he shared the preoccupation with the conditions and characteristics of stable democracy. Of all of that generation, his work on this theme was the most original and the most seriously theoretical.

Having gained such leverage on so important a problem as democratic stability by emphasizing general social organizational and cultural characteristics, Eckstein took what seemed to him the logical next step: he proposed that political science as a discipline change its focus from government and the state to authority relations, broadly speaking. If nongovernmental structure and culture were of such importance, then why not broaden the field and thereby the body of explanatory knowledge? Drawing the consequences of this argument, he, along with his colleague Ted Robert Gurr, embarked on a research program that culminated in a book entitled *Patterns of Authority*, which invited the political science profession to adopt this inclusive paradigm in the place of those then dominating the field.

In his introduction to *Regarding Politics*, Eckstein refers to his effort to broaden the subject matter of political science as the "greatest failure of his career." Let me console him with the thought that our colleagues are much more indulgent of us than this passage in his introduction suggests. The response to his appeal, judging by the productivity of Eckstein's students in nongovernmental authority studies, was quite forthcoming and was enriching of the literature on political socialization and political culture. There are, indeed, few restrictions on the kinds of authority patterns that political scientists are encouraged to investigate. If there was any fault in Eckstein's appeal to broaden the focus of political science, it was that the walls were already largely down. It may be that the packaging of his book on authority diverted attention from its rich and suggestive content and that future generations of scholars will draw on it for research designs and for hypotheses.

Parts 4 and 5 include articles and papers on political development, political culture, political violence, and, most intriguing as indicative of future Eckstein work, "Civic Inclusion and Its Discontents." Here he is pursuing themes first developed in Tocqueville's *Democracy in America*, particularly the second volume forecasting the spread of equality and all the promise and problematics that this trend implied. As one would expect from his prior work, Eckstein's notion of the scope of civic inclusion means much more than the spread of the suffrage and formal access to officeholding. He is concerned with family, peer group, neighborhood, school, and workplace participation and acculturation, since this creates the culture of the poor and shapes and limits the process of democratization. This essay promises another important contribution from the Eckstein atelier.

Stanford University GABRIEL A. ALMOND

Interpersonal Comparisons of Well-Being. Edited by Jon Elster and John E. Roemer. New York: Cambridge University Press, 1991. 400p. $49.50.

In view of the contemporary opinion regarding the intractability of the problem of interpersonal comparisons of well-being, it may seem curious that the classical utilitarians (Bentham, the younger Mill, and Sidgwick) were scarce troubled by this issue. To be sure, they were aware of the considerable practical problems of measurement; of the propensity of individuals to make mistakes in hedonic judgments even with regard to themselves (let alone others); of the want of reliable scientific understanding of the causes of pleasures and pains, especially in regard to quantity; of the diversity of individual satisfactions and displeasures; and of the great uncertainty about effects, under which decisions about what would be conducive to the greatest happiness would have to be taken. Nonetheless, all three were in agreement that the thing to be measured was an objective

concept amenable to scientific enquiry (Mill's idea about higher and lower pleasures notwithstanding). In Bentham's and Sidgwick's accounts of this, it almost seems as if measuring pleasures and pains, and thus well-being, was akin to measuring blood pressure or body temperature. (Sidgwick talks of "psychophysics," i.e., physiological psychology, in this connection; see *Methods of Ethics* 2.6.) Mill's account of the test for quality of pleasure in chapter 2 of *Utilitarianism* is all too brief; but it seems clear from what he does say about the matter that the "verdict of the only competent judges" was meant to be an objective one, good for all. If so, then it is understandable why no one among them might have seen interpersonal comparisons of such a measure of well-being as being in the least problematic.

On the other hand, once we follow the path of the economists from the classical hedonic concept or concepts to the modern concept of utility as subjective preference, to be revealed by the choices individuals are disposed to make, then the problem of interpersonal comparisons does, indeed, loom large. In particular, part of the skepticism about John Harsanyi's reconstruction of utilitarianism derives from doubts on this score.

Of the 11 papers in this volume, 6 are of a technical nature, from which the reader is not likely to get much without at least some acquaintence with the mathematics used in social choice theory or welfare economics. The other five, however, should be more generally accessible.

To begin with the skepticism about Harsanyi and one of the technical essays, Amartya Sen some years ago raised the question of whether the theorems at the core of Harsanyi's defense of his preference utilitarianism were substantive proof of his position or were (as Sen argued) merely theorems about the representability of social preference that are consistent with a nonutilitarian interpretation. In short, what has Harsanyi really proved? John Weymark, in his contribution to the volume, gives a meticulous analysis of this question, a model of the clear exposition of a technical matter. The verdict is that Sen was right.

Both Tim Scanlon and James Griffin, in their chapters, argue that we must move in the direction of a more "objective" measure of well-being if we are to cope with the interpersonal comparison (though for somewhat different reasons). Neither advocates a return to Bentham or Sidgwick, however. Scanlon argues for a more indirect measure along the lines of Rawlsian social primary goods, and Griffin would have us move in the direction of Mill. Both argue that the proper choice of concept of well-being is a substanive issue of ethical theory, an insistence found in several other contributions, as well (e.g., Weymark's and Hammond's). Scanlon's analysis provides a critique of Harsanyi's assumptions about the interpretation of individual preference that is complementary to the discussion given by Weymark.

Daniel Kahneman and Carol Varey, in their essay, present interesting evidence from the psychological literature to the effect that individual preferences and hedonic experience (their term) may diverge significantly, especially where the former involves anticipation of future experience or the latter, adaptation or context effects of various sorts. The preference model, in practice, would diverge significantly from one along the lines of Bentham and Sidgwick; thus, this is not an idle distinction. On the other hand, the evidence about adaptation or context effects suggests that the Benthamite project is rather more complicated than the opening remarks about Bentham or Sidgwick would suggest. It is unfortunate, however, that the evidence they present does not appear to give us much of a handle on the issues raised by Griffin and Scanlon.

But supposing that we follow Griffin, in the direction of Mill, is this approach technically viable? Suppose our "only competent judges" are only "local" experts (but that any two agree on matters of mutual experience). Ortunõ-Ortin and Roemer show that we can piece together these local judgments to get a global interpersonal ordering. This is the good news. The bad news is that if we allow everyone to be a "global expert," do not require agreement, and impose analogues of the Arrow conditions, then we get an analogue of the Arrow result in the form of a "judgment dictatorship"—as Aanund Hylland shows in his chapter. Weaken the universal domain condition to require "antipaternalism," and the conditions become consistent with a "positional dictatorship" (e.g., the maximin rule). But these results ought to be expected, I think, given that Hylland restricts attention to ordinal preferences and ordinal interpersonal comparisons.

Peter Hammond's chapter gives a broad survey and appraisal (mostly negative) of the ideas for interpersonal comparisons that have been tried in welfare economics and includes an extensive (perhaps exhaustive) bibliography. His suggestion at the end that a successful model of interpersonal comparisons will involve judgments about what sorts of people are desirable seems alarming at first blush but may be somewhat less troubling (though still provocative) once one realizes that we already are comfortable with some such judgments (the undesirability of sociopaths, to take an extreme case). The technicalities are at a minimum here, and Hammond's chapter should be accessible to a wider audience than just those skilled in mathematical welfare economics. The same, alas, cannot be said of the chapter by Blackorby and Donaldson, "Adult Equivalence Scales."

The other chapter that I found instructive is that by Jon Elster about the ingredients that seem to go into small-scale (*local* is Elster's term) policy decisions involving interpersonal comparisons of well-being. Elster has space for detail about only a small subset of the kinds of policy decision he initially presents (from allocation of scare medical resources like kidney transplants to allocation of tasks within households), but there is enough to show that "it is a messy business"; and even when comparisons of well-being are the primary feature of a policy decision, significantly different aggregation procedures may implicitly be used, depending on the nature of the decision. Elster has useful things to offer by way of bringing some order into this picture, and his chapter is a welcome addition to a collection primarily of a more theoretical character.

In summary, the primary audience for this book will be those doing normative political theory, political philosophy, political economy, or the like, with some technical background in social choice theory or welfare economics and a formal bent. They will, I think, find much that is of interest here. Some of the material should be accessible, and of interest, to philosophers, social scientists, and policy analysts for whose work the issue of interpersonal comparisons of well-being is pertinent. Finally, a number of interesting problems for

further research both formal and empirical are to be found herein.

University of Texas, Austin PAUL LYON

Democracy and Deliberation: New Directions for Democratic Reform. By James S. Fishkin. New Haven: Yale University Press, 1992. 133p. $17.95.

This small book ranges widely over topics of interest to students of democratic political systems—from the appropriateness of democracy for the governing of large nation–states to problems confronting peoples seeking to move from authoritarian to democratic rule. Its centerpieces, however, are a critique of recent democratic reform movements and a proposal for remedying some shortcomings of the present procedures for nominating presidential candidates in the United States.

Fishkin argues that a fully realized democratic system (to qualify as such) must weigh its citizens' preferences equally in political decisions, insulate those preferences from influences that threaten their integrity, give interests with significant followings effective opportunities to be heard, reject policies that destroy anyone's essential human interests when policies without that result could be chosen, and permit citizens equal and sufficient opportunity to discover and test their preferences on issues to be decided. The actual institutions and procedures of democratic states satisfy these conditions (which Fishkin subsumes under the headings of political equality, nontyranny, and deliberation) very imperfectly; and arrangements that further the realization of one may hinder realization of another. The reforms in the late 1960s of the U.S. system for nominating presidential candidates are a striking illustration of this kind of trade-off. They gave many more people a direct say in these important choices but made the process of deliberation about them a largely empty one.

Fishkin proposes that we choose a sizable body of citizens of voting age by random sampling methods; bring these citizens together for several days and before any states have held caucuses or primaries; and assign Democrats and Republicans to separate "national caucuses," letting independents choose which of these they will join. Then, Fishkin suggests, we should bring presidential candidates before the appropriate caucus, singly and in debates, and let its members question them about themselves and their positions on issues. After the members of each caucus have debated the issues with candidates and each other, we should poll them to learn their choices of candidates and opinions on the issues and (ideally) let them choose a limited number of delegates-at-large. Broadcast some part of these proceedings on national television.

This ingenious proposal has already drawn much attention; indeed, a version of it came near to realization this year. Its intent is to offer "a means of launching candidacies and issues in a competition that is more representative of the entire country than either Iowa or New Hampshire and more deliberative than our conventional campaign process" (p. 4). On some reasonable assumptions, the proposal is a very appealing one. These assumptions are that (1) the major parties will continue to choose most of the delegates to their national conventions in sequential primaries; (2) the sample of voters drawn will in fact be representative of eligible voters nationally; (3) members of the two national caucuses will be able to inform themselves at least as well as those voters who participate in the Iowa caucuses and the New Hampshire primaries now do; and (4) news agencies, contributors, volunteers, and primary voters will see the national caucuses as important tests of the viability of candidacies. Grant these assumptions, and you have gone far toward agreeing that Fishkin is proposing—if not a better way to run the railroad—a better way, at least, to start the train down the track.

Fishkin's agenda for thought and action goes considerably beyond this proposal for national caucuses. These are, in fact, only an example of what he calls a "deliberative opinion poll," that is, a poll that "models what the electorate *would* think if, hypothetically, it could be immersed in intensive deliberative processes" (p. 81). Such polls, though their high costs would necessarily limit possible applications, might play a useful role even in a system for nominating presidential candidates like that abandoned after 1968 or in the consideration of issues submitted in referenda. In any case, deliberative opinion polls are in turn but one example of what Fishkin truly has in his sights, namely, reforms of the institutional processes of nation–states that will realize both political equality and deliberation.

The strength of this book is its capacity for provoking thought about the institutions of representative democracy and ways to make them serve basic democratic values. It also has some weaknesses. It is sketchy in its presentation of arguments, and some claims are exaggerated or otherwise questionable. For example, even critics of the present system for nominating presidential candidates are likely to balk at the flat characterization of it as "momentum without learning; choice without deliberation" (p. 6). And the claim that the U.S. Congress has moved toward majoritarian control is dubious, at least, however much its members now cultivate the electoral connection. Theorists will find little new theory of a fundamental sort, students of institutions, no new evidence about them. To make much of this last observation, however, would be to miss the point of the book. The author intends not to produce new evidence or to build new theory but to invite us to think about how to bring theory and knowledge to bear on the design of better political institutions. The invitation is both an engaging and challenging one, and he sets a good example.

Princeton University STANLEY KELLEY, JR.

Liberal Purposes: Goods, Virtues, and Diversity in the Liberal State. By William A. Galston. New York: Cambridge University Press, 1991. 343p. $49.50 cloth, $16.95 paper.

Is it possible to do political philosophy without any conception of what is good or valuable in human life? Some have tried: John Rawls and others have explored the possibility of grounding principles of justice and right on procedural ideas like equality, reciprocity, and deliberation. Their critics delight in showing that such an enterprise is bound to fail. Reciprocity and equal respect, they say, remain empty as ideals absent some account of what we value in each others' agency; and deliberative norms cannot yield principles for social life

without some account of the substantive point of our conversations.

Those who retain any shred of faith in the proceduralist project should read William Galston's new book, for it is both a clear and up-to-date attack on the proceduralist experiment and a new and sympathetic outline of the value commitments that are actually presupposed by the core positions of liberal political morality.

The critical part of the book is mainly an attack on liberal neutrality, that is, on the principle that both political decisions and normative theories of political decision making should be, in Ronald Dworkin's words, "independent of any particular conception of the good life, or of what gives value to life." Galston considers four justifications for neutrality: skepticism about value, free individual choice, peaceful accommodation among a diversity of groups in society, and equal respect in political argument. The first is easily dismissed: a general skepticism about value can hardly justify a *principle* of neutrality. The fourth, equal respect, elaborated in recent discussions by Charles Larmore and Thomas Nagel, is too constraining for Galston's taste. If we are prohibited from raising anything that offends anyone's cherished beliefs, then most of what we understand as public argument will be ruled out. The middle two are less easy to dispose of but also less obviously proceduralist: each appeals to a conception of the good—either to values concerning autonomy or to the values involved in giving priority to life and peace. So neither can be used as a reason for excluding considerations of the good from politics.

There is nothing strikingly new about this discussion. Galston's account has both the advantage and the disadvantage of being very much up to date. Because it directly addresses the latest articles in the debate about liberalism, it has the character of an informed engagement in the immediate fray, rather than of a more detached discussion of the philosophical issues involved. Neutrality actually raises some very deep questions about why we organize ourselves into states; yet most of the modern discussion takes the existence of the modern state for granted. Thus, Galston does not discuss the "How dare they!" defense of neutrality—the argument that calls in question the very idea that it is for coercive organizations to take stands on matters of ethics, value, and religion.

The second half of the book, in which the author sketches out the value premises of an acceptable theory, is likely to be more important to readers. The crucial chapters are entitled "Liberal Goods" and "Liberal Virtues." We are told that the liberal conception of the good comprises the following values: life, the development of basic capacities, the fulfillment of interests and purposes, freedom, rationality, community, and subjective satisfaction. The virtues liberals should be inculcating are things like courage, loyalty, independence, tolerance, self-restraint, and an ability to listen to another's point of view.

I wish Galston had devoted more space to the detailed discussion of all this. It's not that the lists are wrongheaded. On the contrary, his account is plausible and largely incontestable. However, the philosopher's job is not to pander to our intuitions but to take what sounds plausible and make it seem contestable for sake of bringing out its deeper significance.

Most of the discussion in the book is programmatic. It is about the very idea of liberal goods and virtues, rather than the particular conception itself. It is as though Galston were engaged in the debate about neutrality throughout the book and not just in the first half—as though the goods and virtues were listed in the later chapters purely for the sake of illustrating the more abstract antiproceduralist argument. Surely, if liberalism involves commitment to substantive goods, then liberal political philosophy should consist in the deep and systematic exploration of those goods. In *Liberal Purposes* there are precisely 16 lines devoted to a discussion of the good of life. But whether life (and the peace that secures it) is the preeminent good is precisely the issue on which the whole tradition of liberal toleration turns. There is less than half a page on the satisfaction of desire. But whether satisfaction is worth pursuing for its own sake (even as one good among others) is a crucial issue between liberals and their opponents. Again, there are just 9 lines on the virtue of loyalty. Should one be devoted primarily to the liberal institutions of one's own country, or should one be devoted to their realization everywhere? Are liberal virtues too universalistic to sit easily as civic virtues? These questions are not answered.

We await a discussion that explicitly shows what it is to pursue intimations about the good life in a substantive way if that is what we should be doing. Meanwhile, at the end of this book the most prominent difference between "proceduralist" liberals and their opponents remains that the former, like John Rawls, have actually *done* political philosophy in the style they advocate (whether convincingly or not is another issue), whereas the latter have so far spent all their energy just advocating a change in style.

University of California, Berkeley JEREMY WALDRON

Legal Hermeneutics: History, Theory, and Practice. Edited by Gregory Leyh. Berkeley: University of California Press, 1992. 325p. $15.95.

The word "hermeneutics" tends to divide people into two camps, those who won't go near any book that has the word in the title and those who will buy such a book precisely because it does. For those of you who are in the first camp (but have gotten this far into a book review on the subject), *Legal Hermeneutics*, edited by Gregory Leyh, is a very good place to catch up on what you have been missing, whether you are specifically interested in law or not. For those of you who are already fans of hermeneutics, this book contains a valuable and unusually lucid set of contributions to the development and application of hermeneutic ideas in the law.

What is hermeneutics? Many of the authors, particularly Fred Dallmyer and Gerald Bruns in their excellent essays on the rule of law and the situatedness of texts, respectively, turn to Hans-Georg Gadamer for inspiration. Gadamer believed that interpretation (the activity hermeneutics attempts to understand) is always practical, done for specific purposes in specific situations. Interpreters invariably draw on their broader historical and cultural understandings to work out what various texts mean in the concrete situation at hand—but not because they choose to. Instead, Gadamer argued, they can do otherwise.

These observations have been devastating for many who believe in the rule of law and in the ability of legal

texts like the Constitution to govern through time. Many arguments about the dependence of the meaning of legal texts on the historical and cultural contexts of readers have slid directly into claims of radical uncertainty, instability, and illegitimacy of the law. As most of the authors in this anthology make plain, however, this is not where a deeper hermeneutical understanding should lead. Instead, hermeneutics illuminates why it is that readers in common cultural circumstances generally *do* agree on what a text means. It is precisely because these readers share a common way of life (practices that underwrite interpretations that underwrite practices, etc.) that the meaning of cultural products like legal texts is generally widely shared. And, as Ken Kress notes, *some* indeterminancy in legal interpretation does not completely undermine the legitimacy of law anyway.

Legal Hermeneutics brings together some of the most impressive authors writing about this set of issues. Though a few of the essays (those by James Farr, Kress, and Michael Perry) have been published before, the other essays (by Dallmyer, Bruns, Peter Goodrich, Jerry Stone, Terence Ball, Druscilla Cornell, David Cousins Hoy, Steve Knapp and Walter Benn Michaels, Lief Carter, Gregory Leyh, and Stanley Fish) are published for the first time here. Most of these writers have their primary backgrounds in political or literary theory, rather than in law alone. As a result, this is not the usual set of inquiries about how the Constitution ought to be interpreted in specific doctrinal areas currently under contention but is, instead, a much more enduring contribution to how political and literary theory drives us to reconsider the interpretive practices of the political community in which we live. In general, the quality of historical understanding and theoretical sophistication is much higher in this collection than one generally finds in the vast literature on interpretation and the law.

Hermeneutics is seen in this volume as a discipline with a history, not just a set of slogans to be lobbed at current events in the law. Farr writing about Francis Lieber; Goodrich writing about Petrus Ramus and his followers; and Stone writing about Rudolf Bultmann, Karl Barth, and Paul Ricoeur show how hermeneutical inquiry is not a recent invention for the postmodern age of fragmentation (though Cornell writing about Jacques Derrida, Maurice Blanchot, and Emmanuel Levinas does give the problem a decidedly postmodern spin). The subjects of these essays are people who have thought long and hard about how texts change their meanings over time and yet (for all but the latter set) believe that the interpretation of texts remains within a tradition that is never completely lost.

The largest disagreement in this volume is over the relevance of the historical construction of intention in understanding the meaning of a text. While Knapp and Michaels, as well as Fish, have long thought that intention was crucial to interpretation, Ball and Hoy mount forceful arguments against that view. There are not clear winners and losers among these essays, but one does wonder how much it matters that those who defend a concentration on intentionality have literary works as their main examples and those who reject intentionality concentrate primarily on law. As Gadamer would be the first to point out, the conventions of practice within particular communities of interpretation make all the difference.

In the concluding section of the book, Carter, Perry, and Leyh write about the implications of these debates for legal practice. Perry focuses on how judges' choices of theories of interpretation do affect the outcomes of cases. Leyh concentrates on the conventions of legal interpretation taught in law schools. But perhaps the most telling essay in the whole volume is the description by Carter of a week he spent with 14 trial judges. For these judges, legal hermeneutics did not even register on their mental maps.

That said, there remain good reasons for scholars to be interested in these questions. A focus on hermeneutics connects legal interpretation with other interpretive practices, most notably in theology and in literary criticism. By enlarging the scope of inquiry beyond the narrow and professionally policed boundaries of the law, this volume provides a way to reconstruct the historical and cultural context of debates over legal interpretation, which hermeneutics itself should tell us is where all the action is in the struggle over meaning.

University of Michigan KIM LANE SCHEPPELE

Essays on the Foundations of Aristotelian Political Science. Edited by Carnes Lord and David K. O'Connor. Berkeley: University of California Press, 1991. 255p. $45.00.

The essays in this volume are united in their effort "to rectify the methodological and substantive weaknesses in current approaches to Aristotle's practical science" (p. 7). Most of all, they aim to show the preeminently practical intent of Aristotle's political works. The first four essays examine Aristotle's "social science" generally, and his "anthropology," "economics," and "sociology." The remaining five give fuller treatment to some of the themes that inform the foundations of Aristotle's political thought: justice, gender and citizenship, the best form of government, and the rule of law. The contributors are political theorists (Carnes Lord, Waller Newell, Stephen Salkever, and Abram Shulsky), philosophers (Richard Bodéüs and David O'Connor), a classicist (Josiah Ober), and an historian (Barry Strauss).

Lord claims in the Introduction that Anglo-American scholarship approaches Aristotle "at once too historically and not historically enough" (p. 1). The main reason scholars, with the exception of Leo Strauss and several contemporary Germans, tend either to historicize or to abstract Aristotle, Lord explains, is their failure to appreciate that he aspires primarily to improve (all) human action, and only secondarily, if at all, to theorize about phenomena. Being neither strictly parochial nor strictly theoretical, Aristotle's practical orientation to the human sciences challenges the historicism and positivism that prevail in philosophy and the social sciences.

In addition to demonstrating Aristotle's commitment to practice, the essays correct several particular interpretations, such as that Aristotle regards man as fundamentally participatory, the household morally sterile, and justice opposed to self-interest.

The best of the nine essays are the two by the editors. In "Aristotle's Anthropology," Lord argues that Aristotle's understanding of the origins of society differs from that of contemporary anthropology, which regards the family and kinship relations as critical stages. Lord contends that the evolutionary or organic reading of Aristotle's account of the development of the city rests on a misunderstanding of his view of man's politicality;

man is fundamentally not a pairing or bonding animal, according to Aristotle, but a combination of spirit and reason. Spiritedness, not sociality, explains the coming-to-be of society; for it impels men to resist being ruled as much as it brings them together, and it explains barbarism and tells why society did not (and does not) come to be according to a gradual, universal process. Aristotle's focus on the household at the beginning of the *Politics* is a rhetorical move, Lord explains. Aristotle does not want to reinforce either conventionalism or agonism in political life but aims, by establishing the naturalness of political rule, to reinforce the comradeship that arises naturally among men from their common perception of, and desire to secure, the just and noble.

O'Connor's "Aetiology of Justice" should be read by all theorists interested in the subject of justice. Its main objective is to weigh the claims of a contemporary view of justice, a view which links justice with altruism and impartiality, against those of Aristotle's view, which regards orientation of desire as central to justice. Presupposing a distinction between self- and other-regarding virtues, contemporary moral philosophers, such as Bernard Williams, define *injustice* as a kind of egoism, an indifference to promoting just distributions. Contrary to contemporary interpretations of Aristotle (e.g., Philippa Foot's), Aristotle does not, according to O'Connor, distinguish self- from other-regarding virtues; justice is the symptom or relational manifestation of correctly oriented desires. The source of injustice is, then, according to O'Connor's reading of Aristotle, not a *specific* vice, like egoism or indifference, but misoriented desire. The problem fundamental to justice, then, is "not the aetiological one of the possibility of altruism" but the political one of the possibility of a coincidence between the good man and the good citizen (p. 147).

Salkever's opening essay contrasts Aristotle's "social science," which seeks to improve praxis by presenting the human telos not in terms of some transcendental ideal but as the mean, with both empiricist and interpretive social science, both of which preempt moral relevance—empiricism by reducing human beings and their creations to composite parts and the interpretive approach by denying any essential human relation to nature (its findings are strictly local and archival). Such criticism is compelling, but Salkever dissolves the tension between politics and philosophy that Aristotle sees by blurring Aristotelian distinctions between the nature of the activities, their ends, and the faculties engaged.

Shulsky's essay, which argues that economics, for Aristotle, is a practical science, lacks discussion of Book 5 of the *Nicomachean Ethics*, part of which might be understood to be an attempt to theorize about economics that is compatible with his practical counsel.

Ober's piece on Aristotle's "political sociology" argues that Aristotle's categories of sociopolitical analysis converge not with the materialistic Marxist concept of class, which is fused with the concept of exploitation, but with the more ideological, Weberian categories of status and order, and are useful in showing the societal differentiation of the polis that Aristotle himself recommended. The contemporary relevance of the *Politics*, then, with its presentation of an ideal ordered state with a homogeneous citizenry, is its attempt to show how the political and social can be linked to a socially diverse world so as to shore up moral community as far as possible.

Salkever's second and more successful contribution (published, like his first, in two previous versions) argues that Plato's and Aristotle's countercultural reservations about how far political activity can make human beings virtuous go hand in hand with their appreciation of things private, such as the family and women.

Newell, Strauss, and Bodéüs write on Aristotle on regimes. Newell points out that Aristotle's association of monarchy with absolute justice reveals both monarchy's status as a theoretical standard and political community's nature as a creature of compromise. Strauss claims that Aristotle intentionally—for socioeconomic, political, rhetorical, and philosophical reasons—depicts Athens as an extreme, rather than as the constitutional democracy it was. Bodéüs argues the importance, in Aristotle's eyes, of moral education in the form of law to the duration of regimes and contends, moreover, that Aristotle evaluates regimes on the basis only of their internal consistency. As Paul Vander Waerdt has elsewhere pointed out against Bodéüs, however, Aristotle encourages legislators to work for a second telos, the unqualified betterment of the regime, in addition to preservation.

Lord notes in the Introduction that the collection might have included essays on other topics. A piece on the relevance of Aristotle's biology to his political works, written by Leon Kass or Roger Masters, for example, would, indeed, have been welcome, as would a piece on psychology by, for example, William Fortenbaugh. (Also, Arnhart's book title on p. 44 should be *Aristotle On* Political *Reasoning*.) Not missing or in need of changing, however, is the good index.

Overall, this collection, by improving much predominant thinking about Aristotle's treatment of the human sciences, reveals the Aristotelian challenge to contemporary methods of social science. It also provides a service to the field of political theory by furnishing models of how to illuminate philosophical texts with historical information. In both of these ways, it encourages needed dialogue between social scientists, philosophers, historians, and classicists.

Similar in scope, but not in purpose or unity, to this collection (and providing an *index locorum* instead of a subject–author index), is *A Companion to Aristotle's Politics* (1991), edited by David Keyt and Fred D. Miller, Jr.

Boston University JUDITH A. SWANSON

Ricardian Politics. By Murray Milgate and Shannon C. Stimson. Princeton: Princeton University Press, 1992. 169p. $32.50.

Given Ricardo's reputation as a rather difficult economic theorist and little else, the thesis is novel: "We do wish to claim that Ricardo formulated much of what is characteristic of the democratic political creed of early philosophical radicalism in a distinctive way, that he linked his economic and political speculations in a systematic and novel fashion, and that a re-examination of the grounds upon which he made those arguments is a useful and necessary exercise in historical and theoretical recovery" (p. 6). The incredible thing is that this monograph goes a long way to prove these points.

This is done in a twofold manner: (1) by a meticulous examination of the basis for Ricardo's adherence to a radical reform of the parliamentary franchise (near universality of male suffrage, frequent elections, redistribution of seats, the secret ballot, and greater liberty given

to public assemblies) during the period of preparation for, and his actual, parliamentary career (1818–23); and (2) by a continuous counterpoint with the political thought of James Mill, who was, to a certain extent, Ricardo's political mentor. To this is added a subsidiary counterpoint to the thought of Bentham and John Stuart Mill. Were the counterpoint as sound as the reading of Ricardo, this would be a book to place in the same class as Donald Winch's *Adam Smith's Politics* (1978). But there is a major problem in the comparison with the thought of James Mill.

Ricardo is placed in a new light by suggesting that his thought was far more progressive than Mill's in the extent to which he accepted the class-divided nature of the society of his day and was remarkably unafraid of seeing class tensions expressed in the political and parliamentary arena:

> "Ricardo . . . never once thought that this underlying economic rivalry would simply vanish once the vote was granted. In fact, quite the reverse was the case. Even when . . . those competing interests were not just those of competing individuals but were those of different social classes, Ricardo seems to have been perfectly comfortable with the idea that politics existed precisely to allow all those economic interests to gain political expression, rather than to quiet them" (p. 106; see also pp. 118–19).

This is proved beyond the shadow of a doubt by the texts cited from Ricardo's articles, speeches, and letters. For this alone, the work would be worth reading.

But the comparison with the thought of James Mill misses an important problem. It is based upon a close reading of Mill's essay "Government," as well as a certain number of his other works. The difficulty with taking "Government" as representative—or even as the core—of Mill's thought is simple: it is not his *strongest* essay but, rather, one of the *weakest* of the 12 he wrote for the *Encyclopaedia Britannica* between 1816 and 1823, since he wrote it with one arm tied behind his back. Macvey Napier, the editor, had hired Mill to write a series of articles representative of the Benthamite position in social, political, and legal thought (s.v. "Jurisprudence," "Law of Nations," and "Prisons and Prison Discipline," in particular). But Bentham had published his *Plan of Parliamentary Reform* in 1817, and either it or the review James Mackintosh made of it in December 1818 in the *Edinburgh Review* put the fear of God (or rather of political radicalism) in Napier. As a result, Mill was forced to give but a truncated version of the Benthamite position, as the contradictory and feeble nature of much of the argument reveals. Had the authors of *Ricardian Politics* used Mill's later article "The *Edinburgh Review* on Parliamentary Reform" (*Westminster Review*, July 1825), they would have realized that Mill was substantively closer to Ricardo than they here make out. (But their case that Ricardo was more progressive and less backward looking would have still been sustained.) Elsewhere, they also reveal a slightly uncertain hand with regard to Bentham; his unpublished critique of judicial establishments in France (see p. 133) was published as early as 1790, for example; and their remarks about his inadequacies as an economic theorist reveal a certain lack of sympathy with the ends to which his analysis was to be put.

But despite these comments, this book marks a new stage in the consideration of political economy in the development of liberal thought in the nineteenth century. It is lucidly, at times elegantly, written. The authors have an enviable command of the relevant social, economic, and political literature of the period. Their reflections on the links of Ricardo's economic thought to later political radicalism—from the misnamed "Ricardian Socialists" (they were neither Ricardian nor socialists) to the thought of Marx and beyond—are most stimulating. As an essay in revisionism it should go a long way in readdressing how political economy's relationship with political thought is viewed.

University of Toronto ROBERT A. FENN

Managerial Dilemmas: The Political Economy of Hierarchy. By Gary J. Miller. New York: Cambridge University Press, 1992. 254p. $47.95.

Managerial Dilemmas is a fascinating book that introduces political scientists to an array of organizational difficulties with rational underpinnings. Miller is interested in organizational problems that cannot be solved merely by improving communication between superiors and subordinates or by correcting decision makers' flawed thinking. The situations he analyzes share several properties. They can arise even if decision makers have perfectly accurate beliefs about the organization's behavior and outcomes and even think in fully rational ways. Their essential feature is that individually rational behavior can produce collectively undesirable outcomes. Hence, they can justifiably be regarded as enduring dilemmas confronting public and private organizations.

There are, broadly speaking, two types of rational choice scholars in political science. The first type, inspired by models of perfectly competitive markets, believes that institutions are Pareto-optimal. If they were not, someone could make a buck, get elected, or otherwise gain by proposing a new, Pareto-superior institution. The second type, relying on noncooperative game theory, is more pessimistic and is quite willing to believe that situations can endure indefinitely (i.e., as Nash equilibria) yet be collectively suboptimal. Miller belongs squarely in the second camp. In the heart of the book, chapters 4–7, Miller analyzes several important kinds of authority systems and incentive schemes and demonstrates how they can lead to suboptimal outcomes.

The white knight that rides in, in chapter 9, to restore Pareto-optimality to organizations is repeated play. As Miller emphasizes, it is well known that if future payoffs are valued enough, behavior that is not individually rational in the short run (e.g., cooperation in the prisoner's dilemma) can be sustained as a Nash equilibrium in the repeated game. This means that organizationally desirable outcomes can be realized despite the failures of formal authority and incentive systems.

Unfortunately, as Miller also emphasizes, the white knight has a weakness—the folk theorem. This result says, roughly, that when the future is sufficiently important, *any* outcome that gives each player at least that player's "security level" (what he can unilaterally guarantee himself) can be supported as an equilibrium by appropriately chosen strategies. Miller convincingly argues that the folk theorem poses two serious and related problems for decision makers: How will they coordinate on reaching a particular equilibrium? and How will different players fare in the chosen equilibrium? *Managerial Dilemmas* is probably the first book in political science that confronts the implications of the folk theo-

rem head-on. For example, Miller fully recognizes that "repeated play makes cooperation in a team possible, but not inevitable" (p. 214).

Though Miller draws on a technical literature, all the basic ideas are explained in clear English. There is no unnecessary jargon, and no unnecessary mathematical notation or equations. The book is therefore highly accessible to non–technically trained political scientists and organization theorists who are interested in learning about the "new economics of organization." Indeed, it is probably the best introduction to this literature now available to political scientists.

Occasionally the presentation's informality causes problems. For example, chapter 6 examines an interesting impossibility result: given interdependent production that is unobserved by the boss, there exists no incentive system that simultaneously (1) is Pareto-optimal, (2) is a Nash equilibrium, and (3) balances the budget (the incentive system distributes the organization's revenues without deficits or surpluses). Unfortunately, the discussion fails to make explicit that this theorem presumes one-shot interaction. The reader is thus led into believing that the theorem's implications are more far-reaching than they really are.

Similarly, chapter 5 models the difficulty of reaching a Pareto-optimal deal via piece-rate contracts in the context of a one-shot game; again, this context is implicit. Because Miller does not provide an explicit model of piece-rate deals in a repeated game, the reader does not learn whether Pareto-optimality can be sustained as a Nash equilibrium when contracts extend over time. The discussion then moves to an empirical examination of a firm, Lincoln Electric, where such contracts do seem to work. But although the description clearly shows that this case involves repeated play, the reader has not been analytically prepared for the role of ongoing interaction in securing cooperation and may therefore be puzzled why Lincoln's system succeeds.

Miller provides an answer: the owner has *committed* himself to abiding by the terms of the deal (not cutting back on the rate once he sees how much the workers can churn out). But invoking the notion of credible commitment does not clarify matters. Sometimes the idea is used to explain how a particular outcome is selected in a game with multiple equilibria. (One thinks of Schelling's example in which a driver in a game of chicken throws his steering wheel out the window.) But equilibrium selection does not seem to be the whole story in Miller's analysis of the Lincoln case; for in his account, management continues to demonstrate, in an ongoing way, its commitment to the cooperative equilibrium. Thus, credible commitment helps to sustain an equilibrium as well as select one. But because the Lincoln story involves repeated play, where strategies of conditional cooperation can form Nash (and even stronger) equilibria, commitment may be unnecessary. Once the workers and managers of Lincoln are in the cooperative equilibrium, little is added to the analysis by saying that the parties have committed themselves to their strategies. Each person is simply playing optimally, given everyone else's strategy; and this is all that standard Nash equilibrium analysis has to say about the matter. One therefore suspects that Miller is going beyond the standard analysis. In several places, he refers to the "fragility" of the cooperative equilibrium and to the role of managerial commitment in making that outcome more robust. Miller is onto something here; perhaps future work will clarify these issues.

Miller reaches for an admirable integration of rational choice theory and fieldwork based on social-psychological and sociological perspectives. Sometimes the integration comes off beautifully. For example, the analytical discussion of the bad equilibrium in some companies using piece rates is accompanied by a perfectly appropriate recapitulation of William F. Whyte's descriptions of workers and superiors locked in lose–lose conflicts.

Occasionally, the integration is more forced. Miller tries to argue that "mechanistic" hierarchical incentive systems are inefficient and that the "warm fuzzy" approaches from the human relations school of organization theory, involving nonhierarchical work teams and close interpersonal ties, help greatly in reaching Pareto-optimal outcomes. But it is not always clear how all of these components of the human relations school help pick out the socially desirable equilibrium. (The role of some components, such as trust, is clear.) Conversely, it is not always clear why hierarchy must go. If it is repeat play that is doing most of the work in stabilizing benign outcomes, then hierarchical authority structures (and even "mechanistic" incentive schemes) could be maintained; they simply have to include the appropriate stick-and-carrot components. Indeed, one could argue, as Miller does, that "leadership" (a more positive word for hierarchy?) is crucial in solving the equilibrium selection problem.

But these problems reflect the ambitiousness of Miller's efforts: he does not shy away from hard problems on the frontiers of organization theory or game theory. At the same time, he has written a spirited book that can be profitably read by strong undergraduates and entering graduate students. It is a fine achievement.

Stanford University JONATHAN BENDOR

Love and Power: The Role of Religion and Morality in American Politics. By Michael J. Perry. New York: Oxford University Press, 1991. 218p. $29.95.

In the contemporary debate between liberals and communitarians, most participants have come to accept some important concerns of their opponents. Communitarians acknowledge the importance of social pluralism and individual freedom, and liberals realize that the moral development of citizens is vital to the political system. However, liberals have difficulty incorporating into their theories conceptions of moral standards that are nourished by groups with a comprehensive conception of the good life—religious groups, for example. Liberals fear that in teaching people how they ought to live, such groups may fail to engender forms of moral development that are compatible with respect for individual rights. At the same time, the political order may need the moral standards taught by groups with a comprehensive view of the good.

In *Love and Power*, Perry argues that too many Americans wrongly neglect the contributions of religious groups in the justification of, and deliberation about, political questions. Perry, an acknowledged Catholic, believes there is a widespread and mistaken assumption that religious morality should be, or can be, excluded from political discourse in a pluralistic society that is committed to freedom. He insists that liberal thinkers

seek neutral politics by excluding discourse premised on conceptions of the good that everyone does not accept. He claims that the removal from discourse of unshared premises is itself not neutral because it unfairly excludes from public consideration the moral positions based on religion. Moreover, this exclusion denies the political order the benefits of religious morality.

In place of an impossible neutral politics, Perry defends an "ecumenical politics," in which "beliefs about human good play a basic role in public deliberations about, and public justifications of, contested political choices" (p. 43). In particular, religion offers "a vision of final and radical reconciliation, a set of beliefs about how one is or can be bound or connected to the world—to the 'other' and to 'nature'—and above all, to Ultimate Reality in a profoundly intimate and ultimately meaningful way" (p. 77). Since every religious vision comprises moral beliefs about how one should live, every such conception of what it means to be fully human implies acceptance of some basic responsibility for the well-being of others. In this sense, all religion is political, not private.

According to Perry, ecumenical politics is communitarian because it strengthens political bonds. For example, religious dialogue can celebrate and support basic American values like our constitutional premises about human rights. Also, Perry emphasizes that dialogue based on different and competing religious and moral traditions can serve an integrative function by transforming sensibilities and by bringing cognitive changes. Of course, many readers may think that Perry gives too little attention to the divisions that religious discourse can bring. He insists that ecumenical politics is fallibilist, because it embraces self-critical rationality, and pluralistic, because it respects divergent ways of life as a source of deepening moral insight. These aspects, plus compassion, will lead to political tolerance, not to authoritarianism; the state will not be used for coercion. Contrary assumptions, he thinks, can be traced to the widespread ignorance about religion of otherwise well-educated persons and to the assumption that all religious persons must make the same extreme political demands that are made by some fundamentalists.

Perry correctly argues that political discourse based on the sharing of religious values does not necessarily lead to attempts to enforce a view of the good on others. However, Perry's ecumenical politics is an ideal form of dialogue that will not always be practiced. We need to understand how the political system can draw upon the views of groups with full theories of the good—views that may support moral standards helpful to society—without imposing a comprehensive conception of the good. Some general guidelines may be given, guidelines that should be considered by those taking Perry's viewpoint. Political authorities must support only moral standards that clearly benefit the entire society, and individuals must retain the freedom to reject these standards in their personal lives. Moreover, government must only support the aspects of morality that are not inextricably bound up with a particular view of the good; and government must not proclaim that some conception of the good is superior to other ways of life. Such guidelines require continued commitment to the distinction that Perry too cavalierly dismisses, namely, the liberal distinction between the right (principles of justice guaranteed by the state) and the good (the way of life chosen by individuals). Adherence to this distinction does not preclude Perry's goal, the enrichment of political discourse as citizens share their deepest understandings of the good life, understandings that may be religious in nature.

University of New Orleans ROBERT B. THIGPEN

Equal Justice. By Eric Rakowski. New York: Oxford University Press, 1991. 385p. $49.95.

Justice requires that equal consideration be given to the welfare of everyone affected by some system for distributing benefits and burdens. The presumption is in favor of equal shares; inequality, not equality, demands justification. This is the starting point for most modern discussions of equality, and *Equal Justice* is no exception. But equality of consideration is, as Eric Rakowski's study demonstrates, often an ambiguous, complex, and controversial criterion for choosing among possible distributive schemes. It is, for example, sufficiently indeterminate to accommodate such rival goals as maximizing the aggregate utility or equalizing for each person the consequences of some distributive scheme. Rejecting both of these schemes, that is, utilitarianism and equality of welfare, Rakowski argues that justice is "equality of fortune." This means that "no one should have less valuable resources and opportunities available to him than anyone else, simply in virtue of some chance occurrence the risk of which he did not choose to incur" (p. 1). Thus, no individual should be worse off or better off than anyone else simply because of good or bad luck (e.g., unequal genetic endowments, certain illnesses, a serendipitous discovery or invention). When inequality is the result of "option luck," like a successful or failed business venture, justice does not require that equality be restored. The general idea is that people's shares should be kept equal "except to the extent that their voluntary actions give rise to inequalities" (p. 75). This is a thesis best revealed in its details. What sort of things count as resources? How is their value to be determined? Do those with expansive tastes need more resources than others? Does one forfeit a claim to compensation or help from others by failing to insure against some foreseeable risk? *Equal Justice* is a long and often demanding book. It is also an uneven one.

If justice means equality of fortune, then it seems that every misfortune that one could not reasonably have taken measures to avoid generates a claim for compensation from society. In effect, every *mis*fortune is an *in*justice. Illness, injury, genetic endowments, physical handicaps, social environment, family, opportunity—where any of these constitute a disadvantage for which one cannot be held responsible, a just society will seek a remedy. Where, alternatively, they constitute an advantage for which one cannot take credit, a just society will insist that the benefits of that good fortune be shared. Rakowski is the first to admit that the ideal of equality of fortune, given the complexity and range of factors that must be considered, would be difficult to honor. Indeed, I would imagine it clearly impossible. Rakowski himself notes (to take one instance) that it is probably impossible to determine which part of some successful business enterprise is attributable to voluntary effort and which part is attributable to natural talents for which one does not deserve reward. Rakowski concedes that the theory of equality of fortune will not always (often) yield criteria

for feasible policies. In short, *Equal Justice* is a work in ideal theory pretty much removed from a concern with possible transformations of the world. It is, as much of moral philosophy can be, a suppositional inquiry in which the chief concern is to discover what justice means in cases where actual practice and conventions are bracketed as largely irrelevant. Not surprisingly, therefore, Rakowski is at his best when comparing rival principles and criteria for distributing benefits and burdens. He is less successful at probing the sensibilities that might inform conventional understandings of justice. This is especially evident in the chapter where he defends the nonvoluntary harvesting of cadaver organs and, under certain restrictive circumstances, compulsory organ transplants from live donors. Allowing for a moment that "human tissue is a resource" and that equality of fortune mandates some sort of redistributive donor scheme, it seems equally obvious that cultural meanings and shared understandings must count for a lot here. My complaint is not with how Rakowski balances these considerations but with his failure to see that some balancing is necessary.

It is probably inevitable that part 1 of *Equal Justice* will receive the sort of disproportionate treatment that I have given it. This is unfortunate because part 2, where Rakowski outlines a theory of corrective justice in the context of torts and rules of negligence and strict liability helps to expand the thesis of equality of fortune argued for in part 1 and is, I think, more successful in demonstrating when injury requires compensation. It includes an important chapter criticizing Richard Posner's theory that law should aim at the maximization of social wealth. Part 3, however, which takes up questions about the relevance of numbers to life-saving decisions and the killing of animals to benefit humans, stands alone and should have been published elsewhere.

University of Florida ALFONSO J. DAMICO

Contractarianism and Rational Choice: Essays on David Gauthier's "Morals by Agreement." Edited by Peter Vallentyne. New York: Cambridge University Press, 1991. 339p. $59.50 cloth, $18.95 paper.

Peter Vallentyne has brought together 17 important essays discussing David Gauthier's book, *Morals by Agreement*. A central theme that pervades these articles is summed up best by Peter Danielson, who asks, "Why should agents concerned only to satisfy their own preferences constrain themselves by impartial moral principles?" (p. 292).

Gauthier's social contract emanates from an ideal bargaining position in which each individual as a utility maximizer of one's own preferences comes to realize that each person does individually better by accepting constraints against exploitative conduct, in situations, as Jean Hampton says, where each "has good reason to believe that their partners are inclined to cooperate" (p. 40). In a Pareto-efficient world or a free-market setting, characterized by perfect competition, each would (as Jody Kraus and Jules Coleman say) do as well as possible by acting in purely self-interested ways; and in this case, "it would be irrational for any agent to impose restrictions on the pursuit of self-interest" (p. 255). But when, as in the real world, perfect competition does not take place, this situation creates a Pareto-inefficient environment (p. 256). In this setting, each agrees to constraints each individual believes to be conducive to one's own quest to maximize preferences. Individuals would accept, as the main principle of acquisition, the Lockean proviso, which, in the words of Peter Vallentyne, says that interactions are "subject to the constraint that no one makes him/herself better off by making someone else worse off" (p. 7). The principle of *minimax relative concession* (MRC), which encompasses the Lockean proviso, defines, as Hampton says, the fair terms of cooperation (p. 41). To quote Vallentyne, the MRC indicates that "rational agents would agree to an option for which the highest relative concession is as low as possible" (p. 8).

Gauthier's argument for "constrained maximization" suggests that individuals seek to avoid exploitation, in the hopes that each will be able to maximize one's own preferences. In this vein, both the Lockean proviso and the MRC principle are norms that individuals would voluntarily comply with. Here, the basis for a motivation to support constraints is not Hobbes's Leviathan, which might end up trampling the freedoms and rights that liberal regimes are supposed to secure but an agreement entered into by individuals on a voluntary and noncoercive basis.

But can a motivation to support Gauthier's rules be located solely in self-interest maximization arguments that culminate in a need to avoid exploitation? The book's most important contribution to contemporary scholarship is found in the essays suggesting that contrary to Gauthier, individuals support moral norms not solely from rational choice calculations but from the presence of a moral personality, which suggests rules that individuals find morally valuable for their own sake. Jean Hampton, in her insightful essay, argues that Gauthier needs to recognize that implicit in the commitment to avoid exploitation is the notion of respect for persons and that this idea is a necessary "price" we must pay if we are to avoid making ourselves prey for others (p. 53). In the same vein, David Braybrooke wonders how rights for all and moral progress of any sort can be made unless individuals have "humane feelings" for each other; and so long as Gauthier's theory is ambivalent on this point, his argument "offers only mixed assistance to moral progress" (p. 70). Holly Smith argues that for utility-maximizing individuals, adherence to moral rules means sacrifice and that as a result, individuals would have to approach life with an extreme sense of another important moral trait, perseverance (p. 247).

In the same vein, Geoffrey Sayre-McCord argues in his important essay that many individuals have "sound self-interested" grounds, influenced by the logic of moral argument, for "abandoning egoism in favor of morality" (p. 195). In particular, there are individuals for whom the goals of a moral community are a matter of prime importance over and against self-interest maximization or egoism: "This last group is especially important . . . because almost all human beings belong to it" (p. 195). Peter Danielson, in his fine essay, rejects Gauthier's linking cooperation to the market (and thus to a notion of "exclusive property rights") and says that cooperation, agreement, and bargaining presume "appeals to equality and noncoercion" and thus to "precontractual individual rights [that] do not need [to be] fully developed property rights" (p. 107). Here, it would seem, the ground of community is not market relations

and property rights but a Kantian respect for persons. Jan Narveson says in his interesting essay that even if the initial bargaining position incorporates the assumption that individuals are predatory, they will forgo predatory conduct in the future because they will each realize that predation wastes "efforts which could instead be converted into mutual gains" (p. 144). But even in this case, moral progress would require a sufficiency of "humane feelings" so that individuals would be able to believe that they could work together in future encounters. Finally, David Copp's excellent essay demonstrates that individuals, even if they conditionally comply with Gauthier's rules in a hypothetical bargaining position, may find, given a variety of moral and nonmoral motives, that in the actual world, it is not "rational to dispose themselves to comply with these [Gauthier's] principles" (p. 223). Often, peoples' moral preferences are integral to their core identities; and these preferences govern their actual choices, irrespective of the requirements of constrained maximization (p. 224).

Gauthier, in the concluding essay, goes a long way to diffuse the arguments of some of his critics. Gauthier argues that his individual is much more accommodationist than he would at first seem: "In his interactions, others are led, through knowledge or belief about his dispositions, intentions, and plans, to behave in ways that enable him to do better, even though he does not maximize, than he could expect to do were he believed to be disposed to perform only maximizing acts" (p. 328). The accommodating individual is more willing than the interest-maximizing individual to accept the norms of cooperative life as principal goods to be striven for, whether or not they can be derived from a rational choice argument.

While this volume is an excellent contribution to the understanding and critique of the leading ideas in Gauthier's approach to the liberal social contract, the volume would have been made substantially more useful if essays had been included dealing with the kinds of political and social policy that are necessary in order to secure the liberal social contract that Gauthier's theory requires. In effect, what is missing here is a concern for the shape of politics in a Gauthier-oriented regime. The article by Donald Hubin and Mark Lambeth showing that the Lockean proviso is not an adequate foundation for rights is very helpful in this regard; but more essays of this sort dealing with questions like the importance and place of various rights should have been provided (p. 126). Finally, in this regard, how is the rational choice approach useful in confronting many of the current problems facing liberal societies, like abortion, medical care, welfare reform, race, and so on? By not addressing concerns of this sort, the book, while excellent in explaining and providing telling criticisms of Gauthier's concept of constrained maximization, fails to demonstrate the importance of these arguments to the current effort both to justify and sustain the liberal social contract.

Miami University, Ohio STEVEN M. DELUE

AMERICAN POLITICS

The Logic of Congressional Action. By R. Douglas Arnold. New Haven: Yale University Press, 1990. 282p. $29.95.

The purpose of this book is to explain why Congress enacts the policies that it does. Amid the many issues this concern raises for Douglas Arnold, one question is paramount: Why does Congress sometimes break free of particularized interests and enact legislation that serves the general public? Since reelection is the primary concern of legislators, Arnold asserts, incumbent support for particularized group or geographic interests fits their needs by facilitating "advertising" and "credit claiming." But these same legislators sometimes approve policies that deliver collective goods to the general public while imposing demonstrable costs on voters. Why?

To answer this question, Arnold creates the most sophisticated model of Congress yet proposed by electoral incentive theorists. In Arnold's world, legislators are concerned not just with the *expressed* preferences of attentive citizens but with the *potential* preferences of an inattentive public. After all, legislators might respond so completely to particularized interests in a policy area as to produce general policy effects detrimental to the public as a whole and thereby generate electoral backlash against themselves. Legislators must thus develop extraordinarily fine-tuned electoral antennae, constantly estimating not just immediate policy positions of groups but probable public reactions once a program's effects begin to be felt.

Proponents and opponents of policies develop procedural and statutory strategies that cater to legislators' electoral calculations. In particular, they arrange voting processes so that electorally beneficial policy decisions will be traceable to visible public votes, whereas detrimental decisions will be less visible. And they draft legislation so that electorally beneficial policy action will have immediate and salient policy effects, whereas detrimental policy effects will be delayed and less salient. Once these and related issues are understood, Arnold argues, it then becomes evident how and why Congress can enact policies serving general, rather than particularized, interests. It can do so when a program's general beneficial impact is salient, or potentially salient, to a substantial number of citizens; when coalition leaders can employ strategies that allow citizens to connect the positive general effects to their legislators' votes; and when coalition leaders can hide the connection between the legislators' votes and any negative particularized impact of the program. Arnold illustrates these processes with case studies drawn from the 1970s and 1980s, concluding that during these years legislators' electoral calculations supported general, as well as particularistic, policymaking.

Arnold's effort in developing and illustrating this thesis is impressive, producing one of the most illuminating books I have read on Congress. Every page provides a new insight into some aspect of congressional policymaking. Students of congressional elections, coalition building, roll-call voting, and legislative careers; specialists in budgetary and economic policy, tax policy, and energy policy; theorists of political representation and rational choice analysts—all will find nuggets of golden insight into their special concerns in Arnold's analysis. Arnold's differentiation between actual and potential preferences and legislators' concern for the foreseeable effects of policies are major innovations in electoral incentive theory. And the effort to demonstrate that electoral calculations can account for the enactment of general, as well as particularized, benefits is one of the great tasks confronting students of representative democracy. For all the brilliance of the effort, unfortunately, the book fails to deliver on this central goal.

The primary problem with Arnold's argument lies in a confusion over the distinction between particularized benefits and collective goods. The allure of Arnold's basic puzzle flows from the long-standing debate over whether a representative assembly can serve the public interest by providing for collective goods, particularly when private interests and particularized goods would seem to be the salient concerns of voters. At the outset, Arnold identifies his effort with this classic debate, arguing that general benefits refer to "collective goods that people value because they believe that everyone profits," with such benefits falling "uniformly on members of society" (p. 26); particularistic goods, by contrast, are the benefits that fall on identifiable group or geographic interests. The trouble is that Arnold assumes that group or geographic interests are the only particularistic interests that concern voters. In point of fact, much of the tension between private and collective interests arises from citizen's desires for highly salient, specific, and divisible *individual* benefits, illustrated by their concern for policies that maintain low prices and, in the post–Proposition 13 world, lower taxes. Electoral incentive theorists have long considered such individualized and private benefits to be the "meat and potatoes" of reelection campaigns, with incumbents invariably positioning themselves to claim credit for such salient benefits.

By equating particularized policies solely with those that relate to group or geographic benefits, Arnold includes in his general policies the programs that deliver private and divisible goods to individual citizens. Arnold's theoretical logic and empirical proof then becomes preoccupied with demonstrating that Congress is willing to enact policies that deliver highly salient, specific, divisible and individualized benefits. The resulting analysis provides powerful proof that private and particularized *individual* benefits can compete with particularized *group* or *geographic* interests for the support of electorally attentive legislators. It does not demonstrate that the electoral calculations of legislators support the enactment of general policies that deliver diffuse collective goods.

Missing from the book is a serious consideration of what constitutes a collective good. General programs providing collective goods probably should be expected to meet at least three conditions: (1) the program's primary benefit should be substantial, shared, and indivisible among citizens (e.g., clean air); (2) there should exist real reason to believe that the enactment of the

policy would deliver the shared and indivisible benefit (so that such claims are not simply symbolic); and (3) the program should have some substantial private costs, so that government action is required to obtain the beneficial effect. The existence of a collective good cannot be assumed simply as a result of the reversal of group or geographic interests, as a result of an assertion by coalition leaders of a collective benefit, or as a result of broadly distributed effects of the policy. Rather, there must be substantial reason to believe that a real, shared, and indivisible benefit would accrue from government action.

Applying this definition, none of Arnold's policy cases could be convincingly demonstrated to be general policies designed to provide collective goods. Most clearly provide individualized and private goods (low prices or limited taxes) or restructure the distribution of particularized benefits among individual, group, and geographic interests (the combined taxing and spending cuts of 1981 and the Tax Reform Act of 1986). Others are largely symbolic programs enacted at a time when no real prospect existed for their implementation (gasoline rationing in 1980) or drafted in such a way as seriously to decrease the likelihood of full implementation (as with Gramm–Rudman). In addition, appeals to the collective benefits of programs were often based on highly suspect scientific theory (as in the appeal to supply-side economics to support Reagan's tax and spending cuts).

Seen in this manner, Arnold's logic and case studies explore not how electoral calculations and the reliance on strategic ploys account for the provision of collective goods during the 1970s and 1980s but, rather, just the opposite. Arnold has chosen to study congressional policymaking in a period in which the great cyclical mood swing of American politics (as demonstrated recently in the statistical analysis of James Stimson) was moving away from a sustained concern with collective goods and toward a concern with private goods and individualized benefits. This move took place even in the face of considerable argument that such developments would create great collective costs. He is also studying Congress in the wake of the reform movement of the early 1970s that decreased the institution's capacity for sustained and independent deliberation, and expanded the capacity of citizens and interests groups to audit legislators' individual policy positions. The reform movement thus made members highly vulnerable to the growing public pressure for salient, specific, divisible, and individualized goods. What Arnold has demonstrated is that coalition leaders exploited legislators' increased vulnerabilities in the 1970s and 1980s in order to pursue an expansion of privatized and individualized benefits and to reverse historic concerns with collective goods and the general public interest.

The pressing theoretical question is whether the logic that Arnold outlines will work when the public again becomes concerned with collective problems. Do the same electoral calculations and coalition strategies that produce support for private goods and individualized benefits also generate support for collective goods? I have my doubts. It is simply much easier to design policies that provide immediate and specific benefits of a private and individualized nature than it is to design collective policies that do so (seen in the contrast between the immediacy of lower taxes or restrained prices and the long-term benefit of, e.g., cleaner air). How, then, does one proceed who truly seeks to enact diffuse and shared collective benefits? Can Arnold yet demonstrate that the electoral calculation of legislators is compatible with the provision of collective goods? I believe that he can; but to do so, he must make at least two additional adjustments in his theory.

First, Arnold must develop a more sophisticated interpretation of the voting public, with citizens, as well as politicians, attentive not just to immediate policy benefits but to long-term policy effects and concerned, therefore, not just with private and particularized policy agendas but with shared and indivisible policy benefits. Such an approach would place considerable emphasis on the role of ideas and political explanation in electoral politics, with the prospect that the greatest electoral weapon to sustain incumbents in office may be policies that demonstrate the collective benefit of government. It would also need to recognize that because voters assess private, as well as collective, effects of policies, government must provide collective benefits without undue private costs, and in a manner that ensures that the private costs that are incurred generate the desired collective benefits.

The incorporation of such considerations into electoral incentive theory would then require a second innovation, a determination of the institutional arrangements that facilitate authentic congressional deliberation over whether to deliver (and how best to fund) collective goods. Arnold alludes to such concerns briefly in the concluding chapter and appears to believe that a realistic path to a more responsible Congress comes through voting procedures that inhibit floor amendments (thereby undermining particularized pressures on members) and through increased visibility of final votes on substantive legislation (thereby stressing the salience of such votes). My suspicion is that such strategies, in and of themselves, will only increase the electoral pressures on legislators to respond to the desires of citizens for salient short-term divisible individual benefits. For Congress to reassert its legitimacy as a policymaking institution capable of pursuing collective goods in a responsible manner, it must strengthen its age-old stalwarts of collegial decision making: the parties, centralized leadership, and a deliberative committee system. The ultimate key to such strengthening is for politicians, journalists, citizens, and academicians(!) to grapple with the central issue of democratic government, namely, whether there are collective goods and a public interest that we require a representative government to address.

These, then, are my reactions to *The Logic of Congressional Action*. Others will undoubtedly respond to Douglas Arnold's arguments and closing reflections with different concerns. It is to Arnold's credit that he has tackled one of the most central and unsolved puzzles of political science and has framed the debate in new, innovative and provocative ways. *The Logic of Congressional Action* is destined to become a classic investigation of congressional decision making and a welcomed stimulus to a new generation of theorizing and policy analysis. Arnold has yet to demonstrate that the electoral calculus of legislators yields general policies providing collective goods, but he is clearly knocking at the door.

University of Colorado, Boulder LAWRENCE C. DODD

Nominating the President. Edited by Emmett H. Buell, Jr. and Lee Sigelman. Knoxville: University of Tennessee Press, 1991. 300p. $42.95 cloth, $18.95 paper.

Super Tuesday: Regional Politics and Presidential Primaries. By Barbara Norrander. Lexington: University of Kentucky Press, 1992, 239p. $29.00.

In introducing *Nominating the President*, Lee Sigelman argues that political scientists often focus on the presidential general election "to the virtual—or, in a few cases, total—exclusion of the most time-consuming, expensive, and formative portion of the campaign" (p. xiv). His book with Emmett H. Buell, Jr., he explains, is an attempt to "rebalance the scales through a sustained examination of the politics of the presidential nomination process" (ibid.).

Although Sigelman exaggerates how much scholars have ignored the nominating process (as the chapter references and the "Selected Bibliography" reveal), the book provides an important contribution to understanding the nominating process in general and the 1988 campaigns in particular. And Barbara Norrander, who is both a contributor to the Sigelman and Buell collection and the author of *Super Tuesday*, provides what will probably be the definitive analysis of the attempt by Southern and border states to influence the nominating process by coordinating their primaries on a single day, 8 March, 1988.

Nominating the President contains nine chapters. Buell and James W. Davis analyze the strategic environment of the 1988 nomination race and provide an especially valuable analysis of the Republican and Democratic delegate selection rules. Alan I. Abramowitz, Ronald B. Rapoport, and Walter J. Stone employ their own mail-back survey of Democratic and Republican participants in the 1988 Iowa caucuses and demonstrate the extent to which the Iowa campaign is based upon personal contacts between candidates and their organizations and the caucus participants. Norrander studies voting behavior in the 1988 Super Tuesday, mainly by analyzing the National Election Study's Super Tuesday survey.

Clyde Wilcox provides a detailed analysis of campaign fund-raising and spending in the 1988 contest but acknowledges that it is difficult to pinpoint the effects of campaign spending without an extensive analysis of state polling data and free media coverage. Kenneth D. Wald discusses the importance of religious appeals by both Pat Robertson and Jesse Jackson, arguing that their campaigns demonstrate the permeability of the political parties, the strength of moralistic appeals, the importance of churches as a base of political action, and the diversity of religious appeals in America. Buell studies press coverage of the candidates through a content analysis of campaign coverage in the *Atlanta Constitution*, the *Boston Globe*, the *Chicago Tribune*, the *Los Angeles Times*, and the *New York Times*. Despite extensive "horse race" coverage, these papers provided readers with substantial information about the policy positions of the candidates. Michael J. Robinson and S. Robert Lichter, on the other hand, study television network coverage, and find that "horse race" coverage prevailed over news about the candidates' issue positions.

Buell and John S. Jackson III provide an interesting history of presidential nominating conventions, arguing that although conventions no longer perform the function of actually nominating presidential candidates, they do perform important secondary functions, mainly by providing an opportunity to unify the party before the general election campaign. Finally, W. Wayne Shannon provides a highly critical appraisal of the current nominating system. Setting forth five criteria for evaluating the nominating process, Shannon concludes that most of them are not met and that "the system is *inherently* subversive of party unity" (p. 264). Although Shannon refers to earlier chapters on media coverage, his harsh assessment of the nomination system does not seem warranted by the eight earlier chapters.

Nominating the President is an important collection that contains a great deal of material interesting to students of candidate strategies, media coverage, and the history of the nomination process. There are two shortcomings, however. First, a book focusing mainly on the 1988 nominating process should have included a chapter on the New Hampshire primaries. New Hampshire was the crucial turning point in the Republican contest. Robert Dole's win in the Iowa caucuses, along with George Bush's third-place finish, clearly led to a bounce for Dole; and he actually gained a lead over Bush in New Hampshire Gallup polls. Bush's skillful effort to turn back Dole was crucial to ending Dole's momentum. Second, the editors could have provided a concluding chapter that tied together the earlier chapters, pointing to lessons about the nominating process. Although Shannon's final chapter does draw to some extent upon the earlier chapters, Buell and Sigelman could have provided a more balanced assessment.

Of all the events of the 1988 nominating contest, Super Tuesday was the most interesting innovation. On 8 March 1988, three weeks after the New Hampshire primaries, both the Democratic and Republican parties held primaries in 16 states. Of the 11 states of the old Confederacy, 10 (all but South Carolina) held primaries, as did the border states of Kentucky, Maryland, Missouri, and Oklahoma. Two New England states, Massachusetts and Rhode Island, also held primaries. Five states held Democratic caucuses (including Texas, which held both a primary and caucus). Washington state held both Democratic and Republican caucuses. Although there had been a modest version of Super Tuesday in 1984, Super Tuesday 1988 selected far more delegates on a single day than any previous day in the history of presidential primaries.

Norrander's *Super Tuesday* provides a comprehensive analysis of these primaries, focusing on the impact of the coordinated efforts to create a regional primary. She explains the reasons that southern Democratic leaders wanted to establish a common primary date relatively early during the delegate selection season and also examines Republican hopes that Super Tuesday would backfire on the Democrats by persuading Southern Democrats to participate in Republican primaries. For the most part, she shows, the expectations of party leaders were not fulfilled. Super Tuesday disappointed Southern Democrats by failing to produce a moderate Democratic nominee who could compete effectively in the South. It had little effect on the type of candidates who ran, primary turnout, or the rate at which candidates secured the nomination. Super Tuesday did not fill Republican hopes of inducing Democrats to participate in Republican primaries. On balance, Super Tuesday "did not change the basic process by which candidates captured the Democratic and Republican nominations" (p. 179). In her analyses, Norrander supports her conclusions by drawing upon a wide variety of data sources,

including campaign spending records, aggregate election statistics, and public opinion polls, including the National Election Study's Super Tuesday survey. In addition to providing an excellent analysis of candidate strategies, Norrander makes an important contribution to the study of campaign momentum by arguing that scholars should pay greater attention to the process of candidate attrition.

It is a tribute to Norrander's scholarship that she reaches rather modest conclusions about the impact of Super Tuesday. Authors often tend to exaggerate the importance of their subject matter, but Norrander resists this temptation. If anything, she may somewhat underestimate the impact of Super Tuesday on the outcome of the Democratic contest. She maintains that "Super Tuesday did not decide the Democratic delegate race, but it did establish the three major players for the last half of the primary season" (p. 175). She later concludes that although Super Tuesday helped Bush bring the Republican contest to a rapid close, "in the more open Democratic nomination fight, Super Tuesday made Dukakis's victory more difficult" (p. 188). I would argue that Dukakis' limited successes in Super Tuesday were almost as important for his ultimate victory as Bush's sweep of the Super Tuesday primaries was for Bush's victory. Super Tuesday helped established Dukakis as the only white Democrat with national support; and although he did not eliminate Albert Gore until the New York primary on 19 April, his Super Tuesday wins were crucial in establishing his front-runner status. Questions of interpretation aside, Norrander's book is a valuable contribution to our understanding of the presidential nomination process.

Michigan State University PAUL R. ABRAMSON

The Technology Pork Barrel. By Linda R. Cohen and Roger G. Noll. Washington: Brookings Institution, 1991. 400p. $36.95 cloth, $16.95 paper.

The federal government's support of research and development programs designed to support commercial applications has had episodic visibility, inconsistent funding, uncertain political support, and little agreement about its success. Market failure, national interest, risk sharing, and the need for large amounts of money up front are the primary rationales used for the federal government's involvement in research and development programs that seek to convert a promising technology into a commercially viable form. As Cohen and Noll note, this mixture of politics, economics, and technology has combined in ways that produce both research and development successes and failures. Their analysis is directed at determining the factors that characterize successful programs, and they intend for their recommendations to provide guidance for executive branch and congressional policymakers.

A central weakness in the book is the authors' uncertainty about what standard to apply in evaluating the effectiveness of federally funded commercial research and development. The authors initially and correctly argue that public sector funding of research and development with commercial applications is distinctly different from private sector funding or management of research and development. Unfortunately, a large portion of the authors' analysis rests upon literature-based comparisons of private efforts. Given the authors' own distinctions, a more appropriate research design would have primarily focused on past successful and unsuccessful federal research and development commercial applications programs to derive evaluative criteria that could be used in the analysis of the six case studies.

The analysis suffers when it compares complex federal research and development programs with the theoretical perfection possible when private firms make research and development investments in commercial applications. This perspective is unfortunate, since one of the key features of the real-world private sector is the very high level of failure both for small start-up firms and long-established firms.

The authors show an appropriate and realistic understanding of the strengths and weakness of relying on six case studies. They do not, however, give sufficient attention to what universe their set of six cases represents. The selection criterion used, in part, by the authors appears to be an interest "to minimize overlap with two previous collections of case studies" (p. 77).

Particularly because the authors evaluate the set of six cases as containing three failures, two mixed instances, and one unambiguous success, the reader needs to have confidence about how these cases were selected. The authors' conclusion, however, that the results of their analysis "obviously justify skepticism about the wisdom of government programs that seek to bring new technologies to commercial practice" (p. 365), may be overdrawn. A review of their own data reveals a success rate of 13%–50% for high-risk projects that the private sector had shunned. This suggests that the process works fairly well. Especially in an economic world where 90% of all new businesses fail within five years and only a fraction of large businesses retain their position on the Fortune 500 list for more than a decade, these success rates are significant.

The analysis gets confusing at times when the authors are inconsistent in their categorizations, for example, in one place identifying one success, two mixed cases and three failures (p. 78) and in another passage listing one success, one mixed, and four failures (p. 365).

There is always a tension in a book of case studies about where and when to draw conclusions. Cohen and Noll draw theirs in several places, causing some confusion because the reader is uncertain whether it is a conclusion or a standard against which the case studies are to be evaluated.

A potentially important contribution made is the authors' attempt to determine when information is revealed that determines a research and development project's success and whether the information is provided in a timely fashion to political decision makers. Each of the six case studies gamely addresses this, but clear conclusions are hard to draw.

A second useful contribution developed is the concept of building demonstration projects earlier than needed so that technical or economic failures can be converted into short-term political successes by giving proponents "brick and mortar" and local payrolls to point to as evidence of success.

The authors' idea of creating a commercial research and development agency and congressional committee seems unworkable and likely to become one more level of unneeded bureaucracy.

Cohen and Noll begin their analysis auspiciously by acknowledging the high risk the government under-

takes when it funds and manages research and development commercial application projects that are too difficult for the private sector. In many ways the flaw in their analysis is analogous to trying to compare Small Business Administration success rates to those achieved by commercial banks when only those rejected by banks use the Small Business Administration. Cohen and Noll have taken on a difficult task and have been most successful in their analysis when their criteria are drawn only from other governmental research and development programs. Private sector research and development theories and frameworks are useful for background purposes, but not for evaluating federal research and development projects. Given the increased interest in this area, policymakers may find this book useful in identifying the political, economic, and technical complexities inherent in any large-scale federal research and development commercial applications project.

Ohio State University RAYMOND W. LAWTON

The Presidential Odyssey of John Glenn. By Richard F. Fenno, Jr. Washington: Congressional Quarterly, 1990. 302p. $19.95.

When Incumbency Fails: The Senate Career of Mark Andrews. By Richard F. Fenno, Jr. Washington: Congressional Quarterly, 1992. 309p. $19.95 paper.

As political scientists and political observers, we owe a continuously accruing debt to Dick Fenno for his skills as a scholar, careful researcher, incredibly perceptive observer, and keen analyst of the institutions, processes, and people filling the American political scene. These two books are the second and fifth in Fenno's series on U.S. senators. When Fenno began his extensive study of the Senate, he chose to concentrate on a few senators, studying, among other things, the relationship between their work in Washington and their experiences in their home states. In so doing, Fenno undoubtedly sought to produce a companion piece to *Home Style*, his remarkably acute analysis of how members of the House of Representatives relate to their constituents and how those relationships impinge on the work of the institution. But political events interceded.

These events demonstrated that Senate careers are not quite so predictable as House careers. In 1984, John Glenn ran for the presidency. His career and his relationship with the Ohioans who sent him to the Senate took a turn that, while not unusual for a sitting Senator, strayed from the norm. In 1986, Mark Andrews, another object of Fenno's attention, was upset in his bid for reelection and another pattern for study emerged. Finally, in 1988, a third of Fenno's subjects, Dan Quayle, was tapped as the Republican party's vice-presidential nominee. While Fenno's sample of senators was diminishing, he also found himself in the unique position of having a manuscript on a largely unknown vice-presidential nominee all but completed. *The Making of a Senator: Dan Quayle* was quickly produced and recognized as the definitive (and at times sympathetic) study of the rise to prominence and Senate career of a politician often abused and made the butt of jokes by less careful analysts.

One result of these twists and turns of political events was Fenno's decision to write individual accounts of various senatorial careers, rather than synthesizing the material into one larger work. The two books under review constitute an interesting subset of Fenno's work, the "loser's bracket." In these works Fenno attacks a most interesting question: Why do successful politicians sometimes run notably unsuccessful, and even losing, campaigns?

The Presidential Odyssey of John Glenn looks at the 1984 presidential campaign from one narrow perspective, that of one of the losing nominees for the Democratic nomination. Fenno's method is particularly appropriate for this study. Fenno is the consummate observer, the "soaker and poker." But "soaking and poking" is not random observation. Fenno observes individuals, interactions, and events in context. In this case, the individual was a very public figure, a career Marine Corps officer, a daring test pilot, an astronaut who became an American hero, a losing—and then a winning—candidate for the U.S. Senate, and a nine-year veteran of Senate politics and maneuvering. The context was the most open and public event in American politics, a presidential campaign.

Fenno's observations began with our discipline's accumulated wisdom on how presidential campaigns are run. He applied to that what he had learned about John Glenn the individual from a careful study of all aspects of Glenn's career, then observed Glenn in the presidential campaign. His conclusions are that some of the problems Glenn faced were predictable from a study of his earlier campaigns and from statements of his own views of public service; others followed directly from poor campaign decisions. But in the final analysis, the failure of Glenn's presidential odyssey was a failure to understand the difference in the constituency for a series of Democratic presidential caucuses and primaries and the constituency that is comfortable having John Glenn represent it in the U.S. Senate.

Fenno is most persuasive in arguing that John Glenn has a view of public service—and of his own role as an American hero—that precluded him from reaching out to constituencies, from giving those with particular stakes in the nominating contest a reason for voting for him, from becoming a candidate who evoked passionate responses. Fenno's is a sympathetic analysis: John Glenn never quite figured out what was needed to obtain the nomination; he felt that the public should want him and that he would serve, but not that he needed to convince voters to believe in him wholeheartedly. Nationwide contests are different from those in any single state, even a large one that is in many ways a microcosm of the nation. John Glenn had a certain appeal; but neither he nor his campaign managers (largely strangers who were attracted to his candidacy because it looked like a winning one) ever understood how to convert his very appealing qualities into a winning candidacy.

The loss by John Glenn, the successful Ohio vote-getter, can be explained by his failure to adapt to a new political environment. But what of Mark Andrews? Fenno writes of a "campaigning–governing–campaigning" sequence that is typical of all legislators. The puzzle in this case is how a successful political career could suddenly turn for the worse. Andrews had represented North Dakota in the Congress for more than two decades. Four times, after the state lost its second seat in the House following the 1970 census, he won his House seat in statewide elections. In 1980 he won election to the Senate with over 70% of the vote. Yet he lost in 1986.

Should not Senate incumbents in very small states be as safe as House incumbents? Should not this safety have been especially in evidence for someone like Andrews, who, in Fenno's terms (chap. 2), adapted the governing style of a "House member in the Senate"?

But Fenno's skillful observations and careful analysis demonstrate differences. Andrews worried about Byron Dorgan as a possible opponent and adapted his style somewhat. He thought about a national constituency and adapted somewhat again. But mostly, events—Andrews's explanation of a critical farm vote and filing of a controversial malpractice suit against prominent local doctors—changed the relationship between Andrews and his constituents. Fenno observed Andrews talking to small groups of people. The group gathering over coffee in the little town of Lehr was a typical example. And Fenno saw that the dynamic between Andrews and the locals changed, but Andrews never came to understand that. He not only lost touch with constituents, but he failed to recognize that they saw him differently. Thus, he lost.

These two books tell important lessons about the relationship between politicians and their constituents. They lead us to focus on politicians' perceptions of that relationship, of the role self-deception plays in political defeat. That is a lesson all losers who can reflect objectively on their losses know all too well. Dick Fenno clearly respects and likes the subjects of his studies; some may feel he has become too close to them. But the genius of his work, in my view, is his ability to reflect those positive personal evaluations while still maintaining his stance as an objective and critical analyst, noting lessons about the political process on which we can all draw with profit. A careful reading of the corpus of Fenno's work on the Senate, in these books and the other three, reveals a wealth of insights that add significantly to our understanding of the careers of senators and how the interplay of their work in Washington and their relationships with their constituents affect the life of the Senate and the working of the legislative process.

Colby College L. SANDY MAISEL

Learning to Legislate: The Senate Education of Arlen Specter. By Richard F. Fenno Jr. (Washington: Congressional Quarterly, 1991). 192p. $28.95 cloth, $19.95 paper.

Forging Legislation. By Paul C. Light. New York: Norton, 1991. 273p. $22.95 cloth, $8.95 paper.

When all is taken into account, lawmaking—the enactment of public policy—is the bottom line on the congressional balance sheet. Citizens want Congress to make policy; the legislators want to enter their pet proposals in the statutory ledger. These two works offer complementary insights into the lawmaking process. Paul Light focuses on a single bill, the Department of Veterans Affairs Act, while Richard Fenno approaches policymaking from the perspective of the individual legislator, Republican Senator Arlen Specter of Pennsylvania. Both are "participant observation" studies. Light served as a professional staff member of the Senate Governmental Affairs Committee (John Glenn, D–OH, chair); Fenno's study, another installment of his seminal analyses of senatorial behavior, reflects his travels and conversations with Specter and his staff. Not surprisingly, the conclusions of the two studies converge to offer interesting insights about Congress's assets and liabilities as a formulator of public policy.

Light's book, seemingly aimed primarily at undergraduate students, is a more or less conventional case study of "how a bill becomes a law." It provides a thorough (if a bit verbose—undergraduates may find the many details tough going) overview of an 11-step legislative process (pp. 241–46) from agenda-setting to final passage. Such theorizing as Light attempts appears in a short appendix, where he offers a typology of six senatorial "decision-making styles": rational actor, university teacher (pursuing "the imperfect search for truth"), business tycoon (playing the policy entrepreneur), medieval warrior (seeking to exercise "raw political power" in search of "total victory"), small-town neighbor (trading favors and making decisions through "friendly give-and-take"), and garbage collector (using a bill to "carry other issues that would never pass on their own").

The styles vary both across issues and over the various stages of the legislative process. For instance, the garbage collector role was the "dominant style" at the fact-finding and floor-amending steps of the Veterans Affairs Act but was largely irrelevant during consideration of the Presidential Transitions Effectiveness Act (another Governmental Affairs Committee bill on which Light worked). The styles tax different senatorial resources. For example, rational actors must invest substantial time and energy but little political capital, while the small-town neighbor does not need to invest either (to any significant degree) in seeking policy influence. There are equivalent variations with respect to the needs for information and expertise. Academic students of Congress will find the appendix, containing this set of general theoretical notions, thought-provoking but will be disappointed in the paucity of significant details about their measurement and significance.

Fenno starts from his now-familiar "campaigning–adjustment–governing–campaigning" career sequence. He finds that Specter's "reliance on aggressive, independent, individual effort" (p. 74) characterized his initial election, his adjustment to Senate service, and his subsequent lawmaking activities (esp. passage of the 1984 Armed Career Criminal Act). Fenno highlights the tension between member individualism (heightened, in Specter's case, by his prelegislative experience as a prosecutor and his less-than-comfortable relationship with the Pennsylvania Republican party establishment) and the collective (or "communitarian") effort essential to forge coalitions to enact legislation. While, as always, it is prudent to be cautious about generalizations that derive from a single case, Fenno's analysis, especially when read in conjunction with his treatments, in other works, of John Glenn, Pete Domenici (R–NM), Dan Quayle (R–IN), and Mark Andrews (R–ND) underscores his fundamental proposition that extralegislative considerations profoundly influence lawmaking performance in the Senate.

More specifically, some significant themes emerge from the two studies. For one thing, individual member calculations loom large in congressional deliberations. Light points to John Glenn's desire to leave his mark on what was otherwise a symbolic bill elevating the Veterans Administration to cabinet rank. The Ohio Democrat was unwilling to give the veterans' "iron triangle" its way or simply to move ahead a bill the House had enacted. Rather, he was determined to redress what he

saw as an inequity: the inability of veterans who were denied benefits to sue for redress. While Glenn hoped that judicial review would force the Veterans Administration to improve an admittedly ineffective claims process, veterans groups feared that recourse to the courts would undercut their cozy connection to the Veterans Administration bureaucracy. In addition, Glenn's flirtation with his party's vice-presidential nomination diverted his attention from his lawmaking efforts.

Fenno makes a similar point. Specter's approach, his self-confident, individualistic orientation to legislating, shaped his efforts to enact his career criminal bill. He sought to solicit support from the Reagan White House, as well as his congressional colleagues mostly through personal lobbying, one-on-one, rather than through the cooperative action needed to assemble a winning legislative coalition. His inclinations (perhaps rooted in his personality) gave form to his legislative strategy as they did to his electoral strategy, impeding, Fenno implies, his capacity to advance his legislation easily. In any case, members' motivations and predilections impinge directly on their policymaking activities.

Second, coalition-building efforts are central to congressional policymaking. As suggested, Specter learned only slowly about the need to pursue collective strategies. It took him six months of personal struggle to get a slim three-member majority on his five-member Judiciary subcommittee. His individualism led to uncertain relationships with the full committee chair, Strom Thurmond (R–SC), and the full committee staff. He eventually realized the need to compromise and he accepted amendments that altered but advanced the bill. He agreed to a logroll with Representative William Hughes (D–NJ), chair of the House Judiciary Subcommittee on Crime, attaching the latter's pet proposal to the Senate crime bill as the price for getting his provisions into the House legislation, through the full committee, and passed on the House floor. His career criminal provisions survived in conference only to go down to defeat when Ronald Reagan vetoed the crime package. Specter persevered, however, and in 1984 saw his bill, tailored to meet congressional and executive complaints, signed into law. The arduous battle, while successful, illustrates the limits on individualistic effort: Specter's "learning was . . . constrained by the stylistic preferences he had brought with him to the Senate" (p. 125).

The Veterans Administration cabinet-status bill teaches a similar lesson. To make a nonincremental impact on veterans affairs, Glenn had to maneuver adroitly among the veterans groups, which opposed linking judicial review of denied benefits to cabinet status; Senator Alan Cranston (D–CA), who favored judicial review but opposed linkage for fear it would sink cabinet status; and Senator Alan Simpson (R–WY), who insisted on linkage. He had to play hardball to overcome the opposition of House Veterans Affairs Chair, G. V. ("Sonny") Montgomery, who, as a part of the Veterans Administration subgovernment, was against judicial review in principle. In conference, Glenn won clear victories on only three of his six "must" provisions. He agreed to drop the court review from the cabinet-status bill; but when Cranston put a "hold" on the conference committee report on that legislation, Montgomery was forced to accept a separate judicial review bill (which he had been able to thwart on four previous occasions) to protect Veterans Administration cabinet status.

A third moral that emerges from these stories is the critical centrality of staff. Fenno refers to the "Specter enterprise, . . . the senator and his closest aides" (p. viii). Specter's staffers played important parts in setting the agenda for crime legislation; in managing hearings intended to promote interest in, and support for, the career criminal act; and in dealing with the House Judiciary Committee and its staff. Glenn's staff contributed in similar ways. In addition, it drafted statements for its principal. Interestingly, it prepared two statements—one for, and one other against, linkage—because the senator's position on the matter was uncertain. (Glenn read the prolinkage speech.) For the conference committee, the staffers did the lion's share of the work. Together with their House counterparts, they forged the agreements that comprised the language of the bill; Glenn and his opposite number, Representative Jack Brooks (D–TX), met and largely ratified staff suggestions. There never was a "full dress . . . meeting" of the conference (p. 219). Given the multiple pursuits of elected legislators, the staff plays a distinct and often unappreciated role with regard to congressional lawmaking.

Policymaking, as these books portray it, is nothing if not a messy business. While more theoretically inclined scholars would prefer hard-and-fast generalizations, they may have to settle for broad tendencies. Members matter; for their concerns—electoral requisites outside Congress and policy preferences—and decision-making styles give form to what they do and how they act. Term limits or other changes that would bring different sorts of legislators to Congress might produce quite different policy outcomes than does the present legislature. Coalitions count; for in a decentralized institution, even on relatively minor issues such as those Light and Fenno treat, allies are essential and compromise is the order of the day. More centralized, more disciplined political parties would surely change the character of both the process and the content of congressional decision making. Staff is significant; for hard-pressed lawmakers need and use all the help they can get. To reduce staff availability, as some contemporary reformers propose, might well alter congressional policymaking capacity significantly. Senators and representatives, in short, act in an extraordinarily complex environment. These works suggest that unless scholars understand the range of forces that play on the legislators, they may miss much of the subtlety and nuance that help explain Congress' lawmaking assets and liabilities.

Indiana University LEROY N. RIESELBACH

Toward a Usable Past: Liberty under State Constitutions. Edited by Paul Finkelman and Stephen E. Gottlieb. Athens: University of Georgia Press, 1991. 448p. $45.00.

Among the most noteworthy legal developments of the past two decades has been the rediscovery of state constitutions by state judges and legal scholars. The appointment of Warren Burger as chief justice, which seemed to signal a conservative shift on the U.S. Supreme Court, encouraged some state courts to attempt to insulate their rights-affirming rulings from Supreme Court review by basing them on state declarations of rights. Most proponents of this "new judicial federal-

ism" quickly recognized, however, that an opportunistic reliance on state constitutions could not succeed. If they wanted to develop an independent body of state civil liberties law, they would have to ground it in the distinctive language, principles, and history of state constitutions.

This has proved a daunting task. In interpreting the U.S. Constitution, one can draw upon a rich historical record, an abundance of legal precedent, and a wealth of scholarly commentary. In contrast, state constitutional interpreters have often found the historical record scanty, the precedents scattered or unhelpful, and the legal commentary virtually nonexistent. This collection of essays, written primarily by historians and legal scholars, originated as an attempt to alleviate these problems.

This is not to say that this volume promotes a particular constitutional agenda. Morton Horwitz cautions his fellow contributors about "roaming through history looking for one's friends" (p. 148); but the warning seems unnecessary. If anything, professional suspicion of "law office history" leads to an excess of caution. *Toward a Usable Past* will disappoint readers seeking definitive interpretations of state constitutional provisions. However, there are other uses of the past.

The narrowest function of constitutional history is to provide a context for understanding important cases. Several essays in this volume serve this function. Mary Dudziak traces the controversy over birth control in Connecticut prior to *Griswold*, arguing that the state's ban on the distribution and use of contraceptives indeed limited their availability. Morgan Kousser chronicles legal developments regarding segregation in Louisiana prior to *Plessy* and in Kansas prior to *Brown*. Charles Ogletree examines the treatment of the Supreme Court's jury discrimination cases in state courts. While these case studies have some interest, they are not theoretically grounded and do not permit generalizations.

A second function of constitutional history is to clarify changes in constitutional interpretation over time. The essays in this volume focus less on substantive changes than on changes in interpretive approaches. Although state judges have, since the mid–nineteenth century, emphasized textualism and "strict construction" in interpreting state constitutions, three essays reveal a wider range of interpretive traditions in the states. Ellen Peters demonstrates that earlier judges looked to the common law to clarify constitutional meaning, and Suzanna Sherry shows how judges employed standards of "natural justice" in protecting rights. H. Jefferson Powell analyzes the different understandings of judicial review among Virginia judges a decade before *Marbury*.

Perhaps the most valuable function of constitutional history, however, is to illuminate how changes in legal culture have affected the substance and interpretation of constitutions. The several essays analyzing state constitutions in terms of legal and political culture are among the strongest in the volume. Donald Lutz, James Henretta, and Peter Onuf examine the influence of republicanism on state constitutions. Their emphasis on political participation and on the inculcation of virtue underscores the distinctiveness of state constitutional politics for almost a century after independence. Lawrence Friedman's excellent essay analyzes how a concern about "the dangerous classes" during the late nineteenth century influenced the interpretation of state criminal justice guarantees and discouraged the development of new protections for the rights of the accused.

The danger with an edited collection, however, is that some important questions will not be directly addressed by any of the authors. That seems to have occurred in this volume. Most of the essays assume without examination that the similarities in state constitutional development are more important than the differences. Although some essays recognize that the constitutional agenda in the states during the nation's first century differed from the federal constitutional agenda, no essay systematically considers whether such differences continue to exist. Finally, no essay considers whether constitutional history can provide a "usable past" for state constitutional interpreters.

Nevertheless, *Toward a Usable Past* is an important book. The first volume devoted to state constitutional history in recent years, it demonstrates both the importance of the enterprise and how much work remains to be done.

Rutgers University, Camden G. ALAN TARR

Gaining Access: Congress and the Farm Lobby, 1919–1981. By John Mark Hansen. Chicago: University of Chicago Press, 1991. 265p. $38.00 cloth, $15.95 paper.

To what extent and under what conditions do interest groups influence congressional policymaking? Probably no other question elicits as much fascination and consternation from the American public and scholars of American politics. John Mark Hansen's first book, *Gaining Access*, develops and illustrates a theory of access to account for the variable influence of farm lobbies on agricultural policymaking in the U.S. Congress from 1919–1981.

In general, "interest group access results from congressional strategies for dealing with electoral uncertainty" (p. 5). Assuming that reelection is the primary goal of lawmakers, Hansen treats interest group access to the policymaking process as a decision that legislators make in order to obtain the information necessary to secure that goal.

The influence of lobbyists is a function of the degree to which legislators grant lobbyists both access and privileged consideration to the policymaking process. Access is granted (1) "when legislators judge that interest groups enjoy competitive advantage over rival informants" and (2) "when they expect the conditions that maintain competitive advantage to recur" (p. 215). Used repeatedly throughout the work, the term, *competitive advantage*, means "an interpretation of the advice that helped legislators most in their past election," while *recurrence* means "a prediction that the advice will help legislators in their future elections" (p. 6). Access is thus something decided by and for political elites (p. 3).

Though interest groups compete with parties and policy entrepreneurs for access to members of Congress, they have a number of advantages in this struggle for congressional consideration: "First, they provide information and propaganda more efficiently than their rivals. Second, they promote the electoral aims of their congressional clients more effectively than their competitors" (p. 103). As to the classic trade-off between parties and interest groups, Hansen concludes that "strengthening political parties will not overcome the biases and

inefficiencies of pressure politics," since "parties cannot absorb the social conflicts that otherwise find their outlets in the pressure system" (pp. 226–27).

Hansen's is not however simply a theory of interest group access. Rather, it is a more general theory of how access to congressional policymaking is determined and influence achieved by any individual or group seeking to bring a demand for authoritative action to the attention of the governing regime. This is a key strength to the book, even if its implications, especially for normative democratic theory, are not fully explored by the author.

Gaining Access is not without a few shortcomings. To begin, some scholars may find Hansen's theory difficult (though not impossible) to falsify. Since there are few objective measures of competitive advantage or recurrence, the reader must accept the author's interpretation of how both were interpreted by lawmakers at the relevant time. If lawmakers continued to grant access because they were misinterpreting the competitive advantage of farm lobbies and the recurrence of farm lobby issues, there's no way to know if access resulted from a misinterpretation on the part of lawmakers or from the traditional "iron triangle" explanations of agricultural policy.

The explanatory power of Hansen's theory of access is ultimately dependent upon a theory of macro agenda building to explain why certain issues become and remain salient for government officials and the polity. Patterns of access, observes Hansen, change as (1) issue salience changes, (2) the contentiousness of issues changes, and (3) elections prove informants right or wrong (p. 105). Beyond noting the "circumstances that create competitive advantage" and "guarantee recurrence," such as economic development, industrialization, population growth, and migration (p. 102), a systematic explanation of how the macro political agenda is created and how it shapes the policymaking process is not provided, limiting the theory to explanations based on the micro electoral calculations of incumbent politicians.

The theory's applicability is also limited by its arena of derivation. Many important studies of interest group politics have been based upon the politics of agricultural policymaking. Yet policies and the politics they engendered are not created equal. Notwithstanding Hansen's illustration that the theory is applicable across time and space to other issue arenas (pp. 217–22), agricultural policy may be distinctive as an election issue, providing greater empirical support for the theory than would another policy. Not only may policies determine politics within the governing apparatus of the state (to borrow Theodore Lowi's influential observation), but certain policies, like agriculture, may better solidify the electoral connection that links interest groups to lawmakers than do others.

Finally, Hansen's theory "works" so long as its underlying assumption, that members of Congress are "single-minded seekers of reelection," is the prevailing norm. Challenge this assumption, and the foundations of the theory begin to crumble. Lawmakers not primarily motivated by reelection may grant access to address important exigencies, rather than to "be on the right side of an issue in the next election" (p. 17). Studies increasingly show that reelection may not be the primary motive of national legislators. The level of public-spirited behavior is important for understanding the results of American policymaking, as are values and ideas. These may be more determinative of policy outcomes than the self-interested pursuit of reelection.

Notwithstanding these criticisms, *Gaining Access* should be taken very seriously as an informative and theoretically suggestive contribution to the study of congressional policymaking and the politics of interests. Hansen's theory of access will become a familiar feature in future studies of interest group politics, and also merits attention in studies of political parties, policy entrepreneurship, social movements, and political consultancy. The theory's widespread diffusion will establish the boundaries of its applicability as it continues to expand our knowledge of how political power is distributed in the American regime.

University of California, Irvine MARK P. PETRACCA

Is Anyone Responsible? How Television Frames Political Issues. By Shanto Iyengar. Chicago: University of Chicago Press, 1991. 195p. $19.95.

This book extends Iyengar's earlier work with Donald Kinder, *News That Matters* (1987), which explored the agenda-setting role of television news. The first book refined the work of McCombs, Shaw, and others and broadened it to include framing effects. The concept of framing refers to "subtle alterations in the statement or presentation of judgment and choice problems, and the term 'framing effect' refers to changes in decision outcomes resulting from these alterations" (p. 11).

The research reported in *Is Anyone Responsible?* examines two ways in which television news frames issues: the episodic and the thematic. The episodic frame is the more prevalent one. It ordinarily takes the form of an event-based news report. An example would be the depiction of the terrorism issue in the context of an Irish Republican Army bombing in Northern Ireland. The thematic frame provides a broader perspective; it reports the issue in the context of "collective outcomes, public policy debates, or historical trends" (p. 18). An example would be a news story that discusses the terrorism issue against the backdrop of the historical bitterness between Northern Ireland's Protestants and Catholics.

On the basis of experimental research, Iyengar concludes that episodic framing on television encourages viewers to assign the blame for society's problems to individuals, rather than to social and political institutions, such as Congress or political parties. Thematic framing is concluded to have the opposite effect. Because television news emphasizes episodic framing, says Iyengar, it deflects the blame for problems from government, resulting in a weakening of political accountability—hence the book's title.

Iyengar's experiments were based on paired groups of participants: one group was shown a videotape that included an episodic news report on a particular issue problem and the second group was shown a thematic report on the same problem. The issues of crime, terrorism, poverty, unemployment, racial inequality, and the Iran–Contra affair were included in the experiments. After their exposure to a twenty-minute videotape, which contained seven news stories, including the story that was subject to experimental manipulation, participants completed a post-test questionnaire that included open-ended questions about the causes and treatment of the problem at issue. Responses were categorized as

societal (e.g., a response that attributed crime to impoverished social conditions) or individualistic and punitive (e.g., a response that attributed crime to the character deficiencies of criminals). A comparison of the episodic treatment group with the thematic treatment group revealed that the episodic group's responses usually contained more individualistic and punitive attributions and fewer societal attributions.

The experimental work was backed by a content analysis of all ABC, CBS, and NBC television news stories on the issues in question during the period 1981–86. The content analysis was based on the Vanderbilt Archive's *Abstracts*. The content analysis indicated that although most news stories include both episodic and thematic material, the majority of stories were skewed in the episodic direction.

Iyengar's conclusions are unequivocally stated. Early in the book, for example, he writes: "While there can be no denying the influence of stable dispositional characteristics or cultural norms on attributions of responsibility for political issues, there is compelling evidence that contextual or circumstantial factors are equally—if not more—important . . . . Today, the most important of these contextual influences is television" (p. 10). In the book's final paragraph, he lays the blame for the erosion of political accountability in recent years squarely on television's preference for episodic framing: "The portrayal of recurring issues as unrelated events prevents the public from cumulating the evidence toward any logical, ultimate consequence . . . . Television news may well prove to be the opiate of American society, propagating a false sense of national well-being" (p. 143).

Iyengar's book has substantial merit, but his conclusions are less careful and exact than the experimental research on which they are based. This type of research requires a healthy respect for the limitations of the experimental method. It would have been astonishing, for example, if Iyengar had not found that his subjects, after having just seen an episodically or thematically framed news report on a particular issue, reiterated aspects of the report when asked about the causes and treatment of the issue. To reason from the fact that viewers do repeat such material to the conclusion that network television is behind Americans' tendency toward individualistic attributions is a giant step. This manifestation is deeply embedded in the American political culture and has been for more than two centuries.

Moreover, although it is true, as Iyengar says, that television news focuses "on concrete acts and breaking events" (p. 14), this form of reporting did not originate with television. This model of journalism, which dates at least back to the 1830s, is the dominant form of newspaper reporting and has been taught in schools of journalism since the early 1900s. In fact, newspaper journalists depend even more heavily on episodic reports than do television journalists. Compared with the newspapers' inverted pyramids, television emphasizes the interpretive news report due to its need for tightly structured stories. If stories are to be readily understood by a listening audience, they cannot be allowed to trail off as a newspaper story may. Accordingly, as Dennis Lowery's content analysis indicated (*Journalism Quarterly* [1971]), television news stories tend to be built around inferential sentences, often of an unattributed nature.

It is this thematic quality of television more than the episodic orientation it shares with print that was the foundation, nearly two decades ago, for Michael Robinson's "video malaise" thesis (*American Political Science Review* [1976]). Robinson sought to explain the same phenomena that intrigued Iyengar, but he reached the opposite conclusion. Both cannot be right. Curiously, Iyengar's book contains no recognition of Robinson's notion of "video malaise" anywhere in the text, the notes, or the bibliography. Perhaps Iyengar's view is the correct one. If it is, the problem is more severe than he suggests. It goes beyond television news to *all* news; a focus on events and episodes is deeply embedded in the practice of American journalism, print and broadcast media alike.

Despite its shortcomings, this book is recommended reading for media scholars. Iyengar's experimental methods offer a precision of measurement that media effects research seldom attains. I believe, moreover, that Iyengar's notion of framing effects is one of the truly important theoretical concepts to appear in recent years. Iyengar's challenge is to balance his noteworthy methods and concepts with an equally measured accounting of the substance of American politics and journalism.

Syracuse University THOMAS E. PATTERSON

On the Man Question: Gender and Civic Virtue in America. By Mark E. Kann. Philadelphia: Temple University Press, 1991. 364p. $39.95.

Emmanuel Le Roy Ladurie once suggested that historians could be divided into parachutists and truffle hunters. Parachutists take a panoramic view as they descend to earth. Truffle hunters root around for details on the ground. Mark Kann is plainly a parachutist. *On the Man Question* presents a sweeping thesis and surveys an enormous scene. Kann promises to investigate nothing less than "the intellectual ferment of Restoration England, analyze John Locke's articulation and anticipation of it, and trace its evolution in eighteenth-century and nineteenth-century America" (p. 32). He discovers a dark "other" liberal tradition in America born of a "misanthropic fear of individualism," involving "a desperate search for father figures" and culminating in a culture of "engendered civic virtue" (pp. ix, 14, 19).

Kann's thesis relies upon three large, related claims. The first asserts the truth of Louis Hartz's theory about a liberal Lockean consensus in America, once civic republicanism and patriarchalism are grafted onto it. This entails the second claim: Locke's own political theory is not merely liberal but is, in fact, a "synthesis of individualism, civic virtue and gender" (p. 114). The third claim follows from the first two and asserts that Locke's political theory created an ideological culture within the American republic that sought to "restrain men's selfishness, women's treachery, and young men's passions" by creating citizen–fathers, civic mothers and patriot–warriors (p. 191). In sum, "the subtext of American history" is a quasi-republican, liberal patriarchal Lockeanism that involved "a single-minded effort to make individualism conditional and compatible with social order" by controlling middle-aged men and manipulating young men and women through the rhetoric of civic virtue (pp. 32, 217). We are asked to read this "subtext" in colonial Puritanism, Revolutionary militia service, Jacksonian expansionism, Civil War soldiering,

Victorian marriages, Theodore Roosevelt, and World War I conscription—to mention only a few.

Since a parachutist's thesis can carry decisive advantages in historical explanation, what matters is whether the apparatus that supports it is sturdy enough to carry it safely to earth. I wish it were so in this case, because Kann intends well. He has turned to gender as a necessary outgrowth of investigations into democracy, radicalism, and the history of ideas. However, I have serious doubts about Kann's three claims. Least convincing is the assumption that Americans consciously "adopted" Locke's political theory. We might expect even a reconstituted version of the Hartz thesis to provide some substantive historical and textual evidence for the notion that Locke's writings were integral to American political consciousness. But Kann offers nothing to ground assertions that "Lockean civil and political rights were etched into the nation's founding" or that Locke "articulated the democratic hopes and liberal fears that eventually wed an American dream to an American demonology" or "authored modern liberal hegemony, and his American heirs extended the copyright" (pp. 217, 300). Some truffle hunting would help. Exactly who were these "American heirs"? Exactly how and when did they etch and wed Locke into their understandings? Exactly how and when did this become a consensus? The evidence Kann needs to support these conclusions is simply absent. Until such evidence is forthcoming, the idea of America as a "Lockean consensus," no matter how amended, is in no better shape than it was when Hartz developed it in the 1950s, especially after three decades of subsequent criticism.

The question of how Locke's theory should be interpreted raises other concerns. By reading Locke as a civic republican as well as a liberal patriarchalist, Kann hopes to appropriate the republican revisionist argument—and at the same time finesse it—by strengthening the Lockean consensus theory. This is an inventive move; but everything depends upon the plausibility of the idea that Locke is, at the same time, a patriarchalist, a civic republican, and a liberal. Unless these categories can mean whatever anyone wants them to mean, the historical, textual, and contextual bases for these judgments are, in fact, extremely weak. For us to believe them, we have to forget the point of Locke's critique of Filmer in particular and of patriarchalism more generally; rewrite Locke's few references to *private* virtues as though they were the civic ones of Machiavelli or Harrington; and transform Locke's doctrine of the individual, natural law, and Calvinist calling into words about "individualism" or "companionate marriages" that only John Stuart Mill could have written. Unfortunately, Kann's tendency to read Locke as contributing to social relations that did not yet exist or as able to "anticipate," "prefigure," and "pave the way" toward nineteenth-century America (p. 174) only furthers the suspicion that much of his textual interpretation lacks sensitivity to context and history. Confidence is not bolstered by such claims as that Locke "anticipated Louis Hartz's early American consensus" (p. 117). This calls to mind Quentin Skinner's warning that interpretation should not be a pack of tricks we play on the dead.

Kann's third, and most promising, claim about the engendering of civic virtue in America thus hangs on some slender threads. This is unfortunate, because the book raises the important point that political theories often function to sustain unequal relations of power and to legitimate specific cultural norms along dimensions of gender. But Kann provides neither a theory of gender nor even an account of how he intends to use gender as a category of analysis. Given all that has been written on gender in feminist theory in recent years (very little of it cited by Kann), it is also somewhat surprising that the complexities introduced by race and ethnicity are absent in his big groupings of women and men, where only men are divided into young and middle-aged. (As for class, there are only occasional references to the middle-class.) Moreover, Kann's particular application of gender to the study of American history focuses almost exclusively upon manly themes: masculinity, fraternity, filial bonds, and the psychohistorical saga of fathers and sons. Women are fit to these themes as wives and mothers. If this captures a certain reading of Locke or of the so-called Lockean consensus, it does not adequately explain gender relations in American history or exhaust the ways in which the female has been culturally and symbolically represented. Thus, the diversity of real historical women in the United States and the range of their actual political activities, as well as the complexity of representations of the feminine and femininity, are in the end simplified and sacrificed to the large claims of this well-intended book.

University of Minnesota MARY G. DIETZ

Beyond Persuasion: Organizational Efficiency and Presidential Power. By Matthew Robert Kerbel. Albany: State University of New York Press, 1991. 214p. $16.95 paper.

This book purports to demonstrate that organizational efficiency plays an important role in presidential power, a wonderfully interesting idea. Using data from media coverage on 4 Carter and 4 Reagan bills and 26 other Johnson, Nixon, and Ford cases, Kerbel correlates news story content (e.g., complaints about inefficiency or compliments concerning persuasiveness) with administration success. For example, on the two Carter successes studied, 86% of the 206 media mentions of Carter's persuasion said that Carter "used" persuasion, while on the two Carter defeats, only 54% of the 226 mentions of persuasion said that Carter "used" it. The Reagan percentages and those for the whole closely resemble these (87% and 53% and 88% and 56%, respectively). From such differences on a number of topics, Kerbel draws substantive conclusions about which elements matter: "Efforts to bargain were particularly intense and effective in advance of instances when these presidents successfully achieved their objectives" (p. 44). The last substantive chapter also assesses a LOGIT model predicting success on the 34 cases using five variables: three news-story-based variables, unemployment, and inflation. The combination of differences and the organizational variable's LOGIT performance led Kerbel to his efficiency conclusion.

While this work promises to realize the oft-heard clamor for more systematic empirical analyses, it falls short. Some problems derive from conceptual difficulties, others, from purely empirical sources. As most critics see it, presidency research has too often depended on secondary sources of information, such as reportorial anecdotes, which too often carry no systematic validity or (worse yet) provide "disinformation." Yet

Kerbel proposes to build an empirical analysis based entirely on reportorial sources. Even the substantive data (as opposed to controls) in the LOGIT derive from news counts.

Kerbel fails to suggest the validity of these data. In 1965, for example, Larry O'Brien gave an interview to the Public Broadcasting System and Congressional Quarterly about administration liaison. O'Brien's principal point was that administration practices rarely involve anything other than providing substantive information or organizational efforts—certainly not "arm twisting." This is very similar to Kerbel's findings. Banking chairman Wright Patman, however, seeing the interview transcript, circled all those statements and sent it to O'Brien with the personal suggestion that he would probably need to "take this along with you to your next confessional." One might imagine that sources would *want* to present *their* version. Communicating with reporters, after all, serves to shape how others perceive. Of course, as with O'Brien and Wright Patman, reality varies distinctly from what is reported.

Even when informants do not plan to generate a particular perception, the reports have no greater validity. For example, one of Kerbel's findings downplays the effectiveness of presidential threats. Consider the bargaining situation. If a president threatens a member or faction and the target gives in, no one reports that success—certainly not the administration and certainly not the "target" who has given in. On the other hand, if the president threatens and that threat turns out ineffective, the target may want to talk, that is, build a reputation for constituency commitment. Without direct observation of administration bargaining, however, news counts produce data with a strong bias to reveal ineffective, rather than effective, threats.

At the center of Kerbel's problem lies a question of which strategic interaction to analyze. One characterization of bargaining describes it as involving unitary actors. Reporters tend to focuses on bargaining at this institutional level—the president versus Congress; so, per force, does Kerbel. But bargaining with the president actually involves individuals. If the administration convinces members to change *from* their predispositions, then it has exercised influence. If it then loses, administration efforts may still reflect well on its competence and influence, given that other variables effect the aggregate outcome. Assessing influence requires understanding starting points, not just outcomes. A better LOGIT could help; but Kerbel analyzes only 34 outcomes and excludes the standard controls familiar to Edwards, Covington, and Bond–Fleisher models, which describe predispositions, such as core support, partisan seats, agenda size, election cycles.

At the institutional level, more detail about the administration's agenda seems essential. We know the public (Congressional Quarterly) agenda differs from the administration's internal agenda. Analyzing issues mostly from the public agenda misrepresents the essential: How much administration commitment? When administrations face losing situations on nonpriority issues, might their best strategy generate a losing fight *of necessity*? If Nixon lacks the numbers, might he pursue a defeat that distinguishes carefully between him and his opponents? Kerbel's operationalized strategic situation, based on reporters' asking why this policy failed, might not appreciate Nixon's strategy. Southern Democrats not privy to the plan but wanting the policy might easily blame administration ineptitude. More detail of the initial strategic situation would improve things. Kerbel's questions ring true. But his considerable sensitivities would have gone farther if he had focused on analyzing internal administration materials drawn from archives, rather than on using the media.

University of North Carolina, Chapel Hill TERRY SULLIVAN

Social Norms and Economic Institutions. Edited by Kenneth J. Koford and Jeffrey B. Miller. Ann Arbor: University of Michigan Press, 1991. 258p. $29.95.

The rational choice analysis of social institutions has significantly advanced our understanding of the role of institutions in social life. The relationship between rational self-interested action and the constraints produced by institutional rules has been the source of a variety of static explanations of institutional effects and dynamic explanations of institutional emergence and change. But an important feature of many social institutions is lacking in most accounts employing the rational choice approach—the effects of social norms and ethical values. Here we confront questions about values that are not reducible to self-interest and rules that constrain choice for nonconsequential reasons.

Social Norms and Economic Institutions, a volume of essays edited by Kenneth J. Koford and Jeffrey B. Miller, presents a variety of attempts to incorporate norms and values into a rational choice framework. The main focus of the essays is economic institutions, but the issues they address and the insights they develop are applicable more broadly to other social institutions. The essays are organized into five categories: a general model of economic organization incorporating norms, an analysis of the role of ethical values in economic decision making, experimental results on the role of norms in simple social interactions, theories of the emergence of social norms, and more applied analyses of the effects of social norms in particular economic settings.

Overall, the essays are thoughtful and represent an intelligent attempt to address the interrelationship among values, norms, and rational action. For this reason alone, the book can be recommended as a point of departure for anyone interested in these important questions. As with any emerging field of study, the positive proposals for understanding this interrelationship are preliminary and open to debate. Such a debate will be furthered by the clarity with which these proposals are presented in the various essays. By sketching briefly some of the arguments in individual essays, I can highlight some of the areas in which I would encourage future analysis and debate. I will not focus here on the essays on either experimental results or evolutionary theories of norm selection, because such literature is probably more familiar to the readers of this journal.

In "Habit, Customs, and Norms in Economics," Koford and Miller offer a general analytical approach to economic activity that incorporates social norms. The authors intend this essay to serve as the framework with which to locate and assess the other contributions to the volume. Thus, it allows us to consider some general questions about the main approach advocated by many of the authors. Koford and Miller conceive of social norms as a subset of the more general categories of

habitual behavior and social custom. The discussion is somewhat imprecise, since several overlapping distinctions among norms, habits, and behavior are offered; but the main force of the approach that they recommend is a claim that norms constrain behavior either unconsciously through custom or consciously through the effort to avoid sanctions for noncompliance.

As a recommendation of a conception of social norms on which to ground future research, this approach raises two questions. First, while the conception does capture some of the ways in which norms affect choice behavior, it underestimates an effect that is central to most sociological accounts: norms establish roles and appropriate standards of behavior. In this way, norms affect conscious behavior: People consciously follow normative prescriptions because it is the appropriate thing to do, not merely because they fear sanctions for noncompliance. Second, are norms merely self-enforcing rules (or regularities in behavior) or are they also laws (with the accompanying force of external sanctions)? Norms are treated both ways in the literature and Koford and Miller might have clarified their position on this point. This makes a difference for both explanations of effects and emergence.

More importantly, Koford and Miller argue that explanations of the role of norms, habits, and custom will be found in the "efficiency properties" of these rules. They do not make the standard mistake of arguing that all social outcomes will be optimal. They even show how certain persistent norms may produce inefficient behavior when external circumstances change. They do, however, rest their entire discussion on the collectively beneficial effects of these rules. Norms simplify social interactions by (1) minimizing the complexity of decision making (limiting the spheres of conscious activity) and (2) increasing the predictability of social interactions (by establishing expectations about the actions of others).

For an approach that rests primarily on individual decision making, the invocation of collectively beneficial functions as the fundamental source of explanation is problematic. The standard result of the prisoner's dilemma analysis emphasizes the tension between individual self-interest and collective benefits. If we are to rely on collective benefits and functional needs to explain norms, then these explanations must rest on mechanisms that are not grounded in rational self-interest. In this essay, the emphasis on functionalist logic (minus such a mechanism) does not sufficiently further our understanding.

"Amending the Economist's 'Rational Egoist' Model To Include Moral Values and Norms" by William B. Griffith and Robert S. Goldfarb—and the accompanying commentaries—present a wide-ranging discussion of the methodological and conceptual issues involved in deciding how to treat values and norms in a rational choice model of individual decision making. Griffith and Goldfarb argue for the importance of incorporating moral values into a model of rational decision making and assess the alternative ways in which that might be done. Given their conception of the effects of norms in terms of the effects of moral values, it is not surprising that they opt for modeling normative effects as preferences, as opposed to constraints on choice.

The commentaries challenge the authors' recommendations on the grounds that (1) the importance of norms for economic analysis is overemphasized and (2) the recommended method of incorporation of norms is open to question. I think that the commentators are wrong on the first front but potentially on to something on the second. While the Griffith–Goldfarb suggestions are illuminating, they are not yet persuasive. The effects of norms as constraints should be given more serious consideration, especially if the suggestion by Dennis Mueller that the most important consideration is empirical testability is to be taken seriously. Also, the tension between individual and collective preferences and values should be given more prominence in the analysis.

The final two essays in the volume, "Corporate Crimes and Innovative Punishments" by Peter A. French and "Bargaining and Contracts" by Jules Coleman, Steven Maser, and Douglas Heckathorn, are highly stimulating efforts to understand the effects of principles of fairness and ethical behavior on economic activity. Both are normative in emphasis. French's piece presents a normative argument in support of a principle of ethical behavior (the *principle of responsive adjustment*) for corporate managers, while the Coleman, Maser, and Heckathorn paper is a normative analysis of what fair bargaining outcomes would look like and which principles of bargaining and enforcement might further them. Future research should definitely include more analyses of this kind that enhance our understanding of the normative consequences of such norms. In addition, we would benefit from similar analyses that apply aspects of the logic developed in this volume to positive explanations of the role of norms and values in economic affairs.

Washington University, St. Louis JACK KNIGHT

The Framers and Fundamental Rights. Edited by Robert A. Licht. Washington: American Enterprise Institute Press, 1991. 194p. $19.95.

That ours is an age grown drunk on the rhetoric of rights is attested to by everything from ideologically brutal Supreme Court confirmation hearings, to the endless articles spewing from the law reviews, to the shelves of books being pumped out to satisfy the requirements for academic tenure and promotion. Talk of rights bombards the public imagination.

Sadly, there tends to be a great deal of poverty amid the plenty, however. Most often, the rhetoric of rights has far more to do with rhetoric than with rights. The great flights of fancy that all too often pass for scholarship are rarely burdened by the weight of history or facts. The result has been, in Mary Ann Glendon's phrase, the impoverishment of political discourse. Thus, it is a major event when a collection of essays as thoughtful as those contained in *The Framers and Fundamental Rights* appears. Our public discourse over the nature and extent of rights will be enriched by this good volume.

The Framers and Fundamental Rights appears as the most recent offering of the American Enterprise Institute to the bicentenaries of the Constitution and Bill of Rights. This, the eleventh volume in the series, is the first not under the judicious editorship of Robert A. Goldwin. But Robert Licht has certainly lived up to the high standards Goldwin established. This collection is a model of intellectual depth, stylistic clarity, and ideological balance. It will repay reading by students and experts alike.

The contributions include Benjamin Barber's "Consti-

tutional Rights—Democratic Instrument or Democratic Obstacle?," Judith Best's "Fundamental Rights and the Structure of the Government," Robert A. Goldwin's "Congressman Madison Proposes Amendments to the Constitution," Lino Graglia's "Constitution and 'Fundamental Rights'," Thomas L. Pangle's "Republicanism and Rights," Mark Tushnet's "*Federalist* and the Institutions of Fundamental Rights," and Michael P. Zuckert's "Thomas Jefferson on Nature and Natural Rights." Taken as a whole, they examine the topic of fundamental rights from nearly every conceivable angle.

None of the these splendid essays is likely to rest comfortably with everyone; there is something here to arouse and antagonize anyone who picks up the volume. Yet it is precisely the ability of the authors to provoke us, each in a different way, that makes *The Framers and Fundamental Rights* so valuable: it makes us think about these important issues in new ways.

Generally, the essays agree on certain points, albeit for different reasons. The authors share the underlying belief that there is something terribly wrong with how we have come to think about fundamental rights. Our times are plagued by what Barber calls our "rights obsessions" (p. 36), a view of rights that has largely denied the propriety of politics in the best sense of the word. "Never has there been so much chatter," writes Pangle, "about 'community', 'bonding', 'empathy', 'nurture', and 'gentleness'; and never has there been so icy and thorough a disconnectedness between women and men, between generations, between fellow-citizens and workers and neighbors" (p. 119). When it comes to rights, talk is cheap—in both senses of the word.

The second point in which the authors find some sturdy common ground is the belief that we have lost sight of the historical foundations of rights—where they came from, what they are, and how best to secure them. Thus, we are tossed about on an allegedly philosophic sea with neither compass nor anchor. When it comes to rights, we have simply lost our bearings. Most of the things spoken of as "rights" are but pale imitations of what earlier and more thoughtful generations understood as being worthy of that hallowed name. In particular, as Graglia points out in what is surely one of the most provocative essays in the bunch, "fundamental rights" in the modern sense are nothing more than "mythical supports of a fraudulent structure built and maintained by America's intellectual elite on the conviction that government with the consent of the governed is undesirable in America" (p. 101).

Together, these essays demand of us a serious reconsideration of where we are and how we got here. They urge a return to the fundamental texts of our liberal tradition not to find the answers so much as to remember the questions we should be asking about fundamental rights. This we can do, first, by considering anew how rights are dependent upon government (Best) and, second, by recalling how our Bill of Rights came into being (Goldwin).

Among these very good essays, two demand to be singled out as at once the most profound and the most provocative. Pangle's survey of the history of republicanism and how America sought to reconcile its demands with rights will administer a wake-up blow to those who have nodded off with visions of civic republicanism dancing through their constitutional heads. In a similar way, Zuckert's excursion through Jefferson's theory of nature and natural rights will deepen any reader's understanding of Jefferson's great contribution to the American notion of fundamental rights. These two essays alone make a reading of *The Framers and Fundamental Rights* important; combined with the other essays, it becomes necessary.

Harvard Law School GARY L. MCDOWELL

Interpreting Tocqueville's "Democracy in America." Edited by Ken Masugi. Savage, MD: Rowman & Littlefield, 1991. 526p. $68.65 cloth, $24.95 paper.

At first Masugi's collection appears eclectic—useful for the breadth of its contributors' concerns but held together only by their common subject, Tocqueville's *Democracy in America*. Topics range from women's status in Tocqueville's, as well as contemporary, America to Tocqueville's use of Jefferson's writings on the corrupting effects of administrative centralization. The essays are grouped into three loose sections, dealing with Tocqueville's place in the history of political philosophy, his analysis of American institutions, and his views concerning American character.

But an important theme holds this fine collection together—Tocqueville's attempt to preserve human greatness in democratic times. Most of the contributors note Tocqueville's worry that democracy may undermine liberty. Several build upon this analysis, fleshing out Tocqueville's concern that liberty serve the higher goal of virtue.

Bruce James Smith points out that for Tocqueville, the "taste" for liberty is aristocratic and hence unnatural to the democratic majority. James Caesar outlines Tocqueville's analysis of the institutions (principally a decentralized press, common law lawyers and juries, and townships) fostering liberty by inculcating character traits necessary for local cooperation and proper respect for tradition (p. 311).

In mutually reenforcing ways, contributors point out that for Tocqueville, liberty (improperly understood) may destroy itself, along with proper character. Delba Winthrop argues that rights claims on government for the fulfillment of "equal" needs encourage a fixation upon material equality, destroying diversity and virtue (p. 419). Only when we recognize that rights are meant to secure personal and communal self-government can we encourage honorable conduct (p. 424).

Peter Augustine Lawler points out that even the desire for honor can be corrupted by democracy. For Tocqueville, democracy asserts and demands equality. But we cannot accept being reduced to indistinguishable elements in the mass of mankind. Intellectuals reclaim their individuality by "standing outside" the humanity they themselves "analyze" into a soulless mass (p. 103). Nonintellectuals seek distinction by deifying the universe—and themselves as part of that god (p. 118). In either case, we lose sight of our mortality and our need to preserve our dignity by combating materialism.

To retain our true individuality, we must replace some of our faith in reason with faith in God. John Adams Wettergreen points out that for Tocqueville, Christianity fostered democracy by asserting our equality before God. Yet if we are to check democratic materialism and our consequent susceptibility to soft despotism, we require Christianity's focus upon eternity and the soul (p. 213).

Ralph Hancock adds that religion's utility, for Tocqueville, arises from its truth. While democrats revel in the supposed indeterminacy of their character, religion shows that we have a universal, limited, human nature, rather than any right to limitless satisfactions (pp. 364–65). Only by accepting our limits can we retain the natural grace of our souls and can both recognition and grace take the form of virtuous action. William Kristol even suggests that by inculcating proper morals, we may reclaim, in Tocquevillean fashion, our religious faith (p. 492).

Not all contributors praise Tocqueville's concern with the soul. Edward Banfield castigates Tocqueville for asserting that good societies depend upon good citizens, created by "some central authority" (p. 254). Both John Marini and Caesar contradict Banfield, citing Tocqueville's statement that any "human idea of unity is almost always sterile," whereas God's plan for mankind is carried out by our participation in numerous, seemingly conflicting actions (pp. 282–83, 304). But even Banfield's dissent points out the revolution in Tocqueville scholarship represented in this book. Banfield attacks Tocqueville, the "student of self-interest," for failing to follow Mandevillean precepts. Masugi himself provides another measured criticism of Tocqueville: despite his prescience, Tocqueville "concedes too much to history"; his rejection of equality as a founding idea for political societies leaves the statesman with too little to guide him in ruling (p. xvii).

One may disagree with some arguments raised in this volume (e.g., that Tocqueville conceded too much to the preexisting institutions, beliefs, and practices that, after all, largely form human character). One might also note that Tocqueville's insistence upon the unity of our character and our need to follow God's will in order to live a good life places him within the tradition of natural law and not merely (as is often asserted) of natural rights.

Almost all essays in this volume are quite good. And the book's weakest essay by far (that by Robert Bellah) could not have been excluded without drawing criticism. Bellah's popular work has renewed interest in Tocqueville. But his essay adds none of the textual evidence so sorely needed to show that he understands Tocqueville's thought and applies it properly in his own work. Instead, Bellah continues to use Tocqueville's name and a few strategically chosen passages on "individualism" to further his own political agenda. With this exception, however, the questions raised in this book are precisely the kind one would expect from a serious and thoughtful study of an important thinker.

Oglethorpe University BRUCE FROHNEN

The Political Economy of Defense Contracting. By Kenneth R. Mayer. New Haven: Yale University Press, 1991. 232p. $28.50.

Kenneth Mayer's central argument is that the pork barrel theory of defense spending is both inadequate and inaccurate as a description of the defense contracting process. Instead, he finds the process of defense spending and Pentagon contracting to be largely driven by nonpolitical factors, overlayed by a veneer of congressional credit claiming, position taking, and all the other political phenomena that the Washington establishment uses to make points with the public and gain reelection.

He concludes that "one reason pork barrel explanations are so attractive is that they are simple, parsimonious, and persuasive. They are also mostly wrong" (p. 210). But they persist. They persist because it is in the interest of congressional members, interest groups, defense contractors, and the Department of Defense for there always to be the fallback explanation that a decision was made because of politics or the pork barrel.

Mayer's evidence falls into four areas. He first examines defense political action committee (PAC) contributions to members of Congress, finding that defense contractor PACs give disproportionately to the members of the military committees. This money is also strongly concentrated among those who are generally supportive of the industry and favor high defense spending. His question is whether the money influences votes. He finds that defense PACs are different from other PACs in timing their contributions around both the electoral cycle (the norm) and the budget cycle, so that there is an increase in PAC contributions about the time of budget hearings, markups, and conference committee meetings. His conclusion is that PAC money does not buy votes: "PAC money may provide members with some clues as to where their support lies, but it will not as a general rule guarantee their vote". (p. 96).

Mayer's second area of evidence concerns votes in Congress. Are local interests the primary determinant of a member's attitude on weapon systems? He finds the influence of local spending on the particular project to be relatively minor compared with other factors, such as a member's general attitude toward defense spending.

The third sort of evidence is defense contracting, where he finds the contracts themselves to be relatively nonpolitical. However, legislators typically surround both negative and positive decisions with political credit claiming, blaming, and the like, thus making what is actually a relatively nonpolitical process look very political. He contrasts the selection of prime contractors with the much more political processes involved in military base closures and the politics in Congress of writing restrictive language in authorization bills to attempt to keep programs important to one's district going. The latter, (in contrast to the actual selection of contractors) are very political, as is the selection of subcontractors, where the prime contractor endeavors to spread the subcontracting around to as many states and congressional districts as possible.

Finally, he looks at defense contracting and the electoral cycle, finding that contract awards are given out disproportionately in the two months before each November election but that these are normal contract awards whose processing is accelerated, that is, they would have been given out anyway. Again, credit claiming is maximized, a veneer over a relatively nonpolitical selection process.

Can we believe all this? I think Mayer is right on the essentials, but there are some troubling aspects that we ought to think about. First, in accepting the story that there is a political veneer of credit claiming and position taking over a relatively nonpolitical process, Mayer (and the others in the distributive politics area) is accepting a more sophisticated Washington myth over a less sophisticated, more journalistic one. While we have more evidence to support "our" myth, there are areas where the evidence is just as impressionistic, based fundamen-

tally on quotes from those involved in the process and limited case studies, just like the journalistic descriptions of defense contracting that he rejects. I am thinking specifically of the evidence on contractor announcements.

Second, if we have such a strong political veneer over an essentially nonpolitical process, what is the boundary between the two? What keeps them apart? How strong are those institutional boundaries, and what kind of a theory of bureaucracy do we need to maintain the boundary? Since the public administration subdiscipline has all but destroyed the politics/administration dichotomy, of which the more sophisticated Washington theory is beginning to sound uncomfortably like an adaptation, we need a better theory of bureaucracy to deal with this subject.

Political scientists interested in decision making in the Department of Defense, in congressional–bureaucratic interactions, or in distributive politics will find the data and descriptions of the decision-making process and outcomes interesting and very competently done (e.g., some very comprehensible leverage charts in the chapter on congressional voting); but the major findings have been prefaced in earlier work in the distributive politics area. For journalists, this book will be a major eye-opener.

I strongly recommend it. It is a solid piece of work, with interesting data, good use of several different methodologies ranging from case studies to probit analysis, and one of the few comprehensive examinations of the distributive aspects of an entire department's budget–procurement process.

California State University, Los Angeles J. Theodore Anagnoson

Dual City: Restructuring New York. Edited by John H. Mollenkopf and Manuel Castells. New York: Russell Sage Foundation, 1991. 477p. $39.95.

The Global City: New York, London, Tokyo. By Saskia Sassen. Princeton: Princeton University Press, 1991. 397p. $39.50.

The two books reviewed here are important benchmarks in the study of urban politics. They document the changing character of cities and highlight the increasingly global context of their economic activity. In doing so, *The Dual City* focuses primarily on New York but gives some comparative attention to Los Angeles and London. *The Global City* examines New York, London, and Tokyo—the three major centers of finance and specialized producer services in the world economy. Together, the two books paint a complex picture of the process known as restructuring, the process through which advanced technology and capitalism have modified class relations and transformed cities worldwide.

Sassen's major achievement in *The Global City* is to show that even though New York, London, and Tokyo are located in radically different cultural and national contexts, they display similar trends. According to Sassen, they are shaped by being command-and-coordination posts in an otherwise dispersed world economy. As their role in the manufacture and transport of consumer goods has declined, all three cities have experienced an expanding high-income professional and managerial class but a shrinking middle class. Casual labor and a growing informal economy (i.e., one largely outside of formal regulations, union contracts, and guaranteed benefits) have put much of the population on insecure economic ground.

Heightened affluence among a consumption-minded class of managers and professionals side by side with the increased need and vulnerability in the remainder of the population is at the heart of the "dual city" thesis in the collection edited by Mollenkopf and Castells. Indeed, as both books indicate, the ability of the affluent to pay well for what they want drives up costs for the nonaffluent, sometimes pushing the latter toward privation. A cost squeeze in affordable housing encourages homelessness, for example.

Tokyo is a particularly interesting case. Not only are the beginnings of homelessness evident, but Tokyo now has a significant illegal immigrant population, notwithstanding Japan's tradition of being a relatively closed society. For inhabitants of the Third World, the informal economy of a global city is inviting despite the hardships entailed.

What is the source of these trends? *The Global City* highlights structural change, the transition from an industrial to a postindustrial society. *The Dual City* concurs but gives a more variegated account and brings the account closer to everyday experience in chapters such as "Women Clerical Workers" and "Crime and the Social Fabric." Whereas Sassen concentrates on global processes, the collection edited by Mollenkopf and Castells gives more attention to interconnections between different levels of activity in the postindustrial city.

Both books are attentive to social, economic, and political complexity but also identify a dominant pattern—the diminution of a stable and economically secure middle class. The erosion of stable employment is, of course, the principal contributor to a diminishing middle class. It is plain that the mobility of finance capital and the dispersion of economic production have undercut organized labor and weakened resistance to the casualization of labor.

The two books thus illuminate the persistence of poverty even under conditions of overall economic growth. Specifically, they call into question the argument that welfare dependence has spawned an urban underclass. Social assistance has been eroding, along with the decline of labor unions and the weakening of the "social compact" that mitigated industrial conflict. By inference, the major contributor to the "culture" of poverty is the shortage of permanent jobs with adequate income and benefits. Economic conditions can undermine "family values" and other features of the mainstream culture. In short, casual labor is not conducive to family responsibility and other long-term considerations.

As both books make clear, there is no turning back to an earlier era. For example, stimulation of industrial jobs is no guarantee of economic improvement. In *The Dual City*, Edward Soja's chapter on restructuring in Los Angeles shows that many of the new industrial jobs are low-paying; and, as Sassen argues, a significant amount of industrial work now occurs in the informal economy. In their chapter in *The Dual City*, Ian Gordon and Michael Harloe go to the heart of the matter, citing the reduced incentives for individuals to acquire human capital. The economy itself encourages a live-for-the-moment mentality.

Escaping long-term commitments and obligations is

not restricted to the lower class; it is now pervasive. The ability of mobile capital to induce flexible, profit-serving arrangements has altered society in important ways. The weakening of the implicit "social compact" stands out as an especially important example. But the two books reviewed here depict something much more complicated than a society unraveling. There is a dynamic to the process of restructuring. Mollenkopf and Castells, particularly, give sustained attention to a business and professional core capable of concerted action and to the political handicaps of a "disorganized periphery" of women, minorities, and lesser-paid service *and* industrial workers (pp. 17, 402, 404).

It is not possible to capture here the full richness of these two books and the many issues they raise. There is, however, a major line of argument that unites the two books and guides their discussion. Conflict and division are characteristic of postindustrialism; and this is most evident in the tension between a sector that provides upward mobility and increasing mobility and a sector characterized by shrinking opportunities and deepening deprivation. These two sectors "are not separate and distinct, but rather deeply intertwined products of the same underlying processes," according to Mollenkopf and Castells (p. 11). How, then, will social tension be managed? By separation, by selective disinvestment and retreat into "defended enclaves" (p. 8)? Or, as Sassen suggests, by an ideology of collective powerlessness and inevitable subordination to the forces of the market (p. 334)?

Is there another alternative? The democratic ideal would have us realize and appreciate our shared fate, would see us attracted to the aim of an inclusive society of widening opportunities, and would encourage us to develop the appropriate understanding and build the necessary coalitions to pursue that aim. *The Dual City* and *The Global City* tell us much about how difficult an undertaking that will be. They also tell us how necessary it will be in order to avoid living in a fragmented and conflict-ridden world of uncertain long-term promise. By posing that choice, these two books provide a valuable foundation for beginning a more positive reconstruction of urban life in the postindustrial world.

University of Maryland CLARENCE N. STONE

Media Messages in American Presidential Elections. By Diana Owen. Westport, CT: Greenwood, 1991. 198p. $42.95.

The Formation of Campaign Agendas: A Comparative Analysis of Party and Media Roles in Recent American and British Elections. By Holli A. Semetko, Jay G. Blumler, Michael Gurevitch, and David H. Weaver. Hillsdale, NJ: Lawrence Erlbaum, 1991. 197p. $39.95.

Both of these books examine elections and the media; but they do so from very different analytical, theoretical, and methodological perspectives. The Semetko, Blumler, Gurevitch, and Weaver book is a comparative analysis of the formation of campaign agendas in the 1984 American presidential election and the 1983 British general election. The authors focus on the relative power of the media, candidates, and political parties in shaping the news. Diana Owen's *Media Messages in American Presidential Elections* examines the differential effects of political advertising, news stories, polls, and debates on voters' perceptions of candidates and the campaign during the 1984 and 1988 American presidential campaigns. The emphasis in the Owen book is placed on voters' needs and motivations for using the media during the campaigns and how different kinds of campaign communications might meet those needs.

The Formation of Campaign Agendas builds on the classic agenda-setting work of Maxwell McCombs and Donald Shaw to examine how news agendas are shaped. Rather than concentrate on the media's power to set the agenda of public opinion, however, the authors argue that the media are only part of an interactive process in which candidates and parties struggle among themselves, as well as against news organizations, to control the terms of political debate presented in the news. As the authors clearly demonstrate, the process is a deeply political one and is affected by systemic, institutional, and particularistic conditions that shift the balance of control between the journalists and the politicians.

Starting with a lucid explanation of the major similarities and differences in the media and electoral systems of the United States and Great Britain, Semetko and her colleagues set forth hypotheses to examine the power of the press and politicians to affect campaign agendas. The hypotheses explore the extent of respect or suspicion for politicians and the political process, journalists' pragmatic versus sacerdotal orientations to political coverage, the degree of professionalization of election campaigns, and variation in media competition. In testing these hypotheses, the authors present results from a meticulous content analysis of campaign agendas in selected television and newspaper sources, presidential candidates' stump speeches, and British parties' daily morning press conferences.

As with much agenda-setting research, the authors observe the similarities and disparities among the agendas for a given period of time. One major criticism of this kind of work is that it reveals very little about the direction of influence: Who or what set whose agenda? Or were both agendas affected by a third, external force? In order to address this potential problem, the authors introduce data from their observation of, and interviews with, journalists and editorial staffs of the British Broadcasting Corporation and National Broadcasting Company. This is an excellent example of the use of complementary research methods. The authors give insights into the activities of the daily news operations, the time pressures, the sometimes conflicting journalistic roles, and the relative lack of policy deliberation about the election coverage.

The Formation of Campaign Agendas is a well-researched and clearly written piece of scholarship that advances knowledge about the transactional relationships between the institutions of the press and politics. There are three points that the authors or others working in this tradition might pursue in further research. First, the observations of television newsrooms could be expanded to other participants in the process, particularly the campaign and party organizations. This would provide a more balanced discussion of the reciprocal influences of the campaigns and news staffs. Second, additional cases should be examined in order to test the hypothesis regarding media competition. The differences observed between the campaign agendas in the United States and Great Britain may be due to the demands of a commercial, versus a public service, broadcasting system, as the authors suggest. However,

more than two cases need to be considered to provide conclusive evidence. Finally, to their credit, the authors examine the content of visual communications. This work could usefully be developed to allow for more than the five visuals per television story measured in the current book and to examine the interplay of verbal and visual messages.

Media Messages in American Presidential Elections also examines the 1984 American presidential election, but in comparison to the 1988 election. The book is in the media-effects tradition and asks about the relative influence of different forms of campaign communications on the voters and their electoral decisions. Owen views voters as active and aware consumers of campaign messages. Employing a "uses-and-gratifications" model, the author examines the characteristics of political advertising, television and newspaper news, public opinion polls, and presidential debates in order to assess how they may (or may not) gratify voters' needs.

The first chapter is devoted to explaining the "audience-centered model of mass media use and outcomes" (p. 15) and the survey research utilized to assess audience evaluations of candidates, uses of campaign communications, and perceptions of media effects. Owen argues that there are two main types of effects: subjective (reflecting feelings about how well voters' needs are satisfied by mass communication) and objective (dealing with cognitive and behavioral change). The author focuses on subjective effects by analyzing the self-reports of survey respondents in two (1984) or three (1988) counties in the United States. By relying on the self-reports of subjective phenomena, the author considers only the audience's conscious awareness of motivations for using the four communication types. The data largely confirm findings from past research.

Assuming that the four types of campaign communications have unique characteristics that will meet particular audience needs, the bulk of the book describes and analyzes campaign ads, news, polls, and debates with examples from the 1984 and 1988 elections. In each media chapter, Owen briefly examines the shaping of message types by candidates, their campaign staffs, and mass media organizations. She also explores how candidates and the media use each message type and presents analyses of the survey data to discuss voters' uses and perceptions of messages. The last two chapters examine more directly how voter needs and motives can be satisfied by the four message types.

Owen presents a number of findings from previous research, as well as from the county survey data. This is both a strength and a weakness. It is a strength because Owen supplements the disparate findings of past media effects research with results from her 1984 and 1988 election studies. However, because so much information is presented, it is difficult to trace the central points of Owen's argument. The uses-and-gratifications model the author employs asks us to focus on the role of the active audience and does not seem adequate to explain the differences in types of campaign communication. Since most of the book describes and analyzes types of political communications and the characteristics they exhibit that might satisfy voters' reported motives and needs, it seems that a more appropriate theoretical framework would take into account the motives and goals of the communicators and the nature of the content, as well as the motives of the voters. In a discussion of image formation, Owen hints at an interactive process of "mutual exchange of perceptions" between campaigns and voters (p. 13) but does not develop it. The author is clearly interested in content differences, since she examines advertising, news, polls, and debates. Her ideas would be better served either by elaborating on the connection between the theoretical framework and the data or by using a transactional or constructionist model (e.g., those of Sidney Kraus and Dennis Davis's *Effects of Mass Communication on Political Behavior* [1976] or David Swanson and Dan Nimmo's *New Directions in Political Communication* [1990]).

Both books are well grounded in the literature on media and elections and should be of interest to students of American presidential politics, political communications, or media influence. *Media Messages in American Presidential Elections* adds data from the 1984 and 1988 presidential campaigns to our understanding of media and elections. *The Formation of Campaign Agendas*, with its comparative, multimethod perspective makes a particularly important and original contribution to the existing literature on agenda-setting and electoral politics.

University of Southern California ANN N. CRIGLER

The Rational Public: Fifty Years of Trends in Americans' Policy Preferences. By Benjamin I. Page and Robert Y. Shapiro. Chicago: University of Chicago Press, 1992. 488p. $59.95 cloth, $19.95 paper.

The Reasoning Voter: Communication and Persuasion in Presidential Campaigns. By Samuel L. Popkin. Chicago: University of Chicago Press, 1991. 291p. $19.95.

Public Opinion in America: Moods, Cycles, and Swings. By James A. Stimson. Boulder: Westview, 1991. 156p. $49.95 cloth, $14.95 paper.

Most areas of research display a predictable pattern, characterized by a surge of excitement and energy, followed by solid, normal science, followed yet later by ever-growing calls for new questions and perspectives. The study of public opinion is no exception. Philip Converse's "The Nature of Mass Belief Systems" served as the catalyst for nearly three decades of systematic inquiry into the nature of people's political attitudes and preferences. But during the past few years, political scientists began to express a concern that research had hit a plateau. The plaintive plea, "We need some new ideas and some alternative ways of thinking about public opinion" dominated more than one dinner conversation at professional conventions.

Students of public opinion owe a great debt to the authors of the three books listed above. Published almost simultaneously, these works, individually and collectively, undoubtedly will provide the impetus that researchers have been seeking. In a very real sense, the next generation of graduate students will be building upon a new and exciting foundation.

For those who place faith in the ordinary citizen, the authors have done much more than generate a renewed interest in the research endeavor. All three books resurrect the place of citizens and their preferences within the context of American representative democracy. Not that any of the authors portrays the typical citizen as a philosopher–king, steeped in knowledge about national politics. But democrats will find great satisfaction in the conclusion that public opinion is far from capricious,

arbitrary, and ill-founded. Contrary to the prevailing and rather pessimistic assessment (some might say, indictment) that arose from decades of analysis of individual responses to survey items, these works find in public opinion a capacity to guide public policymaking.

The Rational Public represents the culmination of a project that the authors began a decade ago. Based on a massive data set that combines nearly every existing poll or survey question related to national politics, the study reports, in detail and with great care, trends in Americans' policy preferences between 1935 and 1990. Those who teach introductory American politics or public opinion courses will find a gold mine of information here. Page and Shapiro not only present the trends in easily digestable form but discuss the larger economic, political, and technological contexts that help to explain them.

One who graded public opinion on the basis of reading *The Rational Public* would surely conclude that an *A* is in order; for public opinion, Page and Shapiro argue, meets the "three *R*s" criterion: it is reasonable, responsible, and rational. Not any public opinion, mind you, but *collective* opinion. The latter, immune to problems arising from measurement error or temporary opinion changes by individuals, reacts in an understandable and a predictable fashion to events, broad social and economic changes, and statements of experts and visible public officials. Moreover, public opinion often influences government policy.

Collective public opinion may be rational, but by no means is it foolproof. Page and Shapiro present striking examples of the manipulation of information by officeholders, especially in foreign affairs, which led the general citizenry to prefer policy options that served the politicians', but not the public's, interests. The rationality of representative democracy depends not only on the rationality of collective opinion but also on a supply of honest and complete information provided by those who have direct access to it. Political competition among elites increases the likelihood, but does not guarantee, that such information will be forthcoming.

Like Page and Shapiro, Stimson conceptualizes public opinion as an aggregate phenomenon—and with convincing justification: "If our topic is people, then [the focus on individual psychology] is relatively harmless. . . . But if the topic is politics, then it matters a great deal if aggregate opinions are more orderly and meaningful than individual ones. For it is the aggregate that matters in politics." (p. 2). Presumably, most politicians and journalists would agree.

Whereas Page and Shapiro have written a long book, Stimson has written a short one (an interim report on the way to a larger study of political representation). Whereas the former construe collective opinion in terms of rather specific policy areas (civil rights, civil liberties, wage and price controls), Stimson develops the idea of *policy mood*. What distinguishes mood from specific policy preferences is that the former involves two aggregations: over individuals and over issues. Mood, then, is akin to liberalism–conservatism (Should government do more or less?) but is a function of a whole package of specific policy preferences.

I cannot begin to do justice to the character and quality of Stimson's work. It represents some of the most sophisticated analysis to be found in the field of public opinion. Moreover, the care and thought that go into the conception and measurement of mood will set a new standard of research. Despite all of the technical complexity and sophistication, Stimson retains a commonsense perspective throughout the book. Truly insightful work always becomes "self-evident" upon completion, a criterion that every chapter in *Public Opinion in America* meets.

Mood, Stimson demonstrates, became increasingly liberal during the 1960s and early 1970s, shifted to the Right during the remainder of the decade, and then (surprise!) turned in an undeniably liberal direction just about the time that Ronald Reagan captured the presidency. Just as Page and Shapiro find rationality in the movement of collective policy preferences, Stimson sees a logic in the cycles in mood, a determination that depends on the author's conception of political representation.

To Stimson (in contrast to Page and Shapiro) the linkage between citizens and representatives is not a direct one whereby public opinion and public policy share a one-to-one (even if rough) correspondence. Rather, citizens respond to government performance. If a generally liberal agenda appears to be working, people will, within a "zone of acquiescence," permit politicians to take the lead in developing specific programs. If, however, they begin to perceive problems, citizens will become less tolerant of government action, which will be reflected in a growing conservative mood. Thus the increased conservatism of the mid-to-late-1970s reflects a growing disenchantment with the liberal agenda that dominated the 1960s just as the shift to a liberal mood during the 1980s reflects a dissatisfaction with Ronald Reagan's policies.

One might argue that Page and Shapiro's and Stimson's similar conclusions about the rationality and reasonableness of public opinion depend wholely on aggregation. Analysis at the individual level, such an argument would go, will inevitably lead to a very different conclusion, as it has for nearly three decades.

Not so, contends Popkin. Ironically, Popkin reaches this verdict by turning to the very research that Page, Shapiro, and Stimson likely find unnecessary and superfluous. Especially important are the insights of psychologists Amos Tversky, Daniel Kahneman, and Jerome Bruner, who, through sustained programs of research, have demonstrated that people use heuristics and other informational shortcuts when making decisions. Three cognitive principles loom especially large in Popkin's work: (1) the representative heuristic (inferring what kind of person someone will be by comparison to "typical" people one knows); (2) the recency effect (weighing recent information more heavily than past information); and (3) the Drunkard's Search (simplifying the decision process by focusing on a limited number of criteria). Reliance on these three heuristics, especially in combination, comprises what Popkin calls "low-information or gut-level rationality."

People do not use these rules devoid of context, however. Thus, the framing of alternatives influences the final judgments as much as the informational shortcuts themselves. With respect, specifically, to electoral politics, candidates compete among themselves to frame the campaign to their advantage. Five changes of frame occur repeatedly in presidential primary and general elections: (1) portraying the incumbent as president or as a candidate; (2) discussing the candidates as people or as holders of public records; (3) portraying the candidates as battling to win the nomination or as certain nominees;

(4) emphasizing economic or international issues; and (5) emphasizing unemployment or inflation.

Popkin then goes on to argue that people in fact make reasoned (and, by implication, "good") choices in primary and general elections. The abrupt changes in support for primary candidates make good sense once one recognizes that voters use heuristics and that candidates continually strive, sometimes successfully, sometimes not, to change the prevailing frame of the campaign. Moreover, the mystical campaign momentum that numerous scholars have documented and tried to understand is no more than a result of voters making reasoned choices.

Unlike the other two books reviewed here, *The Reasoning Voter* presents little quantitative analysis. What Popkin has demonstrated, then, is the value of carefully and systematically integrating the literature and then deriving implications.

I inevitably have a few quibbles about each book. Because Page and Shapiro had no control over the timing of the surveys and polls, they cannot completely rule out history effects. Moreover, it may be that the rhetoric surrounding policy proposals does more to influence opinion than the policies themselves. If so, Page and Shapiro may have underestimated how far the actions of public officials hold sway. Stimson unabashedly construes mood in cognitive terms. Perhaps mood reflects a growing anger on the part of citizens toward government. In this light, it would be helpful to know whether the documented changes in mood occur principally among certain segments of the population (e.g., the less interested). At times, Popkin presents as fact what others might consider an open empirical question.

In no way should these quibbles detract from the significance of the works. If there is any doubt, consider two questions political scientists now face. First, if the purpose is to understand the nature and role of public opinion in American representative democracy, should scholars redirect their attention wholeheartedly to aggregate-level, rather than individual-level analysis? That *The Rational Public* and *Public Opinion in America* have just appeared is not completely happenstance. Many disciplines seem headed toward holistic perspectives, as exemplified by the emergence of chaos theory. Ironically, this movement within the discipline is occurring at the very time that political psychology, a highly reductionistic approach, has gained unprecedented prominence. The easy and perhaps correct answer is that we need both perspectives. Whatever one's own choice, the works reviewed here have brought the level-of-analysis problem to the fore, precisely where it belongs.

Second, what criteria should we, as a discipline, bring to bear when evaluating representative democracy? All three works reviewed here reach optimistic conclusions about the quality of public opinion in American politics. Page, Shapiro, and Popkin, like others, view cue taking as an effective means by which people can make proper political judgments. One might argue, however, that the very fact that citizens must look to politicians and other elites for cues underlines a basic problem with large-scale and increasingly complex political systems. "Knowing" via cues may or may not be equivalent to knowing via possessing factual, rooted-in-life information. If not and ordinary citizens cannot gain access to relevant data, what then? Or if, as Stimson argues, mood changes because the citizenry-at-large becomes disenchanted with government programs, why the continuing disenchantment?

Thanks in good part to Benjamin Page, Robert Shapiro, James Stimson, and Samuel Popkin, these kinds of "big" questions beg answers more than ever before. The future of public opinion research could not be more challenging and exciting.

University of Illinois, Urbana–Champaign JAMES H. KUKLINSKI

The Culture of Spending: Why Congress Lives Beyond Our Means. By James L. Payne. San Francisco: Institute for Contemporary Studies, 1991. 225p. $24.95.

Why do members of Congress vote to increase federal spending in an era of $300-billion deficits? In a lively and contentious study, James Payne argues that members vote for higher spending levels because they are "persuaded" to do so by the pro-spending culture in which they work and by their prior socialization, rather than because of an electoral need to appease voters.

This pro–spending culture is a world filled with pro-spending cues, with few if any that encourage opposition to spending. Rather than serve, for example, as a forum for an evenhanded evaluation of federal programs, committee hearings are "rump hearings," where the witnesses are overwhelmingly in favor of greater spending. Payne's review of witness lists also interestingly reveals that anti-spending groups and organizations, such as the Cato Institute and the Heritage Foundation, rarely make the effort to testify and so to educate members during hearings about why program budgets should be cut. Thus, there is little balance to the testimony presented at these hearings.

While agency officials and pro-spending lobbyists dominate the formal hearings' witness lists, the members' informal contacts and other sources of information, including the media, are also dominated by groups and individuals seeking new programs and increased spending. The "data base" on the effectiveness of federal programs that is available to members, for instance, is heavily weighted toward the proposition that government is the appropriate instrument for solving national problems. This data base is produced by the various agencies and interests that benefit from federal spending, who are loath to recommend anything more than marginal improvements in program performance. The alternative of reducing or terminating federal spending is rarely if ever proposed. Government programs are in fact evaluated by true believers, so that "true critics are excluded from the policy-evaluation process because, simply, they contradict the purposes of those who fund and participate in the evaluation projects" (p. 34). The consequence of all this pro-spending information is not just persuasion, but conversion.

Perhaps more important than their surroundings, Payne indicates that prior experience and socialization of members predisposes them to spend. In the case of both Democrats and Republicans, prior governmental office-holding is positively associated with a greater tendency to vote for spending. Moreover, the longer one has served in Congress, the greater the tendency to spend. When distinguishing between Democrats and Republicans, Payne finds that representatives of the two parties exhibit very different frames of reference when they consider whether to vote for a spending bill. Democrats emphasize what Payne calls a "manifest" impulse,

which "leads them to favor immediate government solutions to apparent problems" and thus a tendency to support spending. Republicans emphasize a "latent" impulse and "are more inclined to weigh the long-run costs or harm of a government program, and are therefore less enthusiastic about funding it" (p. 111).

To control spending, Payne advocates creating a culture of anti-spending. This counterculture would include a federal agency that would supply members with information on the inefficiencies and ineffectiveness of federal programs; closed hearings that would shut out lobbyists; a ban on witnesses' testifying before the same committee two years in a row; congressional term limits; restrictions on the amount of time a member might serve on a particular committee; and cost–benefit analysis and program evaluations that would consider the benefits occurring from leaving proposed expenditures in the private sector. Significantly, Payne rejects procedural reforms, such as Gramm–Rudman–Hollings, because members easily find ways to circumvent legal spending limits.

Payne's study is a well-written work that reminds us of the importance of information, attitudinal predispositions, institutional culture, and socialization in budgetary decision making; and he warns that not all spending votes are tied to electoral purposes. The author, furthermore, tells us what any lobbyist working the Hill already knows, namely, that organized opposition to spending is limited and that in their analyses, agencies like the General Accounting Office regularly pull their punches and recommend only marginal programmatic changes.

The culture Payne describes, however, is more complex than he allows. Particularly during the last 12 years, for example, members have regularly heard testimony, regardless of the truth of the matter, that deficit spending would cripple the nation's economy. This theme is constantly replayed by the media; and, to name only one official source, the Congressional Budget Office annually identifies potential program and budget cuts. Moreover, although this study focuses on Congress, the Reagan–Bush administrations have regularly refrained from vetoing appropriations bills, thus significantly contributing to the culture of spending. Finally, although Payne offers welcome relief from the mechanical decisions offered by public choice voting theories, he underestimates the importance of the voters' influence on congressional spending decisions. Members are not paranoid when they think twice about making deep cuts in middle-class entitlements like Social Security. This point is especially important, because the big spending growth in the budget resides in the entitlement, rather than the discretionary accounts.

These comments aside, Payne's book is a valuable addition to the budgetary literature, one that renews the importance of the sociological–cultural framework for studying spending decisions. This book would be appropriate for both undergraduate and graduate students.

University of Virginia JAMES D. SAVAGE

Toxic Politics: Responding to Chemical Disasters. By Michael R. Reich. Ithaca: Cornell University Press, 1991. 316p. $45.00 cloth, $15.95 paper.

The theme of this book centers on the question of how the victims of chemical disasters obtain redress. Specifically, the book takes a comparative view of the politics of chemical disasters by focusing on three such disasters—PBB contamination in cattle in Michigan; dioxin contamination from a factory in Seveso, Italy; and PCB contamination of cooking oil in western Japan. Understanding why the victims of toxic contamination confront similar political obstacles is a major objective of his study. Reich's analysis proceeds in three parts. First, he observes concrete decisions made by political elites and the use of material resources in political bargaining. Next, he pays attention to the processes of agenda formation and analyzes why some issues are organized into politics while others are not. Finally, he analyzes efforts to influence, shape, and determine the wants and demands of powerless groups.

In carrying out his analysis, Reich utilizes case studies as "plausibility probes" for his conceptual schema. The chapters on the three disasters are based on field research conducted during 1978–79, with subsequent follow-up. His methods include collection of primary and secondary documents, as well as elite interviews with approximately 80 major participants in each incident. These participants include victims, politicians, journalists, civil servants, businessmen, private and public interest activists, and legal and medical specialists.

Essentially, Reich argues that the victims of toxic contamination seek redress through politics in three phases: making the problem public, organizing group actions, and mobilizing political allies. In doing so, they often find themselves involved in a process that can "become as poisonous as the chemicals themselves"—"toxic politics" (p. 2). Not long into the process of redress, contamination victims quickly discover that they are powerless. The book concludes with a somber message that incremental tinkering with the regulatory regime may be achievable yet have little impact. Significant change, on the other hand, will have to confront deep political obstacles. Ironically, to obtain even incremental changes in laws, institutions, and goals, more disasters may be required. Thus, to prevent more chemical disasters, "paradoxically and tragically, we may need more chemical disasters" (p. 280).

Other similar books have used the case study approach to analyze the politics of chemical or nuclear disasters. Such books include those on Love Canal (Levine), Bhopal (Shrivastava), Seveso (Conti and Whiteside), and Three Mile Island (Goldsteen and Schorr). In combination with this recent literature, the book suggests that disasters have both detrimental and advantageous effects. From a more positive standpoint, such disasters awaken the public from their complacence and instill in them the understanding that they must take much (perhaps most) of the responsibility for managing their own safety and health, since all too often, corporate and public actors resist their pleas for redress and assurances from technological risk. For example, in Goldsteen and Schorr's *Demanding Democracy after Three Mile Island* (1991), citizens became more favorable toward participatory democracy after discovering that responsible officials misled them in the aftermath of the disaster. In the United States, we have observed the rise of a grassroots movement on toxic chemicals in the aftermath of disasters at Love Canal, Times Beach, and others. The evidence discussed in this book continues to suggest that disasters are bringing about a transformation in the way citizens relate to government. In one instance after another, citizens are "demanding democracy" or even turning toward new

forms of citizen participation that may bring them into the forefront of policymaking and implementation.

In summary, this book is a welcome addition to the growing literature on disaster management. More specifically, it could be useful in courses on environmental politics and policy, as well as public policy more generally. While it is constrained by the usual limitations of case study research, it nevertheless contributes a great deal to ongoing discussions about citizen participation in the wake of chemical disasters and contemporary politics of disaster management.

Colorado State University JAMES P. LESTER

The End of Realignment? Interpreting American Electoral Eras. Edited by Byron E. Shafer. Madison: University of Wisconsin Press, 1991. 187p. $35.00 cloth, $12.95 paper.

This collection is an outgrowth of the Harold G. Lasswell Symposium at the 1989 meeting of the American Political Science Association. The first three chapters, by Joel H. Silbey, Everett Carll Ladd, and Byron E. Shafer, are revisions of the papers presented at the session. The chapters by Samuel T. McSeveney and Walter Dean Burnham are revised and expanded versions of responses to the papers. An excellent bibliography of the literature on realignment by Harold F. Bass, Jr., completes the volume.

It cannot be reported that this collection will end the continuing debate over the utility of realignment theory (synthesis, perspective, model) either by demolishing it once and for all or by providing new and convincing support. The authors of the first three essays question the capacity of realignment formulations to explain either historical or contemporary American politics. They differ, however, in both the nature and degree of their skepticism. Silbey attributes value to realignment formulations for understanding past, but not contemporary, politics and attempts to subsume such formulations under a broader conceptual framework. Ladd's view is summarized by his essay subtitle, namely, "On the Uselessness of 'Realignment' for Understanding Change in Contemporary American Politics"; and he clearly holds the same view of its applicability to historical politics. Shafer is carefully noncommittal in discussing the utility of realignment formulations for understanding past politics but views them as of little or no value for understanding the contemporary era. All three argue that the political system has passed beyond realignment and no longer has the capacity to realign.

The commentators take different positions. For McSeveney, realignment formulations retain value for understanding political history, although he is more dubious where the present era is concerned. Burnham reasserts the value of the realignment framework for understanding both past and contemporary politics and argues that realignment in fact did occur during the years from 1968 to 1972. He does so, however, by introducing an additional type of realignment, one of non- or even antipartisan form.

Discussions of realignment have rarely been entirely consistent from one to the other and often fall short as models of conceptual clarity or definitional agreement. Unsurprisingly, this collection is no exception. In the initial essays, it is often unclear whether discussions of realignment refer only to the rare historical elections that some scholars have described as realigning or to broader formulations that attempt, whether successfully or unsuccessfully, to describe not only realigning elections but also the politics of the years between realignments.

Discussions of the late 1960s and the early 1970s have similar characteristics. These years are seen as marked by profound political change leading to a new electoral era quite different from those of the past. These changes cannot be seen, however, as realignment—at least not of the "classical" form. The first reaction of a naive reader might be that this may be at least in part a matter of definition. Since the authors make much of the differences between historical realignments, it is not completely clear what the properties of a "classic" realignment are supposed to be. Treating these years as a further example of realignment, only of a different form (as Burnham does), may only add an additional complexity to an already overly complex formulation. The test is, of course, further exploration; but even without such an addition, realignment remains an important (though perhaps time-bound) component of our understanding of historical American politics.

These essays are important contributions to the continuing debate over realignment and to our understanding of American politics, past and present. The panelists at the Lasswell Symposium may have come, as McSeveney suggests, "to bury realignment" (p. 95). Taken in total, however, the resulting volume suggests that burial would be, to say the least, premature.

University of Michigan JEROME M. CLUBB

Reasoning and Choice: Explorations in Political Psychology. By Paul M. Sniderman, Richard A. Brody, and Philip E. Tetlock. New York: Cambridge University Press, 1991. 304p. $47.95.

Although woefully uninformed about politics, most citizens manage to provide answers to the myriad demanding and often obscure political questions that confront them in typical mass opinion surveys. How do they do it? This is the central question of *Reasoning and Choice*, a collection of separately written papers woven together by the book's three principal authors.

One possible answer is that bewildered by it all, most citizens respond to surveys in a random or otherwise meaningless fashion. But Sniderman, Brody, and Tetlock, dubbing this the minimalist thesis, reject it as inapplicable to the majority of cases that concern analysts of public opinion, thus setting the stage for the main body of their analysis.

That analysis focuses on "heuristics," or judgmental shortcuts to opinion. The most important of these is the "likability heuristic"—the tendency of people to favor good things, like government aid and freedom of speech, for individuals and groups they like and to oppose good things for those they dislike. Thus, in a series of roughly parallel chapters, the book shows that affect toward blacks, homosexuals, liberals, and conservatives (as measured on hundred-point feeling thermometers) is a reliable determinant of people's opinions on related policy questions. Citizens appear to use the likability heuristic not only for gauging their own policy preferences but for making inferences about the preferences of other groups. They attribute positions similar to

their own to liked groups and positions dissimilar to their own to disliked groups. The book further shows that citizens differ in their reliance on the likability heuristic. Well-educated people attach some weight to feelings in making up their minds about issues, but more to ideology; less-educated citizens rely more exclusively on feelings.

Political scientists who do not specialize in public opinion may be unimpressed by such findings. What, they will wonder, have we really learned when we find out that people favor good things for groups they like and bad things for groups they dislike? This is a fair question; but the findings, nonetheless, constitute progress. There is still doubt in the public opinion field whether there is any structure at all in the attitudes of many less-educated respondents. Sniderman, Brody, and Tetlock make a persuasive case that there is, and that it is based on gut-level likes and dislikes.

The book also devotes substantial attention to the nature and operation of political ideology. One finding is that conservatives are distinctly more negative in their feelings toward liberals than are liberals in their feelings toward conservatives. I could not help wondering whether this dour dislike of political opponents might explain why, as another chapter of *Reasoning and Choice* shows, conservatives are less willing than liberals to extend civil liberties to various outgroups, even right-wing outgroups.

Another intriguing finding was that right-leaning citizens appear, in several quite different situations, more susceptible to manipulations of the survey instrument. In one manipulation, respondents were asked whether they supported a certain policy; but half were told that Congress had passed a law in favor of it and half were not. Right-leaning citizens (here measured by low scores on a measure of affect toward blacks) were more apt to favor the policy after being told that Congress had supported the policy (a program to help minorities), whereas racial liberals were unaffected by the experimental manipulation. In another case, self-identified conservatives were more apt than liberals to change their initially stated opinion when the interviewer attempted to counterargue it ("Would you still feel that way even if . . . ?). By way of partial explanation for these findings, the book maintains, with some empirical support, that conservatives may be more conformist than liberals.

A notable strength of the book is its innovative use of Computer Assisted Telephone Interviewing to test substantive hypotheses concerning the motives of different ideological groups. In one experiment, for example, the authors seek to find out whether conservatives or liberals are more likely to take account of the race of a laid-off worker in deciding whether the worker is entitled to unemployment benefits. (The answer is that conservatives are more likely to pay attention to race. They favor a *higher* level of benefits when the laid-off worker is black, but only when told, in another experimental variation, that the worker had been dependable on the job; otherwise, conservatives are, like liberals, unaffected by the race of the worker.)

Because the book covers a great deal of ground, it is open to challenge from many directions. But I found *Reasoning and Choice* an original and stimulating book that merits careful reading and reflection by specialists in the field of political behavior.

University of California, Los Angeles JOHN ZALLER

Politics, Markets, and Congressional Policy Choices. By Peter M. VanDoren. Ann Arbor: Michigan University Press, 1991. 196p. $32.50.

Government intervention in the economy is ubiquitous. The nature, scope, and scale of this intervention suggest strong normative misgivings on the part of politicians about the allocative and distributive consequences of a market economy. The prophylactic policies of Congress engendered by these misgivings are the targets of Peter VanDoren's work.

VanDoren starts with the charitable hypothesis that Congress is well meaning in its micromanagement of the economy and is pursuing in these policies the legitimate provision of public goods or other remedies to classic market failures. Rejection of this hypothesis follows from even the shallowest examination of congressional policymaking. VanDoren then offers alternative hypotheses that range from well intentioned but misapplied policy to the conscious pursuit of goals unrelated to allocative efficiency or, for that matter, distributive equity.

The normative issues related to market intervention are given considerable attention by VanDoren. Intertwined in this discussion are standard microeconomic treatments of relevant topics such as market failure, property rights, and allocative efficiency. For a number of reasons, this is a very useful enterprise. As a service to those less well versed in microeconomic theory, VanDoren defines and clarifies apparent congressional confusion among allocative efficiency, distributive equity, and naked pork barrel politics.

For the central purpose of his book, an empirical analysis of congressional intervention in post-war energy policy, VanDoren combines his discussion of normative issues with a positive theory of congressional policymaking to generate testable hypotheses relating to the formation of energy (coal and nuclear) policy. The positive theory of policy choice seeks to relate the policy preferences of relevant political actors to economic conditions, interest group preferences, and the distribution of costs and benefits. This presentation is somewhat less compelling than the earlier discussion of normative issues. The sampling from the relevant literatures is a bit too selective and proves difficult to synthesize.

The backdrop to the empirical analysis is a two chapter narrative of the history of congressional micromanagement of U.S. energy policy since World War II. This history is indeed a dismal one and VanDoren spares no opportunity to bring to light the consequences of misguided congressional policymaking. In characterizing energy policy as an endless stream of mistakes the author does not hide his own strong beliefs about what goals policy ought to be achieving: allocative efficiency, with distributional issues dealt with by the redistributional opportunities provided for by the economic gains achieved through greater allocative efficiency. Less clear is where the author lays blame. Although Congress is clearly the guilty party, it is not clear whether the mistakes are by design (different policy objectives), the result of congressional confusion about the true nature

or incidence of the effects of policy choices, or the result of severe constraints on congressional action such as interest group, presidential, and bureaucratic pressure.

The empirical analysis of energy policy choice is meant to shed some light on this issue. The analysis is fundamentally interested in explaining policy choice: which policy proposals pass, which do not. The empirical model predicting policy choice is fairly elaborate. A two-stage probit model is used to accommodate the exogenous effects of economic conditions, interest group preferences, and the distribution of costs and benefits as well as the endogenous preferences of relevant political actors (members of Congress, the president, and bureaucrats). The unit of analysis is the wording of passages in proposed legislation having discernible microeconomic consequences for energy producers and consumers.

Where VanDoren shines is in recognizing why the results of his analysis might prove valuable. He is not interested in showing that policy is misguided (that is almost taken as a given) but wants to know if reform is politically feasible. To demonstrate this, he recognizes that he must show that reform is in the interest of members of Congress and that they have the ability (discretion) to implement it.

The answer is not self-evident. The empirical model is complex (relative to other policy choice models) and the results show a myriad of pressures bearing on the policy choices of Congress and that these pressures are sensitive to the issue at hand. VanDoren is quite (unusually) candid about what can and cannot be learned from his results. The one obvious casualty is the ability to generalize directly from this study. The somewhat wide-ranging specification search that precedes the estimation and the sensitivity of the results to particular policies tell a cautionary tale.

The caution called for in interpreting the results is no reason to abandon the approach or, for that matter, the model itself. VanDoren's empirical analysis is preceded by an oft repeated and accurate string of criticisms directed at standard policy studies. At a minimum he provides us with a set of methodological tools for moving well beyond standard (pat) policy models.

Some readers are bound to be upset by the case VanDoren makes for the pursuit of allocative efficiency. The goal of moving from the majority rule principle that governs current policy decision making to something approaching the unanimity of market decisions hinges on the successful implementation of a mechanism for redistributing efficiency gains. The logic is there but the feasibility has yet to be demonstrated. It would be a shame, however, if that proved to be sufficient deterrent to try.

University of Texas at Austin BRIAN ROBERTS

COMPARATIVE POLITICS

Explaining Economic Policy Failure: Japan in the 1969–71 International Monetary Crisis. By Robert C. Angel. New York: Columbia University Press, 1991. 333p. $37.50.

The United States and Japan together comprise nearly 40% of the world's gross national product. And the U.S.–Japanese (NichiBei) economy—the sum total of trade and direct investment between the two countries—now contributes more than $150 billion to both economies. Because of the critical importance of the bilateral relationship, its condition and future health are matters of deep concern. Although some in both countries, mainly government officials, continue to argue that the overall relationship remains healthy, there are enough danger signals to warrant close examination of the political economy of the U.S.–Japanese relationship.

Indeed, the problematic growing economic interdependence between Japan and the United States is only one of the more visible manifestations of the collision between the two most powerful social currents of our time: the globalization of local, national economies and the imperative to preserve or enhance cultural or national identity.

Unfortunately, the intellectual architecture necessary to advance our understanding of how "domestic" and "international" political economy forces interact is underdeveloped. Under such conditions, a number of research strategies are appropriate, among them the case study approach used to answer questions that give promise of providing useful guidance for subsequent work. The goal in such work is to use a particular instance as a search strategy to uncover underlying dimensions that may warrant further study. The work under review more than fulfills this goal by providing an efficient description of how Japan responded to the "dollar shock" issue of 1969–71. The author not only weaves disparate material together to illuminate the particular crisis but also succeeds in making a strong contribution to how we should think about the present and future condition of the bilateral relationship.

The issue Angel selected for study presents similarities and differences between 1969–71 and the present. Then, as now, Japan's current trade account with the United States was in surplus. Then, as now, the United States applied pressure on Japan to respond to American demands for Japan to make changes in its international monetary policies. The demands, then as now, were made because of domestic American difficulties. Japanese decision makers proved inflexible and only unilateral American action forced Japan into changes. However, the domestic problems of the U.S. economy are far greater in the 1990s than the late 1960s; and Japan's current account trade surplus with the United States is far greater, as well. In fact, Washington and Tokyo have been negotiating over trade related issues on virtually an annual basis since the 1969–71 crisis, but to little avail. Even after additional yen reevaluations, wave after wave of reductions of tariff barriers, and now agreements by both countries to reduce structural impediments in their domestic economies for mutual advantage, Japan's current account trade surplus with the United States and the rest of the world increases.

The author focuses on the development and implementation of Japan's international monetary policy in response to American pressure to revalue the yen. Angel selects this issue because he questions the "received wisdom" of economists and political scientists, who tend to see national-level economic and political decision making in Japan as smooth, coordinated, and successful. He sets out to (1) identify the participants in the decision-making process, including what accounted for their access in the decision-making process; (2) identify the positions of the participants and how they arrived at their positions; (3) determine who decided Japan's policy response with what level of influence; and (4) decide how all these factors combined to produce Japan's response.

To answer these questions, Angel places the period before the American challenge to Japan in context. By the late 1960s the Japanese had clearly begun to succeed in their effort to catch up with other advanced industrial economies. But their single-minded focus on export-led economic growth precluded much attention, on their part, to Japan's impact on the other societies Japan traded with. Consequently, when the Nixon administration placed a 10% import tax on all imports entering the United States and called for a yen reevaluation, the Japanese government was unprepared to respond. Angel does an excellent job of tracing the Japanese inability to respond to a need for a reassessment of international monetary policies designed to maximize the ability of Japanese companies to compete abroad. He is convincing in arguing that the institutional structures put in place during the American Occupation appear to have been associated with the pattern of Japanese leaders' becoming comfortable with the idea of using foreign pressure (*gai-atsu*) as a means to undertake important domestic reforms. He also notes the somewhat paradoxical legacy of resentment among Japanese elites left by the "dollar shock" case, which was to be only the first in a line of cases in which American policymakers would make unilateral demands and the Japanese would be forced to respond.

The detailed answers to the questions Angel poses is important for comparative political economy theory development in general and state-centered theory development in particular. Japan, like the United States, is a capitalist state; but the resemblance may end there. Angel reminds us that viewing the concept of the state as a social institution anchored in cultural and historical context, rather than as another, albeit powerful, interest group yields important insights about how capitalist states differ. Angel presents a powerful analysis suggesting why it is unlikely that any particular institution in the carefully balanced system of Japanese decision-making institutions will step forward to deal with American pressures in a positive manner. Angel wrote about the 1969–71 crisis, but his analysis is strikingly apt today.

RAND Corporation ROGER BENJAMIN

Grassroots Politicians: Party Activists in British Columbia. By Donald E. Blake, R. K. Carty, and Lynda Erickson. Vancouver: The University of British Columbia Press, 1991. 155p. $39.95 cloth, $19.95 paper.

A dilemma confronts political scientists who attempt to study party politics at subnational levels. On the one hand, a narrative that captures the richness of local politics may contain so much particularistic detail that it appeals mostly to readers who have a specific interest in the locale. On the other hand, a narrative that casts local politics into a broad theoretical scheme may lack sufficient detail to interest readers who are not well versed in macro theories of party politics. To avoid this dilemma requires a careful balancing of empirical observation and theory. Unfortunately, this carefully researched book ends up impaled on the first horn.

The authors seek to explain the pattern of left–right (New Democratic party [NDP] vs. Social Credit) polarization that provincial politics in British Columbia sustained from the inception of a minority Social Credit government in 1952 through the party's 1986 electoral victory under its newly chosen "populist" leader, William Vander Zalm. What accounted for the nearly 40 years of extraordinary electoral success these two provincial parties enjoyed, a run of victories that virtually excluded the Progressive Conservatives and Liberals—the dominant national parties—from the legislative assembly? As their principal data base, the authors analyze the results of mail questionnaires sent to delegates to provincial leadership conventions in summer 1986 (Social Credit), spring 1987 (NDP), and fall 1987 (Liberals), with response rates of 27%, 48%, and 40% respectively. If we accept the authors' claim that notwithstanding these low response rates, usual for mail questionnaires, those who answered are representative of the entire convention population, we can credit the authors with "the first systematic account of party activists at the provincial level in Canada" (p. i).

Indeed, the authors provide some fascinating details about the attitudes and characteristics of provincial party activists. For instance, Social Credit and NDP activists report feeling closer to their party's central group than do delegates to the Conservative and Liberal national leadership conventions. Social Credit activists support government spending that encourages private economic development but split among themselves over social spending in the public sector. New Democratic party activists support government spending and regulation in both the economic and social sectors. Liberal activists seem to adopt positions that are deliberately centrist. While middle-aged males remain dominant in all three provincial parties, union membership among Liberal and Social Credit activists has declined since the mid-1970s. Over the same period, the NDP became more heterogeneous as trade union membership was maintained at nearly 50% but membership in professional associations jumped from 5% to 39%. Over two-thirds of the Social Credit and NDP delegates had attended at least one previous convention, as had nearly 60% of the Liberals. Most activists had been party members for over five years.

The authors characterize British Columbia politics as a struggle between two viable parties, the dominant Social Credit party and its principal opponent, the New Democrats. The SoCreds emerged from populist elements, many of whom were Albertan expatriates with financial and organizational connections to the then successful Social Credit party of Alberta. They combined with antisocialist supporters of the provincial Conservative–Liberal coalition government that collapsed in 1952. The NDP developed from the British Columbia branch of the Cooperative Commonwealth Federation, a national farmer–labor party that promoted socialism through reform. The British Columbia branch, however, contained "a much higher proportion of Marxist socialists committed to fundamental change" than elsewhere (p. 4). This struggle polarized from the 1950s through the 1980s as antisocialist supporters of the centrist national parties, particularly the Conservatives, had to choose between casting their votes for an apparently weak Liberal organization or for the stronger—albeit more radical—antisocialist SoCreds. By the mid-1980s, when the British Columbia Social Crediters no longer ran candidates for the House of Commons, over 91% of the party activists reported voting Conservative in national elections. In contrast, NDP activists, who are required to affiliate with the national party, reported 99% support of the national party candidates. Despite aid from the national party in maintaining a formal presence in most provincial constituencies, the Liberals had not won a single seat in the provincial assembly since 1975.

Borrowing some theoretical ideas from David Butler and others, the authors suggest that the militancy of party activists stands in the way of a more moderate politics. Activists, especially those on the Left, prevent the sort of convergence at the center predicted by the models of party competition developed by theorists like Anthony Downs. Three-quarters of the NDP activists agreed that "there is too much emphasis on public opinion polls and slick advertising in politics today," but so did two-thirds of the SoCreds activists. Similarly, 50% of the NDP activists and 35% of their SoCred counterparts, disdained being "careful not to move too far to the (left/right)" (p. 130). Nevertheless, the authors conclude that the relative flexibility of the SoCred activists "must put the NDP in an inherent comparative electoral disadvantage" (p. 133).

In the fall of 1991, shortly after this book was published, electoral support for the Social Credit party collapsed. In the aftermath of accusations that Premier Vander Zalm had criminally exploited his position for private gain, Social Credit lost not only its majority in the legislative assembly but even its position as the NDP's major opposition. The NDP, led by its "moderate" leader (and now premier) Mike Harcourt, won the government for the first time since the 1972 election, and the Liberals suddenly returned with enough seats to become the official opposition.

Needless to say, the authors' analyses of the attitudes and characteristics of party activists who attended provincial leadership conventions neither anticipate nor provide satisfactory explanations for this turn of events. While readers cannot expect the authors to have predicted Social Credit's imminent collapse, it seems fair to argue that the authors became too imbued with their provincial data. An analysis of why the SoCreds failed in Alberta, for instance, might have provided a perspective on the long-term viability of the SoCreds in British Columbia. Moreover, a broader comparative perspective might suggest that in the age of mass communication, regional parties in modern democracies will decline unless they foster a distinctive ethnic or separatist platform.

Nonetheless, readers with a special interest in local party organization or in Canadian provincial politics will find this book an informative historical study.

University of Cincinnati MICHAEL MARGOLIS

State Organized Terror: The Case of Violent Internal Repression. Edited by P. Timothy Bushnell, Vladimir Shlapentokh, Christopher K. Vanderpool, and Jeyaratnam Sundram. Boulder: Westview, 1991. 312p. $49.95 paper.

Genocide Watch. Edited by Helen Fein. New Haven: Yale University Press, 1992. 204p. $25.00.

The two books are useful and thought-provoking collaborative studies on political repression, state terror, and genocide, practices that have bedeviled the twentieth century and are likely to continue to claim millions of lives unless major efforts are made to prevent such state-imposed death. Yet the respective editors note that their topics, despite their obvious importance, have been neglected by scholars and the general public. The neglect, denial, and distortion of genocide is of particular importance to the contributors to Fein's book, since their focus is on prevention of the most horrible crime that can befall a people. Without recognition of genocide, and an active constituency to oppose this crime against humankind, they believe genocide will continue. Appropriately, *Genocide Watch* is accessible to the general public yet is rigorously argued, avoiding the excesses of either optimism or pessimism. *Organized State Terror*, on the other hand, focuses on how to explain a variety of repressive and violent acts by the state within its own borders. It is a book by and for social scientists, but its quest for understanding grows out of moral passion.

Organized State Terror consists of 16 papers loosely organized under several headings: a theoretical introduction, the structural sources of state organized terror, terror as an instrument of state policy, and the social and political psychology of state terror. Most of the essays are excellent, providing sophisticated analyses of single case studies (and, occasionally, comparative studies) ranging from Argentina, to Cambodia, to the Soviet Union, to Nazi Germany, to Central America, to the totalitarian ministate of Jim Jones in Guyana. In a very real sense, the strength of the book lies in its parts, rather than in any overall theory of why some states, under certain conditions, resort to mass violence against portions of their populations. Indeed, it may not be possible to provide a single explanation of state terror (not to mention, repression and genocide); for, as the case studies make clear, state terror is not a single phenomenon but, at most, a set of family resemblances. It may be possible, however, to find more general explanations for *types* of repression and state terror. Also, perspectives that help locate likely areas of trouble, without offering an explanation in a full sense, can be helpful. Viewed in this light, the editors' "theoretical template" summarizing the diverse case studies might be acceptable. They, however, make a much stronger claim for it, namely, that it can illuminate the general conditions for the emergence of political repression and state terror.

The model consists of four main conditions of repression and terror: (1) a distorted conception of the state and the relationship between the state and society ("When the state views its monopolization of power and authority as absolute, society's institutions loom larger as potentially competing centers of power. The state then operates to preclude that competition." Again, such regimes are "typically animated by ideologies sharply at odds with reality and by unrealistic ambitions for social and economic control" (pp. 10–11); (2) conflict and disarray within the state apparatus, leading to political rivalries and a rhetoric of absolutes—in short, weakness; (3) deep economic and/or ethnic conflicts; and (4) strong state-dependence on a foreign power, so that if established by a foreign power, the state lacks legitimacy and resorts to repression and terror, and if recipient of large amounts of foreign aid for the military and other security forces, it not only has the means for repression but develops a military outlook that emphasizes security at any cost.

Such a model is suggestive—but misleading in that it presupposes that a single theory can explain all examples of state terror. In another sense, the theory is partially misplaced, since it does not attempt to locate and explain *particular* types of family resemblances within the larger category of state-imposed violence. Nor does it indicate whether the four general conditions specified in the model are, singly or in some combination, necessary or sufficient conditions for state terror (repression, genocide). Further, the model offers few hints about the relations between repression, terror, and genocide. Are these different in kind, locations on a continuum, or causal sequences? Is it the case that all states that resort to terror also commit genocide? If they do not, what has prevented them from doing so? Lack of opportunity, external pressure, the effectiveness of terror itself? Unfortunately, these issues are not addressed by the editors. Nor do they attempt to draw upon their analysis of the causes of state repression and terror to suggest ways to prevent the states selective and mass violence against its own population.

The thoughtful essays in *Genocide Watch* by experts in a variety of fields address a number of issues related to the prevention of genocide. None of the contributors has any illusion about moral considerations' prevailing in the calculations of governments either to commit or to deter genocide. Rather, they call for systematic campaigns by nongovernmental human rights organizations to expose genocidal acts and build a constituency that will pressure governments and international organizations to take steps against perpetrator states. They also call attention to the costs of genocide in terms of international and regional stability and security, underdevelopment, aid for refugees, and famine relief. Fein points out that for governments to ignore genocidal acts tells the perpetrators that they can get away with it and details the relocations, massacres, and gassings of the Kurds in Iraq as an example of how the process works.

Yet as Leo Kuper notes, since genocide is not a "unified phenomenon," the possibilities for prevention differ with the "annihilatory contexts" (p. 157–58). In any case, action that is likely to be successful must come in the early stages of persecution.

In this light, several of the essays focus on how to detect genocide, (distinguishing it from, say, civil war or isolated killings as reprisals) and on how medical, demographic, and testimonial information from refugees can help alert us to what is taking place. The press has a major role to play here; but too often, it has—through perceptual bias, fear of offending a government, and

distrust of accounts of refugees—ignored, distorted, or only briefly covered major genocides, including Cambodia, the Stalin terror–famine in Ukraine, and Burundi in 1972. Fein reports the argument of Richard Cohen, the columnist for the *Washington Post*, that the press and public will take genocide seriously only if the victims are viewed as innocent, there is an American constituency to support and publicize their cause, and the United States is perceived as having considerable leverage.

The essays identify two other problems that affect the possibility of preventing genocide. One is the need for coordination of the various elements in a constituency for protection against genocide. Although this is a persistent weakness among human rights groups, the report in *Genocide Watch* on the campaign to deter Iran from genocide against the Bahá'ís indicates that fruitful cooperation is possible. The other is that of the bystander who looks on and does nothing. Ervin Staub, in his sensitive and thoughtful study, examines the nature and causes of uninvolvement on the part of the many but argues on empirical grounds that it is possible to transform bystanders into more active, responsible citizens.

Genocide Watch is an insightful and practical guide to the prevention of genocide. Surprisingly, however, only a paragraph is devoted to indigenous peoples, groups that are under constant threat of genocidal attacks. Nevertheless, this is a sobering book, one that should be widely read, and then acted upon.

College of William and Mary ROGER W. SMITH

The Revenge of History: Marxism and the East European Revolutions. By Alex Callinicos. University Park: Pennsylvania State University Press, 1991. 159p. $28.50 cloth, $13.95 paper.

The Left Unraveled: Social Democracy and the New Left Challenge in Britain and West Germany. By Thomas A. Koelble. Durham: Duke University Press, 1991. 162p. $34.95.

These books have little in common beyond an interest in the fate of contemporary socialism. While proclaiming the triumph of Western liberalism as premature, Callinicos' book is a plea to take advantage of the "great opportunity" provided by the Eastern European revolutions for the revival of the Marxist tradition that includes Lenin, Trotsky, and the Left Opposition since that tradition is now freed from its Stalinist incubus and betrayals. For Callinicos, European social democracy does not differ significantly from the conservatism of Reagan and Thatcher, whose liberal economic institutions are still subject to the "deep crises of profitability" foreseen by Marx.

While Callinicos sees the death of Stalinism as an opportunity to revive the spirit of Lenin and Trotsky, Koelble, conceding that the European social democracies are perhaps not too different from their conservative rivals, argues that labor parties are healthy insofar as they have rid themselves of most variants of socialism—Bolshevik or otherwise. Indeed this interesting and careful comparison of the New Left challenge of the 1970s in the British Labour party and in the German Social Democratic party (SPD) shows that any successes they may enjoy are partly due to the triumph of the forces of the "social democratic" Right, as against the socialist Left. Koelble's study indicates that such a strategy has enabled most European labor parties to retain their electoral strength and concludes that social democracy is not the end of the road but is "currently the only viable alternative to the conservative project" (p. 130). This adaptive process is one piece of evidence used by Koelble to show that the elites of the European labor parties are responsive to public opinion, that they disprove Michels's theory of oligarchy, and that the parties and their elites have lost ground by either ignoring new constituencies, like the ecology movements, or taken the old ones (especially the unions) for granted.

While, for Koelble, the overall story of these parties is one of a systematic scrapping of the doctrines of nationalization and workplace democracy and a concentration on softening the harder edges of a market economy, Callinicos scorns theories of market socialism and makes a plea for doing away with the party system as we know it. He envisions a revived system of soviets, a system of workplace democracy that should replace the representative institutions of liberalism, of which the party system is an integral part. Noting the frequency with which soviets have appeared in many of the modern European revolutions, Callinicos argues, quoting Lenin, that such a system is not utopian, "is not anyone's invention," but, rather, "*grows* out of the proletarian class struggle as that struggle becomes more widespread and intense" (p. 111). Callinicos is hardly the first theorist to have observed this phenomenon. While he extols the soviets for their "tendency to break down the distance between economics and politics," Arendt's *On Revolution* (1963), a far more extensive and tragic history (to which Callinicos never refers), sees this breakdown as the basis of the soviets' failure once the necessities of economic housekeeping—better done by bureaucracies—replaces the realm of political freedom in the soviets. Callinicos fails to tell us the conditions under which soviets will arise spontaneously at the turn of the century. He quite effectively condemns the complacency of liberalism and the shortcomings of Keynesianism and predicts that Poland and Hungary will fail to integrate with Western economies and, instead, come to resemble Argentina or Brazil. But since strong soviets have not arisen in Mexico, it is quite another matter to hope or predict that soviets will spontaneously arise in Eastern Europe, not to speak of Western welfare states dominated by citizenries of suburban small property holders.

Why should Callinicos pick fights with social democracy by condemning attempts by Nove, Miller, and others to formulate a "market socialism" (pp. 95) when he himself notes his hero Trotsky's support for the NEP, which was characterized by "various combinations of socialist planning and market mechanisms" (p. 120)? To argue, as Callinicos does, that the forces of history necessitated such "transitional" compromises as a strategy for survival is only to concede the prudence of the European labor parties in making similar political calculations.

Finally, if the history of Western working-class organizations is at all instructive, Callinicos' vision of a relatively decentralized system of soviets and trade unions would be as likely as not to accept market forces and be less concerned to use the power of the state to "force" history. Lenin's condemnation of syndicalism, "tailism," and economism affirms this tendency. It is perhaps significant that the author refers disparagingly to the Stalinist "vanguard" (p. 17), while never linking

this term to Lenin or explaining to us adequately why it was Lenin, not Stalin, who was the first to undermine the power of the soviets. Even if soviets were to develop, Callinicos cannot tell us why workers would not be betrayed once again by the state or by an elite of Marxist intellectuals. Whatever Lenin's view, Callinicos' own vision of a soviet future remains utopian.

Koelble's account of the economism of British and West German trade union politics highlights the clash between working-class economism and socialist theory. As Koelble points out, the predominance of British trade unions through a system of bloc membership and voting constituted a large part of the basis of the triumph of social democracy in the postwar Labour party. It was only by ignoring union interests during periods of economic crises and necessary wage constraints, especially by the second Wilson government, that a critical number of unions came to support the New Left calls for controls on the autonomy of the parliamentary party. Since 1983, however, the unions have consistently rejected party executive candidates associated with the New Left and supported the social democratic policies of Neil Kinnock.

The case of the German Social Democratic party is in some respects even more telling. Although by law trade unions are politically neutral and membership in the SPD is individual, the unions, in what can only be called a triumph of economism, rejected ecologist calls for limits on building, on the grounds that they would be harmful to full employment. They regarded the new leftists as cranks and nuisances; and, as Koelble notes, the social democratic countermobilization against them "depended quite frequently on the mobilization of trade union supporters" (p. 92). It is certainly true that much of the thinking in the New Left of both parties cannot be assimilated to the various proletarian ideologies either of old Marxism or of the Western labor movements. Indeed, what are the prospects for a revival of classical Marxism when to one observer, the students and intellectuals of the Left-dominated Young Socialists "wanted to represent the workers but could not understand their language" or, worse, when workers could not understand Young Socialist jargon?

Koelble emphasizes the sometimes agonizing strategic and organizational choices confronting the two parties in the last generation when confronted with the changing constituencies of the various party tendencies and how they dealt with the successionist movements—the Greens on the SPD Left and the Social Democrats on the Labour Right. He addresses the question of why the two parties reacted to circumstances in different ways in regard to coalition building and in regard to responses to very different external events, especially economic conditions. It is a very worthwhile, readable, and valuable study in the best tradition of political science.

Yet we are led to ask whether the work stands as an adequate refutation of Michels's iron law, because the parties responded to outside pressures and to internal bargaining from multiple elites. Michels's (1949) *Political Parties* stipulates that only when elites remain united are they "always victorious" but that when the dominant classes "struck by blindness pursue a policy that strains relationships to the breaking point," the party masses overthrow the party oligarchies (pp. 167, 172). Koelble himself succeeds in showing how Labour blindly ignored shop stewards who precipitated the trade union revolt of the 1970s. By his own account, the party's partial revival is due in part to a ousting of the New Left and the revival of the old PLP–trade union alliance. A similar general conclusion could be drawn from Koelble's account of the SPD, which successfully resisted, through tactics that would have made Machiavelli blush, a New Left takeover (similar to that experienced by the Labour party). In both cases, we are reminded that the more things change, the more they remain the same.

University of California, Riverside JOHN L. STANLEY

Driving a Bargain: Automobile Industrialization and Japanese Firms in Southeast Asia. By Richard F. Doner. Berkeley: University of California Press, 1991. 371p. $39.95.

The role of transnational corporations in Third World economic development is a highly controversial subject, albeit one whose terms of debate are at least coming into sharper focus. Until the early 1980s, there was primarily a "dialogue of the deaf" between modernization theory, which stressed development through laissez-faire economics in which transnational corporations played a key role, and dependency theory, which viewed transnational corporations as the leading actors in perpetuating the "underdevelopment" of the Third World through the exploitative relationships of world capitalism. Since then, the debate has become more nuanced with the realization that significant industrialization in the developing world is possible for both economic and political reasons. Economically, the operation of the "international product cycle" pushes the manufacture of labor-intensive and standardized goods into nations with an abundance of cheap labor. Politically, "strong and autonomous" states in the Third World have been able to exert countervailing power against transnational corporations and thereby to harness their economic activities to domestic development projects.

In *Driving a Bargain*, Richard Doner makes a major contribution to this controversy by presenting a theoretically centered case study of the automobile industry in four Association of Southeast Asian Nations (ASEAN) countries: Indonesia, Malaysia, the Philippines, and Thailand. These ASEAN nations form an excellent basis for a case study of transnation corporate economic power in the "periphery." With the exception of the Philippines, they have had dynamic economies based on export-led drives in the last several decades and have, at least potentially, substantial domestic markets. Transnational corporations, especially Japanese ones, have entered their markets in force. Their governments have shown keen interest in promoting policies of economic nationalism and industrialization. They occupy a distinct niche in the global political economy, trying to follow Japan and the East Asian "gang of four" (Hong Kong, Singapore, South Korea, and Taiwan) up the international product cycle. In respect to the automobile industry, all have had considerable assembly operations generally dominated by Japanese transnational corporations and some automobile parts industries in which local businesses have played a stronger role; and all tried to upgrade their automobile industries by promoting greater local content, industry rationalization, exports, and the role of domestic capital. All experienced some success but fell far short of their stated goals. However, very considerable differences emerged among the indig-

enous automobile industries in these four nations. Thailand's was clearly the most successful, and the Philippines', the least successful, while Malaysia's and Indonesia's occupied an intermediate position.

Doner presents detailed histories of the evolution of the automobile industry in each country, focusing upon such factors as the mix of local and foreign ownership, the differences between the components and assembly industries, the strategies of transnational corporations (especially their efforts to impede "indigenization"), the political strategies and conflicts of local business interests, regime ties to local and foreign capital, and state policy toward the automobile industry. On the basis of these four case studies, Doner challenges two dominant theoretical conclusions about the transnational corporate role in the developing world: (1) that transnational corporate "structural power" in terms of economic resources and almost inevitable alliances with groups in the host country greatly biases bargaining in their favor; and (2) that states that are strong and autonomous from their societies offer the best opportunity for counteracting transnational corporate structural power.

Rather, Doner advocates a "product cycle" approach. The international product cycle, according to this perspective, produces oligopolistic competition among transnational corporations and the diffusion of technologies that provide opportunities for Third World industrialization and the upgrading of production. The considerable differences among the automobile industries of the seemingly similarly situated ASEAN nations, then, demonstrate that these opportunities are certainly not equally utilized. Doner argues that neither national resource possession nor state characteristics (autonomy and nationalistic policies) explain these variations. Instead, the nature of "growth coalitions" between domestic capital and the state appears to be the key factor in promoting indigenous industrialization. Local businesses provide an insider's knowledge of the industry and a technological sophistication that state technocrats do not possess but that are essential in bargaining with transnational corporations. Conversely, state power is necessary to help local capital expand and pursue its goals vis-à-vis the transnational corporations. Thus, growth coalitions based on "reciprocal consent" between the state and domestic business community are necessary to create the economic and governmental flexibility and strength prerequisite to climbing the international product cycle.

Driving a Bargain, therefore, makes an important contribution to the analysis of the political economy of development by strongly indicating the need to move beyond simplistic images. Regime–society relations emerge as the driving force in development, but they work in complex ways and causal chains. Doner demonstrates convincingly that regime–society relations differ dramatically among even generally authoritarian regimes and that what is important for developmental dynamics is the nature, not the absence, of these links. Thus, political and economic factors are inextricably interwoven, and "development" is an ongoing game of pursuing economic and political self-interest within this matrix. Doner's sophisticated and sensitive relating of case histories to theoretical concerns sets a high standard for understanding this truly political economy of development.

Auburn University CAL CLARK

The Military Revolution and Political Change: Origins of Democracy and Autocracy in Early Modern Europe. By Brian M. Downing. Princeton: Princeton University Press, 1992. 308p. $35.00.

A quarter of a century after European state formation reemerged as a central concern of macroanalysts in both sociology and political science, the controversy goes on. This is no gentle disputation among antiquarians but, rather, a hegemonic struggle among ambitious theorists over the interpretation of our own times. Launched by Barrington Moore, Jr. (*Social Origins of Dictatorship and Democracy*, 1966) as a critique of then-reigning modernization theory, the materialist explanation of regime variation itself stimulated a reaffirmation of the primacy of culture as a determinant of political development (e.g., Bendix's *Kings or People*, 1978). But both sides shared an egregious theoretical flaw, identified as long ago as 1902 by Otto Hintze: because state formation in Europe took place concurrently among many states, interactions among them generated processes that shaped the development of each. Any theory contending that "a people's constitution is in effect shaped by its social structure" was therefore incomplete; and he proposed, as an alternative starting point, the notion that the peculiar character of a given state is "co-determined by its relation to its surroundings" (*The Historical Essays of Otto Hintze* [1975], p. 159). The problem was to ascertain "whether the cases of which this is true are isolated and exceptional, or whether they can be organized in groups and presented as evidence of a typical regular pattern" (p. 160, n. 24).

The theoretical task Hintze delineated is still with us. Although the twentieth century provided plenty of grist for his theoretical mill, by and large, the social sciences remained stubbornly "internalist." In our own discipline, Harold Lasswell's seminal notion of the "garrison state," formulated on the eve of World War II as a "developmental construct" very much in keeping with Hintze's approach, was never incorporated into mainstream theory. However, the internalist hegemony began to wane in the 1970s as a result of two quite disparate challenges. One was "dependency," which argued that a country's economic structures were determined in large part by processes generated at the level of the international political economy. The other stemmed from a congeries of scholars who emphasized war—and strategic interaction among states, more generally—as a major determinant of state formation. Coinciding in time with the exhumation of Hintze, the major work in the latter category was Charles Tilly's compendium, *The Formation of National States in Western Europe* (1975), including not only the editor's own well-known introductory essay but also Samuel Finer's more ambitious attempt to conceptualize military-induced mobilization of human and fiscal resources as a variable and to explore the political consequences of this variation.

Although, in the intervening period, analysis of the war factor has been further elaborated by Tilly and a number of others, Brian Downing lifts us beyond the exploratory phase to a more mature theoretical plane by setting forth a proto-theory of how it contributed to the determination of fundamentally different political outcomes. Although he ignores Finer's contribution, his conceptualization of the factor in terms of resource mobilization is quite similar. But whereas Finer overly elaborated the manifold aspects of the process to the

point of producing a jumble from which it is difficult to extract workable hypotheses, Downing adopts the opposite strategy of drastic simplification for purposes of theory construction. However, unlike many other practitioners of comparative historical analysis, he is clearly aware that it *is* an oversimplification and accordingly goes on to examine the historical circumstances that round out the case. The result is an eminently satisfying marriage of theory and history that makes this book as important from a methodological perspective as from a theoretical and substantive one.

Downing's theoretical objectives are highly ambitious. As indicated in his subtitle, he purports to provide nothing less than an explanation of the "origins of democracy and autocracy." His target is clearly Barrington Moore himself and thereby (as for Hintze in 1902) dialectical materialism in its classic form: "I shall argue that constitutional arrangements predating modernization and military dangers in the newly forming state system were at least as important as agrarian relations in determining political outcomes in Western Europe" (p. 9). Remarkably, the contender has obtained from the champion an acknowledgement of his victory by way of a cover testimonial saying, "This book takes a big step beyond my *Social Origins of Dictatorship and Democracy*."

The first element of Downing's theory refers not to the war factor proper but, rather, to medieval constitutionalism as a baseline condition for the emergence of liberal democracy in Europe. This proposition can hardly be gainsaid, but one must take issue with his insistence that the determinative role of constitutionalism "has been largely ignored by almost all modern social scientists" (p. 5). While Downing himself excepts Randall Collins, Samuel Huntington, and Gianfranco Poggi from the charge of ignorance, many others come to mind, including the late Stein Rokkan; Reinhard Bendix; in the Marxist camp, Barrington Moore himself, who drew from Weber the importance of medieval cities and the bourgeoisie; and Perry Anderson, who emphasized the "detotalization of sovereignty" as a characteristic feature of the West. To these should be added just about everyone writing on the political development of the relevant countries (e.g., the contributors to Raymond Grew's *Crises of Political Development in Europe and the United States*, 1978). Has Magna Carta disappeared from textbooks on British politics?

Downing then proceeds by way of a sort of multivariate analysis, somewhat along the lines attempted by Rokkan, but with a sharper focus on one critical period (the seventeenth century) and six major cases (Brandenburg–Prussia, France, Poland, England, Sweden, and the Dutch Republic). Medieval constitutionalism, as well as the military mobilization factor are treated largely as dichotomous variables, strong or weak. The stronger the constitutionalism, the better its chances of surviving, at least in part; the military mobilization pressures unleashed in the seventeenth century (France and Sweden, as against Prussia). Conversely, constitutionalism's chances of survival are much better if the pressures on it are weak (England) than strong (France). It goes without saying that where medieval constitutionalism is extremely weak or altogether absent (as in Spain, Prussia, and Russia), prospects for the emergence of liberal democracy are practically nil.

But, as noted, Downing shuns reductionism and allows that a number of factors may intervene to break the nexus between war and the destruction of constitutionalism. They include the possibility of mobilizing foreign, rather than domestic, resources (Sweden); lightening of the load by way of alliances (the Netherlands in their war against Spain); the advantages of advanced economy and commercial wealth, if it is in the hands of the merchants (as in Venice or the Netherlands); and, finally, geography and natural topographical features (Switzerland, England, and the Netherlands are easier to defend than France). While there is no gainsaying the significance of these factors, they are brought in on an ad hoc basis and hence lack theoretical import. Although Downing adumbrates possible patterns (e.g., commercial–maritime states are more likely to engage in alliances), he shies from a more systematic account.

Although Downing's framework does not produce startling revelations, it enables him to construct a coherent, theoretically grounded narrative that covers most of the relevant universe and respects historical accounts. This is a major achievement, which points the way to the next theoretical step, namely, an articulation of state formation with the dynamics of the international system of states into a comprehensive body of theory. That is no mean task, not only because weighty configurational elements such as geopolitics are inherently difficult to model but because of interactivity. The war factor is shaped not merely by a given state's responses to exogenous events but also by its own activities at the international level; and these are themselves determined in good part by the general character of the regime. Spain, after all, *chose* to carry out a protracted war against the Netherlands, and Louis XIV *chose* to strive for European hegemony in the late seventeenth century. Were not these projects and the resulting load they imposed on the societies in question a *consequence* of absolutism?

New School for Social Research ARISTIDE R. ZOLBERG

The Struggle for Democracy in Chile, 1982–1990. Edited by Paul W. Drake and Iván Jaksic. Lincoln: University of Nebraska Press, 1992. 321p. $45.00 cloth, $19.95 paper.

Political Structures and Democracy in Uruguay. By Luis E. González. Notre Dame: University of Notre Dame Press, 1992. 224p. $26.95.

These two books make an important contribution to the literature on democratization by focusing on the two countries with the strongest democratic traditions in Latin America prior to their 1973 coups. They are concerned, however, with two different questions. The book edited by Drake and Jaksic focuses on the problem of transitions from authoritarian rule, while González's book is primarily about the prospects of democratic consolidation in Uruguay since 1985. In spite of this difference, there is an interesting convergence between the theoretical approach advanced in both books.

The Struggle for Democracy in Chile, 1982–1990 picks up the story of Pinochet's Chile where J. Samuel Valenzuela and Arturo Valenzuela's edited volume *Military Rule in Chile* (1986) left off. It consists of 10 articles, written by an outstanding international group of country specialists, that concentrate on the changes both within the authoritarian regime and in society in the wake of the first serious demonstrations against the Pinochet-led regime

in 1983. The accounts go through the inauguration of a democratic administration in March 1990. The introduction by the editors outlines in broad strokes the transformations between 1982 and 1990. A superb article by Arturo Valenzuela describes the institutional structure of the regime, highlighting the personalistic control exercised by Pinochet. Varas's essay, focusing on tensions within the regime, supplements this account. Two more essays round out the study of the authoritarian regime. Campero's focuses on the role of a firm group of supporters of the regime, that is, the entrepreneurs. Silva's focuses on the government's response to the 1981–83 economic crisis. The next set of three essays studies different aspects of the opposition to Pinochet, including the role of women (María Valenzuela), trade unions (Angell), and political parties (Garretón). The volume closes with a look at external factors (Portales) and the economic legacies inherited by the new democratic government (Larráin).

In *Political Structures and Democracy in Uruguay*, González, a Yale-trained Uruguayan political scientist, provides an analysis of the effects of politicostructural factors on democratic stability. He briefly describes the historical evolution of the party system and the executive branch and explains the 1933 and 1973 breakdowns of democracy. Thereafter, the bulk of the book analyzes the prospects of democratic consolidation in the new democracy restored in 1985. Central to the elaboration of this analysis are two surveys, which constitute the book's main empirical contribution. One is a 1985 public opinion survey, the other, a 1986 survey of legislators, which allows González to describe the complex nature of party factions and the attitudes of political elites. The book's central argument is that the 1973 breakdown was influenced by the political structures that had been in place for over a half a century, namely, by the fractionalization of the major parties and the "quasi-presidential" system. Concerning the prospects of democratic stability after the 1984 election, which brought an end to military rule, González argues that the factors leading to the 1973 breakdown have, for the most part, remained in place through 1990. Because the 1984 election saw a true restoration of the party system, there was a resurgence of many of the problems that facilitated the 1973 coup. The analysis, in short, leads to a negative reading of Uruguay's democratic future.

Theoretically, these two books exemplify what could be called a "political-institutional" approach to politics. The need to stress purely political factors is most explicitly elaborated in González' book, which resembles Arturo Valenzuela's *Breakdown of Democratic Regimes: Chile* (1978) in advancing a classically Linzian analysis through a case study on democratic stability. The nature of the electoral system and the party system, along with the nature of the executive power, are thus viewed as political structures that actors strategize in and that have a crucial impact on the viability of democracy. Furthermore, searching for a solution for Uruguay's uncertain democracy, González presents an argument similar to Linz's concerning the problematic effects of presidential systems from the perspective of democratic stability. The best remedy, in short, is seen as a shift to a parliamentary system. The problem, then, is that the necessary institutional changes face impressive obstacles. The issue of democratic agency, thus, is seen as going beyond the commonsense notion that political actors do things that undermine democracies, to include the broader question of how to transform political structures in such a way that they should ensure the apparently contradictory goal of democratic stability. The democratic challenge is to shape a political arrangement that allows and invites political participation while securing its stability against corrupting tendencies. In focusing on the actions of political elites and considering the strategic options they face, the book's conclusions are quite pessimistic in the end.

González's contribution, in short, is to have provided a detailed study of an understudied case and framed it in terms of the ongoing debate among comparativists, spearheaded by Linz and Lijphart, on the political institutions of democracy. The book's main shortcoming is that the explicit focus on political elites is not balanced through the study of actors in civil society. As in much of the "political-institutional" literature, questions about the type of linkage between political parties and social actors (e.g., business, labor, and various social movements) are never addressed. An issue as basic to democratic theory as whether there are actors with well-defined interests that can then be represented, therefore, simply does not emerge.

If González's main concern is with democratic stability, the volume edited by Drake and Jaksic focuses on the other side of the democratic question. Rather than considering how to stabilize a new democracy, they study the antecedent process of moving away from authoritarian rule. Their concern is thus with factors that lead to the destabilization and removal of an authoritarian regime. Along the lines of O'Donnell and Schmitter's classic *Transitions from Authoritarian Rule* (1986), this book shows that in transitional periods, actors seem to enjoy a greater scope for choice than in periods of "normal" politics. Also consistent with most of the transitions literature, the number and type of actors considered in Drake and Jaksic's book suggests that in fluctuating scenarios, a broad range of actors engage in political action. The plurality of actors, nonetheless, converge into neatly divided camps, which imprint, to a greater extent than in democratic systems, a peculiar state–opposition dialectic upon the process of transition.

In contrast to O'Donnell and Schmitter, however, action and reaction are viewed as framed by institutional factors or political structures. Thus, in a manner consistent with González' approach, Arturo Valenzuela and Garretón, in particular, among the contributors, show how the strategies of various actors cannot be understood outside of the institutional characteristics of the regime. It follows from this that transitions are in part determined by the peculiar institutional features of the preceding authoritarian regime. Again contra O'Donnell and Schmitter, who sought to find the common elements shared by all transitions, this approach leads to a highlighting of variations in the process of transition. This emphasis on strategic actors operating within political structures, in short, contributes to a key aim of comparativists, namely, to distinguish between different "modes of transition." The next question in comparative analysis, however—the possible links between variations in the transitional process and the problems and prospects of democratic consolidation—is beyond the scope of the Drake and Jaksic volume. The research of this question, moreover, would necessitate a move beyond these two works. It would require an explicitly comparative study, and it would demand consideration of cases both in their phase of transition from authori-

tarian rule and as new democracies. These two books, nonetheless, are essential readings for the advancement of such a research agenda.

University of Illinois, Urbana–Champaign GERARDO L. MUNCK

Revolutions of the Late Twentieth Century. Edited by Jack A. Goldstone, Ted Robert Gurr, and Farrokh Moshiri. Boulder: Westview, 1992. 395p. $55.00 cloth, $19.95 paper.

Autocracy, Modernization, and Revolution in Russia and Iran. By Tim McDaniel. Princeton: Princeton University Press, 1991. 239p. $29.95.

Under the impact of the world's enormously varied violent transfers of state power since 1945, political analysts are finally relinquishing an old illusion, namely, that revolutions are singular phenomena for which it is possible to state a single invariant set of necessary conditions, sufficient conditions, and internal sequences. As with the abandonment of many old, cherished beliefs, the new apostates are not always aware of how heterodox they have become; and those who do know often only whisper their unbelief. So it is with Tim McDaniel, Jack Goldstone, Ted Gurr, and Farrokh Moshiri. They broadcast many other messages but mute their apostasy. In vivifying a view of revolution as contingent and various, they have nevertheless mortified the classic sociology of revolution.

At first glance, Tim McDaniel looks like one of the old believers, arguing (as he does) the common properties of revolutionary processes in Russia and Iran. In earlier work, he presented the Russian Revolution as an outcome of contradictions between state-initiated capitalist industrialization and the maintenance of czarist autocracy. Now he claims that the revolutions of 1917 and of 1979 both originated in autocratic modernization, a path to the modern world Barrington Moore's "conservative modernization" did not quite capture. Unlike Germany's Junker-based authoritarianism, says McDaniel, the prerevolutionary Russian–Iranian drive toward industrial prosperity rested on the arbitrary intervention of a divinely sanctioned or self-sanctioned ruler in a country's economic affairs. Thus, the conditions for revolution in those two countries differed deeply from those that prevailed in other kinds of states, where either old elites or the new classes formed by capitalism made their weight felt.

In a dualism resembling Samuel Huntington's portrayal of Western revolutions, that intervention simultaneously undermined the old bases of stability and inhibited the creation of new ones. Autocratic modernization hollowed out society, leaving a space into which disorder rushed. To present this view, McDaniel makes an unfortunate choice, writing a series of essays to emphasize differences and (chiefly) similarities between Russia and Iran, rather than providing two separate sketches, each linked internally by a coherent causal analysis. The result is a provocative set of comparisons, rather than a compelling parallel analysis of revolutionary processes.

In order to make his analysis plausible, McDaniel offers some dubious historical judgments. He greatly exaggerates, for example, the "hallowed tradition" and "divine sanction" of Russian autocracy, forgetting that 14 serious pretenders gained popular support during the seventeenth century, that great families attempted to place their own kinsmen on the throne repeatedly when a disputable succession or a weak ruler arrived, and that a half-dozen czars died at the hands of assassins. In the case of Iran, he minimizes the importance of *bazaaris* and mullahs as connected social elites before and during the revolution of 1979, treating the bazaar's tightly linked merchants as residues of the past, rather than constituents of modern Iranian social life.

McDaniel likewise shows surprising indifference to geopolitical, fiscal, and military effects, to which the works of Theda Skocpol should have sensitized him. On the Russian side, for example, the Russo–Japanese war and World War I disappear as effective causes of revolution. On the Iranian side, we read almost nothing about the shah's close alliance with the United States, except that Jimmy Carter's promotion of human rights made the monarch more vulnerable to claims from dissidents within Iran. Skepticism in these regards does not automatically vitiate an analysis of the Russian or Iranian revolutions. Still, others have made strong enough cases for the importance of such external links in these, and many other, revolutions to warrant the skeptic's ruling them out explicitly, rather than simply ignoring them. Despite the blind spot, McDaniel's interesting version of Alexis de Tocqueville, Emile Durkheim, and Samuel Huntington offers an important challenge to the next round of revolutionary analysts.

When they are speaking most generally, Gurr, Goldstone, Moshiri, and their contributors voice ambivalence about the universality of revolutionary processes. They argue that since 1945 the international situation has changed so much that revolutions occur in different kinds of countries, with different mobilizing claims, and under different circumstances. Yet they also argue that "all revolutions proceed through three phases, beginning with a state crisis, followed by a struggle for power, and efforts by the eventual victors to reconstruct the state. Moreover, no revolutionary crisis occurs until there is a conjunction of three necessary conditions: a crisis in the old state, alienation of a significant segment of the elite, and mass mobilization" (p. 325). The apparent contradiction disappears, however, when we recognize that the universals follow tautologically from the definition of revolution as "the forcible overthrow of a government followed by the reconsolidation of authority by new groups, ruling through new political (and sometimes social) institutions" (p. 37). In fact, the bulk of the Gurr–Goldstone–Moshiri book faithfully documents the diversity of revolutionary conditions, processes, and outcomes in the contemporary world, as well as their difference from revolutions of the past.

The compendium of cases will serve students of twentieth-century revolutions well: Vietnam (H. John LeVan), Nicaragua (Dévora Grynspan), Iran (Farrokh Moshiri), Poland (Jaroslave Piekalkiewicz), Afghanistan (Anwar-ul-Haq Ahady), the Philippines (Richard J. Kessler), Cambodia (Barbara Harff), Zimbabwe (James R. Scarritt), South Africa (C. R. D. Halisi, Patrick O'Meara, and N. Brian Winchester), the Palestine Liberation Organization and Intifada (Joshua Teitelbaum and Joseph Kostiner). All are reflective, informative, and connected somehow with the Goldstonian scheme presented at the book's outset. Introductory and concluding essays by various combinations of the editors neatly stitch the book and its cases together.

The book disappoints, nevertheless, precisely where

its conceptual preferences should have made it strong, namely, in specifying how the international system changed the conditions affecting revolutions after 1945—for example, the links (however indirect) between the Cold War and the rise of nationalist revolutions. Those links inevitably appear, disguised, in the accounts of individual countries, as in Richard Kessler's treatment of Ferdinand Marcos's connections to Ronald Reagan and George Bush. Jaroslaw Piekalkiewicz' analysis of Poland likewise inevitably takes up Soviet intervention. Yet despite acknowledging that in all cases "international factors have contributed directly or indirectly to state crisis" (p. 331), the Gurr–Goldstone–Moshiri "comparisons and policy implications" deal almost entirely with domestic politics. These authors provide no reasoning that leads to inferences concerning the impact of the Soviet Union's disintegration (or the European Community's integration) on the prospects for revolution in Europe or elsewhere. The theoretical revolution, it seems, has not quite completed its work.

New School for Social Research CHARLES TILLY

Red Vienna: Experiment in Working-Class Culture, 1919–1934. By Helmut Gruber. Oxford: Oxford University Press, 1991. 270p. $29.95.

In this work, Gruber has chosen to study a fascinating experiment in which politics and culture were linked in an effort to create social change. Picking up where Carl Schorske's *Fin-de-Siecle Vienna* (1980) leaves off, the book begins with an insightful description of Vienna as a socialist laboratory—a thriving metropolis ready for social, political, and cultural experiments. Gruber then proceeds to discuss the policies and programs implemented by the socialists between 1919 and 1934. These programs involved everything from reforms in public housing and social services to dramatic attempts at redefinition of family life, community spirit, artistic taste, and use of leisure time. He examines the real accomplishments of these programs, as well as the cultural and political obstacles which ultimately undermined the Viennese experiment.

The core of the book is Gruber's analysis of the Viennese socialist cultural programs. Here he brilliantly discusses the elite culture and cultural theory, the power of the written and spoken word, the attempts to enrich and ennoble the workers' artistic taste, and the inevitible conflicts arising from the desires of the party leaders versus those of their working-class supporters. His interpretation is balanced and insightful, acknowledging that although serious problems existed in the conception and implementation of policies, red Vienna actually was quite successful in implementing several innovative and positive social reforms.

Gruber's book is exhaustively researched and well written. Taking almost five years to complete the manuscript, Gruber has managed to assemble a wealth of material from a variety of sources, including new documentation from Viennese archives and university institutes. Of particular interest is his research regarding women workers. Even though women made up approximately 40% of the labor force at the time, few treatments of this period have dealt with the recruitment of women to the socialist party and the party's attempt to address women's issues as part of their cultural programs. Therefore, Gruber's research and analysis are a very welcome addition to our understanding of this subject.

Overall, this work skillfully integrates political, social, and cultural history. The book represents an important contribution to the study of Austrian social democracy and provides a useful case study for students interested in cultural politics, urban renewal, and social reform.

Hamline University KAREN J. VOGEL

Authority without Power: Law and the Japanese Paradox. By John Owen Haley. New York: Oxford University Press, 1991. 258p. $37.50.

Political Life in Japan: Democracy in a Reversible World. By Takako Kishima. Princeton: Princeton University Press, 1991. 142p. $27.95.

Few studies of Japanese politics have yet penetrated into the mainstream of comparative politics. Too frequently driven by the desire to explain yesterday's headlines using a Japanese terminology completely incomprehensible to non–Japan specialists, most works on Japanese politics remain theoretically barren and therefore, for most comparativists, are consigned to those small compartments of their brains reserved for "exotica." This has begun to change, fortunately, in the area of political economy. There, for at least a decade, both Japan specialists and non–Japan specialists have been engaged in a theoretically rich and highly informative set of exchanges. It remains to be seen whether that experience will be carried forward into other dark corners of Japanese politics; but clearly the burden is on the Japan specialist to create works that become empirically and theoretically indispensable to nonspecialists.

The two books under review endeavor to reach such a wider audience, albeit with varying results. On the surface, they would appear to have little in common aside from the fact that both deal with Japanese politics. Yet essentially, both argue that the surface-level order that seems so pervasive throughout Japan is ultimately quite precarious. Haley, drawing on a range of secondary literature, offers a lengthy, historically rich examination of the development of Japanese law. Japan, he argues, appears to have a centralized state with a high level of authority that enables it to intervene in all areas of life. Yet, in reality, the government's de facto capacity to coerce and compel is remarkably weak (p. 14). Consequently, Japanese governments from prefeudal time to the present have continually been forced to rely on "extralegal, informal mechanisms of social control as a means for maintaining social order with a concomitant transfer of effective control over the rules and norms that govern society to those who are able to manipulate these informal instruments of enforcement" (ibid.). In short, the real power of social control rests with families, villages, firms, and other small social units.

Kishima is also concerned with the power of those below. But in contrast to Haley, she is far more concerned with demonstrating the applicability of poststructuralist theories to Japanese political life than with exploring inherently problematic aspects of the Japanese experience. Drawing heavily on Foucault and the vocabulary of deconstruction, her short book offers mostly firsthand examinations of what she calls "marginal beings and liminal states" in contemporary Japanese politics (p. 22). Doing so, she contends, allows her to

illustrate the "human, non-reified interactions among political players." In practical terms, this translates into an examination of several cases: a parliamentary Finance Committee chairman's subtle and informal human relations massaging of the committee's members; an examination of the "orgiastic atmosphere" of an election campaign headquarters; nonsensical dancing and play acting by politicians at the dinner party; a tearful presentation by former prime minister Nakasone before the ruling Liberal Democratic party's executive board; and portraits of three of that party's officials seen as outside "tricksters," defiant of established political rules. This combination of microstudies, she contends, illustrates how Japanese politics can take on subjective meaning to its participants and, more importantly, how such activities provide a basis for "dynamic, progressive, and irreversible social change" in the country at large (p. 14).

Haley's book is by far the more explicitly comparative. Indeed he uses the comparative method to take direct aim at a number of longstanding cliches about Japan. Perhaps his most important target is the notion that the United States offers some logical comparative standard by which to measure Japan. In law, as in most other areas, he notes, the two countries have far less in common than Japan has with most parliamentary systems of Western Europe. In this context he also makes a good case against the notion that Japanese are culturally nonlitigious. Rather, he shows, the country's limited number of lawyers, judges, and procurators make the Japanese court system one of Japan's least efficient organizations. Why bring a case when it may be a decade before it is decided?

In addition, Japanese crime rates are applaudably low and declining in comparative terms; but little of this, he demonstrates, is the result of tough cops, tight laws, and merciless judges. Instead, almost infinite discretion by police, procurators, and judges is the rule in Japan; and this is aimed at "correction" of criminal behavior, rather than its punishment. Japanese-style correction involves engaging the criminal, the victim, and their respective social organizations (usually family or firm) in the process of creating remorse and restitution by the criminal, which in turn reduces recidivism in Japan to admirably low levels.

Still another major thread in Haley's study involves the demonstration that while their formal powers appear to be great, contemporary Japanese bureaucrats derive most of their formal powers from rules put in place by the U.S. Occupation, not from any Japanese tradition of statism. Moreover, he argues that bureaucrats rarely have the power simply to give orders to the objects of their alleged control: "The formal regulatory powers that Japanese administrations do exercise are . . . notably weaker than those of comparable governmental agencies in other industrial democracies" (p. 159). Instead, he argues (following Richard Samuels), most typically bureaucrats must bargain to ensure compliance with their goals.

Finally, in a very compelling interpretation, Haley contends that the power of Japan's organized crime families reflects the general weakness of authority in Japan, demonstrating instead the importance of autonomy and self-policing by powerful organizations. Ultimately, therefore, he contends that Japanese law "serves as a means for legitimating norms while it remains relatively ineffective as an instrument of coercive control" (p. 200). And the norms (at least in the many marginally legal areas of Japan where organized crime families are influential) are those that favor allowing the criminals to police themselves.

Haley's book is by far the easier of the two to follow in its central argument. With its one central thesis, it musters a series of easily comprehended examples as illustration and thus resonates well with existing standards of social science. The empirical examples in Kishima's book, on the other hand, are more sparse. While generally interesting and informative about the day-to-day human aspects of Japanese politics, most of her examples are presented principally to illustrate a much more ponderous theoretical architecture that in the end remains far from compelling. Delightfully humane instances of human interaction are freighted with the heavy deconstructionist burden of proving far more. Perhaps, for those so inclined, the cases offer major new insights into human self-fulfillment and social change; to others they will be far more valuable as portraits that show in convincing human terms that Japanese politicians are not terribly different from their counterparts in other political venues.

Commitment, or noncommitment, to the deconstructionist paradigm will be the ultimate test of how Kishima's book is received. Poststructuralists will surely find it a fine example of the cross-national applicability of their theory. Doubters are less likely to be convinced. Haley's book, on the other hand, has by far the greater chance to achieve broad appeal, because it engages a series of issues that both are currently very salient to a broad spectrum of scholars and at the same time involve central puzzles that are applicable in any industrialized country. It is in that direction, surely, that the future integration of Japanese studies into comparative politics must lie.

University of Colorado, Boulder T. J. PEMPEL

Behind the Intifada: Labor and Women's Movements in the Occupied Territories. By Joost R. Hiltermann. Princeton: Princeton University Press, 1991. 265p. $29.95.

The Palestinian Uprising: A War by Other Means. By F. Robert Hunter. Berkeley: University of California Press, 1991. 292p. $24.95.

Both of these studies examine the origins and staying power of the Palestinian Uprising that broke out suddenly in December 1987 and continues in various forms today. Both authors contradict two commonly held but mistaken views of the Intifada, namely, that it was a spontaneous outburst of the masses lacking both organization and leadership and that it was the work of local agents of the Palestine Liberation Organization following orders from outside the occupied territories. These explanations assumed that the revolt lacked strong roots in Palestinian society and that it would exhaust itself after an initial burst of unguided fury. Instead, Hiltermann and Hunter persuasively portray the Uprising as the culmination of a decade-long process of association formation and political mobilization that transformed the character of the West Bank (and to a lesser extent the Gaza Strip), despite repeated crackdowns by Israeli military authorities.

Both authors highlight the years of institution building that preceded the Intifada, carefully tracing the

emergence of a diversified network of voluntary groups among workers, students, women, merchants, professionals, civil servants, villagers, Muslims, and Christians. Although these groups did not initiate the uprising, they all joined in quickly providing it with organization, leadership, and coordination. In turn, the Intifada gave many struggling and fragmented groups an infusion of new members and a common set of goals. Before long, the art of association became so closely intertwined with nationalist protest that they were virtually indistinguishable.

Hiltermann and Hunter agree that the growing vigor and resourcefulness of Palestinians' associational life has had far-reaching consequences in and beyond the Occupied Territories. The Uprising was sustained and periodically renewed despite recurrent pronouncements that it had run its course. A whole new tier of "inside" leadership emerged alongside the old guard of the PLO, strengthening Yasser Arafat's claims of preeminence while pushing him toward the more urgent pursuit of a negotiated settlement and a two-state solution. Israeli public opinion was forced to reconsider the costs of continued occupation and the temptations of creeping annexation. American diplomacy was given yet another opportunity to take up the unfinished business of the Camp David accords.

Most important, both writers interpret this florescence of associational activity as convincing proof that Palestinians in the Occupied Territories are capable of representing themselves. Hiltermann and Hunter share remarkably similar views of the historical significance of this change. Their conclusions are nearly identical on four major issues.

First, rapid group development signifies at least the partial resuscitation of civil society in the Palestinian heartland. After experiencing multiple traumas, the sinew and tissue of community have grown back to the point where they can support a stronger awareness of common sentiments and a more complex division of labor. Although neither author uses Durkheimian vocabulary, they furnish vivid descriptions of a society where both "mechanical solidarity" and "organic solidarity" are increasing at the same time.

Second, voluntary groups have become the nucleus of the Intifada and the base of a more powerful national liberation movement. Most groups are allied with one of the competing factions that have fragmented Palestinian politics for decades, particularly with Fatah, the Democratic Front for the Liberation of Palestine, the Popular Front for the Liberation of Palestine, the Communist party, and various Islamic groups. At times, this linkage encouraged the proliferation of weak associations, squabbling over the same limited membership. On the other hand, these same connections also invested interest group leaders with important leverage in fashioning new alliances between the factions. Association leaders in the Occupied Territories not only took up key positions on the steering committee of the Intifada, they also pressured the factions to cooperate with one another on the "inside" and the "outside." The result was a more unified PLO with a wider mass following but also with greater responsiveness to constituencies it formerly took for granted or sought to control.

Third, the group network is frequently described as the blossoming infrastructure of a future Palestinian state. This may be the boldest and most debatable conclusion of both books. It is one thing to argue that the "institutionalization" of the Uprising symbolizes a maturation of Palestinian society and a deepening of its nationalist consciousness. It is quite another thing to suggest that these organizations comprise a state-in-the-making.

Hiltermann and Hunter leave little doubt that the people of the Occupied Territories have cultivated the art of association well enough to represent themselves in several arenas at the same time—locally, regionally, and internationally. Indeed, their achievements have far surpassed the expectations of the PLO and Arab patrons who financed community organizations with every confidence that they would serve their sponsors' interests more than their own. Nevertheless, the authors engage in wishful thinking when they suggest that a vigorous associational life is a way station on the road to an independent state. Yet even this exaggeration has merit if it alerts us to the possibility that a Palestinian state might be politically pluralistic and competitive and thus not easily manipulated by either its leaders or its neighbors.

Fourth, both writers agree that the Intifada is not a social revolution within the Palestinian community. Rather, they note that pressures to sustain a united front during the uprising have postponed demands for social justice accumulating for years among workers, women, youths, and the poor. Hiltermann is much more critical and partisan than Hunter on this issue. Hiltermann frequently disparages the conservatism of Fatah and the "bigotry" of Islamic groups while praising the progressivism of the PLO leftists and the communists. He is concerned that the uprising may actually reinforce some of the most repressive aspects of Palestinian culture. Hunter, on the other hand, notes a more benign desire to preserve a wide range of popular traditions, including customary law, arts, and religion. Hunter gives an informed and subtle account of the contribution of the Islamic movement to the Intifada that is refreshingly free of the usual polemics and stereotypes.

Both books are valuable supplements to earlier studies of West Bank and Gaza politics by writers such as Emile Sahliyeh and Ann Lesch, who focused more on elites and officeholders than on associations. Hiltermann is a sociologist who concentrates on the details of the labor and women's movements whereas Hunter is a historian who tries to situate social change in grand contexts, temporal and international. Neither study contains much in the way of social theory. Both are highly readable, mainly journalistic accounts that wisely allow many interviewed participants to speak for themselves. Hiltermann's voices are mostly left-wing organizers, whereas Hunter's are mostly fellow university professors and intellectuals. I strongly recommend listening to both choruses.

University of Chicago ROBERT BIANCHI

The Political Economy of National Security: A Global Perspective. By Ethan Barnaby Kapstein. Columbia: University of South Carolina Press, 1991. 252p. $39.95.
The Political Economy of Defense: Issues and Perspectives. Edited by Andrew L. Ross. Westport, CT: Greenwood Press, 1991. 240p. $47.95.

The combination of the Reagan military buildup and its consequences and the ending of the Cold War has inspired a recent burst of publications on the political

economy of national security. *Political economy* is a fashionable term these days and, as such, has become difficult to define. It encompasses quite a broad range of research in both approach and substance. At times, it includes far more than it excludes. Within the broad and somewhat nebulous category of political economy, what is the political economy of national security? To judge from these two volumes, the political economy of defense includes any analysis of the interactive relationship between politics and economics in the area of national security. For Ethan Kapstein, at the core is the fundamental and enduring question of nations' simultaneous pursuit of security and prosperity. According to Andrew Ross, who edited *The Political Economy of Defense*, it encompasses three areas of research: "(1) the political dimensions of economic actions in the defense realm; (2) the economic dimensions of political actions in the defense realm; and (3) the security dimensions of political economic actions" (p. 8). Despite the apparent parity among the three dimensions, the fundamental and dominant concerns are largely economic, including the economic consequences of defense spending, the economics of international arms trade, defense industries, fiscal constraints, and defense planning.

These two books share more than an emphasis on political economy. Both volumes are comparative and international in approach. The Kapstein text explicitly argues that the political economy of national security can only be understood as an interaction of national and international forces and that this is increasingly the case in an interdependent world economy. It also uses comparative cases throughout, from both developed and developing countries. The chapters in the Ross volume, while sometimes focused on one country, tend toward comparative and international analysis, as well.

While the books begin from common concerns and subject matter, they diverge in their merit as scholarship and in their utility for the classroom; that is, the Kapstein volume is a relatively succinct textbook, while the Ross volume is an edited reader, and each enjoys the benefits and drawbacks of their respective formats. The Kapstein book is comprehensive in scope but of rather shallow depth. The Ross volume has sufficient depth in many chapters but is like many other edited volumes a somewhat eclectic selection of topics and contrasting approaches.

As a textbook, the Kapstein volume is a solid piece of work. It is nearly up to date (the best that can be expected of anything published today in international relations), comprehensive in its coverage, and strengthened by the comparative and international perspective. In good textbook fashion, it touches on most of the major issues on the economic side of national security, including chapters on defense spending, defense industries and procurement, the arms trade, economic relations among military allies, and the effect of a global economy on national security. Most of the discussion is well done and informative. Kapstein's emphasis on the effects of interdependence, including the internationalization of defense production, is especially interesting. But two drawbacks are evident.

First, the breadth of coverage is not matched by sufficient depth. Several of the chapters left me (imagining myself as a student) wanting more—much more in some cases. Only a few of the chapters (e.g., that on the arms trade) seemed to provide enough substance and detail. Good students, I think, will be left unsatisfied. One chapter on mobilization, war, and conversion, for example, was weighted more toward mobilization than conversion, although the latter, I think, is the more controversial and more interesting problem these days.

Second, the author's initial analytic framework and subsequent claims about frameworks are handled somewhat loosely. The introduction offers the obligatory tour of the major paradigms in International Political Economy (liberalism, realism or neomercantilism, and marxism); but there is a lack of clarity about whether students are to use them as explanations of, or prescriptions for, state behavior. Marxism is described as an explanation (it is not, of course, prescriptive). But Kapstein ends the introduction by saying the best policy prescription is a combination of liberalism and realism. From there on, the IPE trinity is not used systematically. And much of what Kapstein talks about does not necessarily fit those models anyway—such as weapons procurement and defense spending, where national politics and bureaucratic forces are important. This makes the IPE models look rather obligatory and pro forma. Kapstein's claim that he wants to provide a framework for analysis in each chapter only underscores this problem. Frameworks rarely emerge clearly (the chapter on alliances is an exception). Most of the time, one has been given a good introduction to the topic and provided with some concepts and examples.

The Ross volume seeks to transcend the traditionally segregated political and economic approaches to the study of national defense. In his introduction, Ross makes a tentative case for the *political economy of defense* as a nascent and potentially coherent subfield; but this attempt seems strained. Just as political economy is a collection of theoretical approaches and substantive concerns, so is the political economy of defense. Consequently, the merit of the volume is in the individual chapters, not in its effort to define an emerging endeavor. As the title and author note, it is an assemblage of issues and perspectives. Moreover, the kind of work in the Ross book has been going on for quite some time. Somewhat uneven in their quality, most of the chapters are interesting and informative; yet all in all, they offer no surprises or innovative approaches and insights. Most of the findings are familiar or self-consciously inconclusive.

Although the editor argues that the political economy of defense transcends a narrow focus on the economic consequences of military spending, 5 of the 10 chapters address that problem directly; and it is an indirect concern in 1 or 2 others. For example, Steve Chan provides a brief literature review on the relationship between military spending and economic performance; and Daniel Nelson examines the impact of Warsaw Pact defense spending on member nations. Much of this work is substantial and well-done research, such as Judith Reppy's comparative piece on the relationship between military research and development funding and international trade performance and David R. Davis and Steve Chan's longitudinal analysis of security and welfare in Taiwan. The most political analysis is the chapter on electoral cycles and defense spending in Israel, by Alex Mintz and Michael D. Ward. Politics is also important in Glenn Fong's very good chapter on Pentagon–industry collaboration in high technology.

While one doubts that the political economy of defense is more than a broad set of issues and perspectives, that is not an argument against its importance as

an area of research. I do have a concern about the apparent increase in economy-centered research in the area of defense and national security now that the Cold War is ending. My concern is that the strong tilt toward economic analysis and economic issues could crowd out real politics and political analysis of military policy, in much the same way that the dominance of strategic logics (e.g., deterrence theory) in international relations theory tended to preclude the insights of political analysis in our understanding of national security policy during the Cold War.

University of California, Santa Cruz DANIEL WIRLS

From Revolutionary Cadres to Party Technocrats in Socialist China. By Hong Yung Lee. Berkeley: University of California Press, 1991. 437p. $48.50.

Hong Yung Lee's new book is an extremely broad study of "the structure, personnel, and historical formation of the cadre system in China" (p. 1). It covers the entire history of the Chinese Communist party (CCP) from its founding in 1921 to the present although the bulk of the material deals with the post-Mao reform era. An immense amount of data, including 56 tables, are presented on all levels of the Party and state from the highest officials in the land to ordinary cadres and Party members. The substantive issues covered include recruitment patterns, bureaucratic methods of personnel management, the politics of cadre staffing, and speculative argument concerning the characteristics of the political system emerging during the reform period. While readers will undoubtedly find something of interest in this wide-ranging study, it has significant limitations in terms of both empirical accuracy and conceptual clarity.

Although the book's central theme that there has been an elite transformation from "revolutionary cadres" to "Party technocrats" is clearly stated in the title and is, within limits, noncontroversial, it is more difficult to determine its basic argument in terms of how elite composition relates to political outcomes. Perhaps the most representative statement of the author's position is that "the less institutionalized a political system [like China's], the more likely political elites will bring the ideology, experiences, and outlooks of the social classes from which they came into the political process" (p. 387). There are several problems with this which can be seen in Lee's treatment of the revolutionary cadres dominant in the Maoist era. First, Lee ascribes an alleged "continuing rural orientation of the revolutionary elite" after 1949—itself a questionable notion—to the initial recruitment of the ruling elite "largely from poor peasants with a low level of education" (pp. 47, 387). This is simply not so if we regard the "ruling elite" as most concretely represented by the Central Committee elected in 1956. As Donald Klein's work 30 years ago demonstrated, these leaders were far from the bottom of the traditional social scale in their origins and they were quite well educated with substantial numbers having tertiary, and even foreign, training. But perhaps *ruling elite* is meant to refer to the Party as a whole, where the characterization would be more (but hardly fully) adequate. Such an approach is suggested by various assertions that political outlooks, such as the "rural orientation," came not so much from the CCP's top leadership but from the mass membership. For example, Lee argues that "the root of the Maoist ultraleftist tendency should be traced back to the cadre corps. . . . In this sense Mao's peasant mentality represented rather than shaped those of the majority of cadres" (pp. 73–74). But given all we know about the leader-dominated Chinese system, the suggestion that fundamental regime policies largely *reflected* the social characteristics of ordinary CCP members, which were in fact quite different from those of the top leadership, is very hard to credit.

There is, however, more to credit the notion, also advanced by Lee, that much political conflict can be explained by the concept of "situational groups," that is, groups forged by the impact of particular state policies on their members. Here he usefully adopts the well-established distinction among the victims, survivors, and beneficiaries of the Cultural Revolution in explaining developments in both the last days of the Maoist period and the early post-Mao era. But apart from some errors of fact (e.g., the treatment of Chen Yun, perhaps *the* major architect of the reform of the cadre system, as essentially having little to do with it), shortcomings to the approach are reflected in the contradictions within Lee's account. Lee astutely ascribes the impetus for reform to the rehabilitated victims of the Cultural Revolution, who, having suffered Maoist excesses and had the opportunity to reflect upon the shortcomings of the system during their period in the wilderness, became "born-again reformers" once returned to power (p. 168). Yet key members of this group, including Chen Yun, Peng Zhen, and Bo Yibo are elsewhere pictured as conservative opponents of reform (see, e.g., pp. 285–86). While there undoubtedly is something in this, too, the book lacks a systematic analysis of the paradox. It offers neither a careful empirical examination of the politics of the "old revolutionaries" nor a theoretical explanation of their presumed shift of position.

Finally, the discussion of the background of the new generation of Party technocrats provides some rich detail on their well-known characteristics but leaves unsettled major questions concerning the politics of this generation. Indeed, quite sensibly Lee cautiously canvasses alternative theories concerning the tendencies of technocratic leaders and, on more than one occasion, notes that no definitive conclusion is possible. Nevertheless, he does have a preferred view that the technocratic concern with results, rather than ideology, will result in a greater tendency to bargain and compromise, the likelihood of a collective style of leadership, and fewer power struggles and purges than marked the rule of the old revolutionaries (see p. 407). Still, as Lee acknowledges, the relative lack of close personal ties among the technocrats could result in division or stalemate; and a detailed examination of elite politics during the reform era (only spasmodically undertaken in the book) might show the restraining hand of the surviving old revolutionaries on their younger colleagues, who would possibly have been much more prone to open conflict if left to their own devices. Most of all, a careful reconstruction of reform politics would arguably show that the likelihood of polarized, as opposed to consensual, politics has more to do with the problems and stresses facing the leadership than with the characteristics of particular elite groups.

University of Sydney FREDERICK C. TEIWES

Self-Interest and Public Interest in Western Politics. By Leif Lewin. New York: Oxford University Press, 1991. 146p. $48.00 cloth, $16.95 paper.

Leif Lewin sets for himself a very imposing task with the first line of this book: "Is it self-interest or public interest that predominates in Western democracies?" It is Rousseau's question, Are people guided by their individual wills (democracy being but the sum of these individuals wills) or by some general will that is distinct (or at least distinguishable) from individual will? This is a question that has concerned political scientists of all stripes and colors, Lewin argues; but because they make different assumptions and work at different levels of abstraction, they are often talking past one another, rather than to each other. Thus, the field as a whole has reached no consensus on how best to structure government to foster the common good. The aim of this book is not to add to the debate in any one of the areas of political science that have addressed the self-interest/public interest question but, rather, to encourage cross-fertilization between the different schools of thought.

To achieve this goal, Lewin begins by sketching the nature of the debate in the rational choice, political philosophy, and electoral behavior subfields. Following Bentham, Condorcet, Hobbes, Mill, and Smith, the "public choice" rationalists assume that people are guided by their self-interest, while the "social choice" rationalists ask whether what is best for society is but the sum of what is best for its individual members. Philosophers concerned with this problem (Lewin relies mostly on Sen and Harsanyi) doubt that anyone can know what is in a person's self-interest (even that person) or, consequently, debate how best to determine what is the general interest. Electoral researchers have explored whether the general public lives up to the classic democratic ideals of the rational, informed voter guided by a disinterested view of the common good, as opposed to being the irrational, unthinking, socially determined or passion-driven voter that Madison feared.

The bulk of the book, however, is devoted to a review of the evidence for the basic self-interest assumption of the public choice school. We hear from Downs (*Economic Theory of Democracy*, 1957 and *Inside Bureaucracies*, 1967), Buchanan and Tullock (*Calculus of Consent*, 1962), and Niskansen (*Bureaucracy and Representative Government*, 1971) that voters are narrowly self-interested; that parties and politicians are spineless, programless vote maximizers; and that bureaucrats care only about increasing their own budgets. These classics of the public choice literature structure the remainder of the book, as Lewin explores whether voters, politicians, and bureaucrats are as self-interested in their actions as the rational choice literature says they are.

The evidence turns out to be a devastating attack on the self-interest assumption. The public rarely vote their own pocketbooks; there is little or no evidence that politicians try to create "electoral business cycles" or that parties feel free to adopt any position they believe the majority of the public favors. Moreover (while the evidence is much less complete here), there is also little or no support for the assumption that bureaucrats are budget-maximizers.

The strengths of this fine, concise book are the diversity of areas covered and the author's awareness of the North American, European, and Japanese literatures on all of these topics. I would strongly recommend it to the participants in any of these debates. As a scientist, I appreciate Lewin's insistence on *evidence* as he attempts to adjudicate between the advocates of the self-interested and public-interested views. Paradoxically, the major limitation of this book is that same focus on evidence, or (more precisely) the limited nature of the available data. Although I cannot claim to be an unbiased observer of this debate, to my mind, the evidence against self-interest as a major motivation for political action is overwhelming.

The case for the public interest alternative is not nearly as strong, however. To begin with, we are shortchanged on any discussion of the philosophical underpinnings of the public interest viewpoint. Rousseau and Locke are not seriously mentioned until the end of the final chapter. And, as Lewin acknowledges, the evidence for some sort of public interest motivation is generally lacking—limited primarily to voting behavior research. This is not a criticism of the book so much as a criticism of those of us practitioners who develop the theories and provide the evidence to address this question. The fact still remains, however, that if we can reject the hypothesis that self-interest guides most political activity in Western democracies, we, as a field, are nowhere near being able adequately to test the alternative hypothesis that public interest is a major motivator of that same behavior.

Rutgers University RICHARD R. LAU

The Religious Challenge to the State. Edited by Matthew C. Moen and Lowell S. Gustafson. Philadelphia: Temple University Press, 1991. 320p. $44.95.

This volume is the product of a conference on religion and politics held at the University of Maine in 1989. Although the title accurately describes the general thematic focus of the collection, many approaches to various aspects of the problem are represented in the essays. The editors' introductory essay provides an abbreviated historical contextual background to the problem and thumbnail summaries of the individual essays. However, it provides neither a conceptual framework within which these essays could be integrated nor an analytical elaboration of their theoretical significance.

Although the editors state in the preface that the book is primarily intended for scholars, a number of shortcomings diminish this collection's significance as a scholarly work. Only the essay by Matthew C. Moen appears to be based on original research using primary data (in this case, interviews, documents and publications of the Christian Right in the United States). The others are either primarily or exclusively based on the analysis of secondary sources (mostly the work of other scholars). Unfortunately, few of the contributors bring new perspectives through the application of different theoretical perspectives or original analytical insights to their data. The editors state, "Because the approach of the contributors is normative and historical, the volume is accessible to a wide readership" (p. x). The descriptive nature of many of the essays diminish their scholarly value.

No contributor refers to any of the other contributions in the volume. This is particularly unfortunate because it wastes an opportunity for more comparative analyses

and the potential to refine conceptual frameworks. For example, the suggestive insights of Damian Fernandez regarding the role of popular and political religion in the Cuban Revolution could have profitably referred to Allan Metz's discussion of civil religion in Israel. Fernandez asserts that political religion provided a source of legitimacy for the Cuban Revolution but fails adequately to demonstrate how this was done. To paraphrase Clifford Geertz (quoted by Fernandez), he fails to show how the symbols symbolized. The use, in reference to religion, of terms like *popular, political,* and *civil* without conceptually defining and refining them is a missed opportunity of the whole volume.

Metz (a specialist on Latin America) attempts to cover too much ground in his survey of the highly complex nature of religion and politics in Israel. Borrowing heavily on the pioneering work of Charles Liebman and Eliezer Don-Yehiya, he patches together what he terms a "theoretical framework." Unfortunately, this framework is no more than a few generalizations about the nature of the relationship between religion and the state. The work of Liebman and Don-Yehiya is important for the originality of their primary research but not for its theoretical sophistication. They use Robert Bellah's notion of civil religion as a focus for their most important book, a concept Metz does not even utilize in his analysis. His two case studies add no new insights, either conceptual or substantive, to this rather unfocused and unoriginal essay.

Another even more glaring example of the lack of communication between the contributors is the fact that neither Ann Lesch, who writes knowledgeably about the Muslim Brotherhood in Egypt, nor John Voll, who examines the same subject as one of the four cases of Islamic fundamentalism in Africa, refer to each other's analysis. Voll's case analysis is much more successful than Metz's.

Metz introduces the notion of corporatism in his essay on church–state relations in Mexico but fails to utilize it as a conceptual framework for his analysis and does not even mention the term in his conclusions. Nor does he refer to Gustafson's use of corporatism in his analysis of church and state in Argentina, a compliment Gustafson returns by ignoring Metz's essay. Since Gustafson is one of the editors, his omission is even more glaring. Aside from the introductory essay by the editors, only James Warhola, in his lucid and interesting discussion of religion and modernization in Gorbachev's Soviet Union, makes a single, general reference to the volume as a whole.

A very brief essay by Donald Bain, an expert on strategic studies, on the papal challenge to Soviet regimes in Eastern Europe is most noteworthy for the memorable line, "When the pope speaks, people listen" (p. 138). Mark Bartholomew's short analysis of the relationships between the church, the peace movement, and the Social Democratic party of Germany is both knowledgeable and informative.

The volume lacks both an index and a general reference list. Both omissions undermine the utility of the volume for scholars. It appears as if this volume was rushed to press before rapidly changing events could make the book appear outdated. The editors would have done better to have encouraged the contributors to refine their essays and to refer to one another's contributions and used that extra time to write a concluding essay that would bring out the general implications of the findings of the individual authors. Unfortunately, in its present form, this volume makes a very modest contribution to the scholarly literature.

Rutgers University MYRON J. ARONOFF

Political Participation and Democracy in Britain. By Geraint Parry, George Moyser, and Neil Day. New York: Cambridge University Press, 1992. 509p. $84.95 cloth, $34.95 paper.

British specialists are not the only likely readers of this impressive research work. It is a major contribution to our discipline's understanding of political participation in democratic societies generally. The large array of data is British, but the authors present and analyze their findings in an intellectual context that is hardly parochial and often explicitly comparative. Along with the exploration of hypotheses of their own, they test many findings from earlier scholarly studies of political participation in several nations, referring most frequently to *Participation in America* by Verba and Nie (1972).

The book's data are from a substantial project that Parry and Moyser directed, as principal investigators, with funding from Britain's Economic and Social Research Council. Research, in 1984 and 1985, involved not only a national sample survey of nearly sixteen hundred people but also a survey of about the same number in six diverse localities, plus interviews with three hundred selected leaders in those same localities. Questions were designed to learn the extent and nature of political participation, usefully categorized as voting; party campaigning; collective action (through meetings, petitions, and other group pressures); contacting public officials; and direct action (marches, blocking traffic, political strikes, and boycotts). Attention concentrates on the minority of citizens whose participation goes beyond voting. Rightly, as the authors say, that kind of British participation has been much less fully studied than British voting behavior. They fill a large portion of the gap in our scholarly knowledge by telling us about the numbers active in each category, the social status of these participants, the resources or other factors that help account for participation, the impact of participation on policy outcomes, and the satisfaction that participants derive from their activities.

So general a description does not do justice to the wealth of information and analysis that the authors provide. An idea of the book's richness, as well as of its quantitative character, may be inferred from the presence of 49 figures, 7 charts and maps, and 111 tables. The expository prose is ample and clear. Moreover, the authors put their study in a coherent theoretical, even philosophical, framework, reflecting a concern with the significance of participation in a democratic society. Especially enlightening is the discussion of the strongly local emphasis of most participant activities. It was first discovered in the national survey and then confirmed and illuminated in the several local studies that activists are more often motivated to influence policies close to home than they are to take up the broad issues that command the attention of the national news media. Local, not central, government is the usual target. Issues beyond the everyday concerns of citizens are to a larger extent left to officeholding representatives between elections. The authors evaluate the consequences for stable

and effective democratic government with great sophistication, taking into account the contrasting traditions, on the one side linked to Rousseau and on the other, to Schumpeter.

Citing a few of the book's many other findings will illustrate its significant lines of inquiry. Americans, accustomed to unfavorable comparisons of voting turnouts in the United States with those in Britain and other nations, will be interested in data showing British participation in certain political activities to be at a somewhat lower level than American participation in similar categories. A more generally intriguing matter is the special place that party campaigning occupies in the responses to questions about whether the various participatory activities led to increased knowledge. Whereas most activities were not seen by participant–respondents to have added to their knowledge, the major exceptions were two forms of party campaigning. Canvassing for votes and behind-the-scenes party clerical work were reported as educative in their effect. But the absence of such learning in nonparty political activities did not mean that the relevant participants failed to find satisfaction in their experience. A high degree of satisfaction characterized most participants. Again, the local surveys fully confirmed the national survey. "Participants," the authors conclude, "displayed remarkable degrees of contentment with the outcomes of their dealings with local authorities" (p. 403). Their sense of individual efficacy was at a respectable level, even for some who expressed considerable political cynicism. Here, as elsewhere, the relationship is complex. Indeed, the complexity, along with multidimensionality, is a principal theme of the authors' careful analytical study.

University of Wisconsin, Madison LEON D. EPSTEIN

The Apartheid State in Crisis: Political Transformation in South Africa, 1975–1990. By Robert M. Price. New York: Oxford University Press, 1991. 309p. $55.00 cloth, $16.95 paper.

In this study of recent South African politics, Robert Price distinguishes processes of transition (changes in a society's formal political order, consisting of rules and institutions) from processes of transformation (changes in a society's substructure of domination, consisting of social interactions, cultural norms, economic activities, and informal power relationships). Price argues that changes in the latter make possible change in the former. In the case of South Africa, a two-decades-long process of economic and social transformation have led to the current talks on changing the formal rules that govern South African politics.

Price observes that apartheid was established in the aftermath of World War II in order to bring Afrikaners up to socioeconomic parity with South Africans of British descent, to reverse gains made by blacks in South Africa during the war years, and to respond to an international system slowly developing norms of decolonization. While never accomplishing this last goal, by the early 1970s, apartheid had transformed the interests and demographics of Afrikaners to the point where their elites saw apartheid as a drag on the economic growth needed to preserve white domination.

The imperative of reforming apartheid emerged during a period of regional confrontation. The collapse of Portuguese colonialism in Southern Africa created the threat of a region unified against white domination in South Africa. The success of liberation movements in Angola and Mozambique spurred on such movements in Zimbabwe, which in turn emboldened black protest in South Africa itself. A newly found confidence among South African blacks, combined with the economic deprivations of apartheid, created the environment in which the Soweto uprising of 1976 took place. The regime responded to the Soweto riots with brute force and repression, which prompted the international community to increase pressure on South Africa to change. The pressure—economic and cultural isolation—exacerbated the downward economic spin of South Africa and pushed the regime to undertake reform. Thus began a slow, roundabout effort to eliminate apartheid in order to maintain white power and privilege.

Price, drawing from the insights of Tocqueville, describes how the reforms had unanticipated consequences that strengthened internal opposition to white supremacy. Renewed opposition was met with renewed repression; renewed repression was met with new international condemnation and stiffer sanctions; renewed international pressure increased the need for reform and strengthened domestic opposition, which led to more repression. By the mid-1980s a situation that Trotsky had described as "dual power" existed in South Africa. What Price refers to as the "security contradiction" of the white regime could only be broken by the willingness of the regime to negotiate a transition in its formal political rules and constitution.

Price knows South African politics, economics, and society and writes well. He recognizes that developments in South Africa are a product of three levels of analysis—international, regional, and national—which he vividly and impressively weaves together in order to explain how change has come to South Africa.

Weaknesses in Price's analysis come from two sources. First, he tends to see various changes in South Africa as linear and therefore unsusceptible to reversal. For instance, early on, Price states that changes in the substructure of society will necessarily lead to transition, a claim that he subsequently backs away from (pp. 4, 285). Elsewhere in the book, he claims that economic processes irrevocably shattered Afrikaner identity and values (pp. 83–85). Yet if we have learned anything about political identities of cultural groups, it is that they wax and wane and that sentiments of group identity can disappear only to reemerge at a later date.

Second, Price's formulation of the relationship between substructure of domination and structure of formal order suffers from imprecision. Consider, for example, the grab bag that makes up the substructure of domination: social interactions, informal norms, economic activities, and informal power relationships. Should we expect changes in these categories to be synchronous? Do any of the categories take precedence over the others? Here, the two authors that inform Price's conception of society differ. Tocqueville saw revolution as inevitable in France because of the disjuncture between the formal rules of the Old Regime and the informal constitution of French life. In his history of the Russian Revolution, Trotsky saw the key disjuncture as one between the formal political rules that benefitted a particular class and economic changes that had rendered that class obsolete.

In the South African case, there have been important

changes in some of the categories of the substructure. But the transformation that Price describes is an incomplete one; changes coexist with important continuities. Two examples come to mind: economic activities that continue to benefit the white population of South Africa disproportionately and mental legacies of racism. If Price's overall thesis, namely, that formal political rules must rest on the informal substructures of domination, is correct, then any transition to majority rule in South Africa will stand on shaky foundations; the formal constitution will proclaim equality, while the informal one will mock such claims.

Even with its faults, Price's book is a stunning accomplishment. It towers over recent analyses of the South African situation and puts to shame recent historical sociological treatments of revolution that amount to histories written to illustrate a theoretical assertion like the autonomy of the state or the nature of class relations between lord and peasant. Price, like Trotsky and Tocqueville, constantly ranges back and forth between historical facts, patterns, and relationships on the one hand and broader theoretical concerns on the other. And like Trotsky and Tocqueville, Price's keen insights come not from some overarching theoretical perspective that by insisting that it explains everything, explains nothing, but from familiarity with historical detail and sociological method.

Johns Hopkins University STEPHEN J. STEDMAN

Democracy and the Market: Political and Economic Reforms in Eastern Europe and Latin America. By Adam Przeworski. New York: Cambridge University Press, 1991. 210p. $39.50 cloth, $12.95 paper.

This book deals with two of the most important and least understood phenomena occurring in the world today: democratization and the transition to more market-oriented economic systems. Przeworski is a wise and insightful analyst unusually well placed to observe the transitions in both Eastern Europe and Latin America closely and thus, perhaps, uniquely qualified to theorize about them. The strength of the book lies in the effort to create general models of processes that are usually treated descriptively.

The stylized political world that underlies these essays is populated "not by freely acting individuals but by collective organizations that are capable of coercing those whose interests they represent," latent groups that might become organized, and individual voters who can periodically reward or punish political leaders but seem not to affect the strategies of the groups whose interactions with each other determine political outcomes (see pp. 12, 39). This is not the only possible stylization of a democratic political system, and it occasionally runs into inconvenient events that require some interpretative surgery to make them fit. But an imperfect model (and all are imperfect) is always better than no model; and this model gives Przeworski the leverage he needs to theorize in areas that have been notorious as analytic swamps.

I shall concentrate on three of the numerous ideas in this wide-ranging book that seem to me to form the logical core: the requirements for stable democracy, the choice of new democratic institutions during transitions, and how the transition to market-based economies affects the probability that stable democracies will arise from the breakdown of authoritarianism.

Przeworski's treatment of stability begins with the observation that democracy survives when groups that lose out in the policy process continue to comply with the democratic rules of the game. He therefore focuses on losers, developing an abstract model of their preferences as a way of exploring the conditions that would affect their willingness to remain in the democratic game. In the model, losers' compliance depends on the stakes of the game, the probability of winning in the future, and their discount rate (all affected by, among other things, the institutional structure of a particular democracy), as well as the probability of successful subversion.

Once it has been established that institutions affect the probability that democracies will consolidate themselves, it becomes important to understand how different concrete institutions affect both policy losers' calculations and how political actors choose new institutions during transitions to democracy. Przeworski says little about the former but devotes considerable attention to the latter. In the Przeworski world, institutions emerge as the result of bargaining among political "forces." Where the "relation of forces" is known and uneven, institutions will reflect the interests of "a particular person, party, or alliance" (pp. 81–82). Where the relation of forces is known and balanced, the outcome is indeterminate. Where the relation of forces is unknown, institutions can be expected to emerge that contain checks and balances, reduce the stakes of competition, and provide guarantees to potential minorities. Anarchic and uncertain transitional situations may thus, counterintuitively, be most conducive to the emergence of stable democracy in the long run.

In the final essay of the book, Przeworski moves from the general issue of democratic consolidation to the particular threat to consolidation posed by concurrent transitions to market-based economics. In this essay, he has many sensible and insightful things to say about the uncertainties and short-term costs of economic transition; and he develops a series of perceptive arguments to explain the choice of radical, over gradualist, adjustment strategies.

A risk-averse person would not have ventured into this subject so early on in the process, when outcomes were still so uncertain. But strong theory gives scholars the courage to get up and do what needs to be done. With the advantage of more experience of reform than was available to Przeworski, however, it now seems that his conclusions about the political consequences of economic reform are too pessimistic.

As Przeworski notes, the costs of economic transition for organized labor are likely to be high. Because he sees the political process as dominated by the struggle for advantage among organized groups, Przeworski concludes that governments will only be able to pursue adjustment through one of two strategies: consultation and negotiation with groups, especially unions, that will be hurt by reforms (concertation), which he sees as unlikely in developing countries for several sound reasons; or else, insulation of policymakers from affected groups, which he sees as undermining democracy. In fact, however, several governments (most notably, Argentina, Turkey, and Thailand) have carried out substantial reforms (without concertation) while maintaining political support through at least one election.

By the clever sequencing of reforms or dramatic reductions in inflation, they have made reforms palatable to the average voter while imposing heavy costs on much of the unionized working class. They have, in other words, found support for themselves and their policies among the relatively unorganized masses of voters while politically marginalizing better-organized groups. Although relatively unimportant in the book as a whole, this seems to me a good example of the limitations of the Przeworski stylization. In democracies, outcomes sometimes depend on interactions between political leaders pursuing their own interests and freely acting individual voters, not organizations "capable of coercing those whose interests they represent."

To return to the whole, this is an important book on important topics. Its vivid imagery, lively language, and unexpected but apt metaphors make it highly enjoyable to read. Like other work by Przeworski, it will help structure the thinking of other scholars. It will also frustrate anyone who attempts to use the arguments in it as the basis for building a sturdier accumulation of knowledge. The empirical referents of concepts central to the models are so underspecified that it is hard to imagine how one would go about testing them. How, for example, could you tell whether the "relation of forces" was balanced or not? How could you tell whether an unknown balance of forces resulted in institutions that limit the stakes of the political game without any information about what concrete political institutions have that effect? Nevertheless, the book is thoughtful, imaginative, and provocative. It will cause its readers—scholars, political activists, graduate students, and even some undergraduates—to think interesting thoughts.

University of California, Los Angeles BARBARA GEDDES

Politics within the State: Elite Bureaucrats and Industrial Policy in Authoritarian Brazil. By Ben Ross Schneider. Pittsburgh: University of Pittsburgh Press, 1992. 337p. $49.50.

This lively and important book is an account of the triumphs and failures at the vanguard of Brazilian policy-making represented by the steel and mining sectors. The coverage is broader than the subtitle indicates; for the analysis ranges over the decades of developmentalism, democratic as well as authoritarian, from the postwar years to the present. One of the implications of Schneider's research is that changes in political regimes do not matter much for the way the Brazilian *sistema*—the deep structure of power—operates.

The paradoxical idea behind the analysis is that the distinctive trajectory of bureaucratic careers in Brazil, dominated by agency-hopping and political, rather than civil service–style, appointment, undercuts institutional predictability at the same time that it permits and even facilitates a creative mix of interorganizational competition and coalition building. Although he does not resort to the jargon, the evidence assembled by Schneider can be understood as documenting the vagaries of the labor market internal to the Brazilian public sector and its consequences for getting the job done.

Politics within the State is worth reading and rereading, first, simply as an insightful phenomenology of the sprawl and folkways of the Brazilian state. The organizational guerrillas who are the subjects of story will have no trouble recognizing themselves and the arcane recesses of their environment. In going through its pages I was reminded of the vulnerable artfulness of Brazilian soccer—almost all offense, given to *o lance genial* (the stroke of genius), only to collapse the next moment—for all one knows, out of boredom with the game. The book is fun to read. Schneider writes suspiciously well.

Schneider also raises important questions about the links between reform-mongering, organizational design, and economic strategy. The challenge involved in dealing intelligibly with bureaucratic politics—and with the Brazilian public sector, in particular—comes not only from the size of the thing itself but also from the simultaneous vastness and inadequacy of the literature on the subject. Like many others before him, Schneider attends to the hard-chargers, the managerial zealots bent on compressing "fifty years of development in five," as a Brazilian president once declared. As Delfim Netto, the *primus inter pares* of the barons of grandeur, put it with still greater hyperbole, "Development is the moral equivalent of war." Schneider himself suggests that this focus ignores the agencies charged with services, the cultivation of human capital, and, more seriously, the larger bureaucratic context (less flashy, more inertial, closer to the backwaters of Brazilian politics) above which the superstars of capital accumulation and futuristic technology move and shake. While attention is given to the coziness between ministerial officials and their counterparts in private industry and banking, the lack of contact between development hotshots and those engaged in mop-up and peripheral chores like health and education—the clubbiness of winners and their Darwinian exclusion of the timid, the luckless, and the inept—seems crucial to understanding the cumulative inequities that defy democratization. In this light, the pathologies of the American entertainment industry would be a better metaphor for Brazilian development than a balletic soccer match. The analogy breaks down not in the magnitude of the profits or the style of the subculture but in the costs to losers.

Schneider's criticism of the assumption that bureaucratic fragmentation regularly leads to inefficiencies is reasonable. Yet his contention that development projects in Brazil succeed more frequently than expected is problematic. If the baseline for this claim is that fragmentation inevitably gets in the way of intended results, then the hypothesis is bound to be correct. However, a more sensible standard for evaluating implementation might start with a statistically normal distribution of outcomes. The idea would be to estimate what organizational formats produce better (or worse) results than they might do randomly. The logistics of testing this null hypothesis (hardly a model but better than no criterion at all) would involve a larger number of cases than the four examined by Schneider, who is careful to list a number of conditions and factors that contribute to success and failure in variably coordinated and chaotic settings. Nevertheless, baldly stating criteria for success and failure or else giving reasons for not doing so would clarify the particular outcomes.

But a significant implication of *Politics within the State* is that using a random walk as a point of departure for understanding policy implementation in Brazil—while more realistic than condemning the process to failure by fragmentation—is historically inaccurate. Over time, and at an accelerating rate over the past decade, the

chances of success seem to have deteriorated. This may be the nightmare effect of the administrative turnover that boosted innovation earlier in the public sector. The circulation of officials almost certainly created incentives for each of them to embellish his curriculum vitae by launching new ventures without incentives to complete the projects during their brief tenures. Such a proliferation of commitments helps explain how aggregate bottlenecks and irreversible paths build up from tactical improvization. It also lends a certain pathos to the cycle of enthusiasm and exhaustion—the manic-depressive syndrome—common among the talented individuals responsible for the fortunes of the Brazilian state.

Adept at cutting deals and finding shortcuts, energetic in resolving problems on the spot, Brazilian bureaucrats and politicians have seen their institutions veer out of control and their developmental visions thwarted. Next to the distinctive combination of patrimonialism and piecemeal empiricism, the anomaly of vaunting ambition and shortsightedness may be as close to a fixture of Brazilian political culture as one is likely to encounter in so fluid a spectacle. Expedience as an ideology is not pragmatism. This ethos emerged in the ramshackle constitution of the New Republic; and it produces the sort of scenario that periodically sets the military tapping its fingers at yet another demonstration that democratic politics may be, if not quite catastrophic, less than the sum of its parts.

If development in Brazil has become a race against worsening odds, for reasons having to do both with institutional perversities and structural distortions embodied in the concentration of wealth, it may be instructive to set the Brazilian impasse against the less-discouraging experience of countries like Spain and South Korea, with comparable histories of authoritarian and democratic episodes—not to mention cases closer to home, such as Mexico and Argentina. In conveying the drama and the stakes of Brazilian politics and in offering a provisional interpretation, *Politics within the State* brings us closer to placing the terrible enigma of Brazil in comparative perspective.

Arizona State University PETER MCDONOUGH

Disorder under Heaven: Collective Violence in the Ming Dynasty. By James W. Tong. Stanford: Stanford University Press, 1991. 325p. $39.50.

In this book James Tong offers a quantitative, diachronic, rational choice, state-centric study of collective violence during the Ming Dynasty. Quantitatively, he marshals data on 630 violent events and a variety of data on the economic and political context surrounding them. Temporally, his study spans the 277 years of the Ming era. His approach is rational choice in that he hypothesizes that the decision to join in collective violence was the product of individual calculations of the odds of survival in time of dearth and hardship and the odds of survival as an outlaw in the face of government repression. His approach is statist in that most of his measures of the odds of surviving either hardship (e.g., provision of government relief) or as an outlaw (e.g., proximity of government forces) are measures of state performance and capability.

Tong's study is exemplarily straightforward and parsimonious. In an introductory chapter he poses his research tasks, namely, to describe and explain the major forms of collective violence during the era; sketches out his model; and describes the major patterns visible in his data, namely, a preponderance of collective violence in the South, in the latter half of the dynasty, in rugged and remote regions, and in the form of banditry. Chapter 2 elaborates the model—a choice model based on the interplay of individual motives (primarily survival), the resources available to the people, and the opportunities for contention open to them under the political status quo—and the data, with terms defined and operationalized using the county–year (of which there are 303,869, given 277 years and 1,097 counties) as the unit of analysis.

Chapters 3 and 4 are the centerpiece of the book. Chapter 3 presents in descriptive detail the different types of collective violence: and in chapter 4 two scales (composites of four measures of survivability and six measures of survivability-as-an-outlaw) are constructed and posed against the collective violence data for each unit of analysis. Contention across county–years varied directly with survivability-as-an-outlaw and inversely with the survivability of hardship; together, they powerfully indicate that (as hypothesized) banditry as a response to hardship was by far most likely in regions and at times in which the survivability of hardship was lowest *and* survivability-as-an-outlaw was highest.

Chapter 5 goes into detail as to why the observed relationship should hold, focusing primarily on regime capabilities and how they shaped the opportunity structure of collective violence both in toto and as they varied across time and space. Chapters 6 and 7 consider two alternative explanations of collective violence: that it results from rapid social and/or economic change and that class conflict is the force behind it. The data from Ming China provide little support for either. Motives, resources, and opportunities appear to be unquestionably a superior explanatory constellation.

The special strengths of this book are its parsimony, persuasiveness, and comprehensiveness. Without falling into simplistic number crunching, Tong presents his model and his data thoughtfully and with appropriate caveats, uses data both illustratively and analytically, and winds up his analysis (including relevant historical background and consideration of the two alternative models) in only 214 pages of text. Moreover (perhaps because it is so simple and straightforward), his argument is persuasive, at least to me. The components of Tong's scales seem to be valid indicators of the concepts in question, and his operational measures are valid measures of the component variables. Finally, Tong's study is comprehensive. The genre of historical political sociology includes few studies of collective violence covering any society so intensively over such a long period. Although equivalent, the quantitative analysis in Charles Tilly's *Contentious French* is neither so systematic nor so permeating. In Tong's words, "For no other premodern system are annual, local-level data on collective violence as available as they are for the Ming" (p. 9); and, as he points out in his conclusion, data collection efforts presently underway in China hold out the promise of extending this study by several centuries in both directions from the Ming.

This said, I still have three reservations regarding this study: a worry, a caveat, and a disagreement. The worry is that there may be more data-underreporting than Tong argues. A similar data set for a similar period

(1590–1877) for another preindustrial society (Tokugawa Japan, with one-fifth the population of Ming China) includes 7,664 incidents of collective contention, of which 1,258 involved aggressive or violent action and 811, outright violence. By any criterion of comparison, China seems extraordinarily quiescent.

The caveat is that this study is not quite comparable to many of those (by, e.g., Tilly, Gurr, and Hibbs) that come quickly to mind, because the collective violence it focuses on is overwhelmingly *collective, armed crime*, not just political conflict or protest or violence, or social contention more broadly construed. Thus, the model is more likely to fit Jesse James than Emiliano Zapata. Tong gives good reasons for this focus, but it may still restrict the comparability of the study.

Finally, I disagree with some of the assertions explicated in Tong's model. In the first place, I do not agree that "in premodern China, as in other agricultural societies, subsistence was the central objective of the peasantry." (p. 78), unless *subsistence* is defined to include *status* subsistence, that is, keeping one's family and community economically, politically, and socially viable. I think that the sorts of economistic calculating studied in Samuel Popkin's *Rational Peasant* were always at work and could lead to collective violence of various types. Nor do I agree with the corollary that free-riding was not a problem in collective violence because participants sought only private goods and that "the desire to seek public goods" is not a "plausible explanation of motivation for premodern collective violence" (p. 199). It *is* true for *this type* of collective violence—banditry—but not for the sorts of political and social violence studied by others, in which public goods could play a powerful role, as the example of Zapata suggests.

In other words, this is not a disagreement with what Tong has found in his data but a disagreement with the generality of his findings. Certainly, on its own terms, Tong's study is solid, persuasive, and informative; and it deserves, and rewards, reading by anyone in the field of contentious collective behavior.

University of North Carolina JAMES W. WHITE

Race to the Swift: State and Finance in Korean Industrialization. Jung-en Woo. New York: Columbia University Press, 1991. 280p. $35.00.

It is increasingly clear that the role of finance in the extraordinary growth and structural transformation of the East Asian economies is a crucial topic. Nowhere was financial policy used more aggressively than in Korea. It is also clear that the preferential allocation of capital played the crucial role in the emergence of Korea's giant business groups, or *chaebol*.

Jung-en Woo construes finance broadly and approaches it historically. She locates the origins of Korea's strong state primarily in foreign influences, particularly the security concerns of the United States, and the regional economic concerns of Japan as mediated by the United States. Thus, her approach builds on dependency theory but is more determined by global security politics than the logic of international capitalism and allows for considerable room for maneuvering on the part of the peripheral state. A second major theme is the creation of a capitalist class and of "Korea, Inc" through a credit-based financial system. Subsidiary arguments include the repeated subversion of orthodox financial and trade reforms urged on Korea by the United States, the International Monetary Fund, and the World Bank and, in contrast, successful economic intervention by the Korean government.

An initial theoretical chapter is followed by a discussion of colonial Korea. The experience of Japanese colonialism, including precocious development of an activist financial system led first by the colonial state and then by the Japanese *zaibatsu* (but never by local entrepreneurs), became a template for postwar development, she argues. Import substitution and aid grubbing under Syngman Rhee in the 1950s were not simply corrupt and ineffective but laid an economic base for the 1960s and delayed domination by Japan. Takeoff in the 1960s was made possible in good part by Japanese investment and support for the ruling party. High-interest-rate policies adopted under American pressure were incomplete, and led to a huge foreign debt, since interest rates abroad were lower; debt, in turn, led to instability and authoritarianism and, finally, a return to low real interest rates and bureaucratic allocation of capital.

Chapter 5 covers the "Big Push" toward industrial deepening of the 1970s (which the author sees as motivated by the Nixon doctrine and global economic shocks) and provides thumbnail sketches of development in five key industries. Chapter 6 is the heart of the book: "A credit-based financial system, mediated by an interventionist authoritarian state, became the basis of Korea, Inc." (p. 149). The state shoveled money to exporters and heavy industry despite their lower profitability and used control over access to capital to ensure economic performance. The state socialized the risk of the *chaebol*, while small firms and households were forced to rely on the unregulated curb market. By the 1980s, she argues, changes in the security environment and global economy and the skyrocketing of nonperforming loans convinced Korean technocrats, now overwhelmingly "transnational elites" trained in the United States (p. 190), to liberalize the financial system; while by no means complete, this liberalization and the growth of the stock market and of nonbank financial intermediaries has marked a decisive change in Korea, Inc.

The strength of the book is clearly in history, particularly on the influence of the Japanese period (a controversial issue) as a model. The in-depth treatment of American and Japanese policies toward Korea is unusually well weighted. The discussion of the implications of regional economic integration for Korea is interesting and ironic, in light of recent developments: dual hegemony in Asia with a predominant economic role for Japan is not new and was, in fact, designed by the United States (pp. 88–92, 184–87).

The book does suffer from some important omissions. It provides no sustained account of politics, particularly for the period since the fall of Rhee. There is surprisingly little analysis of the actual details of financial policy and virtually none on financial and other bureaucratic institutions (see pp. 84, 103, 159). The Ministry of Finance manages only 3 citations in the index, while Nixon receives 15. Similarly, little attention is paid to the actual organization of the *chaebol*; and the unusual definition conflates group structure and market power (p. 149). Moreover, while Woo concludes that the flip side of the development state was a "racketeering state," questions about rent seeking are dismissed in two sentences (pp. 69, 200).

Looking comparatively, it is impossible to explain from Woo's externally dominated account why Taiwan's financial system was rigidly constrained, rather than mirroring Korea's, and why high real interest rates there led to increased domestic savings and very little foreign debt. Similarly, despite her characterization of Korea as a "clone" of Japan (p. 176), the *chaebol* operate very differently from Japan's *keiretsu*. The Korean government dominated businesses and, on occasion, compelled them to merge in ways that have no precedent in Japan. The lack of a concluding chapter also weakens the analytic and comparative aspects of the book.

Finally, while the bibliography is extensive, the author implies that no one has ever recognized the importance of finance in Korea before; and that is simply not true. Important recent works by Alice Amsden, Tun-jen Cheng, and others receive at most glancing recognition. Had the publication of *Race to the Swift* not been delayed, its arguments would have been more novel, and its emphasis on dependence, less dated. It is best seen as a broad introduction to the history and international context of Korean industrialization, rather than as a cutting-edge analysis of Korean finance.

INTERNATIONAL RELATIONS

The World Trading System at Risk. By Jagdish Bhagwati. Princeton: Princeton University Press, 1991. 156p. $16.95.

Losing Time: The Industrial Policy Debate. By Otis L. Graham, Jr. Cambridge: Harvard University Press, 1992. 370p. $29.95.

Parallel Politics: Economic Policymaking in Japan and the United States. Edited by Samuel Kernell. Washington: Brookings Institution, 1991. 390p. $36.95 cloth, $15.95 paper.

The grouping of these three volumes reflects the interconnections between the politics of the domestic economy and the international politics of trade and security. *Parallel Politics* is a valuable collection of Japanese and American essays comparing the two nations' political management of the domestic economy. Because the essays make good reading assignments that present a clear position and sketch the historical and institutional texture of the two cases, the book will be useful in graduate and undergraduate classes.

The American essays tells a consistent and convincing story. "Political Institutions and the American Economy" by John E. Chubb and Paul E. Peterson is an excellent overview that traces the historical development of the American system of political economy. It examines how the collision of new issues and established institutions has stymied the management of the U.S. economy. Historically, the federal government found mechanisms to contain their rivalries while still providing coherent leadership; but those mechanisms have now failed. The presidential/congressional struggle now overlaps the party struggles and blocks effective policy. Matthew McCubbins reinforces this message, arguing effectively in "Party Politics, Divided Government, and Budget Deficits" that the enormous American national budget deficits are the product neither of the Reagan policies nor of congressional abdications. Rather, they are consequences of a divided government that has stalemated. Allen Schick argues in "The Surprising Enactment of Tax Reform in the United States" that astute political management permitted sharp changes in the tax structure, which suggests that sharp changes in policy are possible. If so, then a crucial question falls in between chapters: Why could we find new directions in tax policy but not effectively address the budget problem of a gap between spending and revenue? It would have been helpful if one of the authors had addressed what was different about these two problems.

It is in the Japanese case that we find controversy. Both popular discussion and much academic literature emphasize the capacities of a directive Japanese developmental state to provide industrial leadership. Consequently, a balancing emphasis on local politics is very valuable. The controversial assertion woven into Samuel Kernell's overview essay is that in Japan, appearances and earlier literature to the contrary, politicians, not bureaucrats, run the country. Do we require a revision or a marginal corrective in our understanding of Japan?

This volume provides several competing answers to the question of politicians, party, and bureaucrats in Japan. The conventional view is that there is a substantial difference between the U.S. and Japan in the policy priorities and capacities for direction and policy implementation. Haruo Shimada's essay, "Structural Policies in Japan" supports this traditional view of bureaucratic authority and directed strategies. Michio Muramatsu and Masaru Mabuchi present a story, in "Introducing a New Tax in Japan," in which the single ruling party provides—or comes over time to provide—the capacity to shape policy directions. It is very helpful to our understanding of how the Liberal Democratic party (LDP) influences policy and the capacity for governance. Yukio Nguchi's discussion of budget making is certainly consistent with the increased power of the LDP in conflicts within ministries. But critically, the Ministry of Finance remains the principal player in settling conflicts between ministries. Thus, in this essay, the power is balanced between bureaucracy and party, each having a separate domain. However, Eisuke Sakakiabara's overview of the Japanese political economy, "The Japanese Politico–Economic System and the Public Sector," presents a Japan in which the politicians whose centrally local concerns are grouped in policy cliques and political factions dominate. Neither the Ministry of Finance nor the dominant party, the LDP, play much of a role. Indeed, in his vision, the government stands aside from the market and often competes with it. The worlds of the development state (Chalmers Johnson), policy compacts (Richard Samuels), and the semicorporatist doorkeeper (T. J. Pempel) are no where to be found. This debate is neither resolved nor, really, confronted in the book; and the notion that developmental policy is simply the other face of the "politics of particularism" simply sidesteps the problem and buries the most interesting questions. For example, "collusive solutions to market dilemmas" in most countries simply retard growth. In Japan such arrangements are often elements of "controlled competition" (Murakami and Yammamura, Tyson and Zysman). True, as Sakakiabara argues, the (public) postal savings banks and the private banks compete; but the overall pattern of financial flows is one that has both sustained industrial development and created a particular pattern of competition. Are these financial flows and patterns accidental or created?

The most effective section of the volume is the comparison of structural policy in the United States and Japan. Roger Noll and Haruo Shimada present a common essay that develops a set of premises and hypotheses that guide their individual analyses. They argue together that structural policy is easier to formulate in Japan and more likely to be long-term, even though both countries will have difficulty scaling down inefficient sectors. Noll's lucid essay argues that the United States does not have a coherent and directed policy; nonetheless, he manages to outline the pattern of policy that does influence the industrial structure. Noll's overall argument is not new, but he presents it exceptionally well. The specific discussions of individual policy domains are quite rich and very interesting. I regret, for example, that the section on deregulation could not have been a chapter in itself, so that the supposed success in transportation, energy, and telecommunications in the

1980s could be set more fully against the overt failures in finance and the new problems in telecommunications and transportation. Shimada's essay usefully focuses on the Japanese industrial sector policies that have attracted American attention because of their international dimensions. Importantly, he also considers the Japanese effort to set right distortions in the economy, with primarily domestic consequences—a list that includes the gap between the high nominal income and low standards of living, increased wealth differentials in terms of real estate and financial assets, and differential allocation of economic resources between Tokyo and other regions (p. 285). In sharp contrast to Sakakiabara's presentation, Shimada asserts the critical and coherent role of the state in industrial development. Shimada is not set the task of explaining how a system made up of particularistic politicians can produce a coherent outcome. But the volume, already very good, would have been even better had this question and the difference in views between Shimada and Sakakiabara been exploited.

The editor, Samuel Kernell, proposes as his integrating theme that politics in both countries is centrally about local politicians satisfying the demands of constituencies, particularly those who have suffered in the marketplace. Local politics is certainly aggregated differently in each country because of differences in bureaucracy and party. Nonetheless, the common feature, claims Kernell, is that "rather than implementing some comprehensive strategy of growth, [policy in each country] offers protective cover to ailing and favored sectors of the economy through trade protection, sympathetic commercial regulation, and direct subsidy" (p. 328). Kernell provides an interesting and helpful analytic framework for examining the place of local politics and the mechanisms of political aggregation in the two countries. Kernell's position is not "tested" by the essays but, rather, is an interpretation of, and approach to, the material discussed. One problem with Kernell's approach is that the two particularisms, Japanese and American, produce quite different economic results. A complementary theme, not an alternate one, would be to identify the distinct policy results and ask why the common particularisms of local politics produce such distinct outcomes.

Losing Time, by Otis Graham, is a contemporary history of the industrial policy debate. In a sense, it depicts the story of the economic option that was not adopted in the 1980s, an alternate path to that chosen by the successive Republican administrations. It traces the intellectual and political debate. The detail will be a useful resource for those constructing the story of the politics of American economic decline. Although a carefully constructed history, the book would have benefited from an analytic framework that set the contemporary story in a historical context and provided an interpretation of the domestic politics of the period and an independent interpretation of the competitive and trade problem.

By contrast, Jagdish Bhagwati's *World Trading System at Risk* is a sharply focused defense of the multilateral trading system organized around the General Agreement on Tariffs and Trade (GATT). It is articulate, well crafted, and very frustrating. Bhagwati has an important case to make; and at the core, it is one I would largely agree with. The multilateral trading system has made great contributions to our economic welfare and is now at risk from demands for protection and strategies for advantage. A number of his proposals to reform the GATT system are useful and interesting places to begin discussion. The difficulty is that he dismisses outright the concerns underlying the demands on governments to protect or promote in ways that might threaten the GATT. Those concerns emerge from a vision of trade and an understanding of the terms and consequences of competition that differ from his. The form and language of his arguments preclude debate about the dynamics of trade, what the exact risks to (not just sources of strain on) the trading system are, or what solutions might be appropriate. He presents his arguments as if they were theoretically, analytically, and empirically dispositive. Those who would disagree with his characterization of the problems or seek other lines of solution are, in his view, apostates, holders of false beliefs. Bhagwati argues that "facile views of Gatt's impotence" are given fuel by "ignorant prattle by academic economists . . . unburdened by historical knowledge, scientific expertise, and the sustained scholarly reflect[ion] that these matters require." The list of those criticized directly in the book for various sins including theoretical fallacies (and presumably therefore spewing such ignorant prattle) include such journalists as Robert Kuttner and Jim Fallows, as well as political scientists. The economic credentials of the political scientists and journalists may be easily challenged. But also on the list are such outstanding economists as his Massachusetts Institute of Technology colleagues R. Dornbusch and Paul Krugman; Harvard economist (presently vice-president for economics at the World Bank) Lawrence Sommers; and my colleague, Laura Tyson. Many of us would share his basic concerns. His analysis and his policy prescriptions would gain greater weight by truly engaging the issues, rather than disposing of them with rhetoric. Some examples are helpful.

Consider the place of Japan in the trading system. Is Japan—the world's second largest economy with advanced and sophisticated technology and some dominant industries—continuing to follow developmental strategies that insulate its market from foreigners and promote domestic firms to create advantage in global markets? If so, competitor governments will attempt to defend their firms and competitive position with protection. The GATT will be strained. But in Bhagwati's eyes Japan either is an open, liberal economy or at least is distinct in ways that are not crucial to the trade debate. Consequently, the problem for Bhagwati are Japan-bashers, not Japan. Maybe he is right and Japan is fundamentally an open liberal economy, or at least an economy whose distinct domestic approaches are not crucial to trade issues. But the notion that Japan's protected markets were crucial to its success in the past and remain important to creating advantage and managing declining sectors is not so easily dismissed. Certainly, the debate about nontariff barriers makes argument and evidence complex. Perhaps the allegations are as hard to disprove as they are easy to make, but that does not make them wrong. Bhagwati's Japan is close to that of Sakakiabara in *Parallel Politics*. Shimada's Japan in the same volume fits the model of the Japan-bashers. Arguments by Murakami and Yammamura that Japanese business structure and policy drive a pattern of excess competition, domestic market saturation, and resultant policy intervention and dumping are never confronted and are hardly the fantasies of American Japan-bashers. The technical debate over econometric studies of Japan's trade, some of which suggest not only

discrimination but a very unique pattern of trade, is swept aside by the assertion that "the best crafted studies" favor the view that Japan's trade patterns are not distinct. Perhaps; but others, such as Bela Belassa and Edward Lincoln (former director of the Japan Economic Institute and hardly a first-line basher) would disagree about substance and methodology. They offer very convincing alternate interpretations of the data that Bhagwati introduces. There are strong and legitimate alternate positions, and Bhagwati cannot simply wave them away.

Or consider the debate on strategic trade theory. Bhagwati is concerned that these arguments, if misused, can justify protection. I would agree and argue that the marriage of strategic trade theory and arguments about technological externality can produce a potent ideological brew justifying first-strike economic strategies with protectionism as a core. But that does not make the arguments wrong. To ignore the technological externalities gained by winning a position in sectors that use large volumes of emerging new technologies (a gain that Bhagwati either avoids or denies) requires dismissing the conclusions of a range of economists including Christopher Freeman, Richard Nelson, Paul Winter, Giovanni Dosi, and many others. There are issues here that the trade regime must confront. The best way would be through an agreement on multilateral rules for investment and intellectual property (as Bhagwati and Sylvia Ostry argue); but it may be tough to reach agreement and even tougher to agree that the deals are being kept.

It is unfortunate that Bhagwati's case is not made in the language and style that permits sensible discussion and debate. The debate is an important one, extensive common ground is possible, and the remaining issues for debate are important and fascinating. For the reader intrigued by Bhagwati's views, I would commend his earlier book *Protectionism*. My substantive disagreements remain; but in this previous volume, Bhagwati makes his central case in a more sustained and reasoned way.

University of California, Berkeley JOHN ZYSMAN

In the Name of Democracy: U.S. Policy toward Latin America in the Reagan Years. By Thomas Carothers. Berkeley: University of California Press, 1991. 309p. $29.95.

The major question Thomas Carothers addresses is, Did Reagan administration policy promote or hinder the development of democracy in Latin America? Based on more and less detailed chronological reviews of administration policy toward over a dozen countries, his answer is a "qualified no" (p. 249). By Carothers' accounts, the qualifications are indeed minimal. In El Salvador, for example, administration policy, which strengthened the corrupt and "profoundly anti-democratic" military, had "adverse effects with respect to promoting democracy" (pp. 44–46, 251). Even the administration policies that for Carothers represent the "farthest point of evolution with respect to promoting democracy" do not receive high marks (p. 150). For example, U.S. assistance was only a "minor factor" in the success of the 1988 Chilean plebiscite campaign; and in Paraguay, the U.S. role in ousting Stroessner was "small" (pp. 163, 166).

Carothers addresses two subsidiary questions in less detail. First, why did the Reagan administration adopt such a strong stance toward promoting democracy in Latin America? Most of Carothers' answers are not especially surprising. Among other things, the administration promoted democracy to persuade reluctant members of Congress to approve requests for military aid, to garner support for its anticommunist policies from a public wary of such crusades, and to alter the conditions giving rise to leftist movements and social instability. Carothers also contends that the administration's stance on democracy resulted from a tendency in U.S. foreign policy making for "rhetoric to influence reality": Once the administration publicly linked its policies to democracy, it came under pressure to match its pronouncements with substance (p. 244).

What did the Reagan administration actually meant by democracy in Latin America? is the second subsidiary question of concern to Carothers. He concludes—again, not surprisingly—that the administration's definition was a hyperformalistic, electorally focused, top–down version of what conventional, Western political science understands by the term. The conception was so narrow that it allowed governments exhibiting any measure of corruption, disdain for human rights, and control by military and economic elites to be classified as democracies.

People moderately knowledgeable about U.S. relations with Latin America will not learn much new from Carothers' country-by-country summaries of U.S. policy. Nonetheless, the book is useful in providing an accessibly written, one-stop description of U.S. policy toward many nations over an entire decade. Throughout these discussions, Carothers highlights divisions within the administration, thereby enlivening his accounts considerably and helping him explain subtle policy shifts over time.

The book's strongest and most original chapter deals with political development assistance programs, with which Carothers has intimate knowledge because he worked with Agency for International Development beginning around 1985. This chapter discusses both the National Endowment for Democracy and the spinoffs of Reagan's Project Democracy initiative; and it makes it even more clear why Carothers' assessment of the administration's contribution to democracy in Latin America is largely negative. Taken together, the National Endowment for Democracy and the Project Democracy spinoffs constituted the heart of the democratic development component of administration policy. Yet these programs were minuscule compared to administration spending on military programs; and major portions of them were directed toward such activities as police training and counterterrorism. Finally, Carothers shows why the Reagan administration per se deserved less credit for these democratic centerpiece programs than might seem to be the case. For one thing, many of the Project Democracy spinoffs succeeded in accomplishing their modest goals only because of the informal efforts of individual career officers in the Agency for International Development and other agencies, many of whom had served in their capacities before Reagan's election and remained after he had departed.

Unfortunately, Carothers made a series of research choices that limit his book's value. First, though much of his discussion is based on interviews with past and current U.S. officials, Carothers shares little about these

interactions or his respondents (e.g., when the conversations took place, how many people he talked to, or how or why he selected them). As a consequence—and especially since most of those he interviewed declined to speak on the record—readers are forced to remain particularly skeptical of many of Carothers' assertions.

Second, the author chose not to deal with U.S. policy toward Cuba, despite the country's relevance to his topic. For one thing, the administration played relentlessly on the democracy theme vis-à-vis its Cuba policy. For another, Carothers notes, time and again, how the perceived threat from that country was foremost on the minds of administration officials as they sought to develop policies toward many of the countries he does discuss. The author's decision to ignore U.S. policy toward Cuba, even while including treatments of U.S. policy toward countries of inarguably less significance, produced a noticeable and unnecessary gap in the book.

Third, Carothers made some unfortunate and poorly justified choices in his use and treatment of some key concepts. The first was to ground his critique of Reagan's policies in a conventional, Western political science definition of democracy, rather than in a broader, more inclusive understanding of the term that would link politics and policies to social and economic considerations. Second, he failed to take seriously enough his own goal of disentangling the rhetoric and reality of administration policy. Rather, his tendency is often is to confound the two.

Carothers' choices on these two matters are related to the book's most serious shortcomings. Often, the author's critiques fall flat and his analyses lack sharpness. There seems to be an odd mismatch between his forceful descriptions of policy development and implementation and his bland evaluations of these processes. At times, it is almost as if one were reading two different books. Finally, Carothers is left with an inadequate stock of tools with which to make sense of his data, forcing him, time and again, to retreat into additional, more detailed presentations of facts and events. The upshot is a book that, in my view, is too long on description and too short on insightful explanation. It is primarily at the moments Carothers' allows himself to distinguish clearly between rhetoric and reality and to make connections between politics and the social and economic contexts in which they are embedded that his book is at its best.

University of Oregon LINDA FULLER

Exploring Realpolitik: Probing International Relations Theory with Computer Simulation. By Thomas R. Cusack and Richard J. Stoll. Boulder: Lynne Rienner Publishers, 1990. 209p. $32.00.

Cosmologists and international relations theorists are faced with the "$N = 1$" problem: while they can study subsystems, only one example of the overall system exists. Computer simulations provide one route out of this conundrum. Just as cosmologists can simulate the aggregation of scattered atoms into stars and galaxies, so computer models of political consolidation can show the development of states from smaller territorial units through conflictual interaction.

Cusack and Stoll present a systematic and detailed analysis of one of the best known of these models, based on Stuart Bremer and Michael Mihalka's "Machiavelli in Machina: Or Politics Among Hexagons" (1977). The idea of simulating political aggregation through territorial conflict is a fairly general one. It had been anticipated by Michael Dacey in 1970, and a similar model for urban segregation was developed simultaneously by Thomas Schelling in *Micromotives and Macrobehavior* (1978).

Cusack and Stoll use the model to explore a number of questions raised by realist theory, in particular, how far power-oriented self-interest creates an "invisible hand" that prevents a multistate system from degenerating into a single "empire." The book includes a chapter-length, amply footnoted discussion of realism, including many of its classical, neo-, and post- variants. The authors find realism to rest on a "fractured" and disparate foundation, though this may be due in part to their casting a net so wide as to include as "realist" virtually all theories that posit the use of "power."

The model contains a variety of parameters such as the accuracy of power estimation, the cost and destructiveness of war, and the variance of power growth rates, as well as several different decision-making rules. This project, though spun off from the GLOBUS simulation, (an elaborate and highly parameterized model), is relatively parsimonious. The analysis is further focused by concentrating almost solely on the question of multistate maintenance. The impact of the parameters is analyzed using statistical analysis on the simulation outcomes following a sophisticated experimental design involving tens of thousands of simulation runs.

The general behavior of the simulation proves remarkably insensitive with respect to most of its parameter values. While each has some influence, by far the most important is the function relating the ratio of the power of two antagonists to the likelihood of victory. In the basic model, multistate systems are reliably sustained only when victory requires a very high ratio; otherwise, about 50% of the simulations coalesce into a single empire.

The experiments with the decision rules, on the other hand, produce a variety of behaviors. Collective security systems and, to a much lesser extent, balancer systems are more likely to preserve states than simple power seeking. While this is a plausible result, the authors note that some theories have argued against collective security efforts as needlessly exposing states to risks. The model thus usefully distinguishes among theories. Expected utility maximization, alliances, and internal revolt are some of the other behavioral variations explored with the simulation.

How realistic is this model? To the extent that one is interested in territorial aggregation determined by relatively simple rules involving comparison, maximization, and occasional expected utility calculations using power, the model is probably quite robust. While there is more to realism than just these calculations, the model provides a systematic exploration of behaviors that are all too often simply assumed in realist theory. Granted, the model says nothing about the Rio Summit or the Uruguay Round; but it probably says a lot about Yugoslavia, Armenia and Ethiopia.

Even the tendency of the model to result in empires may be consistent with observed behavior. The units in the simulation need not be Westphalian states; they require only power, territory, and autonomous decision making. The evolution of a decentralized system into a "universal empire" was observed in subsystems such as Tudor England, fifteenth-century Spain, Tokugawa Ja-

pan, and China in 1945–50. The apparent stability of the multistate system we see today may be due in part to prior periods of "imperial" aggregation within its subsystems.

Most of this work was done prior to 1989 and focuses almost entirely on aggregation. While one cannot expect prescience of the authors, it would be very interesting to see greater attention devoted to the issue of dissolution of units through internal instability. Fortunately, since the computer code for the simulation is available from the authors and can be run on any reasonably powerful personal computer, such experimentation is possible for other researchers.

In summary, Cusack and Stoll provide a thorough analysis of a basic model of political power, decision making, and territory. It is neither the first nor the last word on the subject but provides a useful baseline for further experimentation and is to be recommended to individuals interested in formal models of international behavior.

University of Kansas PHILIP A. SCHRODT

U.S. Foreign Policy and the Shah: Building a Client State in Iran. By Mark J. Gasiorowski. Ithaca: Cornell University Press, 1991. 242p. $35.00.

American Presidents and the Middle East. By George Lenczowski. Durham: Duke University Press, 1990. 321p. $40.00 cloth, $17.95 paper.

It is becoming increasingly commonplace among political scientists to recognize the impact of domestic politics on international politics, and vice versa. The two books under review represent the intricacies of this dialectical relationship. The volume by Lenczowski looks at how American presidents from Truman to Reagan have articulated their foreign policy toward the Middle East in light of domestic considerations at home. The book concentrates on the eight presidents' perceptions, priorities, and policies vis-à-vis the Middle East. However, as the author informs us early on, this is not "a psychopolitical analysis of the presidents' personalities and motivations" (p. 5).

Drawing on over 40 published memoirs by presidents, secretaries of state, national security advisors, and ambassadors, as well as Israeli, Egyptian, Iranian, and British statesmen, Lenczowski provides a lucid amount of how post–World War II American presidents viewed the Middle East. He identifies containment of the Soviet threat, survival of Israel, and accessibility of oil supplies as the three constant concerns of American policymakers in the region (p. 281). Lenczowski maintains that the first was considered to be the most important, while the priority of the other two fluctuated depending on the administration in power.

Although *American Presidents and the Middle East* deals with a host of international crises originating in the Middle East (Suez, Mosaddeq's oil nationalization, the civil war in Yemen, Cyprus, and the Soviet invasion of Afghanistan), the central focus of the book is the Arab–Israeli conflict and U.S. involvement in it. The author pays particular attention to the pressures put on successive U.S. administrations by Israel and the American Jewish community. We are told of Truman's "misgivings and caveats" about supporting Zionist objectives (p. 26); Eisenhower's standing up to Israeli pressures; and Johnson's unequivocal support for Israel, which he regarded as a "strategic asset." Furthermore, Lenczowski insists that Nixon and Reagan's desire to appease strong constituencies at home and their Cold War view of the Soviet Union led them to seek closer ties between Israel and the United States. Overall, he considers Johnson as the most vulnerable, Eisenhower the most impervious, president when it came to domestic pressures (p. 280).

Lenczowski's work suffers from three weaknesses. Despite his treatment of certain domestic considerations and constituencies, many important factors and details are left out. The reader is not adequately informed of the compass of political impediments, interest calculations, domestic preoccupations, and partisan congressional agendas each respective president had to grapple with. The most conspicuous omission of the book, however, is any discussion of how presidents tried to build public support for their foreign policies at home in the midst of all these crises. Second, by relying exclusively on memoirs and certain official documents from the executive and the legislative branches, the volume suffers from its sparse source material. Considering the fact that political memoirs are more often than not marred by a sense of self-flattering and self-conceit, the author could have enhanced the value of his work by qualifying and corroborating his sources with other competent accounts that are available. Finally, Lenczowski does not refrain from interjecting his personal value judgements in the book. For example, he brands the Iranian Prime Minister Mosaddeq as "thirsty for power," his oil policy as "reckless" and his sense of nationalism as "misguided" (pp. 36, 64).

In contrast to Lenczowski's book, *U.S. Foreign Policy and the Shah* by Mark Gasiorowski deals with the exogenous determinants of domestic policy. In this original and highly competent book, Gasiorowski examines the nature and progression of the "cliency" relationship that emerged between the United States and Iran in the aftermath of the 1953 coup overthrowing Premier Mosaddeq. After defining *cliency* as "a mutually beneficial, security-oriented relationship between the governments of two countries that differ greatly in size, wealth, and power" (p. 2), the author provides a promising theoretical framework for how international cliency relationships can influence the domestic politics of client countries.

Gasiorowski's main argument is that economic aid and security assistance provided by patron powers to their client states empower the latter to seek autonomy from civil society. Lacking any societal constraints, the state can begin to defy all demands for political participation, thereby leading to serious unrest, instability, and even revolution. Henceforth, the initial intention of patron powers to maintain political stability in their often strategically located client states may inadvertently produce the opposite results.

In seven detailed chapters, Gasiorowski examines the nature of state formation in Iran over the last four decades. He maintains that the formation of the cliency relationship between the United States and the Shah and the rapidly augmenting oil revenues in the 1960s and 1970s helped to initiate and sustain a highly autonomous Iranian state in the prerevolutionary period. Gasiorowski contends that a mere 10 years after the overthrow of Mosaddeq, an autonomous Iranian state was firmly in place (p. 187). This state's premeditated use of repression as its most important autonomy-

enhancing mechanism contributed to the advent of the Islamic revolution.

In his analysis of the 1953 coup, which can quite properly be regarded as a turning point in modern Iranian history, Gasiorowski has left no stone unturned. Utilizing a wealth of recently declassified documents from the British Public Records Office, the U.S. National Archives and the U.S. Department of State, in addition to over 70 interviews with British, American, and Iranian officials and activists involved in the event, Gasiorowski has produced by far the leading study on the subject. Through his meticulous use of primary and secondary sources, Gasiorowski has authoritatively augmented our knowledge of that tempestuous event and its tragic aftermath.

This book, however, is not without its shortcomings. Many political economists would argue with Gasiorowski's assertion that cliency was more important than oil as a determinant of state autonomy. It is highly doubtful whether the state could have sustained its autonomy from civil society to such a degree and for such an extended period of time without the petrodollars. One should not lose sight of the fact that the financial largess of the state, provided to it by oil exports, enabled it to coopt an already-subdued polity. Second, the author's identification of the National Front (led by Mossadeq) as the main political organization of the modern middle class (p. 84) may be somewhat of an oversimplification, considering the eclectic constituency base of that party, which drew support from disgruntled *bazaaris* and the Qashqai tribe, in addition to the urban secular middle class.

Lenczowski and Gasiorowski respectively demonstrate that a great power can be pressured by a small ally and its vocal domestic supporters and that patron states should beware of enabling client states to become highly autonomous. Their virtue resides in the fact that by making the confluence of domestic and international policies problematic, they can provide all students of foreign policy with much food for thought.

Syracuse University MEHRZAD BOROUJERDI

Pathways from the Periphery: The Politics of Growth in Newly Industrializing Countries. By Stephan Haggard. Ithaca: Cornell University Press, 1990. 276p. $12.95 paper.

Stephan Haggard seeks to compare the development policies of the East Asian "tigers" (Korea, Taiwan, Hong Kong, Singapore) with those of two Latin American countries (Brazil and Mexico) and to account for the differences. More than that, however, he wants to explain the policy changes adopted in each of the countries during the postwar era.

The East Asian strategy of export-led industrialization has been much more successful than the import substitution strategy (ISI) adopted throughout Latin America. But Haggard points up an interesting paradox. Among the reasons ISI was instituted in Latin America was the belief—shared by technocrats and representatives of the organized working and middle classes—that ISI in a protected national market would allow for higher average wages and, consequently, greater distributive equity and less dependence on forces beyond national control. Export-led industrialization, in contrast, was thought to entail severe wage restraint and dependency. Yet the outcomes have been the diametric opposite of these expectations: the data cited by Haggard show clearly that all but one of the "tigers" score higher than the Latin Americans on Gini measures of distributional equity and on quality-of-life indexes such as average level of education, longevity, and infant mortality rates.

Haggard, in seeking to unravel this paradox, is mindful of the impact of international forces and pressures. He notes, for instance, how both Korea and Taiwan actually began their industrial development along ISI lines but then shifted to export-led industrialization as declining U.S. economic assistance made the former policy less viable. However, his explanatory framework prioritizes domestic factors, since no theory of the international system can explain policy differences between developing countries whose situations are otherwise similar. For Haggard, the key domestic factor is the structure and capabilities of the state: in some countries, "political elites have inherited or built organizational structures that significantly constrain the ability of societal actors to achieve their political and economic objectives" (p. 3). This is important because successful development requires more or less drastic policy changes to adapt to changing world conditions or redress demonstrated failures. But any strategy of development creates social forces with a stake in it; and if those forces are well organized and politically mobilized, their tendency is to use their political power to block changes that would adversely affect their interests.

Consequently, the study of development policy becomes the study of efforts by ruling elites to build supporting coalitions in the context of a set of state institutions "that provides differential incentives for groups to organize. Because of variations in institutional structure, political elites differ in their organizational capabilities and the instruments they have at their disposal for pursuing their goals. . . . It is at the intersection of choice and institutional constraint that political explanations of economic growth must be constructed" (p. 4). Hence, Haggard eschews rational choice approaches to explaining policy output, although he admits that they can shed light on the actions of the contending societal groups.

This position reduces to restating development policy choice as a collective action problem along the lines discussed by Mancur Olson: when societal groups can organize to influence policy, they form coalitions to secure benefits for themselves and thereby restrict both the state's ability to choose among available policy options and the coherence of policy itself. Haggard thus returns us to the argument of the 1960s (which much of the subsequent literature has been at pains to refute) that development may be less than fully compatible with an early broadening of democratic norms and institutions. To be sure, Haggard is not an advocate of all political authoritarianism, since he knows that such regimes may be penetrated by dominant groups with partial interests. In Latin America, where this penetration has been frequent, "the association between industrial strategy and authoritarian rule . . . appears to be weak" (p. 255). Rather, the authoritarianism he favors is the sort labeled "state autonomy." The most effective development policies, he avers, are products of "those regimes which limit autonomous political organization and public contestation," whether through the direct use of state power or via corporatist controls (pp. 44–45).

It seems to me that Haggard is tacitly assuming that the authoritarian order is led by people who are both aware of, and devoted to, the public good—or at least have an interest in a form of development that will benefit a wide range of social sectors. It also seems that he has presumed a high degree of administrative expertise at the disposal of these leaders. (Although the cases he has chosen give him no reason to make the point explicitly, he plainly excludes personalist authoritarian regimes like, say, Mobutu's in Zaïre or Somoza's in Nicaragua.) But what about communism, which would seem to meet all the requirements of a "desirable" form of authoritarian control? To say that communism failed owing to its rejection of markets and fear of the international economy begs the question; for that answer implies the significance of leaders' *beliefs* about the nature of the world and the kind of society they want to build, and Haggard does not discuss such beliefs, how they are formed, or how they are affected by international influences. While he makes mention of "economic ideologies" (pp. 46–47), these are professional understandings of economics and policy, transmitted through international professional networks and institutions. They are not the worldviews and moral interpretations of social reality that we usually mean when we employ the term.

There are, of course, many other reasons why committed democrats will not rush to embrace Haggard's claims. One is the present coincidence between the restoration or strengthening of Latin American democracy and the most serious effort yet undertaken in the region to undo the excesses of statism-cum-ISI. A second is the suspicion that the political practice of subordinate social groups may be informed by stronger democratic impulses and a better sense of the general welfare than we have assumed. Richard L. Sklar is attempting to build a theory on just this basis ("Developmental Democracy," *Comparative Studies in Society and History* 29[1987]). His efforts remain at a preliminary stage of exposition; but, in my opinion, they are already fruitful enough to give us pause.

Haggard's book should serve well as a text for graduate and advanced undergraduate courses in development policy. It may not be the last word on the subject. Apart from its uncertain view of political democracy in developing countries, its relative inattention to class forces deprives it of explanatory power in regard to underlying processes of social and political change. But students will learn the truth about the industrialization of East Asia—that is, that this process depended and still depends on heavy state intervention—and will profit from the comparisons between East Asia and Latin America. They will also be stimulated to reflect on the thought that the shortest distance between the objective of equitable development and the result may not be a straight policy line.

Dartmouth College DAVID G. BECKER

Peace and War: Armed Conflicts and International Order 1648–1989. By Kalevi J. Holsti. New York: Cambridge University Press, 1991. 379p. $54.50 cloth, $15.95 paper.

Focusing upon foreign policy issues, particularly those over which states fight violent conflicts, Holsti attempts a systematic treatment across three-and-a-half centuries. This in itself is a stupendous exercise. Link the size of this empirical effort with the amount of knowledge required to make the analysis meaningful politically and the conclusion must be that this is a major work of scholarship indeed.

The book combines empirical research on international relations with diplomatic history; assessment of foreign policy treaties and their aftermath; and the strategic outlook of statesmen, that is, political realism with an admixture of idealism. Further, study of the assimilation of defeated hegemonic states is an important dimension of this work. Holsti carries the examination of the Peace of Westphalia (1648) and the Treaties of Utrecht (1713), each of which ended and began a new system, through the more familiar Congress of Vienna (1815), Peace of Versailles (1919), and the San Francisco treaties that led to the establishment of the post-1945 bipolar system. Contained within these portentous treaty constellations are the issues over which the prior system collapsed and a new system was born.

A great attraction of the book is how it unearths the visions of the architects of statecraft like Stanhope and Talleyrand, Metternich and Castlereagh, as well as those of the rogues like Hitler and Stalin. By staying close to the individuals who made foreign policy, this assessment of international relations possesses authenticity.

Perhaps the highpoint of Holsti's writing comes with his evaluation of the thought of Woodrow Wilson. Wilson was enigmatic. He was magnanimous and punitive. He was interventionary (in Latin America) yet the opponent of power politics at Versailles. He was a dreamer yet ruthlessly disregarded the concerns of Lloyd George and Clemenceau. He was a great proponent of public opinion yet remained ignorant of the opinion at home and in the Senate that would kill his grand idea. Wilson was the hero of self-determination and democracy at a time when neither could be fully effected and when the greatest danger still lay with old-fashioned nationalism and dictatorship. Still today, it is Wilson, more than perhaps any other diplomatist, who has left an imprint on the theory of international relations, showing that a world of democracies is less likely to be war-torn than its contrary.

According to the descriptive statistical findings Holsti reports, the place of territory in the disputes of governments has declined. Territory as an issue has gone from a high of about one-quarter of the total disputes in the seventeenth and eighteenth centuries to less than one-tenth in the late twentieth century. This finding could lend support to the notion of the demise of the territorial state. But if one combines all of the other categories of issues involving territory—namely, strategic territory, territory (boundary), national liberation as state creation, national unification and consolidation, secession as state creation, and territory per se—the inference is quite different. Together, territory in this larger sense accounts for about a third or more of all issues throughout the period. Territorial dispute remains, in its many forms, the most problematic issue facing states today.

Despite the great conceptual and empirical difficulty of determining how many foreign policy issues pertain and which issues are more central in any given dispute, Holsti possesses a data set that, when further analyzed, may produce other important insights. For example, the relationship between the size and seriousness of an armed dispute and the issue or issues at stake is of great interest. It is to be expected that certain core issues

regarding role and status, as well as security, will predominate in the most violent and major of confrontations. Holsti has not yet tested this hypothesis, though he might.

Combined with its astute investigation of the attitudes of the statesman, the empirical findings of this pioneering work make this book rich ground for subsequent theory development.

Elaborated in the final chapters is the difference between the system of the advanced industrial states (virtually the central system, or the great-power system, in other parlance) and the system of states in the Third World. Surely, Holsti is correct that governments within each of these systems or subsystems pursue some divergent foreign policy aims. His assertion that the former is preoccupied with avoidance of nuclear war while the latter is more focused upon the problem of the security of the state and the survival of the governmental regime is undoubtedly correct. Though nuclear proliferation may yet blend these heretofore divergent subsystemic anxieties, nevertheless, to the extent that the types of conflict differ for each subsystem, so may the reasons for war.

A full incorporation of other approaches to world politics with the splendid empirical assessments of this volume promises many further insights into the cause and results of aspirations to world order.

Johns Hopkins University CHARLES F. DORAN

Dominoes and Bandwagons. Edited by Robert Jervis and Jack Snyder. New York: Oxford University Press, 1991. 299p. $37.50.

During the Cold War, the domino theory and a series of related metaphors (e.g., "rotten apples in a barrel," "weakest links in a chain," etc.) lay at the heart of American foreign policy in small countries around the world and largely accounted for the pattern of U.S. intervention in Third World revolutions, especially in Vietnam and Central America. The domino theory held that decisive action had to be taken to prevent the fall even of small countries of little or no intrinsic political, economic, or strategic significance lest the fall of such countries set in motion a chain of events inexorably leading to communist takeovers in country after country throughout entire regions. Indeed, the consequences might even be global, for falling dominoes might undermine the credibility of U.S. commitments elsewhere, leading to a "bandwagoning" effect as neutral states and even allies rushed to accomodate the apparently inexorable communist wave.

Despite its critical significance to American foreign policy in the Cold War—and indeed (as Snyder and Jervis show) to the policies of great powers throughout history—there have been remarkably few systematic, scholarly analyses of the domino theory or empirical/historical evaluations of its validity. This excellent book has gone a long way to fill the gap, though there still is a need for detailed historical case studies (e.g., for Vietnam.

In their introductory and concluding chapters, Jervis and Snyder provide historical and theoretical overviews of the domino theory, bandwagoning, and related metaphors. The other essays, all of them first-rate, include analyses by Stephen Walt and Deborah Welch Larson of bandwagoning, balancing, and alliance formation; Douglas J. Macdonald's discussion of the domino theory during the Truman administration; Ted Hopf's assessment of the Soviet Union's reaction to the domino theory; and other analyses of Soviet policy in the Third World by Douglas Blum, Richard Herrmann, and Milan Hauner.

While there are some differences among the contributors, most are very skeptical of the domino theory. The most important overall conclusion is that while, historically, there have been some circumstances where dominos have fallen or states have jumped on bandwagons (e.g., Eastern Europe, 1989–91), much more typically, the theory fails to predict the behavior of states. There are a variety of reasons for this, including the inapplicability of events in one country or region to very different circumstances in other countries or regions, as well as the power of nationalism in creating obstacles to expansionist states or ideologies. Beyond that, one of the most important arguments of the authors (especially Jervis, Snyder, and Walt) is that the domino theory is more often a self-denying, than a self-fulfilling, prophecy. When the first in a feared chain of dominoes fall (as happened in China in 1949, in Cuba in 1959, and in Vietnam and Angola in 1975), neighboring states are much more likely to balance than to bandwagon—that is, they shore up their alliances, rebuild their military power, take preventive action to avert revolution, and so on. Moreover, as Hopf demonstrates, after Vietnam, Soviet behavior in the strategically significant areas of the world was more cautious, rather than more aggressive; for Moscow correctly anticipated that the West would redouble its efforts to prevent any significant shift in the global balance of power.

For these reasons, then, the fall of Vietnam in 1975 had little lasting effect on the Cold War conflict. Some neighboring small states of no intrinsic significance quickly succumbed to communism (Laos, Cambodia); and there was a brief surge of Soviet support for a handful of Third World revolutions elsewhere, especially in Africa; but there was no widespread collapse of dominoes. Even in Asia, none of the large or truly important states, like Japan or India, were affected; and there was certainly no loss of U.S. credibility or rush to accomodate elsewhere, as in Europe or the Middle East. Jervis persuasively explains why: "The domino theory exaggerates the role of reputational interests in determining the outcomes of confrontations and the inferences observers draw and commensurately underestimates the importance of intrinsic interest. . . . States seem able to separate peripheral from vital interests" (p. 42).

There is little reason to think that assessments of the domino and bandwagoning theories have lost their relevance in the post–Cold War era. As the authors demonstrate, in all historical eras, there has been a tendency for dominant powers to adopt domino theories in order to justify interventionist behavior. Precisely because of the collapse of the Soviet Union, the United States is militarily even more dominant than ever. Therefore, it is still vulnerable to the imperial temptations that ultimately account for the domino theory.

State University of New York, Buffalo JEROME SLATER

The New European Community: Decisionmaking and Institutional Change. Edited by Robert O. Keohane and Stanley Hoffmann. Boulder: Westview, 1991. 208p. $49.95 cloth, $14.95 paper.

Euro-politics: Institutions and Policymaking in the "New" European Community. Edited by Alberta M. Sbragia. Washington: Brookings Institution, 1992. 303p. $32.95 cloth, $14.95 paper.

The New European Economy: The Politics and Economics of Integration. By Loukas Tsoukalis. New York: Oxford University Press, 1991. 333p. $52.00.

The titles of these three volumes have in common the word *new,* in recognition of the momentous changes that have taken place in the European Community (EC) since the mid-1980s. The writings found in them may be characterized as representing "new thinking" on the institutions, policymaking and economics of the EC as of the early 1990s. With the exception of Stanley Hoffmann, the writers are also "new" to the debates regarding the nature of the beast, debates that raged in the 1960s and then exhausted themselves during the period of Eurosclerosis of the 1970s and early 1980s.

The volume edited by Hoffmann and Robert Keohane contains essays written in 1989 and 1990 that sought to gain better theoretical purchase regarding the genesis and political meaning of the 1986 Single European Act (SEA). The other two works were produced during the period of the intergovernmental conferences (1990–91) that led up to the Maastricht summit of December 1991.

Although the discussion brings fresh perspectives to bear on new phenomena, the books edited by Keohane and Hoffmann and by Sbragia, written mostly by political scientists and addressing essentially political topics, are haunted by the specter of the earlier debates, particularly in their frequent uses of the terms *neofunctionalism, neorealism, intergovernmental,* and *supranational.* The best job of sorting these terms out is done in the Sbragia collection by David Cameron in his essay "The 1992 Initiative: Causes and Consequences." The first two terms are treated by Cameron as labels for theoretical perspectives, while the latter two are applied to EC institutions. Basically *neofunctionalism* highlights the role of "supranational institutions," particularly the EC Commission, in making decisions that in Ernst Haas's terms, "upgrade the common interest" among member states. *Neorealism* emphasizes the role of "intergovernmental institutions" (the Council of Ministers and, esp., the European Council) in arriving at decisions that express the "lowest common denominator" of agreement among members.

In their introductory essay, Keohane and Hoffmann argue that none of these terms exactly applies to how decisions are made in the EC today. Neofunctionalism produced the "spillover hypothesis" that predicted a strengthening of supranational institutions as a result of the consequences of EC policies pursued in one economic sector for the performance of the member countries' economies in other sectors. Spillover and the even more economically deterministic "international political economy" hypothesis would have predicted a strengthening of supranational institutions during the economic crises of the 1970s to address the dislocations produced by the energy crises and national macroeconomic policy failures. They acknowledge that development of the European Monetary System (EMS) in the late 1970s provided the hypotheses partial support. However, swifter progress toward the internal market and a full Economic and Monetary Union (EMU) should have occurred but did not. They do not make a similar effort to weaken a third hypothesis, which they label "preference convergence," namely, the prediction that decisions will be reached only if the preferences of member states converge. This stems from neorealist premises and stresses intergovernmental institutions. Nor do they suggest that the convergence which occurred in 1984–85, making the SEA possible, was brought about by factors common to the principal actors. This sets the stage for the next essay, by Andrew Moravcsik, which gains attention from Cameron and other writers in the Sbragia collection.

Moravcsik makes a strong case for the preference convergence hypothesis, couched in the sense that member states can be expected to reach only the lowest common denominator of agreement. In the case of the SEA, the principal actors on which a neorealist would focus are West Germany, France, and Britain. Moravcsik details the preferences of the Mitterrand administration and the Thatcher government that converged on the SEA, a package agreement that combined the elimination of barriers to the EC internal market with relaxation of the unanimity convention regarding Council of Ministers voting on most pieces of internal market legislation. Prior to the agreement, France and West Germany had acquiesced in a budget agreement that went a long way toward satisfying Britain's complaints about EC funding burdens. While there was substantial agreement among the three as to the desirability of the market-freeing aspects of the SEA, Moravcsik's analysis makes it clear that France and Germany gave ground on the budget issues (esp. France, given the decision to lessen the Common Agricultural Policy share of the budget), while Britain gave ground on the voting procedure issue. This suggests more an upgrading of the common interest than the arrival at the lowest common denominator of agreement among the three. However, this is not to disagree with Moravcsik's more general contention that member governments acting within intergovernmental institutions played the decisive role in the process.

Other writers in the two volumes are more reserved on that score, since they pay more attention to the role played in the formulation of the SEA by the European Commission, as the leading supranational institution. Cameron argues that the commission was laying the groundwork for the SEA with specific internal market proposals during the early 1980s when the member governments were confining themselves to broad statements of intent, rather than to the concrete actions that began with the Stuttgart summit in 1983. This was before Jacques Delors became commission president at the beginning of 1985. Cameron appears to agree with Moravcsik that Delors's role could not have been decisive before the June 1985 Milan summit. But that was the point at which the package deal began to take shape, and Cameron believes that Delors played an important strategic role in bringing the deal about. In more general terms, Peter Ludlow, in his balanced essay "The European Commission" points to the "educative" role of commissioners in helping governmental leaders to "learn" of the necessity for common action to be taken to deal with common problems, a perspective that has neofunctionalist overtones. Cases in point, in addition to Delors in the latter 1980s, were the roles played by

Commission President Roy Jenkins in helping to bring about consensus in support of the EMS in the late 1970s and by Commissioner Etienne Davignon in fostering, in the early 1980s, industrial policy cooperation among major European companies that later supplied influential support for the SEA.

Efforts are made by other writers to transcend, or at least escape, the intergovernmental/supranational polarities as conceptual tools. In his essay "The EC Council," Wolfgang Wessels makes a distinction between the constitutional decisions and package deals made at the European Council summit meetings and the ordinary work of the Council of Ministers, involving "iron triangles" familiar to students of the American political system. In the Sbragia collection, *Europolitics*, B. Guy Peters makes a similar distinction in his essay "Bureaucratic Politics and Institutions of the European Community." According to Peters, there is "the level of very visible *haute politique*, in which the leaders of the member nations meet as the European Council to negotiate among themselves over the future shape of Europe," and a second level, that of "the bureaucracy functioning within the Commission" (p. 76). Wessels subscribes to the idea that innovative acts of the European Council, which others take as evidence of intergovernmentalism, are responses to economic imperatives that the heads of state and government take in common. Hence, the European Council has become a supranational body that upgrades the common interests. For his part, Peters resuscitates Martin Heisler's 1873 European Polity model as one appropriate for how intergovernmental bodies make decisions in the new era of qualified majority rule; that is, the motivation to join in common decisions and avoid isolation is stronger than under the unanimity rule. Thus, both the European Council and the Council of Ministers are more apt to reach decisions promotive of integration than to protect narrowly defined national interests.

More transcendent is the attempt by Alberta Sbragia in her concluding chapter to expand the concept of federalism to characterize what the EC is becoming in political/constitutional terms. According to Sbragia, the idea of federalism that has prevailed in the debates about the EC has been too narrowly influenced by the essentially unique brand of federalism found in the United States. Germany, where the member states are more powerful than those in the U.S. federal system, would provide a better model for understanding the EC today and for projecting it into the future. When theorists friendly to European integration have thought about an end-state, they have found it difficult to escape something like the U.S. version of federalism. As the EC moved further and further away from that model, especially as its intergovernmental features became more pronounced, such theorists came to despair of their desired goals' ever being achieved. Yet a looser, more flexible, concept might have served them better, in Sbragia's opinion.

Whether these imaginative efforts to go beyond the old debates will take on adherents would be impossible to predict at present. The rejection of the Maastricht Treaty by Danish referendum has highlighted the problem of the "democratic deficit," which Shirley Williams discusses with considerable insight in "Sovereignty and Accountability" in the Keohane and Hoffmann collection. Perhaps the problem of how to associate the mass public in what has been until now an essentially elitist set of institutions will come to preoccupy more students of the EC in the next decade; or perhaps it will be the problem of reconciling the internal market with the need to protect the "losing" regions, economic sectors, and social classes—a problem addressed in essays by Gary Marks and Peter Lange in the Sbragia volume. Such problems will likely be exacerbated with EC expansion, about which little of substance is said in either volume. Other supranational institutions are also considered: the European Court of Justice by G. Federico Mancini, a judge on the court (in Keohane and Hoffmann) and Martin Shapiro (in Sbragia) and the EMS in a sharply analytical essay by John Woolley (in Sbragia). Unfortunately, only a mention of these fine essays is possible here. In short, both volumes provide for political scientists a wealth of useful interpretations of recent complex and largely unanticipated developments.

For the political scientist who has difficulty mastering the complexities of EC economic policies, *The New European Economy* by Tsoukalis will be indispensable. While essays in the Sbragia volume by Cameron, Woolley, Marks, and Lange are written in a political economy mode by political scientists, they stress the political, more than the economic, factors operating in EC economic policymaking. Tsoukalis, an economist, provides a clearly written account of the economic factors at play while continually calling attention to political antecedents and consequences. As economists are inclined to do, he opposes the "market" and the "state," assigning efficiency to a free market and stability and equity to politics. His own preferences are by no means exclusively on the side of economic efficiency. Whereas writers in the Keohane–Hoffmann and Sbragia books concentrate for the most part on the issue of whether power is becoming more centralized in EC institutions, Tsoukalis addresses what may well be the more fundamental issue: Will the EC remain simultaneously a market-liberating "economic giant" and an economy-shaping "political dwarf"? He interprets the SEA and the steps toward the EMU as means by which the member states have been depriving themselves of the instruments of economic control without allowing the institutions of the EC to acquire compensating control measures of its own.

A "spillover hypothesis" that could be derived from Tsoukalis' analysis would suggest (1) that as the distributive consequences of the SEA reveal themselves, at least in times of recession, to be negative for competitively weaker firms, economic sectors, regions, and member countries, interest groups and governments affected will press for the acquisition of redistributive powers by the EC and (2) that as the EMU shows itself to be an effective means of maintaining price stability while removing the capacity of exchange rate fluctuation and the countercyclical uses of fiscal policy by member states to maintain stable economic growth without high unemployment levels, affected interests will seek a transfer of fiscal capacity from the national to the EC level. In both scenarios, EC powers would expand accordingly.

Tsoukalis' analysis shows that such neofunctionalist expectations remain dubious in the present context. Neither the social policy nor the revenue-gaining powers of the EC are as yet very impressive. Member governments are retaining their holds on both, even though their capacity to wield these policy instruments for purposes of redistribution and economic stabilization have diminished substantially since the 1960s. In other words, a reading of Tsoukalis leaves one skeptical about

whether the SEA and EMU are good examples of neofunctionalist spillover. More likely they represent a "spilling out" of political capacity into a void. If we follow Tsoukalis, then, without a strong Eurostate there can be no effective regional or industrial policy, no "Fortress Europe," no social corporatism, and (very likely) no public acceptance.

University of Missouri, Columbia DAVID M. WOOD

Adjusting to Reality: Beyond "State Versus Market" in Economic Development. By Robert Klitgaard. San Francisco: International Center for Economic Growth, 1991. 303p. $22.95 cloth, $11.95 paper.

Robert Klitgaard possesses a genuine talent for communicating with broad audiences about serious matters of public policy. As with his previous, highly successful *Tropical Gangsters* (1990), *Adjusting to Reality* explores themes of great interest to scholars and policymakers in an engaging and accessible way. In the case of *Tropical Gangsters*, practical problems of development assistance motivated the work; in this case, it is the problems associated with structural adjustment.

There is a serious analytic core to this book. The argument is grounded on the theory of market failure, in particular, the problems arising from imperfect information. Given market failure, Klitgaard emphasizes, it makes little sense to talk of a return to the market or of an abandonment of the state. In making this point, Klitgaard goes further than have others to offer specific steps that governments can take so that "government failure" does not merely replace "market failure" in the making of public policy. In making his case, Klitgaard draws from a variety of his own experiences. Most centrally, he works with materials from Bolivia and various parts of Africa. The skill with which he employs case materials imparts an immediacy and freshness to this work.

While there is thus much to admire in this book, there is also much to criticize. While engagingly written, well grounded analytically, and communicated with a sense of immediacy, the book comes across as superficial. There are several reasons. One is endemic to the development field—the tendency to advance single-factor explanations. Once it was population; at another time, the terms of trade; most recently, parasitic governments. In *Adjusting to Reality*, it is imperfect information. One can legitimately ask, Even if a government did all that Klitgaard says it should, would the economy grow? The answer is that we do not know, because so many other factors, besides the absence of high-quality information, are at work. Klitgaard's broader point—that there remains a broad role for governments, even in market-based economies—is, of course, a good one and well worth making. But by narrowing the argument to a single source of market failure, he threatens to make costly information the flavor-of-the-week in a field already too given to faddism.

A second reason the work will not ring true to many is that it is dangerously apolitical. In this book, there are decision makers but not politicians; there are policymakers but not presidents or generals who seek to use their control over office to build coalitions, win elections, or undertake those other steps that must be taken in order to stay in power. Suppose it true that if a government followed the recipes offered in this book, development would occur. One might still wonder whether all decision makers would be equally motivated to follow them. The factors that would influence the eagerness with which they would do so would be precisely those factors of interest to political scientists. They have been studied by such scholars as Ronald Rogowski, Jeff Frieden, Joan Nelson and company, Robert Kauffman, Steph Haggard, and many others—scholars who have focused on the *politics* of structural adjustment. They are not analyzed here.

The two criticisms can perhaps be more persuasively registered if they are combined. Suppose we focus on other sources of market failure—public goods, externalities, or imperfect competition resulting from the large size of "special interests." Then it would be inconceivable for politics not to become the central focus of the book. The policy counsel and technocratic solutions provided in this volume would be revealed for what they are—well-meaning, often clever, occasionally astute, but far too often politically unsophisticated.

I would use this book with undergraduates. It might be useful, as well, in public policy programs. It would not work well in graduate courses.

Duke University ROBERT H. BATES

France after Hegemony: International Change and Financial Reform. By Michael Loriaux. Ithaca: Cornell University Press, 1992. 314p. $36.50.

Even a dabbler in French political economy knows that before you can properly claim to know anything at all, you must first master the details, all of them, eccentric and obscure though they are and pointless though at first they seem. Michael Loriaux has mastered the details. He has also mastered their historical and political context and framed the whole with a credible theory.

Loriaux sets out to map the Labyrinth—that maze of relations among state, finance, and economy that marked the development of France after 1945—and not only to map it but also to show how it developed; why it could succeed for a time; what pressures it came under as the world economy unraveled in the 1970s; and why, ultimately, in an irony of ironies, a Socialist government was compelled to adopt liberalizing reforms beginning in 1983. He succeeds brilliantly at these tasks, providing a historical narrative that is a dense, sustained synthesis covering perhaps two-thirds of this work.

Ariadne's thread for the whole enterprise is a single concept, that of an "overdraft economy," characterized by assured access to credit for major economic agents. Loriaux argues that such an economy arose under the "hegemonic protection" of the United States, survived for a while, became sclerotic, and eventually crumbled as American protection was removed.

Whereas others, including myself, have emphasized the modernizing role of French state mechanisms from Monnet through Barre, Loriaux compels attention to a darker side. His focus is on the "insurance functions" of the state and on the "moral hazard" that arose as the state lost its way in its own net of implicit guarantees of economic and social position. In a country that after 1945, allowed state-influenced institutional credit sources to dominate it and then devolved social security

functions onto firms, the presumption of assured access to credit invited stasis. There were modernizing institutions, to be sure; but Loriaux argues that on balance, the system inhibited economic and technological adjustment and made France more vulnerable to the shocks of 1973 and after than it otherwise would have been.

As at the level of the firm, so at the level of the state. France itself was able to institutionalize its internal overdraft economy only because the United States was prepared to grant analogous privileges to the whole nation. This we did, at first, out of fear of the French Communist party. From the Marshall Plan through 1968, France was able to close the gaps between the expected profitability and competitiveness of its industries (and other ventures, such as the First Indochina War) by relying on the United States. But when the United States turned inward, adopting a policy of "predatory hegemony" under the strains of Vietnam, France was cut loose. It then had to begin to face the hard budget constraints imposed by oil shocks, then European monetary coordination, and also, presumably, by the unwillingness of the Germans to extend credit on quite such easy terms.

Thus we come to the paradox of the 1980s. A Conservative government, that of Barre, had tried and failed to restore France's competitiveness through massive use of the traditional techniques of industrial and financial intervention. A Socialist government took two years to figure out just how hard the budget constraint had become. Then came the crisis. What to do? The only solution was to establish a capitalist financial market and an asset-based banking system in France, for the first time since the 1930s, so as to reestablish a buffer between the demands of society for insurance and the true capabilities of the state to provide it. This the Socialists did. It was an elegant (if not wholly effective) exercise in the politics of necessity, and Loriaux's write-up is an elegant exercise in the analysis of political choice.

Loriaux is highly critical of the overdraft economy from its inception to its end. In this, it may be that he stretches his point. He evidently believes that a restoration of free financial markets, to have begun with Mendes-France's proposed, but spurned, monetary stabilization of January 1945 and followed thereafter with a program of monetary orthodoxy à la Jacques Rueff, would have yielded a more competitive and resilient French economy in the long run. How can we be sure? After all, the French economy did grow reasonably strongly through the 1950s and 1960s, while maintaining at least a simulacrum of social stability. It had not achieved this when strong and free financial markets existed, in the 1930s. Perhaps moral hazard, overinsurance, and inflation were prices that had to be paid to achieve growth, prosperity, and some modernization in the delicate political environment of postwar France. The politics of necessity is a tricky business, and it is a little unfair to celebrate the outcomes when they conform to orthodoxy while condemning them when they do not.

Nor is it certain that the overdraft economy per se was a recipe for failure. Other overdraft economies existed—notably in Japan, Korea, and Finland—and (as Loriaux acknowledges) at least the first two of these showed capacity for internal reform in advance of crisis. Perhaps to create such an economy was a rational response to the opportunities provided by American hegemony, a chance to get ahead while the getting was good. And perhaps France's problem was mainly a matter of misplaced investment choices. In particular, where Japan and Korea zeroed in on the American market, France chose to adventure into the supply of weapons, capital goods, and engineering projects (notably, subways, airports, ports, and mines) to the developing world. It might have been a reasonable bet that expanding U.S. hegemony would have sustained the market for such exports; but it happened, instead, that American hegemony contracted. France, having made choices that were not so much wrong as unlucky, found itself and its opportunistic system among the first victims of a changing world.

These, however, are issues of interpretation. The pleasure of Michael Loriaux's achievement is that he makes possible a discussion of such issues on an exceptionally solid foundation, both of historical fact and reasoned theoretical judgment. *France after Hegemony* is an admirable book and a satisfying read.

University of Texas, Austin JAMES K. GALBRAITH

Inadvertent Escalation: Conventional War and Nuclear Risks. By Barry R. Posen. Ithaca: Cornell University Press, 1992. 280p. $36.50.

With the end of the Cold War, many policy-relevant books in security studies became of purely historical interest. Barry Posen's study of the process by which conventional conflicts can escalate to nuclear war avoids that fate, at least in part, because of its explicit theoretical focus. The body of the book is a very detailed examination of projected military operations in a major war between the Warsaw Pact and NATO, a potential conflict that has joined the communist regimes of Eastern Europe and the Warsaw Pact in the proverbial ashcan of history. Fortunately, the analytical tools that Posen develops and exercises in the study can be applied to a variety of regional conflicts in the post–Cold War world.

Posen's central argument is that a large-scale conventional war between two nuclear-armed adversaries is likely to escalate to the use of nuclear weapons despite the initial intentions of both sides to avoid such escalation. Three factors cause such tendencies. First, Posen argues, the "security dilemma" in international relations (in which actions taken by a state to defend itself unintentionally threaten others) also applies to the conduct of conventional war. Political leaders may issue orders to execute conventional military operations for defensive purposes, unaware that such operations threaten or damage the nuclear forces and command-and-control of its adversary. If that adversary believed that it was in danger of losing its nuclear capability, it might choose to launch a preemptive or limited nuclear attack in a desperate effort to avoid the effects of such vulnerability. Second, the organizational interests of the military exacerbate this dilemma: militaries often favor offensive doctrines and plans, since offensive operations tend to increase organizational power, simplify planning problems, and enhance prestige. In addition, military organizations, like most organizations, greatly value their autonomy from outside influence, which can seriously inhibit the sharing of details about operational plans with civilian authorities. Third, Posen borrows the concept of the "fog of war" from Clausewitz: the inevi-

table difficulty in understanding communications and intelligence in the midst of combat encourages inadvertent escalation both by making detailed central control over operations problematic and by increasing the fear that an adversary might take advantage of such confusion by launching a surprise attack.

The rest of the book presents Posen's assessment of the likely conduct of conventional military operations in a major war in Europe in the mid-1980s. There are four case studies. First, Posen analyzes a large-scale air war between the two alliances and argues that NATO conventional attacks on Warsaw Pact air defenses and command-and-control systems in Eastern Europe would have eventually increased the vulnerability of the strategic command-and-control systems in the Soviet Union. Second, an assessment of the ground forces campaign leads to the conclusion that NATO armored forces could have defended the central front, thereby avoiding deliberate escalation to nuclear war. Third, Posen examines the potential for escalation if NATO naval forces, following the U.S. maritime strategy, had attacked Soviet ballistic missile submarines and naval bases in a conventional war. Finally, Posen compares offensive and defensive strategies for NATO protection of sea lanes in the Atlantic, arguing that defensive operations could have been successful. In these scenarios, leaders in Moscow might have felt pressures either to initiate the use of nuclear weapons first or, at a minimum, to delegate effective control of nuclear weapons to lower-level military officers, thereby increasing the danger of accidental or unauthorized use of such weapons.

Posen's assessments are certainly plausible, although (as is usually the case in counterfactual analyses) reasonable people can disagree about the likelihood of various contingencies. Future research can therefore further illuminate this issue by examining prenuclear historical cases of inadvertent escalation and war termination. For example, a thorough investigation of the reasons why some conflicts escalated to gas warfare while others did not would at least provided analogical evidence on the likelihood of different nuclear scenarios. Similarly, studies of war termination may provide insights into the conditions under which states facing defeat terminate hostilities (the U.S. government's rationale for the maritime strategy) or make desperate decisions to escalate combat to more dangerous levels (Posen's argument).

In a *very* brief (two page) section of the concluding chapter Posen presents two reasons to suspect that medium and small nuclear powers in the future face even more serious dangers of inadvertent escalation in any conventional war: (1) "they are unlikely to be able to afford the numbers, basing modes, or early-warning capabilities that helped the superpowers to develop survivable retaliatory forces" and (2) "the conventional forces with which these countries have conducted their competition have all regularly engaged in offensive military operations" (p. 201). I would add a third reason to anticipate problems, namely, that many developing states have lower degrees of civilian control over the military, which would compound the organizational causes of escalation identified by Posen. These are strong reasons to be concerned. Posen does not, however, analyze factors which might *reduce* the vulnerability of nuclear weapons and command-and-control between small nuclear powers, such as the absence of stealthy aircraft or sophisticated antisubmarine warfare capabilities in these countries. Yet although Posen does not adequately address the similarities and differences between his superpower cases and the circumstances likely to exist between future proliferators, this was not his main task. Other scholars will be indebted to Posen for giving them a very valuable set of analytical tools to do this important work.

Stanford University SCOTT D. SAGAN

Winning the Next War: Innovation and the Modern Military. By Stephen Peter Rosen. Ithaca: Cornell University Press, 1991. 275p. $33.00.

In recent decades, research and debate on the determinants of military strategy and doctrine have advanced in two main waves, which we may call the *professionalist* and *institutionalist* approaches. The professionalist approach, defined by Samuel Huntington in the late 1950s, focuses on the status of military officership as a distinct profession with its own specialized knowledge and corporate identity. Motivated by technical love of their craft and by their sense of social responsibility, officers seek to enhance the resources and autonomy of the military in order to maximize its capability to carry out its function of securing the state. Civilian intervention in military decision making is unhelpful, because officers know their craft better than outsiders, and often damaging, because it politicizes and deprofessionalizes the officer corps.

The institutionalist approach, advanced by Barry Posen, Jack Snyder, Stephen Van Evera, and Matthew Evangelista in the mid-1980s, starts from slightly different premises but reaches quite different conclusions. Institutionalists recognize the military as a large, specialized, hierarchical organization whose behavior can be understood using the tools of organization theory. Large organizations, including the military, pursue institutional interests in maximizing their budget, prestige, and independence from outside control and in preserving the organization's self-concept, or "essence." Unless monitored from the outside, strategic and doctrinal choices may sometimes respond more to the military's institutional self-interests than to state requirements for military effectiveness. However, civilian monitoring can be difficult, because the military's near monopoly on relevant expertise makes it difficult for outsiders to criticize service arguments effectively (although the immense U.S. postwar civilian defense establishment has ameliorated this somewhat).

Innovation is often resisted, because it threatens the budget, independence, or essence of services or branches that may be deemphasized in favor of others, forced to coordinate more closely, or even lose their traditional missions. Successful innovation will be more likely when the existing leadership and doctrine has been delegitimated by defeat; when civilians intervene to help innovators overcome resistance; or when the innovation supports, rather than challenges, the organization's autonomy and essence.

Stephen Rosen seeks to revive the professionalist approach, arguing that innovation often originates within the military and is rarely instigated or facilitated by civilians. His study, an expansion of his "Theories of Victory" (*International Security* 13[1988]), provides explanations of what he sees as three distinct classes of

military innovations: peacetime, wartime, and technological. First, he argues that peacetime innovation is a function of military communities' vision of the future of war and of their criteria for promoting senior officers. Successful innovation depends on insightful imagination, as well as creation of promotion paths that will allow junior officers to advance their careers while pursuing the innovation. This, in turn, requires the support of senior officers. Civilian intervention in the promotion process would be seen as illegitimate and would factionalize the officer corps (pp. 20–21).

Second, innovation in wartime is far more difficult than in peacetime, because time is short, the lessons of combat are often not obvious, and disruption of ongoing operations is risky. Successful wartime innovation, when it occurs, usually requires new measures of strategic effectiveness. Innovators must rethink the connection between operational missions and strategic goals, since success may require not improved execution of existing missions but, rather, their abandonment in favor of new missions and capabilities (p. 110). This process is carried out primarily inside the military.

Finally, for military-technological innovation, Rosen rejects both the institutionalist and "technology-push" explanations in favor of a modified "demand-pull" approach. Technologies are developed based on intelligence estimates of requirements to counter the enemy's current, and expected future, capability, both in terms of technology and doctrine. Successful innovation depends on managing the inherent uncertainty in intelligence. At the research-and-development level, civilian scientist can contribute; but military management is preferred, because officers better understand the combat applications of technology (p. 227). (As a sidelight, Rosen claims that U.S. military research-and-development has been much more cost-effective than most observers realize [p. 46]; this is a question worth further investigation.)

Rosen makes significant contributions, especially in pointing out the importance of promotion paths and strategic evaluation, but does not overturn the institutionalist argument. Internal innovators do often generate new doctrines (and sometimes new technologies), and judicious use of promotion and other internal bureaucratic levers can build constituencies within the service; but actual implementation in creation of new force types or war plans is often blocked by entrenched interests that the innovation threatens. Before World War I, numerous military reformers in all the major European armies pointed out the need to adjust tactics to a battlefield on which the defense had been strengthened by machine guns and barbed wire; but they could not prevail against institutional interests that required offensive doctrines.

Rosen's three peacetime cases illustrate this. The 1930s renovation of U.S. Marine Corps amphibious doctrine, which fitted perfectly with the corps's essence as the spearhead of overseas land operations and enhanced its resource and autonomy claims, was carried though, in part, by promoting amphibious-minded junior officers and without civilian assistance.

Also in the interwar years, Rear Admiral William Moffett's strategy of coopting senior nonaviators to support promotion of junior aviators made all the difference between the advance of American aircraft carrier doctrine and the stagnation of the British Fleet Air Arm at the same time. However, Rosen is wrong to play down the importance of the Pearl Harbor attack. While an effective combat doctrine was developed before the war, it did not replace the Navy's battleship-centered war plan until Pearl Harbor eliminated the battleships.

Finally, in the 1950s, airmobility doctrine began to make progress within the army when pilots were no longer looked down on as glorified taxi drivers and were, instead, considered eligible for promotion to combat commands. However, sizable airmobile combat units were not formed until Defense Secretary Robert McNamara demanded their creation in 1962. Rosen minimizes the importance of this intervention by suggesting that McNamara may have been primed by aviation advocates within the army, but the crucial point is that they could not prevail without outside assistance.

In one sense, Rosen's promotion path argument is worth more weight than he gives it. One of the most important motivations for military resistance to innovations is that they create requirements for new professional skills and devalue the skills of officers trained in the old doctrine, damaging their prospects for promotion.

So how do we win the next war? Rosen suggests that in an environment in which we cannot predict the likely scenarios that we may face or the missions that will be required and where limited budgets will not permit large-scale acquisition of new weapons or creation of new force types, we must rely instead on flexibility and innovation. In particular, he recommends relying on analysis and simulation of as many different contingencies as possible and researching a variety of technologies, rather than investing heavily in production of any one.

This policy advice is eminently sensible (and rapidly becoming conventional wisdom), although it is not really dependent on the rest of the book. More interesting would have been recommendations directly tied to the author's theoretical arguments. If successful peacetime innovation requires new promotion paths, can we design ways to institutionalize opportunities for younger officers to make their careers pursuing innovation doctrines or technologies? If wartime innovation depends on improved measures of strategic effectiveness, can we improve the odds that focused and timely analysis will be conducted, disseminated, and acted upon in future conflicts? Attention to these questions might help us design useful reforms.

University of Michigan CHAIM KAUFMANN

History and Strategy. By Marc Trachtenberg. Princeton: Princeton University Press, 1991. 292p. $44.50 cloth, $14.95 paper.

History and Strategy is a collection of seven essays by Marc Trachtenberg, all but one of which have been published elsewhere. Their subjects are diverse: the early evolution of American strategic thought, the origins of World War I, American nuclear strategy in the early 1950s, the nuclearization of NATO, the Berlin crisis, the influence of nuclear weapons in the Cuban Missile Crisis, and the relevance of historical analysis. Many of the essays are excellent, all provocative; but they do not cohere as a book.

The chapter on American strategic thought sets out to answer a puzzle, Why did the "golden age" of strategic

analysis "hit something of a dead end in the 1960s"? It never really provides an answer but develops an insightful critique of the literature. Trachtenberg faults these strategy analysts, especially Thomas Schelling, for narrowly conceptualizing war, peace, and strategy as problems of crisis management and bargaining. By focusing almost exclusively on the manipulation of risk and "the purely military side of war causation," American strategists reduced strategy to tactics and analyzed these tactics outside of any political and historical context. To reinvigorate the study of strategy, it is necessary to ground deductive, abstract analysis in a thorough understanding of the processes that have led to the development of nuclear arsenals and the conflicts to which they are relevant.

The second essay in the book is the author's controversial attack on the thesis that war broke out in 1914 because of the rigidity of military plans and the loss of control they engendered. The gist of his argument is that the Schlieffen Plan was based on the accurate political judgment that France would not remain neutral in a Russo–German war; that German political leaders understood and approved the Schlieffen Plan; and that they, not the military, made the decision for war. In Russia, too, Trachtenberg maintains, political authorities understood the meaning and consequences of mobilization.

From World War I, the book shifts back to nuclear strategy and how Americans adjusted to the loss of their monopoly on nuclear weapons. The author argues that anticipated shifts in the military balance played a critical role in shaping grand strategy and specific policies, especially with regard to Korea. He documents how seriously preemption and other aggressive strategies were taken at the highest levels of the government in the early 1950s. No final decision was taken against preemption until 1954. The chapter as a whole illustrates the myopia of the Pentagon and the Eisenhower administration. For both, the military balance was the only reference necessary to explain the twists and turns of Soviet foreign policy.

A follow-on chapter examines U.S.–West European military relations during the 1950s. Trachtenberg challenges the conventional wisdom that the nuclearization of NATO was an attempt to bridge the gap between European defense requirements and the political and economic constraints that ruled out large conventional forces. He insists that a nuclear-oriented strategy made good military sense in the early 1950s. The real debate in Washington was between the army's conception of a "forward defense" and the air force's preference for a "peripheral strategy" that contemplated withdrawing from the continent. By 1953, technical breakthroughs and the growth of the nuclear stockpile made a nuclearized forward defense feasible. Such a strategy was preferable to the Eisenhower administration and the Europeans for strategic and political reasons.

The next two chapters look at two of the tensest confrontations of the Cold War: Berlin in 1959–62 and Cuba in 1962. Trachtenberg makes a compelling case that the Soviet challenge to the Western position in Berlin was motivated primarily by Soviet fears that West Germany would soon acquire nuclear weapons. From the Soviet perspective, Konrad Adenauer and the United States were intent on changing the status quo, Moscow, on maintaining it. In the end, the Unites States came to accept the division of Germany and even to view it as a positive development. The crisis also indicated just how difficult nuclear weapons made it for either side to threaten war credibly.

The Cuba chapter is now out of date because of the new information that has since become available, especially on the Soviet side. The question it poses is still timely: What role did nuclear weapons play in shaping American and Soviet policies in the crisis? Trachtenberg argues that the lopsided strategic balance led to asymmetrical nuclear anxieties and (here I strongly disagree) to a "balance of resolve" that favored the United States and was reflected in the outcome of the crisis. He is on firmer ground in arguing that President Kennedy and Secretary of Defense McNamara were constrained by their fear of loss of control from exploiting their strategic advantage. Soviet leaders, who did not see this, exaggerated the threat of an American nuclear attack.

The final chapter, "Making Sense of the Nuclear Age," argues that historical scholarship can facilitate a reconceptualization of the fundamental problems of foreign and military policy in the nuclear age. This essay should have introduced the volume and gone on to identify the themes that would be examined in the subsequent chapters. With a sharp introduction, the individual chapters could have been more focused and the interesting but irrelevant essay on World War I dropped from the collection. The conclusions should have offered the author's reconceptualization of nuclear strategy, thereby validating his initial claim and enhancing the volume's value and interest to scholar and policymaker alike.

University of Pittsburgh RICHARD NED LEBOW

International Theory: The Three Traditions. By Martin Wight. New York: Holmes & Meier, 1992. 286p. $39.95

Martin Wight can be considered the founder of the English school of international relations theory, which emphasizes the cultural and moral presuppostions of international relations, its historical dimensions, and the works of great thinkers in the Western tradition. This book consists of Wight's lectures at the London School of Economics during the 1950s and 1960s, published 20 years after the author's death. In a brilliant introduction, the late Hedley Bull, Wight's most distinguished student, argues that Wight's approach "provides an antidote to the narrow and introverted character of the professional academic debate about International Relations, . . . opening it out to wider intellectual horizons" (p. xix). So it does: indeed, much of the merit of this work lies in its claim that contemporary controversies are extensions of old disputes, carried out in previous centuries by thinkers more deeply imbued with philosophical subtlety and historical understanding than we are. Such an argument allows us to fit ourselves better into a collective tradition, giving us perspective and, one hopes, humility. Publication of *International Theory* is therefore an important contribution to the literature, which should be read by American students and scholars.

International Theory is built around Wight's threefold classification of thought on international relations into Realism (sometimes labelled Machiavellian), and Revolutionism (stylized as Kantian), and rationalism (viewed as Grotian). Realism denies the reality of international

society, sees states' interests as essentially in conflict, and justifies action by necessity or by success. War is inevitable; history is cyclical. Revolutionism is an odd, hybrid category, meant to encompass Kant, Cobden, Lenin, Hitler, and Stalin. It seems to me that generalizations about revolutionists fit the latter better than the former. Kant, indeed, stressed that world peace would be promoted by republican constitutions within states. But he was no utopian about human nature; he sought a loose federation, rather than a world state; and he did not believe in an authoritarian transformation of the world. Wight himself suggests in his conclusion that "soft" revolutionists, from Kant to Nehru, should be distinguished from "hard" revolutionists, such as the Jacobins and Marxists (p. 267). Rationalists—toward whom Wight seems to lean—regard interstate society as real, compromise among interests as usually possible, and moral dilemmas as soluble through a combination of respect for rules and concern about consequences. War is to be avoided when possible and waged as humanely as possible when it occurs.

Wight admits that there is a "confluence" of these traditions; he is aware of the perils of classification. In his introductory essay, Bull argues that "the account of the three traditions will not bear all the weight that Martin Wight sought to place upon it" (p. xviii); and I agree. The hybrid character of his revolutionist category muddies his analysis of revolutionism. However, the categories of realism and rationalism facilitate some of Wight's most striking insights: such as "the Hobbesian character of the United Nations," never more evident than in the war against Iraq (p. 34); realism's expansionary conception of national interest versus rationalism's contraction of interests (p. 126); and realism's ambivalence about our ability to ascertain others' interests versus rationalism's claim for the objectivity of distance (pp. 146–47). Wight's categories work better for interests, international society, and the ethical basis of action than they do for power, balance of power, bargaining, and war. World politics is multidimensional, and views on bargaining or the balance of power are not cogently defined by views on international society or ethics. In spite of Wright, rationalists need not believe in the inviolability of promises, especially if such promises seem to conflict with peaceful change and adaptation to new situations.

Wight is definitely a thinker in the Western tradition, making few references to other cultures' views of international relations. Consistent with his Christian piety, one might fear that he would therefore adopt an uncritical view of the actions of the west toward non-Western peoples. Nothing could be further from the truth. His brilliant chapter 4 on relations with "barbarians" extensively documents Western justifications of savage cruelty and wars of extermination toward these peoples. Indeed, he identifies "extermination to eradicate heresy, to purify society, for scientific social engineering, for the sake of the cause," as "specifically Western." Islam, he says, "may have invented the holy war, but it did not exterminate" (p. 229). For critical insights such as these, from someone *within* the Western tradition, *International Theory* is worth serious reading and reflection.

Wight's greatest oversight, which Bull also mentions, is his neglect of the scientific or behavioral search for laws of action (or contingent generalizations) about world politics. Wight does not defend his view that cumulative knowledge is impossible in world politics. He claims that rationalists do not see international politics in terms of laws of behavior but that most contemporary behavioralists, who seek laws, are also rationalists. Yet American international relations specialists, even the most behavioral and rationalist, should read this book in order to place themselves in the tradition of thought in international relations, appreciate the insights that come from studying particularities, and see how history and philosophy can enrich our study by providing us with insights and even, one dares to say, testable hypotheses.

Harvard University ROBERT O. KEOHANE

The Tet Offensive: Intelligence Failure in War. By James J. Wirtz. Ithaca: Cornell University Press, 1991. 290p. $34.95

Strategic military surprise has been a satisfying genre in security studies. Investigation of a complex puzzle—why states and leaders seem so vulnerable to catastrophic surprise when the resources devoted to avoiding them are substantial, the stakes huge, and their suspicions about antagonistic states very high—has yielded a relatively simple and elegant theoretical explanation. Even better, it seems to hold across cultures, times, and personalities, with later studies providing additional confirmation.

James Wirtz's volume is a case in point, very much in keeping with other case studies of strategic surprise. Thus, it has little in terms of innovation on this subject. However, it is more than satisfactory in recounting the events of the Tet Offensive and is clear and precise in the application and refinement of the available theory. The theory and contributors to its development are insufficiently cited. Readers unfamiliar with the subject may not realize how firmly the book is set within an existing theoretical perspective.

Is vulnerability to strategic surprise due to the attacker's *deception* or the victim's perceptual mistakes? Is defender misperception due mainly to the combination of attacker secrecy, the ambiguity of available data, and the distractions of other information ("noise") or mainly to distortions imposed by defender preconceptions, beliefs, and expectations? Are the key mistakes made by top officials or by organizations and lower-level personnel? Finally, do the misperceptions spring from standard cognitive processes or "motivated biases"? Wirtz's analysis puts considerable emphasis on deception (more precisely, on the interplay between the victims' perceptual predilections and the enemy's elaborate deception effort). Like analysts of other cases, however, he finds that the victims' preconceptions in this instance were crucial. There was enough information available, clear enough in import, for the Americans to have anticipated the Tet Offensive. Their preconceptions (bolstered by the deception) got in the way. He parallels other studies in locating the major mistakes mainly at the top, with leaders and central headquarters analysts. Finally, most of the distorted analysis they displayed appears to have flowed from unmotivated bias. Along the way, he spots instances of all the standard cognitive errors, such as: (1) assuming more action–reaction linkages with the enemy than actually exist; (2) letting preoccupation with one's own strategy override efforts to grasp the enemy's;

(3) crying wolf; and (4) comfortably explaining away discrepant information.

As the emphasis on deception is the most innovative feature of all this, it is unfortunate that it is open to challenge. The massing of enemy forces on the borders, especially near Khe Sanh, is depicted as a deception about the location of the forthcoming attack designed to keep American forces away from the cities. Thus, a Vietcong attack there would face only the (ARVN) and could more readily (it was hoped) provoke a popular uprising. Maybe so, but he admits that the evidence that deception was the purpose is incomplete; and the evidence there is fits the equally plausible explanation that the North Vietnamese wanted to exploit the Americans' presence at the border to inflict heavy casualties and maybe another Dien Bien Phu, while *simultaneously* hitting the ARVN and the government in the cities. This could make Khe Sanh less a deception than part of a two-pronged attack, which would explain why the enemy did not just feign an attack but went into it vigorously, taking heavy casualties. Hanoi may have been seeking the same damaging political–psychological results via *either* of the two attacks. Whether one was simply intended as a deception cannot be definitively determined, and the conventional understanding of the role of deception in achieving a strategic surprise is left unchanged. His analysis is a stimulating view that will have to await further information from Hanoi to be fully confirmed.

Even the claim that Westmoreland overreacted (was deceived) in reinforcing Khe Sanh is problematic. After all, as the author notes, another Dien Bien Phu would have had an immensely damaging impact on the war effort, and Westmoreland was under great pressure in this regard because of McNamara's huge investment in the idea of a defensive barrier across the northern border and President Johnson's intense preoccupation with that area. He would have had to keep very large forces there in any case, deception or not.

For our general reflections on the Vietnam War, the book is valuable in many ways. For instance, Wirtz finds little evidence of willful distortion of information. Most of that which challenged official perceptions (alternative analyses, dissenting intelligence findings, discrepant information) was passed along to very high officials and given at least some consideration. The officials do not, in his account, appear to have aggressively evaded confrontation with criticism and dissent.

He disputes the view that headquarters in Saigon deliberately understated the size of Vietcong forces—the position of the CIA's Samuel Adams at the time and since. Military Assistance Command Vietnam's estimates were largely correct, he says; but Hanoi, accepting the veracity of the same reports Adams used, arrived at the same inflated estimates of their support in the south that he did. American leaders knew that a major Vietcong offensive would be militarily foolish in view of actual Vietcong strength. Hanoi overestimated its strength in deciding to mount what the United States, therefore, considered an improbable kind of attack. This is a nice touch in the author's assessment, although finding that attacker misperceptions played an important role is not original with Wirtz and this case.

He also concludes that those suspicious of the periodic enemy-offered truces (because the enemy exploited them) or of Hanoi's offers to negotiate were, on the whole, correct. The North used such offers to help set up the Tet Offensive; and taking advantage of the Tet ceasefire was only exploitation beyond the norm.

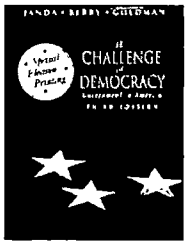
New Houghton Mifflin texts add sparkle to your political science courses.

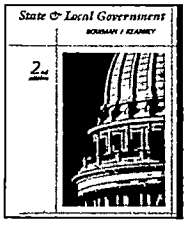


American Government
Third Edition

Alan R. Gitelson, Loyola University of Chicago
Robert L. Dudley, George Mason University
Melvin J. Dubnick, Rutgers University, Newark

With *American Government,* students get more than a clear, concise presentation of the essential facts—Gitelson, Dudley, and Dubnick's unique myth/reality framework helps them form their own opinions about the issues at the heart of government and politics today.

528 pages • paperback • Just published



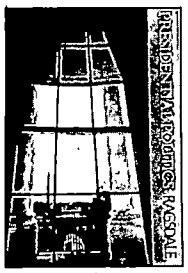
★ELECTION PRINTING

The Challenge of Democracy: Government in America
Third Edition

Kenneth Janda, Northwestern University
Jeffrey M. Berry, Tufts University
Jerry Goldman, Northwestern University

Freedom, order, or equality?
Pluralist or majoritarian democracy?
By viewing American government in terms of these two themes, the best-selling Janda/Berry/Goldman text gives coherence and relevance to the facts of government. Look to the new Election Printing for the latest in election outcomes and Supreme Court appointments and decisions, as well as the outstanding support package you expect from Janda, Berry, and Goldman, including interactive software programs developed by the authors.

759 pages • hardcover • Just published

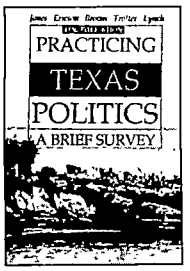


State and Local Government
Second Edition

Ann O'M. Bowman, University of South Carolina
Richard C. Kearney, University of Connecticut

State and local governments are expected to do more for their citizens every day with less help from the federal government. With an up-to-date policy focus, this text reflects the way changing expectations have affected institutions, political behavior, and policies.

608 pages • hardcover • Just published

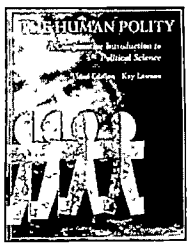


Presidential Politics

Lyn Ragsdale, University of Arizona

Lyn Ragsdale uses a central theme—the president's personal power and image of leadership vs. the pluralistic institution of the presidency—to examine the complex issues that surround the Oval Office.

512 pages • paperback • Just published



Practicing Texas Politics
A Brief Survey

Eugene W. Jones, Angelo State University
Joe E. Ericson, Stephen F. Austin State University
Lyle C. Brown, Baylor University
Robert S. Trotter, Jr., El Centro College of the Dallas County Community College District
Eileen M. Lynch, Brookhaven College of the Dallas County Community College District

Keeping up with Texas politics is a challenge, particularly for beginning students. Administrations change, different players emerge, and new issues arise — and only one author team keeps making sense of it all: Jones, Ericson, Brown, Trotter, and Lynch. This brief edition, with the same text/reader format as the longer edition, contains updated coverage, including the 1992 campaign and elections.

320 pages • paperback • Just published

The Human Polity
A Comparative Introduction to Political Science
Third Edition

Kay Lawson, San Francisco State University

Kay Lawson has revised her successful introductory political science text to reflect the enormous political changes that have taken place the world over in the last few years. Retaining the theme of interdependence that made this text a leader, the new edition offers an expanded discussion of the relationship between economics and politics.

Human Rights, Law, & Politics

Human Rights in the World Community

Issues and Action (Second Edition)

Edited by Richard Pierre Claude and Burns H. Weston

The best analytical work of leading scholars and activists in the field of international human rights is presented in this expanded and extensively revised second edition.

Oct. 1992. 480 pp, 16 illus. Cloth, 3154-6, $54.95; paper, 1396-3, $22.95

Critique

Review of the Department of State's Country Reports on Human Rights Practices for 1990

Lawyers Committee for Human Rights

This is the thirteenth volume in an annual series produced by the Lawyers Committee for Human Rights, now available from the University of Pennsylvania Press. The report reviews 61 countries from all regions of the world which have a variety of relationships with the U. S. government.

Distributed for the Lawyers Committee for Human Rights. Jun. 1992. 460 pp. Paper, 0-934143-55-1, $19.95

Inter-State Accountability for Violations of Human Rights

Menno T. Kamminga

Kamminga challenges one of the cornerstones of classic international law: the presumption that states are entitled to exercise diplomatic protection only on behalf of their own nationals. He offers a systematic re-examination of this proposition.

A volume in the Pennsylvania Studies in Human Rights. Oct. 1992. 240 pp. Cloth, 3176-7, $32.95

Politics and Plea Bargaining

Victims' Rights in California

Candace McCoy

In 1982, California voters passed Proposition 8, promoted by supporters as the Victims' Bill of Rights, on the initiative ballot. McCoy describes the political genesis of victims' rights legislation and the impact of Proposition 8 on plea bargaining.

A volume in the Law in Social Context Series. Jun. 1993. 256 pp, 15 illus. Cloth, 3190-2, $36.95 (tent); paper, 1433-1, $18.95 (tent)

Emancipation

The Making of the Black Lawyer, 1844-1944

J. Clay Smith, Jr.; Foreword by Justice Thurgood Marshall

In this, the first truly comprehensive social and political history of black lawyers in America, Smith presents a one-hundred-year history of the achievements black lawyers attained in the face of overwhelming odds.

May 1993. 790 pp, 30 illus. Cloth, 3181-3, $56.95 (tent.)

Agents of Opportunity

Sports Agents and Corruption in Collegiate Sports

Kenneth L. Shropshire

Winner of the 1992 Outstanding Book Award—Choice Magazine.

"One of the most informative and balanced books on the sports industry"—*Philadelphia New Observer.*

1990. 192 pp. Cloth, 8212-4, $25.95; new paperback, 1443-9, $16.95

Guide to International Human Rights Practice

Second Edition

Edited for the Procedural Aspects of International Law Institute in collaboration with the International Human Rights Law Group by Hurst Hannum

This thoroughly revised edition of what has become the standard work in its field continues the original focus on the "nuts and bolts" of international human rights law and practice.

Nov. 1992. 328 pp. Cloth, 3167-8, $49.95; paper, 1410-2, $19.95

In Defense of Rights

Attacks on Lawyers and Judges in 1991

Lawyers Committee for Human Rights

The 1991 edition of *In Defense of Rights* details nearly 500 attacks on members of the legal profession as they attempted to pursue human rights violations. This book underscores the need for solidarity with embattled lawyers and judges everywhere. The yearly reports will be distributed by the University of Pennsylvania Press.

Distributed for the Lawyers Committee for Human Rights. Jun. 1992. 200 pp. Paper, 0-934143-50-1, $19.95

The Craft of Justice

Politics and Work in Criminal Court Communities

Roy B. Flemming, Peter F. Nardulli, and James Eisenstein

The authors studied nine felony courts in both similar and dissimilar communities in three states, and the results provided an unparalleled opportunity to examine the contextual and environmental conditions that shape the efforts of individuals who use their personal influence to determine how felony cases are processed.

Dec. 1993. 224 pp, 17 illus. Cloth, 3187-2, $24.95

Red Scare in Court

New York versus the International Workers Order

Arthur J. Sabin; Foreword by Howard Fast

"Sabin tells the heartbreaking story of how the IWO, and with it the hopes and dreams of thousands of American working people, was destroyed. It is a very important story, a grim and awful story. It must be read and understood, so that nothing like it will ever happen again"—from the Foreword by Howard Fast.

Apr. 1993. 372 pp, 13 illus. Cloth, 3189-9, $29.95

The Failure of the Criminal Procedure Revolution

Craig M. Bradley

The Failure of the Criminal Procedure Revolution is a groundbreaking effort to advocate sytematic and essential reform in America's court system.

Jun. 1993. 256 pp. Cloth, 3200-3, $32.95 (tent)

The Social Engagement of Social Science

A Tavistock Anthology

Volume II: The Socio-Technical Perspective

Edited by Eric Trist and Hugh Murray

A volume in the Innovations in Organizations Series. May 1993. 656 pp. Cloth, 8193-4, $44.95 (tent)

THE WESTERN POLITICAL SCIENCE ASSOCIATION

announces that the *Western Political Quarterly* is changing its name to the:

Political Research Quarterly

Effective with the March 1993 Issue, Volume 46, Number 1

Selected forthcoming articles:

Bennett, Stephen E., and Linda L.M. Bennett. "Out of Sight, Out of Mind: Americans' Knowledge of Party Control of the House of Representatives, 1960-1984"

Berch, Neil. "Another Look at Closeness and Turnout: The Case of the 1979 and 1980 Canadian National Elections"

Conniff, James. "Burke and India: The Failure of the Theory of Trusteeship"

Dixon, William J. and Bruce E. Moon. "Political Similarity and American Foreign Trade Patterns"

Ethridge, Marcus E. "Equality and Responsive Institutions: Elements of a General Model"

Garand, James C., Kenneth Wink, and Bryan Vincent. "Changing Meanings of Electoral Marginality in U.S. House Elections, 1824-1978," comment by Gary C. Jacobson

Gray, Virginia and David Lowery. "The Diversity of State Interest Group Systems"

Honig, B. "Rawls on Politics and Punishment"

Radcliff, Benjamin. "Liberalism, Populism, and Collective Choice," comment by William Riker

Tedin, Kent L. and Oi-Kuan Fiona Yap. "The Gender Factor in Soviet Mass Politics: Survey Evidence from Greater Moscow"

Articles in all fields of political science are welcome in the *PRQ*. Follow APSA style guidelines for manuscripts submitted for publication. We average less than three months to evaluate a manuscript for publication. Manuscripts should be submitted to:

Walter J. Stone, Editor
Political Research Quarterly
Department of Political Science
Campus Box 333
University of Colorado
Boulder, CO 80309

Subscriptions are $20.00 for individuals, and include membership in the Western Political Science Association. Send remittance to: *Political Research Quarterly*, 252 Orson Spencer Hall, University of Utah, Salt Lake City, UT 84112.

True France

The Wars over Cultural Identity, 1900–1945

HERMAN LEBOVICS

Lebovics shows how, among politicians and thinkers on both the right and the left, the glorification of True France masked the cultural project of eliminating diversity. *The Wilder House Series in Politics, History, and Culture.* $29.95

God's Peoples

Covenant and Land in South Africa, Israel, and Ulster

DONALD HARMAN AKENSON

"Superb scholarship and compelling writing."—*Library Journal.*
"Splendidly illuminating and enthrallingly readable."
—Conor Cruise O'Brien.
Asserting that the dominant peoples of South Africa, Northern Ireland, and Israel have based their cultural identity on a belief in a direct covenant or contract with an all-powerful God, Akenson vividly chronicles the profound effects of this conviction on each state's history. $29.95

House of Cards

Why Arms Control Must Fail

COLIN S. GRAY

"If peace breaks out, can arms control be far behind?" According to Gray, this sardonic motto describes events of the 1990s just as well as it did those of the 1920s. Gray offers a provocative history of twentieth-century attempts at arms limitation, as he challenges the fundamental assumptions of arms control theory. Arms control has never worked, he concludes, because it never can. *Cornell Studies in Security Affairs.* $28.95

Reasoned Freedom

John Locke and Enlightenment

PETER A. SCHOULS

"A rare close reading of Locke's work on education, showing as well a thorough and sensitive understanding of Locke's thought on many important doctrines and issues. Schouls offers a number of new interpretations of Locke on the nature of reason, rationality, the role of the passions, freedom, and learning. This study should take its place among the better books on Locke."—John W. Yolton, Rutgers University. $37.50 cloth, $13.95 paper

Contestations

—a new series edited by William E. Connolly

The Inner Ocean

Individualism and Democratic Culture

GEORGE KATEB

"Kateb is one of the most powerful and original minds in political theory today, and his best work is on individuality and democracy. *The Inner Ocean* makes a very important statement in contemporary democratic theory and is a pleasure to read."—J. Donald Moon, Wesleyan University. $27.95

The Anxiety of Freedom

Imagination and Individuality in Locke's Political Thought

UDAY SINGH MEHTA

"A fine study of Locke's views. A significant and provocative contribution to the current rethinking of liberal individualism."—James Tully, McGill University. $24.50

Rival Capitalists

International Competitiveness in the United States, Japan, and Western Europe

JEFFREY A. HART

Nowhere can the cataclysmic reversals in international competitiveness since the Second World War be traced more clearly than in the United States, Great Britain, France, Germany, and Japan. Surveying the development of the steel, automobile, and semiconductor industries in each of these countries, Hart illuminates the role of national policy in a rapidly changing world. *Cornell Studies in Political Economy.* $39.95 cloth, $16.95 paper

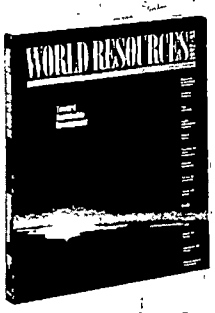
The Cultural Front

Power and Culture in Revolutionary Russia

SHEILA FITZPATRICK

Chronicling the battles for "cultural hegemony" which marked the first decades of Soviet rule, Fitzpatrick argues that the traditional intelligentsia, despite its loss of autonomy, emerged as the partial victor in its struggle against the new Communist elites. $39.95 cloth, $13.95 paper

Culture and National Identity in Republican Rome



ERICH S. GRUEN

Few encounters in antiquity have had more profound consequences than that between Greek culture and Republican Rome. Focusing on the ruling elites of the middle and later Republic, Gruen offers a compelling account of the assimilation and adaptation of Greek culture by the Romans. $37.50

At bookstores, or call 607-277-2211 (credit card orders only)

Cornell University Press 124 Roberts Place, Ithaca NY 14850

Oxford

New!

World Resources 1992-93
A Guide to the Global Environment

WORLD RESOURCES INSTITUTE, *Washington, D.C.*

The new edition includes a special focus on children's health, covering major causes of mortality, new initiatives to improve child survival, the role of nutrition in child health and survival, and issues in financing child health care.

1992 400 pp.; illus. paper $19.95 cloth $32.50

New edition!

The Judicial Process
Sixth Edition

HENRY J. ABRAHAM, *University of Virginia*

Written by one of the nation's most astute observers of the court, the new edition of this classic text examines the impact of recent dramatic developments, including the ascension of four new Justices to the Supreme Court, and changes in the jurisdiction of the federal courts.

January 1993 480 pp.; 5 illus. paper $19.95

Feminist Jurisprudence

Edited by PATRICIA SMITH, *University of Kentucky, Lexington*

"The materials selected for the collection are of the highest quality. Their organization not only reflects the state of the questions but also a deft sense of the point of teaching jurisprudence."—J.R. Lindgren, *Lehigh University*

1992 608 pp. $35.00

The Nature and Process of Law
An Introduction to Legal Philosophy

Edited by PATRICIA SMITH, *University of Kentucky, Lexington*

Using the U.S. legal system as a model, this comprehensive anthology presents law as a process, part and parcel of a system of government and defined constitutional procedures. Offering relevant documents, court cases and short readings in history, law and philosophy, it establishes the basis of law in political theory, then presents substantive issues in private and public law.

February 1993 832 pp. $45.00

Politics in Mexico

RODERIC AI CAMP, *Tulane University*

Thoroughly grounded in Mexican history, this introductory text explores the politics of Mexico, examining not only the roots of its contemporary political culture, but the structure of government, electoral process, issues of corruption and foreign policy, and possible future directions.

February 1993 288 pp.; 36 tables, 4 figures
paper $14.95 cloth $39.95

Prosperity Versus Planning
How Government Stifles Economic Growth

DAVID OSTERFELD, *St. Joseph's College, Washington, DC*

"Lively and interesting. Osterfeld's political economy framework, his discussions of important issues such as corruption, property rights, the environment, and the legal context, and the attention he pays to the key variables in development—food, resources, and population—also distinguish this book from most of the others in the field."—Anil B. Deolalikar, *University of Washington*

1992 288 pp.; 22 illus. paper $19.95 cloth $39.95

Towards A New Economic Order
Postfordism, Ecology and Democracy

ALAIN LIPIETZ, *Centres d'Études Prospectives d'Économie et Mathématiques Appliquées à la Planification*

Drawing on examples from the recent history of Europe, the Third World and North America, internationally esteemed political economist Alain Lipietz argues that it is the intersection of the changing international economy with the experience of reaching the limits of Fordist forms of production that is responsible for the political and economic crisis of the last decades.

1992 196 pp. paper $14.95 cloth $39.95

Labor Parties in Postindustrial Societies

Edited by FRANCES FOX PIVEN, *City University of New York*

This path-breaking text examines challenges faced by labor in the West over the last decade, through a comparative study of labor-based political parties in the United States, England, France, West Germany, Sweden, Israel and Canada.

1992 304 pp. paper $16.95 cloth $39.95

Lessons of Struggle
South African Internal Opposition, 1960-1990

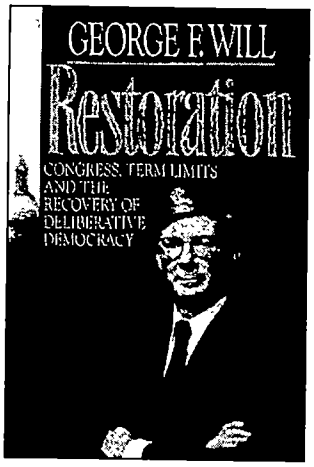
ANTHONY W. MARX, *Columbia University*

"A richly textured and timely discussion of the peoples' movements during the years we spent on Robben Island and in exile. We are lucky to have such an insightful analyst."—Walter Sisulu, *African National Congress*

1992 384 pp.; 13 illus. paper $15.95 cloth $45.00

The Theoretical Evolution of International Political Economy
A Reader

Edited by GEORGE T. CRANE, *Williams College*, and ABLA M. AMAWI, *Georgetown University*



Bringing together classic works and leading contemporary arguments, this text outlines the development of three schools of IPE thought—Liberalism, Marxism, and Realism—and also includes recent syntheses of these approaches to show how conventional theoretical categories are giving way to more eclectic conceptual schemes.

1991 320 pp.; 4 illus. paper $19.95

NEW FROM THE FREE PRESS

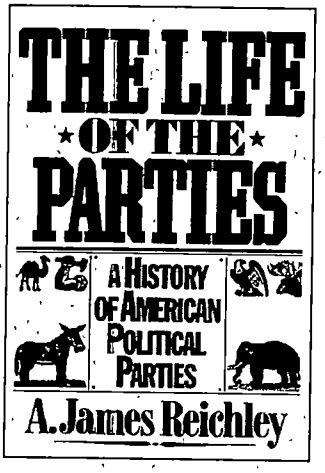
RESTORATION
Congress, Term Limits and the Recovery of Deliberative Democracy
George F. Will

"A biting, humorous, and...perceptive sifting of much of the sand that fouls the national political machinery...Mr. Will has accurately charted the fault lines in the national political terrain."
—**Joseph A. Califano, Jr.**, in *The New York Times Book Review*

1992 0-02-934437-9 $19.95

UNDUE PROCESS
A Story of How Political Differences Are Turned Into Crimes
Elliott Abrams

"A sharp, incisive look into how new legal processes have demonized those who do not toe a certain political line. Abrams tells a fascinating—and disturbing story of his own experience and the heavy price he paid for his loyal service to the Reagan Administration. This is an important and timely book—revealing in its delivery and powerful in its message."
—**Richard Nixon**



1992 0-02-900167-6 $22.95

AFTER TET
The Bloodiest Year in Vietnam
Ronald Spector,
George Washington University

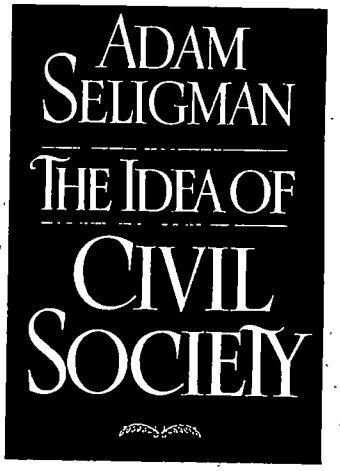
"Immensely readable and thoroughly researched, this is a major contribution to the study of the war and a superb book."
—**George C. Herring,**
author of *America's Longest War*

A Book-of-the-Month Club Featured Alternate
A History Book Club Featured Alternate

1992 0-02-930380-X $24.95

THE LIFE OF THE PARTIES
A History of American Political Parties
A. James Reichley

"It is hard to imagine a better time than now for reexamining American political parties. Reichley shows us how parties have developed and how they have managed 'incompatible ideological traditions.' The forthcoming debates on the future of American political parties will be informed by Reichley's careful and well-written study."
—**Charles O. Jones,**
University of Wisconsin-Madison



1992 0-02-926025-6 $27.95

REFIGHTING THE LAST WAR
Command and Crisis in Korea, 1950-1953
D. Clayton James,
Virginia Military Institute, with
Anne Sharp Wells

"James has brought to bear his unparalleled knowledge to explore how MacArthur and the rest of the American high command, conditioned by the total war concepts of World War II, came to wage the Korean War as a limited war in spite of themselves. This is superb military history that should provoke thought about how to fight the limited wars still likely to await us."
—**Russell F. Weigley,** author of *The American Way of War*

A History Book Club Alternate

1992 0-02-916001-4 $24.95

THE IDEA OF CIVIL SOCIETY
Adam Seligman

"A most exciting, original and well-documented presentation of the idea of civil society in the Western—in the broadest sense of the word, including Eastern Europe—historical experience and political tradition. The unique contribution of Seligman's presentation is that it combines a broad cross-disciplinary approach firmly rooted in history, sociology, and political science. Will be a work with very wide appeal."
—**S.N. Eisenstadt,** Hoover Institution

1992 0-02-928315-9 $24.95

VOLTAIRE'S BASTARDS
The Dictatorship of Reason in the West
John Ralston Saul

"A rich, rewarding, highly original book that casts a fresh perspective on all aspects of our public life. There are innumerable brilliant insights...Massively grounded in hard fact...[it] should be required reading for graduate students in the humanities."
—**Camille Paglia,** in *The Washington Post Book World*

1992 0-02-927725-6 $29.95

ENERGY IN THE EXECUTIVE
The Case for the Strong Presidency
Terry Eastland

"Will transform the debate over the American presidency while also providing the intellectual foundation for the current battle against congressional power."
—**E.J. Dionne,** author of *Why Americans Hate Politics*

1992 0-02-908681-7 $22.95

ABOVE THE LAW
Police and the Excessive Use of Force
Jerome H. Skolnick, *University of California, Berkeley* and **James J. Fyfe,** *American University*

The astonishing acquittal of four Los Angeles policemen in the Rodney King case precipitated mob rioting and a worldwide outcry against police violence. Skolnick and Fyfe use this incident to introduce their definitive new study of the nature of police violence, the extent of its presence in America today, and the possible ways to remedy a problem which is undermining public confidence in police across the nation.

February 1993 *0-02-929312-X* *$24.95*

RETHINKING AIDS
The Tragic Cost of Premature Consensus
Robert Root-Bernstein, *Michigan State University*

Since 1983 it has been held that HIV is the cause of AIDS. In this path-breaking book, Root-Bernstein reviews the entire existing body of AIDS research, and—focusing on a number of anomalies—challenges the HIV hypothesis, showing how the spread of AIDS has not followed the predictions of the HIV-only model, and how sometimes even HIV positive patients seem to have rid themselves of the virus. Debunking the conventional wisdom about AIDS, he refocuses attention on specific controllable factors that may determine, rather than increase our risk of AIDS. He also offers hope to those with HIV that they may yet survive infection.

1992 *0-02-926905-9* *$24.95*

THE LEVERAGE OF SEA POWER
The Strategic Advantage of Navies in War
Colin S. Gray, *National Institute for Public Policy*

"For anyone interested in thinking about how maritime power has in the past, does in the present, and will in the future play in the strategic environment, this book is essential reading."
—**Williamson Murray,** author of *Calculations: Net Assessment and the Coming of World War II*

1992 *0-02-912661-4* *$24.95*

INSIDE AMERICAN EDUCATION
The Decline, The Deception, The Dogmas
Thomas Sowell, *Hoover Institution*

"Trenchant, insightful, comprehensive and above all true, Sowell's account of a journey inside American education challenges those who like it the way it is and stiffens the resolve of those fighting for radical change."
—**Chester E. Finn, Jr.,** Founding Partner, The Edison Project

1992 *0-02-930330-3* *$24.95*

PALESTINIANS
The Making of a People
Baruch Kimmerling, *Hebrew University* and **Joel S. Migdal,** *University of Washington*

In this timely and authoritative account of the origins and history of the Palestinian people, Kimmerling and Migdal give a sensitive and detailed portrait of this nascent society as it struggled to survive the dissipation of the Ottoman empire, the devastations of World War I, the transfer to British authority, and the subsequent destabilizing impact of Western economies.

1992 *0-02-917321-3* *$27.95*

THE CATHOLIC ETHIC AND THE SPIRIT OF CAPITALISM
Michael Novak, *American Enterprise Institute*

Drawing on the works of modern Papal social thought, Novak demonstrates how the Catholic tradition has strengthened the meaning of contemporary capitalism. Novak shows how, in the face of a century's conflict with communism, the Church has forged a new and fuller conception of free markets and commercial society as humane institutions. It is this ethically invigorated notion of capitalism that Novak sees as the greatest resource for the new and emerging nations of Eastern Europe and Russia, the Third World, and the spiri-tual restoration of civil institutions in the West.

February 1993 *0-02-923235-X* *$22.95*

ADAM SMITH IN HIS TIME AND OURS
Designing the Decent Society
Jerry Z. Muller, *Catholic University*

"An extraordinarily good book on the most quoted and least read of the worldly philosophers. It is the best single-volume overview, critique, and celebration that I know."
—**Robert Heilbroner,** author of *The Worldly Philosophers*

1992 *0-02-922234-6* *$22.95*

SICK SOCIETIES
Challenging the Myth of Primitive Harmony
Robert B. Edgerton, *University of California, Los Angeles*

"A very effective challenge to the belief of many anthropologists that societies are inherently well-adapted systems, it also refutes the relativistic myth that other cultures must never be described as 'sick.' It should be required reading."
—**Dr. C.R. Hallpike,** author of *Principles of Social Evolution*

1992 *0-02-908925-5* *$24.95*

New in paperback—

BAD BLOOD
The Tuskegee Syphilis Experiment
New and Expanded Edition
James H. Jones

This prize-winning classic of race and medicine has been expanded to explore the Tuskegee Study's legacy in the age of AIDS.

"A valuable, superbly researched, fair-minded, profoundly troubling, and clearly written book."

SINGULAR EUROPE

The Economy and Polity of the European Community after 1992

William James Adams, Editor

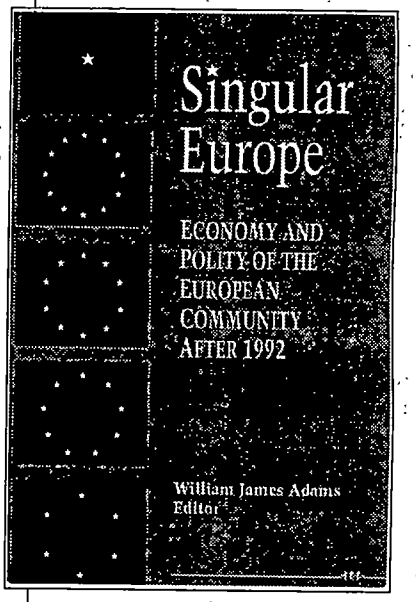
Leading international experts in economics, political science, business, and law discuss the impact of Program 1992 upon European and world economies. Contributors are William James Adams, Severin Borenstein, Bo Carlsson, Gunter Dufey, Dr. Reinhard Ellger, John H. Jackson, Alexis Jacquemin, Frédéric Jenny, Stephan Leibfried, Ernst-J. Mestmäcker, Tommaso Padoa-Schioppa, Gary R. Saxonhouse, John D. Steinbruner, William Wallace, Joseph H. H. Weiler, and Susan L. Woodward.

cloth $45.00

EXPERIMENTAL FOUNDATIONS OF POLITICAL SCIENCE

Donald R. Kinder and Thomas R. Palfrey, Editors

This book provides a comprehensive view of the range and effectiveness of experimental methods in political science. It includes studies of media impact on voter information, the testing of formal political models of voting, the measurement of public opinion, collective action and Prisoner's Dilemma problems, information and voting, bureaucratic and legislative rules and agendas, political choice behavior, and political psychology. A volume in the Michigan Studies in Political Analysis series.



cloth $49.50 / paper $14.95 February

LAW'S VIOLENCE

Austin Sarat and Thomas R. Kearns, Editors

The contributors to this new book draw on a variety of disciplines—law, history, political science, anthropology, philosophy, and literature. All consider the question of how violence done by and in the name of law differs from illegal or extralegal violence—or indeed, if they differ at all. A volume in the Amherst Series in Law, Jurisprudence, and Social Thought.

cloth $34.50

BEYOND THE SOVIET THREAT

Rethinking American Security Policy in a New Era

William Zimmerman, Editor

This new book links Russian studies and security studies to explore the policy implications of the collapse of the Soviet Union. Contributors are Andrew Bennett, Charles L. Glaser, Ted Hopf, Paul Huth, Allen Lynch, Miroslav Nincic, Richard Hyland Phillips, and Deborah Yarsike.

cloth $37.50

NARRATIVE, VIOLENCE, AND THE LAW

The Essays of Robert Cover

Martha Minow, Michael Ryan, and Austin Sarat, Editors

Robert Cover saw official courts as combatants and not as neutral arbiters in conflicts over values. This collection of his essays explores the relationships among language, communities, and values and contributes both to legal theory and social criticism. A volume in the Law, Meaning, and Violence series.

cloth $37.50

BRITISH ELECTIONS AND PARTIES YEARBOOK 1991

Ivor Crewe, Pippa Norris, David Denver, and David Broughton, Editors

Focusing upon electoral research, this first volume in an annual series brings together important contributions by leading political scientists, economists, geographers, historians, and social researchers to provide a comprehensive range of reference data.

Machismo, Danger, and the Intimacy of Power in Nicaragua

Roger N. Lancaster

"This large, poetic, powerfully evocative book is about the terrible intimacy of power . . . which emerges as the soft underbelly of the Sandinista revolution." —Nancy Scheper-Hughes, author of *Death Without Weeping*

$25.00 cloth

From *Life is Hard*

Fear at the Edge

State Terror and Resistance in Latin America

Edited by Juan E. Corradi, Patricia Weiss Fagen, and Manuel Antonio Garretón

"Very seldom does a collected volume achieve the academic quality and internal coherence that one sees in this case. It is a major contribution to comparative research on post-authoritarian situations." —Carlos Waisman, U.C., San Diego

$45.00 cloth, $14.00 paper

Chen Village under Mao and Deng

Expanded and Updated Edition

Anita Chan, Richard Madsen, and Jonathan Unger

This enthralling account of a Chinese village in the throes of the Maoist revolution, has been brought up to date. "[Depicts] in rich detail the background against which reforms are being carried out."—*New York Times*

$40.00 cloth, $15.00 paper, illustrated

Labor and Imperial Democracy in Prewar Japan

Andrew Gordon

New in paper—"Ambitious and provocative. . . . A daring and extraordinarily suggestive study; it is also backed by copious statistics and is evocatively illustrated."—*Monumenta Nipponica*

Twentieth Century Japan: The Emergence of a World Power

1991 John K. Fairbank Prize, AHA

$15.00 paper, illustrated

Losing Face

Status Politics in Japan

Susan Pharr

New in paper—"An excellent illustration of cross-cultural analysis in which Western theory illumines Japanese experience, and the example of Japan, in turn, provides a helpful dimension to the study of conflict in advanced, industrialized societies."

—*Journal of Asian Studies*

A Philip E. Lilienthal Book

$13.00 paper

The Rise of a Party-State in Kenya

From "Harambee!" to "Nyayo!"

Jennifer A. Widner

Widner charts the transformation of the Kenya African National Union (KANU) from a weak, loosely organized political party under Jomo Kenyatta into an arm of the president's office, with "watchdog" youth wings and strong surveillance and control functions, under Daniel arap Moi.

$45.00 cloth

Protecting Motherhood

Women and the Family in the Politics of Postwar West Germany

Robert G. Moeller

"All future texts on modern Germany will have to take on board the findings of this major study." —Volker Berghahn, author of *Modern Germany*

Moeller uses social policy as a lens to focus on society's conceptions of gender difference and "woman's place."

$42.00 cloth, illustrated

For the Best in Political Science

Merchant Capital and the Roots of State Power in Senegal: 1930–1985

Catherine Boone

In most post-colonial regimes in sub-Saharan Africa, state power has been used to structure economic production in ways that have tended to produce economic stagnation rather than growth. In this book, Catherine Boone examines the ways in which the exercise of state power has inhibited economic growth, focusing on the case of Senegal.

Cambridge Studies in Comparative Politics

41078-9 Hardcover $59.95

Social Choice

A Framework for Collective Decisions and Individual Judgements

John Craven

This textbook provides a survey of the literature of social choice. It integrates the ethical aspects of the subject (discussing potentially desirable conditions for social judgments), with positive aspects of decision mechanisms that center on the revelation of true preferences. The book draws together the work of a great many papers in a common notation, pointing out interrelations that are often missing in specialist papers.

32536-6 Hardcover $49.95 / 31051-2 Paper $15.95

Banning Chemical Weapons

The Scientific Background

Hugh D. Crone

Banning Chemical Weapons provides a readable and brief outline of chemical warfare; its origin and the offensive and defensive aspects. The aim of this volume is to give technical information to people interested in the wider aspects of disarmament, by showing how this technical material must be used in negotiations to achieve a worldwide and enforceable ban on chemical weapons. While not a textbook, this volume provides accessible technical background to the issue of chemical disarmament.

41699-X Hardcover $39.95 / 42711-8 Paper $12.95

Revolution in Russia

Reassessments of 1917

Edith Rogovin Frankel, Jonathan Frankel and Baruch Knei-Paz, Editors

In this volume, published in the 75th anniversary year, eighteen leading specialists from different generations, countries and schools of thought re-examine the key issues and events of 1917.

Contributors: *Jonathan Frankel, Israel Getzler, Donald J. Raleigh, Rex A. Wade, Allan Wildman, John Channon, Diane Koenker, William Rosenberg, David Mandel, Ziva Galili y Garcia, Ronald G. Suny, Stephen F. Jones, Ingeborg Fleischhauer, Neil Harding, Robert Service, John Keep, D. A. Longley, Edward Acton, Baruch Knei-Paz.*

40523-8 Hardcover $59.95 / 40585-8 Paper $18.95

Minority Representation and the Quest for Voting Equality

Bernard Grofman, Lisa Handley and Richard G. Niemi

"This is the best single book on contemporary voting rights law. It combines a comprehensive survey with a balanced discussion of unsettled issues. Its technical discussions are both thorough and accessible. Scholars, litigators, and judges will all benefit from its insights."

—Pamela S. Karlan, University of Virginia

This book is the most up-to-date treatment of voting rights law and the numerous controversies surrounding minority representation.

39128-8 Hardcover $34.95

Health Politics

Interests and Institutions in Western Europe

Ellen M. Immergut

Ellen Immergut analyzes comparatively the politics of national health insurance in Sweden, France and Switzerland—three countries where the same legislative proposals have been considered but where the policy results vary widely.

41335-4 Hardcover $49.95

Institutions and Social Conflict

Jack Knight

Many of the fundamental questions in social science entail an examination of the role played by social institutions. Why do we have so many social institutions? Why do they take one form in one society and quite different ones in others? In what ways do these institutions originally develop? And when and why do they change. *Institutions and Social Conflict* addresses these questions.

Political Economy of Institutions and Decisions

42052-0 Hardcover $54.95 / 42189-6 Paper $16.95

From Union to Commonwealth: Nationalism and Separatism in the Soviet Republics

Gail Lapidus and Victor Zaslavsky, Editors With Philip Goldman

The collapse of the Soviet Union and the emergence of fifteen independent states on its former territory is one of the most momentous developments of the twentieth century. In *From Union to Commonwealth*, five leading international scholars—Leokadia Drobizheva and Galina Starovoiteva from Russia, and Gail Lapidus, Ronald Suny and Victor Zaslavsky from North America—team up to examine the forces that lay behind the rise of national movements which challenged, then destroyed, the stability and territorial integrity of the former Soviet state.

Cambridge Soviet Paperbacks 6

41706-6 Hardcover $39.95 / 42716-9 Paper $12.95

Turn to Cambridge

Contending with Hitler
Varieties of German Resistance in the Third Reich
David Clay Large, Editor
Contending with Hitler is a distillation of recent scholarship on Germany's domestic resistance to the Nazi dictatorship. Consisting of twelve original essays, it sets forth the issues that specialists and laymen alike must keep in mind as they try to understand the nature and significance of this complex problem.
Contributors: *David Clay Large, Willy Brandt, Theodore Ellenoff, Fritz Stern, Martin Broszat, Detlev J. K. Peukert, Claudia Koonz, Konrad Kwiet, Michael Krüger-Charlé, Peter Steinbach, Thomas Childers, Peter Hoffmann, Klemens von Klemperer, Charles Maier, Hans Mommsen*
Publications of the German Historical Institute, Washington, D.C.
41459-8 Hardcover $34.95

Presidents and Assemblies
Constitutional Design and Electoral Dynamics
Matthew Soberg Shugart and John M. Carey
In this book, the authors systematically assess the strengths and weaknesses of various forms of presidential systems, drawing on recent developments in the theoretical literature about institutional design and electoral rules. They also demonstrate that electoral rules are critically important in determining how authority can be exercised within these systems, describing the range of electoral rules that can be instituted and the effects they have on the shape of party systems.
41962-X Hardcover $54.95 / 42990-0 Paper $16.95

The United States as a Developing Country
Studies in U.S. History in the Progressive Era and the 1920's
Martin J. Sklar
These seven essays are primarily concerned with the U.S. as a developing country in the early twentieth century, undergoing stages of development from competitive capitalism to corporate capitalism, and from industrial to "postindustrial" society.
40060-0 Hardcover $49.95 / 40922-5 Paper $14.95

Structuring Politics
Historical Institutionalism in Comparative Analysis
Sven Steinmo, Kathleen Thelen and Frank Longstreth, Editors
This volume brings together original essays by scholars working on a diverse range of empirical issues, but whose work is in each case informed by a "historical institutional" approach to the study of politics.
Contributors: *Colleen A. Dunlavy, Frank Longstreth, Peter A. Hall, Victoria Hattam, Ellen Immergut, Desmond S. King, Bo Rothstein, Sven Steinmo, Katherine Thelen, Margaret Weir*
41780-5 Hardcover $54.95 / 42830-0 Paper $18.95

Four new titles in the series Cambridge Texts in the History of Political Thought

Harrington: *The Commonwealth of Oceans* and *A System of Politics*
James Harrington
J. G. A. Pocock, Editor
James Harrington's brief career as a political and historical theorist spans the last years of the Cromwellian Protectorate and the Restoration of 1660. This volume comprises the first and last of Harrington's writings.
41189-0 Hardcover $54.95 / 42329-5 Paper $17.95

Bodin: *On Sovereignty*
Jean Bodin
Julian H. Franklin, Editor
This volume contains the essential points of Jean Bodin's theory of sovereignty, a landmark in legal theory and royalist ideology. The four chapters presented form the core of Bodin's classic work, *Six Livres de la Republique.*
34206-6 Hardcover $49.95 / 34992-3 Paper $15.95

Malthus: *An Essay on the Principle of Population*
T. R. Malthus
Donald Winch, Editor
This book provides a student audience with the best scholarly edition of Malthus' *Essay on Population.* Written in 1798 as a polite attack on post-French revolutionary speculations on the theme of social and human perfectibility, it remains one of the most powerful statements of the limits to human hopes set by the tension between population growth and natural resources.
41954-9 Hardcover $39.95 / 42972-2 Paper $11.95

Diderot: *Political Writings*
Denis Diderot
Robert Wokler and John Hope Mason, Editors
This volume presents a selection of the political writings of one of the most significant figures of the French enlightenment. It contains the most important articles that Diderot contributed to the *Encyclopédie*, of which he was principal editor.
36044-7 Hardcover $49.95 / 36911-8 Paper $15.95

Oxford

Green Globe Yearbook 1992

Edited by HELGE OLE BERGESEN, *Fridtjof Nansen Institute,* MAGNAR NORDERHAUG, *Nordic Branch of Worldwatch Institute,* and GEORG PARMANN, *Scandinavian University Press*

This work examines the international politics of environmental management. It shows the accomplishments of the international community in solving specific environmental and developmental issues, the main obstacles to effective international solutions, and suggestions for future attempts to overcome these problems.

1992 304 pp.; 58 illus. $45.00

Revolutionary Sparks

Freedom of Expression in Modern America

MARGARET A. BLANCHARD, *University of North Carolina, Chapel Hill*

A broad-gauged discussion of freedom of expression in America, this book begins by studying the period after the Civil War and Reconstruction when new and unsettling ideas appeared with great regularity on the American scene.

1992 592 pp. $49.95

The Politics of National Security

Congress and U.S. Defense Policy

BARRY M. BLECHMAN, *Defense Forecasts Inc.; Henry L. Stimson Center, Washington, D.C.;* with the Assistance of W. PHILIP ELLIS

"This is a well-organized, comprehensive, and very readable account of how and why Congress has seized—and more importantly retained—much of the high ground in the creation of defense policy.... Compared to other books in this genre, this is a gem." —*Political Science Quarterly*

1990 (paper 1992) 272 pp. paper $14.95 cloth $29.95

Courts, Corrections, and the Constitution

The Impact of Judicial Intervention on Prisons and Jails

Edited by JOHN J. DIIULIO, JR., *Princeton University*

"This collection of research articles is so interesting and well written that citizens who are aware of the seriousness of prison problems in our society today will find it an up-to-date and objective contribution to their existing knowledge."—*Perspectives on Political Science*

1990 (paper 1992) 352 pp. paper $16.95 cloth $38.00

Creation and Abortion

A Study in Moral and Legal Philosophy

F.M. KAMM, *New York University*

"Kamm is probably the most sophisticated deontologist writing on normative issues today....A *major* contribution to the literature."—Shelly Kagan, *University of Illinois at Chicago*

The Church and the Left

Adam Michnik

Edited, translated, and with an Introduction by David Ost

Years in advance of the collapse of communism in Eastern Europe, Poland underwent one of the most radical and painful social and political upheavals of our century. In *The Church and the Left*, Michnik gives full expression to the ideas that have shaped the drama of Poland and of our time.

"Michnik is one of those who bring honor to the last two decades of the twentieth century."—Nobel laureate Czeslaw Milosz

The Politics of Truth

FROM MARX TO FOUCAULT

Michèle Barrett

In this book, about the dramatic eclipse of one of Marxism's major theoretical and political weapons, the theory of ideology, the author shows how the problems of ideology are symptomatic of the difficulties now besetting the Marxist tradition of thought. 208 pp. Cloth, $37.50; paper, $12.95

Arms Control by Committee

MANAGING NEGOTIATIONS WITH THE RUSSIANS

George Bunn

Written by a participant in many of the negotiations, this book is essentially a series of case studies of U.S.-Soviet nuclear arms control negotiations. It also looks to the future: What changes will occur in the arms control process given the end of the Cold War? 360 pp. $39.50

Social Order and Political Change

CONSTITUTIONAL GOVERNMENTS AMONG THE CHEROKEE, THE CHOCTAW, THE CHICKASAW, AND THE CREEK

Duane Champagne

This book analyzes the conditions in which democratic governments are formed and become stable through examining in detail the history of four American Indian societies, in the process documenting a general theory of politics and constitutional government. 368 pp. $45.00

Ronald Dworkin

Stephen Guest

A lucid and comprehensive introduction to, and critical assessment of, Dworkin's seminal contributions to legal and political philosophy, this book aims to make his theories clear and accessible and to give a sympathetic yet rigorously argued overall picture of his thinking. 320 pp. Cloth, $42.50; paper, $14.95

Democratic Values and Technological Choices

Stuart Hill

The author develops and tests (in the controversy over the Diablo Canyon nuclear power plant) a model of citizen assessment that directly challenges current methods of policy analysis and public participation in making decisions on complex technologies such as dams and nuclear power plants. 300 pp. $37.50

Letting the People Decide

THE DYNAMICS OF A CANADIAN ELECTION

Richard Johnston, André Blais, Henry Brady, and Jean Crête

This innovative study explores the dynamics of political campaigns in general by attempting to make sense of the specific events of the 1988 Canadian election campaign. It covers such topics as issues, strategy, speeches, debates, polls, advertising, and national and electoral history. 288 pp. Cloth, $37.50; paper, $12.95

The Politics of Trade in Latin American Development

Steven E. Sanderson

A unique attempt to integrate material from the literatures of international trade, development, regional economic history, and resource management to describe the historical differences between Latin American nations and the industrialized world on the virtues of free trade. 368 pp. Cloth, $45.00; paper, $16.95

U.S.-Mexico Relations Series

U.S.-Mexico Relations

LABOR MARKET INTERDEPENDENCE

Edited by Jorge A. Bustamante, Clark W. Reynolds, and Raúl A. Hinojosa Ojeda

The papers in this volume, the product of extensive collaboration between Mexican and U.S. scholars, describe the structures of labor markets in the United States and Mexico, the framework of U.S. immigration policy, and the probable future evolution of both. 368 pp. $52.50

The Dynamics of North American Trade and Investment

CANADA, MEXICO, AND THE UNITED STATES

Edited by Clark W. Reynolds, Leonard Waverman and Gerardo Bueno

North American trade and economic relations are changing faster than anyone could have predicted even a few years ago. This wide-ranging book by scholars and policymakers from each of the three countries involved uses, for the first time, a trinational perspective to address the issues and problems posed by these changes, notably in regard to North American economic integration. 300 pp. $42.50

STANFORD UNIVERSITY PRESS
Stanford, CA 94305-2235

The Dynamics of Ethnic Competition and Conflict

Susan Olzak

Focusing on the period 1877-1914, this book puts forward and tests a new theory of ethnic conflict that sees competition by different ethnic groups for scarce jobs and other resources as the cause of higher rates of racial conflict and violence in late 19th- and early 20th-century American cities.
272 pp. $32.50

Shanghai on Strike

THE POLITICS OF CHINESE LABOR

Elizabeth J. Perry

Placing Chinese workers in comparative and theoretical perspective, the author explores the political proclivities of labor in 20th-century Shanghai and argues that fragmentation can actually empower, rather than incapacitate, the working class. 550 pp. $49.50

The Political Economy of Japan

VOLUME 3: CULTURAL AND SOCIAL DYNAMICS

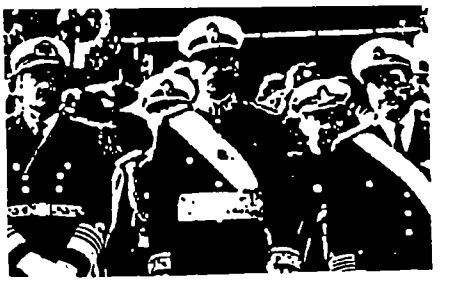
Edited by Shumpei Kumon and Henry Rosovsky

This is the third and final volume of a series that constitutes a state-of-the-art analysis of Japan's phenomenal economic rise, its society, and its place in contemporary world affairs. Previous volumes treated *The Domestic Transformation* and *The Changing International Context.*
360 pp. Cloth, $49.50; paper, $17.95

Technology and the Wealth of Nations

Edited by Nathan Rosenberg, Ralph Landau, and David C. Mowery

Most discussions of U.S. economic competitiveness focus on the creation of new technologies, but the abundant evidence presented in this book indicates that the key factors underpinning U.S. competitive weakness are concerned with the commercialization of technology. 400 pp. Cloth, $49.50; paper, $16.95



Bad Medicine

THE PRESCRIPTION DRUG INDUSTRY IN THE THIRD WORLD

Milton Silverman, Mia Lydecker, and Philip R. Lee

The authors show in great detail how local drug firms in the Third World have taken advantage of loose regulatory practices and unscrupulous behavior on the part of regional and national health care professionals to promote the sale of dangerous or worthless drugs.
360 pp. $29.95

NOW IN PAPER

Authoritarianism and the Crisis of the Argentine Political Economy

William C. Smith

This study of Argentina over the past 25 years confronts two questions: Why has Argentina, one of Latin America's wealthiest and most developed nations, failed so tragically to reconcile economic modernization and liberal democracy? Why have authoritarian regimes failed even more spectacularly than those led by civilians?
416 pp. Cloth, $47.50; paper, $16.95

Assessing the President

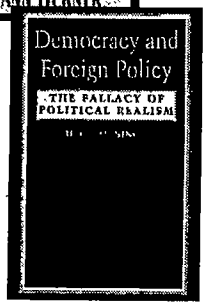
THE MEDIA, ELITE OPINION, AND PUBLIC SUPPORT

Richard A. Brody

The author presents a model of information processing that ties public support to indications of policy success or failure brought to the attention of the public through daily news reporting by the media.
208 pp. Cloth, $29.50; paper, $10.95

STANFORD UNIVERSITY PRESS
Stanford, CA 94305-2235

American Interests



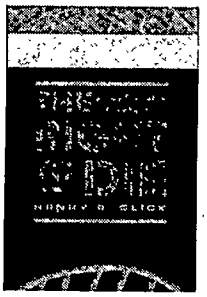
GENDER IN INTERNATIONAL RELATIONS

Feminist Perspectives on Achieving Global Security

J. Ann Tickner

Demonstrating how a feminist perspective on international relations changes and expands our view of the global system, Tickner examines gender differences in the political, military, economic and ecological arenas.

192 pp., $30.00



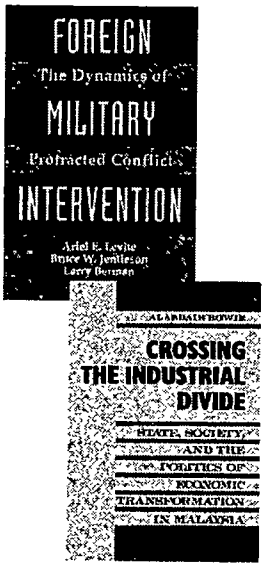
DEMOCRACY AND FOREIGN POLICY

The Fallacy of Political Realism

Miroslav Nincic

Is liberal democracy incompatible with a wise and effective foreign policy? Nincic proves that if so, then professional statesmen, not the public and its legislative representatives, spur on these incompatibilities. He also explores U.S. foreign policy consequences on some central aspects of our democracy.

200 pp., $37.50



FOREIGN MILITARY INTERVENTION

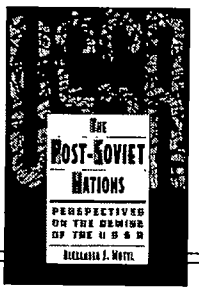
The Dynamics of Protracted Conflict

Edited by Ariel E. Levite, Bruce W. Jentelson, and Larry Berman

Whenever one country invades another, it does so based on one assumption: strong nation-states may militarily force a favorable political order on weaker ones. Here, international scholars examine the issue, identifying emerging patterns, timing, strategies, motivations, and justifications.

352 pp., $32.50

CROSSING THE INDUSTRIAL DIVIDE



State, Society, and the Politics of Economic Transformation in Malaysia

Alasdair Bowie

"Clearly written, well-researched and argued, and a model of the political economy in analyzing a Third World country, Bowie's work provides strong arguments for an analytical approach that relates to economic and social realities rather than using an ideological approach to force the analysis to fit."

—CHOICE

222 pp., $42.00

THE COLD WAR AND AMERICAN SCIENCE

The Military-Industrial-Academic Complex at MIT and Stanford

Stuart W. Leslie

This cautionary tale about the militarization of science at the expense of research in the civilian sector uses MIT and Stanford as examples to show how the American post-World War II military, technological, and academic alliance redefined and degraded both American science and the American university.

Jan., 335 pp., $42.00

THE POST-SOVIET NATIONS

Perspectives on the Demise of the U.S.S.R.

Edited by Alexander J. Motyl

"Not only an important historical perspective on the disintegration of the Soviet Union, but also an illuminating insight into the likely prospect of the former empire."

—Zbigniew Brzezinski

336 pp., $34.50

THE SOCIAL ORIGINS OF EGYPTIAN EXPANSIONISM

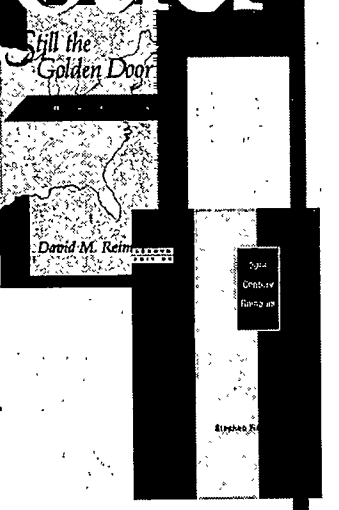
During the Muhammad 'Ali Period

Fred H. Lawson

Why do countries capture and occupy lands beyond their own borders? Focusing on Muhammad 'Ali Pasha and Egyptian expansionism after 1810, Lawson contends that domestic political conflicts directly determine foreign policy—not, as widely believed, the temperament of the leaders. The result is a groundwork for the study of expansionism.

215 pp., $40.00

DYNAMICS OF REGIONAL POLITICS



Four Systems on the Indian Ocean Rim

Edited by W. Howard Wriggins with F. Gregory Gause III, Terrence P. Lyons, and Evelyn Colbert

How did the end of the Cold War affect the Horn of Africa, the Persian/Arabian Gulf, the South Asian subcontinent, and Southeast Asia? Looking at these geographical subsystems individually, this work explores international conflict and cooperation patterns while testing hypotheses about international alignment and conflict.

352 pp.,$40.00

At Home & Abroad

THE RIGHT TO DIE
Policy Innovation and Its Consequences

Henry R. Glick

Glick probes the "right to die" movement—its construction, numerous components, and significance.

"A most thorough and erudite book giving the deep background on the right to die for the many scholars who are tackling this controversial subject."

—Derek Humphry, founder of the Hemlock Society, author of FINAL EXIT

238 pp., $32.50

STILL THE GOLDEN DOOR
The Third World Comes to America
Second Edition

David M. Reimers

Extensive revisions of the brilliant first edition on immigration and ethnic history include a discussion of undocumented immigration and the Simpson-Rodino Bill, a thorough exploration of the key events of the last five years, and highlights of the new wave of East European immigrants.

368 pp., $50.00 cloth, $14.50 paper

CLASS, POLITICS, AND IDEOLOGY IN THE IRANIAN REVOLUTION

Mansoor Moaddel

One cannot understand the Iranian Revolution without examining class politics, state action, religion, and the ideological relationship between them all, says Moaddel. His analysis traces the disputes from Shi'i revolutionary discourse to what he defines as a Third World version of fascism in the post-revolutionary order.

336 pp., $37.50

Emerging Issues in Biomedical Policy
An Annual Review

VOLUME II: DEBATES OVER MEDICAL AUTHORITY AND CHALLENGES IN BIOMEDICAL EXPERIMENTATION

Edited by Robert H. Blank and Andrea L. Bonnicksen

Focuses on two crucial issues in biomedical policy: treatment of fatal illness with life-extending technologies and policy-making regarding medical experimentation. As in the first volume, close attention is paid to the importance of technological advances in shaping the debates of policy.

288 pp., $45.00

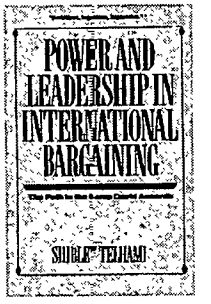
The series is available through our Standing Order Program. Call for details.

TWENTIETH CENTURY RUMANIA
Second Edition

Stephen Fischer-Galati

To what extent is contemporary Rumania a product of its history and evolution in the twentieth century? Fischer-Galati addresses this as he evaluates the issues Rumania faces in the post-communist era as a member of the European community and as a modern democratic state.

246 pp., $65.00 cloth, $16.50 paper



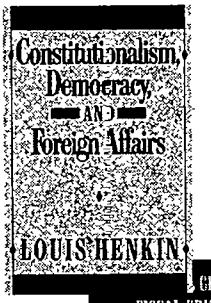
POWER AND LEADERSHIP IN INTERNATIONAL BARGAINING
The Path to the Camp David Accords

Shibley Telhami

"Demonstrates how a thoughtful application of international relations and formal bargaining theory can be used to reinterpret Middle Eastern processes."

—INTERNATIONAL JOURNAL OF MIDDLE EAST STUDIES

280 pp., $18.50 New paperback!



CONSTITUTIONALISM, DEMOCRACY, AND FOREIGN AFFAIRS

Louis Henkin

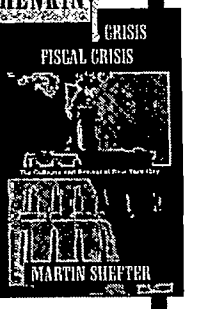
"States strongly and with impressive scholarship what too few have said about the dangers of a new imperial Presidency."

—THE NEW YORK TIMES BOOK REVIEW

125 pp., $12.95 New paperback!

POLITICAL CRISIS/FISCAL CRISIS
The Collapse and Revival of New York City

Martin Shefter



WINNER: APSA'S BEST BOOK ON URBAN POLICY

"[Shefters'] analysis of past crises presents an opportunity to better understand if not be prepared for crises to come."

THE POWER OF POLITICS, THE POLITICS OF POWER

IDEOLOGUES AND PRESIDENTS

From the New Deal to the Reagan Revolution

Thomas S. Langston

How have ideologues—people drawn to politics by the force of ideas—influenced presidential administrations? For Thomas Langston, these "people of ideas" form a class of political actors distinct not only from pragmatic professional politicians but also from nonideological "experts," with whom ideologues compete for power. Whether liberal or conservative, Langston argues, they are a creative yet destructive force in policymaking.

$35.00 *hardcover*

THE ORDEAL OF WOODROW WILSON

Herbert Hoover

with a new introduction by Senator Mark Hatfield

"[An] extraordinary memoir, unique in the annals of the American Presidency."—Daniel Patrick Moynihan

Admirer of both subject and author of *The Ordeal of Woodrow Wilson*, Mark Hatfield contends that Wilson's message, as conveyed by Hoover, is as important today as it was when the United States was first thrust into a global leadership role.

Woodrow Wilson Center Press

INSIDE NASA

High Technology and Organizational Change in the American Space Program

Howard E. McCurdy

Using archival evidence as well as in-depth interviews with space agency officials, Howard McCurdy investigates the relationship between the performance of the American space program and NASA's organizational culture. He concludes that the performance of high-technology agencies inherently tends to decline, given conditions existing within modern government.

New Series in NASA History: Roger D. Launius, Series Editor

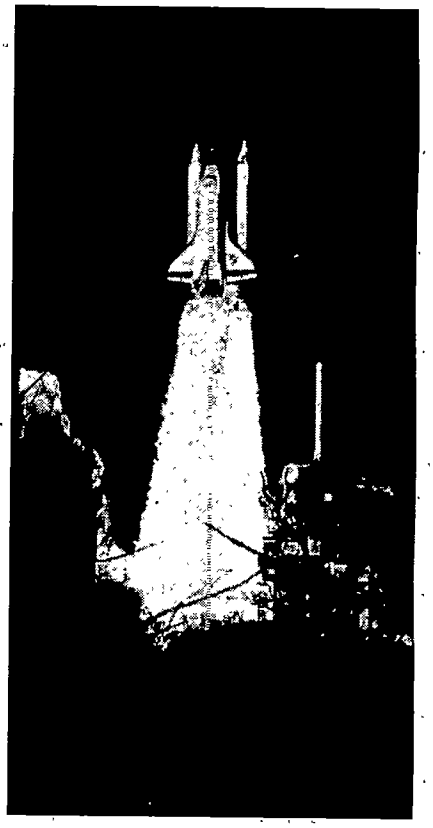
$32.95 *hardcover*

LIBERAL DEMOCRACY AND POLITICAL SCIENCE

James W. Ceaser

"A welcome candidate for a prospective list of texts for introductory courses in American politics and political theory.... It asserts the primacy of the political dimension in interpreting modern ideals for liberal democracy."—Avery Leiserson, *Journal of Politics*

$13.95 *paperback*



INTERNATIONAL COOPERATION AND PUBLIC GOODS

Opportunities for the Western Alliance

Mark A. Boyer

"This book makes an important contribution to international relations theory. Boyer demonstrates that the theory of public goods, as applied to alliances, is weak, both logically and empirically. He improves the theory by integrating it with the theory of comparative advantage, and shows that this combined theory gives a better explanation of burden-sharing in NATO than public goods theory alone."—Glenn Snyder, University of North Carolina, Chapel Hill

$33.00 *hardcover*

THE CIVIL RIGHTS SOCIETY

The Social Construction of Victims

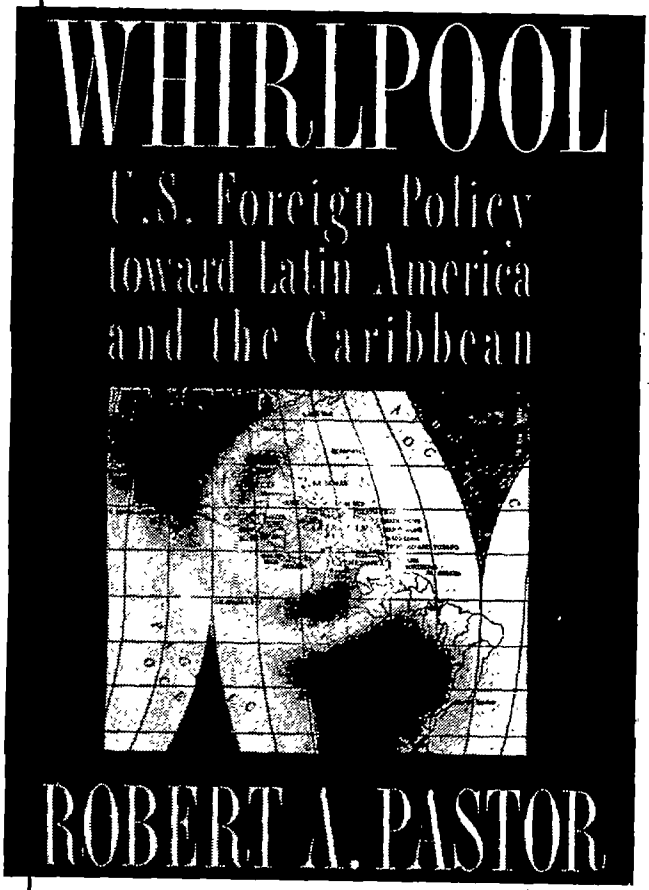
Kristin Bumiller

"Bumiller provides an original and badly needed perspective for understanding antidiscrimination law, and raises probing and disturbing questions about effective governmental strategies for helping people who are disadvantaged in other ways as well."—Murray Edelman, University of Wisconsin-Madison

$12.95 *paperback*

THE INTERNATIONAL PRACTICE OF ARMS CONTROL

edited by Emanuel Adler



Do classic arms control ideas still make sense in today's world? Has arms control increased U.S. security—and if so, why? How has the world changed since 1960? And what should be the nature, goals, and means of arms control agreements in the future? Fifteen experts explore answers to these questions against the background of a rapidly changing international scene.

Whirlpool

U.S. Foreign Policy toward Latin America and the Caribbean

Robert A. Pastor

In every generation the United States has been drawn into the Latin American whirlpool, where it becomes obsessed with small nations like Nicaragua and defiant dictators like Manuel Noriega. Has the end of the Cold War liberated the United States from the whirlpool of recurring interventions in Latin American politics?

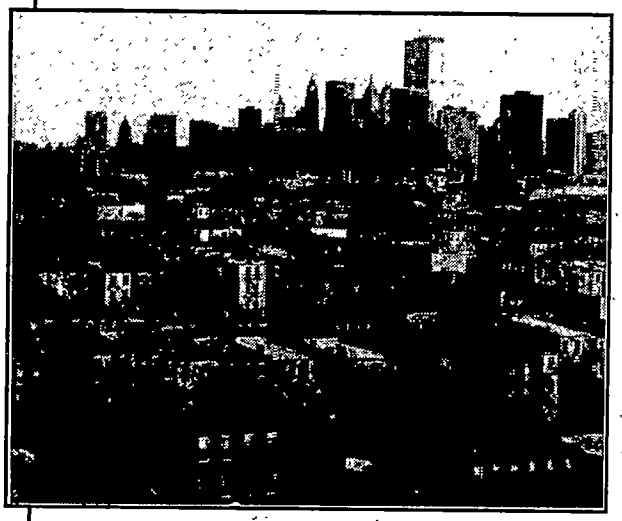
"Robert Pastor has written yet another brilliant book on the U.S. and Latin America. Again, he interprets the future against the background of the past. His proposals for future policy are creative, imaginative and intellectually sound. This book is required reading for everyone concerned with U.S.-Latin American policy in the years ahead. He is right on target."
—Theodore M. Hesburgh, C.S.C., President Emeritus, University of Notre Dame

Princeton Studies in International History and Politics
Editors: John Lewis Gaddis, Jack L. Snyder, and Richard H. Ullman
Cloth: $24.95 ISBN 0-691-08651-6

Making Democracy Work

Civic Traditions in Modern Italy

Robert D. Putnam



With Robert Leonardi and Raffaella Y. Nanetti

Taking advantage of a unique experiment begun in 1970 when Italy created new governments for each of its regions, Robert Putnam and his collaborators spent two decades analyzing the efficacy of these governments in such fields as agriculture, housing, and health services. Their findings were surprising: regions that enjoy effective government in the 1990s have inherited a legacy of civic engagement that can be traced back to the early Middle Ages. Putnam and his colleagues draw broad lessons for democratic theory from their twenty-year journey through Italy.

"The word 'classic' needs to be used sparingly, and I do. This work by Robert Putnam and his colleagues will be a classic in political inquiry and political theory. By the rare opportunity of studying Italian regional experiments from birth, it widens out to explore the way institutions shape political behavior. And that exploration, beautifully and lucidly written, is used to analyze the enduring questions about the nature of representative government."—*Daniel Bell*

Cloth: $24.95 ISBN 0-691-07889-0

Princeton

A Phoenix in the Ashes

The Rise and Fall of the Koch Coalition in New York City Politics

John Hull Mollenkopf

In the years following its near-bankruptcy in 1976 until the end of the 1980s, New York City came to epitomize the debt-driven, deal-oriented, economic boom of the Reagan era. John Mollenkopf explores why a city with a large minority population and a long tradition of liberalism elected a conservative mayor who promoted real estate development and belittled minority activists. Through a careful analysis of voting patterns, political strategies of various interest groups, and policy trends, he explains how Mayor Edward Koch created a powerful political coalition and why it ultimately failed.

First in a new series

Labor Visions and State Power

The Origins of Business Unionism in the United States

Victoria C. Hattam

Why has labor played a more limited role in national politics in the United States than it has in other advanced industrial societies? Victoria Hattam demonstrates that voluntarism, as the American labor policy was known, was the American Federation of Labor's strategic response to the distinctive structure of the American state.

In the three decades following the Civil War, when labor's legislative victories were continually eroded by the courts, the AFL developed a deep mistrust of politics and eventually devised other means of advancing workers' interests through the dual tactics of collective bargaining and industrial militance on the shop floor.

"Hattam approaches an important subject in an extremely interesting and provocative manner."
—Melvyn Dubofsky, SUNY-Binghamton

Princeton Studies in American Politics: Historical, International, and Comparative Perspectives
Editors: Ira Katznelson, Martin Shefter, and Theda Skocpol

Cloth: $35.00 ISBN 0-691-07870-X

Regulating Labor

The State and Industrial Relations Reform in Postwar France

Chris Howell

In May and June of 1968 a dramatic wave of strikes paralyzed France, making industrial relations reform a key item on the government agenda. French trade unions seemed due for a golden age of growth and importance. Today, however, trade unions are weaker in France than in any other advanced capitalist country. How did such exceptional militancy give way to equally remarkable quiescence?

To answer this question, Chris Howell examines the reform projects of successive French governments toward trade unions and industrial relations during the postwar era, focusing in particular on the efforts of post-1968 conservative and socialist governments.

"This is an important and at times brilliant analysis—the first significant and comprehensive book on the French trade union movement in English since. . .the 1950s."—*Martin Schain, New York University*

Cloth: $39.50 ISBN 0-691-07898-X

Hegel's Political Philosophy

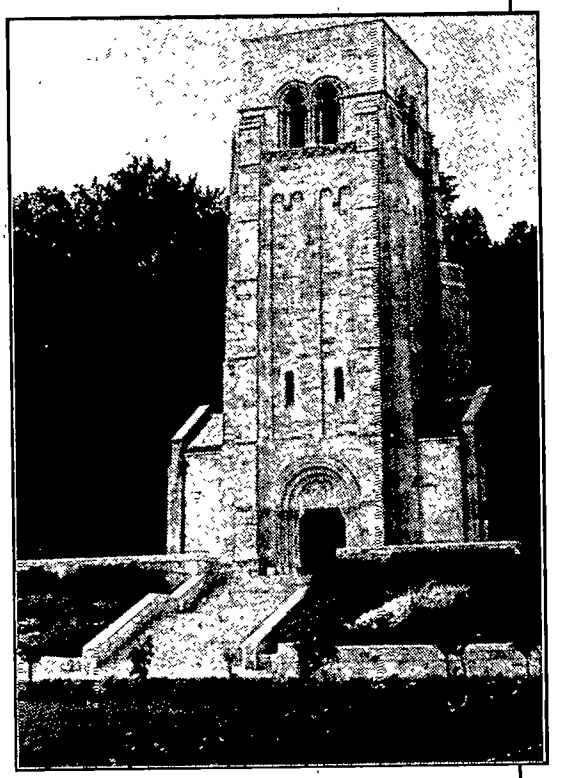
Interpreting the Practice of Legal Punishment

Mark Tunick

To scholars of Western intellectual history Hegel is one of the most important of all political thinkers, but politicians and other "down-to-earth" persons see his speculative philosophy as far removed from their immediate concerns. Put off by his difficult terminology, many believe that Hegel's idealism unduly legitimates the status quo. By examining his justification of legal punishment, this book introduces a Hegel quite different from these preconceptions: an acute critic of social practices. Mark Tunick draws on recently published but still untranslated lectures of Hegel's philosophy of right to take us to the core of Hegel's political thought.

"This lively and engaging book treats Hegel in a lucid, conversational way that has the desirable result of demystifying his often formidable jargon."—*Steven B. Smith, Yale University*

Cloth: $35.00 ISBN 0-691-07410-0



Enclaves of America

The Rhetoric of American Political Architecture Abroad, 1900-1965

Ron Robin

Whether determining the style of its embassies or the design of overseas cemeteries for Americans killed in battle, the U.S. government has greatly valued architectural symbols as a way of conveying its power abroad. In order to explain the political significance of American monuments on foreign soil, this illustrated book explores the efforts made by the United States from 1900 to 1965 to enhance its image as a military and economic force with displays of artistic achievement. Ron Robin also examines American political values during the radical change brought on by the growing entanglement of the United States in the affairs of other nations.

The Future of Liberal Revolution

Bruce A. Ackerman

In this timely and important book, a leading legal and political philosopher examines the renewed possibilities for the spread of democratic liberalism now that the Cold War has ended and new orders emerge after the recent revolutions in Eastern Europe.

"The collapse of Communism is as much a challenge to liberalism as it is to socialism. Ackerman argues eloquently for liberal revolutions that will not only achieve, but also preserve, human freedom. This short book is long on wisdom."—Alan Wolfe
$18.50

War and Reason

Domestic and International Imperatives

Bruce Bueno de Mesquita and David Lalman

Using a combination of game theory, statistical analysis, and detailed case histories, two leading theorists of international relations here analyze the strategies designed to avoid international conflict.

"This book sheds real light on a number of the most important questions in international relations."—George W. Downs
Illus. $40.00

Arendt, Camus, and Modern Rebellion

Jeffrey C. Isaac

"Isaac draws together Arendt and Camus into a fruitful dialogue. That dialogue is wide-ranging and tackles major events of the twentieth century, the creation and terrible denouement of totalitarianism, and, in its aftermath, the possibility for democratic politics, the forging of human identity, and the sustaining of anything like an ethical life. The work is very important."—Jean Bethke Elshtain
$30.00

New in Paperbound

Domination and the Arts of Resistance

Hidden Transcripts

James C. Scott

A penetrating discussion both of the public roles played by the powerful and the powerless and the mocking, vengeful tone they display offstage.

"[A] remarkable, mind-opening book."
—Zygmunt Bauman, *Times Literary Supplement* $14.00

Administrative Law

Rethinking Judicial Control of Bureaucracy

Christopher F. Edley, Jr.

This seminal book presents a fundamental reconsideration of modern American administrative law which, says Christopher F. Edley, Jr., is largely a failure.

"A fundamental challenge to the traditional project of administrative law."—John C. Hughes, *Perspectives on Political Science*
$14.00

Abe Fortas

A Biography

Laura Kalman

Lively and provocative, this prize-winning biography of New Dealer, corporate lawyer, and Supreme Court justice Abe Fortas draws on previously unavailable material to shed important new light on the man and the legal and political history he helped to shape.

"[An] exemplary biography....Lucid and gracefully written."—William E. Leuchtenburg, *The New Republic* Illus.

KANSAS

Virtue and the Promise of Conservatism

The Legacy of Burke and Tocqueville

Bruce Frohnen

"The most probing analysis of the fundamental characteristics of conservative thought since Russell Kirk's *The Conservative Mind*. This is a significant contribution to modern political thought whose thesis and positive proposals for the realization of the good life merit the close attention of all who are concerned with reversing the intellectual and moral decline of the West."—GEORGE W. CAREY, author of *The Church in the Market Place*. "An insightful study of modern conservatism, one that uniquely delineates its philosophical and spiritual sources in Western thought and gives a ringing Burkean call for reawakening and conservative reform. Well worth reading and pondering."—ELLIS SANDOZ, author of *A Government of Laws: Political Theory, Religion, and the American Founding*.

192 pages. $25.00

Ratifying the Constitution

Edited by Michael Allen Gillespie and Michael Lienesch

New in Paperback

A diverse group of historians and political theorists unravel the labyrinthine complexity of ratification on a state-by-state basis. "The reader will come away with an understanding that the ratification of the Constitution was scarcely less miraculous than its drafting."—FORREST MCDONALD, author of *Novus Ordo Seclorum: The Intellectual Origins of the Constitution*. "The strength of this book is in its close focus on the particular issues, personalities, and factional divisions in each state and the effect that these had on the ratification decision."—*JOURNAL OF POLITICS*.

418 pages. Cloth $29.95, Paper $14.95

George Washington and American Constitutionalism

Glenn A. Phelps

"This is a splendid, well-written reexamination of George Washington as a constitutional thinker as well as a practitioner."—THOMAS E. CRONIN, editor of *Inventing the American Presidency*. "This book clarifies for the present generation what Washington's contemporaries knew very well—that throughout his life, and especially during his ten years of extraordinary political leadership, 1787–1797, he was an earnest, consistent, and even profound republican constitutionalist, in theory as well as in practice."—RALPH KETCHAM, author of *Framed for Posterity: The Enduring Philosophy of the Constitution*. "This is a book we have long and truly needed. Phelps makes the case for Washington's decisive importance to the development of American constitutional republicanism."—LANCE BANNING, author of *The Jeffersonian Persuasion: Evolution of a Party Ideology*.

272 pages. $27.50

Chester I. Barnard and the Guardians of the Managerial State

William G. Scott

"A work of extraordinary value. It shines a revealing light in three directions. The milieu in which Barnard made his contribution illuminates him and his works, his works illuminate the milieu, and together they illuminate the (much changed and more problematic) contemporary economic, social, and managerial world."—DWIGHT WALDO, author of *The Administrative State*. "Very strong in its delineation of the evolution of management thought and developments in American industry which played a part in Barnard's intellectual development. Scott has taken a difficult subject, put it into historical perspective, and has dealt with historical and intellectual antecedents very effectively."—JACK RABIN, coauthor of *Politics and Administration: Woodrow Wilson and American Public Administration*.

256 pages. $27.50

Eisenhower and the Management of Prosperity

New in Paperback

John W. Sloan

"This masterly treatment of Eisenhower as economic manager will be warmly received by both political scientists and historians. A major addition to the literature on presidential policy making, economic and otherwise."—JAMES E. ANDERSON, author of *Public Policy-Making*. "An excellent book that merits attention . . . from anyone interested in the modern presidency and in American political economy.—*JOURNAL OF POLITICS*.

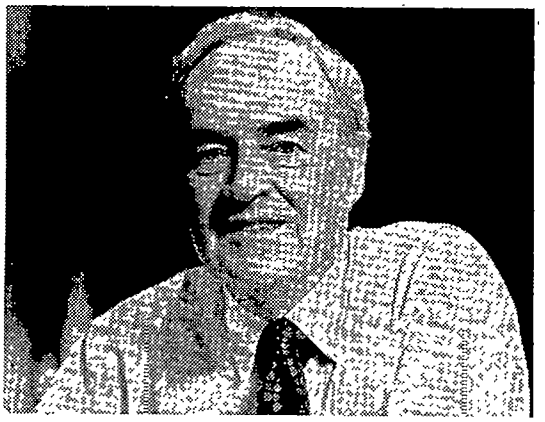
Of Kennedys and Kings

Making Sense of the Sixties

HARRIS WOFFORD
U.S. Senator, Pennsylvania

Introduction by Bill Moyers



"Unforgettable and chilling . . . Wofford delves into [the sixties]; pulling memories together with fresh evidence to wrest the logic from dark events. . . . The temptation is great to cite a hundred passages from this book; to demonstrate—rather than merely assert—that it makes sense of the sixties."
—**Eric Redman, *The Washington Post***

"Wofford is at his anecdotal best in this memoir of the New Frontier when he is writing about the fabled campaign or describing the Peace Corps. . . . The major events of the Kennedy Administration are chronicled in detail . . . and this makes the book particularly useful for anyone too young to remember Kennedy's Presidency or too busy to have consumed any of the shelfful of JFK books that have already appeared."
—**Charles Kaiser, *Newsweek***

"*Of Kennedys and Kings* is a splendid navigational aid to the Kennedy era."
—**Alan L. Miller, *Christian Science Monitor***

Harris Wofford served in the Kennedy White House as Special Assistant to the President and chair of the subcabinet group on civil rights. While on the White House staff, he also helped Sargent Shriver form the Peace Corps and from 1962 to 1964 served in Ethiopia as the corps' Special Representative to Africa. During the decade of struggle from Montgomery to Memphis, he was an advisor to Martin Luther King, Jr.

Wofford in 1966 became founding president of the State University of New York's College at Old Westbury and was president of Bryn Mawr College from 1970 to 1978. In May 1991 he was appointed to fill the seat of the late Senator John Heinz and in November, when he defeated former Governor and U.S. Attorney General Dick Thornburgh, he became the first Democrat elected to the U.S. Senate from Pennsylvania since 1962.

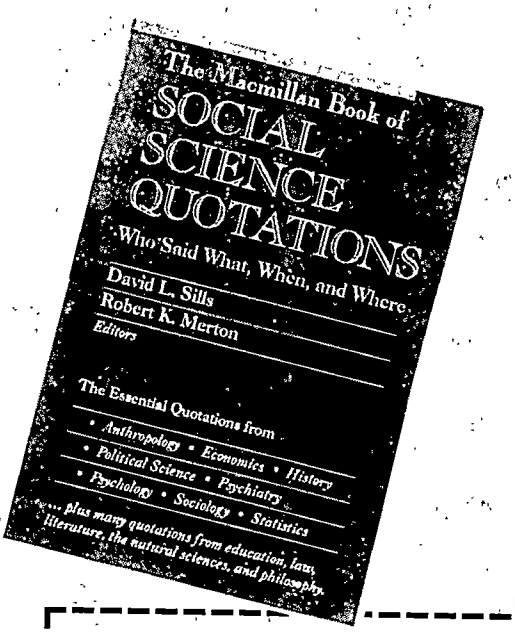
No social scientist can afford to be without



THE MACMILLAN BOOK OF Social Science Quotations

WHO SAID WHAT, WHEN, AND WHERE

Edited by DAVID L. SILLS, *Social Science Research Council,* and ROBERT K. MERTON, *Columbia University*

Here, collected in one volume for the first time, are the essential quotations from anthropology, economics, history, law, philosophy, political science, psychiatry, psychology, sociology, and statistics, plus many quotations from education, literature, and the natural sciences.

Over 2,500 quotations from a wide range of social scientists and other scholars are included, alphabetically arranged by author. The original date and the exact source of each quotation are given. The volume includes an extensive bibliography and a comprehensive index.

Here's what social scientists are saying...

"*Summum opus.* A dazzling, momentous achievement... Everything important that has been said in the social sciences will be found here."
—Daniel Patrick Moynihan, *U.S. Senator*

"A treasure house of insight and wisdom, *Social Science Quotations (SSQ)* is also an altogether delightful book for browsing in the idle hours."
—Arthur Schlesinger, Jr., *The City University of New York*

"As an economic man, I cheer when *SSQ* comes out in paperback. Now both home and office can afford a copy. Just another illustration that *demand is elastic with respect to price.*"
—Paul A. Samuelson, *Massachusetts Institute of Technology*

"What better combination than to browse and be instructed at the same time. These are the joys of *SSQ* and its precise scholarship, unexampled in books of quotations."
—Daniel Bell, *Harvard University*

Modern editions of classic works for today's reader

UNION AND LIBERTY: THE POLITICAL PHILOSOPHY OF JOHN C. CALHOUN

Edited by Ross M. Lence

"This is the finest collection in a single volume of Calhoun's important works enunciating all aspects of his political philosophy, a philosophy that profoundly influenced the course of American history. Calhoun's ideas continue to influence political discourse, and no doubt always will. All his major speeches are here. . . . Most important, all the selections are complete and unabridged. This is truly an editorial triumph." Robert V. Remini, Professor Emeritus, University of Illinois

This outstanding collection begins with Calhoun's two most significant works, the *Disquisition* and *Discourse*. They are followed by twelve other important speeches, letters, and political essays.

626 + xxx pages, index. Hardcover $35.00 0-86597-102-1; Paperback $9.50 0-86597-103-X

OTHER NEW AND SIGNIFICANT TITLES

FURTHER REFLECTIONS ON THE REVOLUTION IN FRANCE

GPG GREENWOOD PUBLISHING GROUP INC.

The Poverty Debate
Politics and the Poor in America
By C. Emory Burton

Summarizes, overviews, and attacks conservative arguments that poverty is not widespread and that it is caused by indolence.

Greenwood Press. 1992. 224 pages. 0-313-28594-2. $47.95
A paperback is also available: 0-275-94436-0. $16.95

Public Management in the States
A Comparative Study of Administrative Performance and Politics
By Richard C. Elling

Based upon a sampling of some 800 public managers in 10 states, examines the current condition of public administration at the state level.

Praeger Publishers. 1992. 304 pages. 0-275-93432-2. $55.00

Youth's Battle for the Ballot
A History of Voting Age in America
By Wendell W. Cultice

This is the first full history dealing with the voting age in the United States from 1607 to 1991 that shows how military service and suffrage have been linked through the years.

Greenwood Press. 1992. 288 pages. 0-313-27962-4. $45.00

Citizens, Political Communication and Interest Groups
Environmental Organizations in Canada and the United States
By John C. Pierce, Mary Ann E. Steger, Brent S. Steel, and Nicholas P. Lovrich

This volume shows how interest groups can bridge the knowledge gap between public policy making and citizens in the U.S. and Canada.

Praeger Publishers. 1992. 256 pages. 0-275-93579-5. $47.95

The Politics and Philosophy of Political Correctness
By Jung Min Choi and John W. Murphy

This is the first comprehensive examination of "Political Correctness"—PC—and the positions of its critics.

Praeger Publishers. 1992. 184 pages. 0-275-94286-4. $39.95

Environmental Politics
Public Costs, Private Rewards
Edited by Michael S. Greve and Fred L. Smith

The essays in this volume address the use and manipulation of environmental regulations and policies for political and economic objectives which, they argue, have little or nothing to do with responsibly serving the public.

Praeger Publishers. 1992. 224 pages. 0-275-94237-6. $45.00
A paperback is also available: 0-275-94238-4. $19.95

Presidential Influence and Environmental Policy
By Robert A. Shanley

This unique study of the administrative tools and techniques that American presidents have used to influence environmental policymaking is invaluable for understanding presidential limitations and the history of environmental policy.

Greenwood Press. 1992. 200 pages. 0-313-25883-X. $45.00

The Constitutional Amending Process in American Political Thought
By John R. Vile

This the first full-length work to present debates over the constitutional amending process as a perennial theme in American political thought. Vile looks at the historical influences on and discussions surrounding the amending process that was incorporated into Article V of the Constitution.

Praeger Publishers. 1992. 224 pages. 0-275-94280-5. $47.95

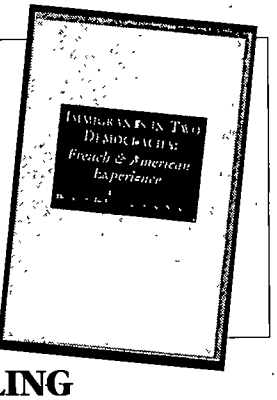
POLITICAL SCIENCE



IMMIGRANTS IN TWO DEMOCRACIES
French and American Experience

EDITED BY DONALD L. HOROWITZ AND GÉRARD NOIRIEL

An American Academy of Arts and Sciences Book

"Ethnicity...has proved a far more powerful force in world politics than the class struggle proclaimed by Marxist theorists and rulers for much of the 20th century. If we are to better understand it, and I contend we must, we shall look to important works such as *Immigrants in Two Democracies*."—Senator Daniel Patrick Moynihan

507 pp./ $55.00 hardcover

RACE AGAINST THE COURT
The Supreme Court and Minorities in Contemporary America

GIRARDEAU A. SPANN

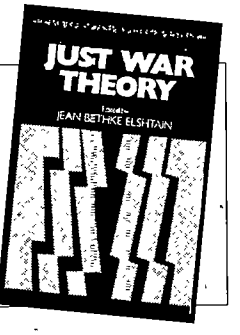
This provocative work argues that the Supreme Court perpetuates the subordination of minorities by operating as an undetected agent of majority preferences.

January/ 256 pp./ $40.00 hardcover

STOPPING THE KILLING
How Civil Wars End

EDITED BY ROY LICKLIDER

Examines civil wars in Colombia, the Sudan, Yemen, the U.S., Greece, and Nigeria, exploring causes of peace and issues of negotiation and settlement.



372 pp./ 6 maps/ $40.00 hardcover

JUST WAR THEORY

EDITED BY JEAN BETHKE ELSHTAIN

Essays by Michael Walzer, Stanley Hauerwas, James Turner Johnson, Michael Howard, Paul Ramsey, William V. O'Brien, Robert L. Holmes, and Stephen Toulmin examine the concept and implications of just war.

352 pp./ $17.50 paperback/ $40.00 hardcover

AMERICAN FOREIGN POLICY TOWARDS LATIN AMERICA IN THE 80S AND 90S
Issues and Controversies From Reagan to Bush

HOWARD J. WIARDA

This is an insider's account of the ideologies behind America's policy towards Latin America during the last three administrations.

384 pp./ $17.50 paperback/ $50.00 hardcover

IMMIGRATION AND THE AMERICAN CITY

THOMAS MULLER

A Twentieth Century Fund Book

Muller surveys the political and economic history of American immigration and convincingly argues that the clamor at America's gate should be a cause of pride, not anxiety.

The Ultimate Challenge: Our Planet's Survival

Drafts Agenda 21, Rio Declaration, Forest Principles

This book contains the official documentation of the Rio Conference, otherwise known as the Earth Summit. The central part of the documentation is the Drafts Agenda 21 which is, in essence, a blueprint for action in all major areas affecting the relationship between the environment and the economy. It focuses on the period up to the year 2000 and extends into the 21st century. This unique publication is a must for all professionals in the fields of environment and development, libraries and archives.

E.92.I.16 92-1-100482-9 600pp. $75.00

The Global Partnership for Environment and Development: A Guide to Agenda 21

This guide summarizes for the reader the programmes and themes of the "Earth Summit" which will enable each of us to act responsibly and be represented in the important dimension of the overall strategy for a global transition. It has specifically been written for the general reader and as such is easy to read and an invaluable reference for everyone.

E.92.I.15 92-1-100481-0 116pp. $9.95

Nations of the Earth Report: Vol. I United Nations Conference on Environment and Development

As part of the preparations for the Conference, governments were asked to prepare National Reports presenting their perspectives and experience, together with information on policies, activities and issues at the national level. This book is intended as a "Quick-reference Compendium" to these Reports, which have been summarized to give the reader an idea of the main elements and concerns raised in them. Due to the quantity of reports submitted, they are being published in three volumes, with the first 47 reports contained in the first volume. This book is important to everyone monitoring the activities of governments on this basic issue such as librarians, lawyers, public health administrators, teachers and media specialists. Vols. II and III will present other countries not included in Vol. I.

E.92.I.17 92-1-100483-7 Vol.I 285pp. $50.00
E.92.I.18 92-1-100484-5 Vol.II $50.00 Forthcoming
E.92.I.19 92-1-100485-3 Vol.III $50.00 Forthcoming

European Red List of Globally Threatened Animals and Plants

A list published on the animals and plants in Europe threatened with global extinction. It includes mammals, birds, reptiles, amphibians, freshwater fishes, invertebrates as well as endemic vascular and non-vascular plants. It is a tool in identifying and implementing the appropriate protective measures for these species.

E.91.III.E.34 92-1-1165229 153pp $29.00

Consolidated List of Products whose Consumption and/or Sale have been Banned, Withdrawn, Severly Restricted or not approved by Governments

Newly revised, this fourth edition is an invaluable reference to products determined harmful to human health and/or the environment by governments worldwide. It provides updated regulatory, commercial and scientific data on over 600 pharmaceuticals, agricultural and industrial chemicals and consumer products. An essential desk reference for manufacturers, government regulatory agencies and commissions, consultants, universities, libraries, research centers, scientific and technological associations and those involved in health and environmental issues and safety.

E.91.IV.4 92-1-103145-9 807pp. $95.00

European Agreement Concerning the International Carriage of Dangerous Goods by Road (ADR) and Protocol of Signature

Transporting waste by sea, air or land is an important environmental issue, and increasingly so in the European community. This book presents the European agreement, the Protocol of Signatures, annexes and amendments up to 1 January 1990. The various substances are listed and defined as well as general and special provisions applicable to the transport of these dangerous materials. Provisions relating to packaging, test requirements, radioactive materials, containers, cleaning and labelling are discussed throughly.

E.89.VIII.2 92-1-139027-1 V.I & II 640pp. $85.00

Multilingual Terminology Bulletin on Environment and Development

Terminology Bulletin No. 344

This two-volume multilingual terminology bulletin was prepared specifically with the UNCED assembly in mind. It is a significant reference tool to promote consistent, accurate and authentic conceptual links and terminology for use by experts and language staff in Arabic, Chinese, English, French, Russian and Spanish. It ensures the use of correct title and nomenclature on new concepts and neologisms as well as facilitates understanding and direct contact among the international and research communities associated with environment and development.

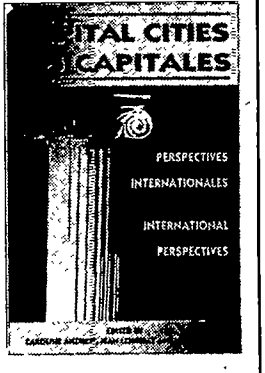
Enlightening Titles from CARLETON UNIVERSITY PRESS

Driving Continentally
National Policies and the North American Auto Industry — edited by Maureen Appel Molot

The auto industry in North America is in serious trouble. The papers collected in the book examine this industry that is critical to the economies of the United States, Canada and Mexico at a time when the three countries are taking steps to be much more closely linked. As we prepare for the implementation of the North American Free Trade Agreement it is important to understand how past government policies in the three countries have promoted, protected and shaped the auto industry, and how the industry might respond to the NAFTA. *Jan. '93, 375 pp., ISBN 0-88629-197-6 paper $21.95*

Limiting the Proliferation of Weapons
The Role of Supply-Side Strategies — edited by Jean-François Rioux



The Iraqi military build-up and the invasion of Kuwait have alerted the world to the dangers involved in the spread of advanced weapons and of high technologies. In this book, an international team of arms control experts adresses important questions raised by the use of export sales restrictions in controlling the spread of weapons. In non-technical language, they examine vital issues relating to ballistic missiles, as well as to nuclear, chemical, biological and conventional weapons. *Nov. '92, 208 pp.*
ISBN 0-88629-192-5 casebound $34.95 ISBN 0-88629-193-3 paper $21.95

Ethics in Public Service — edited by Richard A. Chapman

Specialists from the United States, Canada, Britain, Australia and Sweden focus on topics currently being debated in the field of public service ethics, in this thoughtful volume. The essays are specially written for the book and cover topics including the promotion of public service ethics, the teaching of ethics, freedom of information, trade unions, protection of human rights and the legal aspects of public service ethics. *Jan. '93, 275 pp., ISBN 0-88629-191-7 paper $21.95*

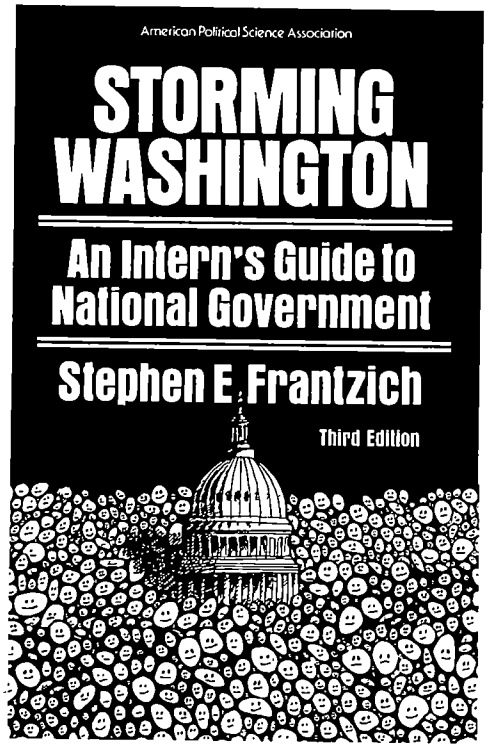
Social Justice and the Constitution — Perspectives on the Social Union for Canada
edited by Joel Bakan and David Schneiderman

"Bakan and Schneiderman's collection of essays provides a window onto a debate within the Canadian left and social movements that bears fundamental importance to the future of Canada and to theorizing about law in general; namely, to what extent can law assist in the empowerment of the disempowered? *Social Justice and the Constitution* is a must read for anyone concerned about social and economic justice." *Patrick Macklam, Faculty of Law, University of Toronto.*
Nov. '92, 176 pp. ISBN 0-88629-196-8 casebound $27.95 ISBN 0-88629-195-X paper $17.95

Capital Cities/Les capitales: Perspectives internationales/ International Perspectives — edited by John Taylor, Jean Lengellé and Caroline Andrew

This unusual study looks at the nature and role of capital cities around the world— past, present and future. The papers are by scholars from many countries and disciplines. Topics include the changing roles of capitals, problems with capitals, the creation of Washington, D.C., New York – world city, ancient and new capitals in Latin America, and future directions for European capital cities. 7 essays in French, 15 in English. *Jan. '93, 375 pp.*
ISBN 0-88629-178-X casebound $39.95 ISBN 0-88629-179-8 paper $24.95

Aid as Peacemaker: Canadian Development Assistance and Third World Conflict — edited by Robert Miller



Does development by its very nature produce conflict? Are there times when countries supplying aid should take sides in third world conflict? Can aid help promote peace? This collection of essays by experts in development aid makes an important contribution to our understanding of peacekeeping and peacemaking. *Nov. '92, 224 pp.*
ISBN 0-88629-176-3 casebound $27.95 ISBN 0-88629-177-1 paper $15.95

Ph.D. or equivalent is required, research and teaching interest in application and theory preferred as well as interdisciplinary orientation. Appointments will be made for the 1993-94 academic year.

Please send resume, references, and an example of scholarly work, by January 15, 1993 to:

Dean's Office
Faculty Recruiting
Yale School of Organization and Management
Box 1A Yale Station
New Haven, CT 06520-7368

Yale is an equal opportunity, affirmative action employer and especially encourages applications from women and members of minority groups.

NEW FROM NORTHEASTERN

RECOLLECTIONS OF THE NEW DEAL
When the People Mattered
Thomas H. Eliot
Edited and with an introduction by John Kenneth Galbraith

Recollections of the New Deal is Thomas H. Eliot's recently completed memoir of his role as principal author of the Social Security Act.

"A brief, well-written insider's view of Roosevelt's New Deal.... Other books tell the story but fail to capture the drama. Both general readers and scholars would enjoy this."
— *Library Journal*

$24.95 cloth

Revised Edition
EIGHTY YEARS AND MORE
Reminiscences 1815-1897
Elizabeth Cady Stanton
Introduction by Ellen Carol DuBois
Afterword by Ann Gordon

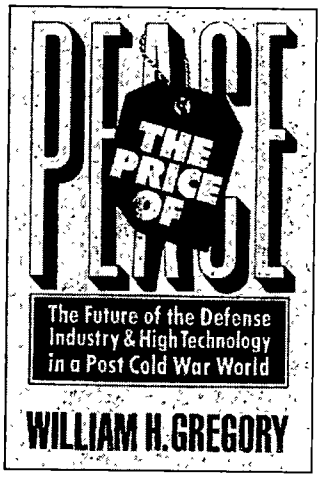
"This powerfully written book is essential reading for anyone who would understand not only the origins of the women's rights movements, but the nature of American society in Stanton's era."
— Eric Foner
Columbia University

$37.50 cloth • $14.95 paper

Revised Edition
THE ELIZABETH CADY STANTON–SUSAN B. ANTHONY READER
Correspondence, Writing, Speeches
Edited, with critical commentary, by Ellen Carol DuBois
Foreword by Gerda Lerner

Praise for the previous edition:
"[Ellen DuBois's] critical commentary . . . is vivid and interesting, her interpretation of personality and event engaged, alive."
— Vivian Gornick
The New York Times Book Review

$37.50 cloth • $14.95 paper



ETHNICITY, RACE, AND AMERICAN FOREIGN POLICY
A History
Alexander DeConde

"DeConde writes about foreign policy, but he pulls at a thread that hints at the unraveling of the centuries-old Anglo-American bonding that shaped national policy from colonial times through the cold war. Given the current massive flux of U.S. ethnic makeup, then: a timely work."
— *Kirkus Reviews*

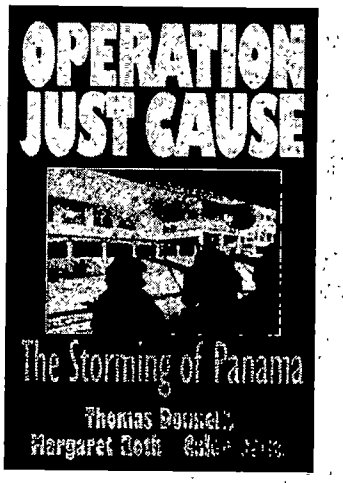
NEW FROM LEXINGTON BOOKS

THE PRICE OF PEACE
The Future of the Defense Industry and High Technology in a Post-Cold War World

William H. Gregory

The end of the cold war, the dissolution of the Soviet Union, the wane of communism world-wide, and the quick victory in the Gulf have all led to calls for a smaller defense budget, reduced levels of military pesonnel, and fewer expensive high-tech weapons. The result of these cutbacks, Gregory argues, is not a peace dividend, but a further burden on the already shaky economy. Gregory explains the little-known and far-reaching effects of the defense cutbacks and calls for a new national technology policy that will ensure our military, technological, and economic survival.



1992 0-669-27950-1 $24.95

THE INTERNATIONAL ARMS TRADE

Edward J. Laurance

The events of the past year in the Persian Gulf, which saw Iraq import enough armaments to defy the major powers, have brought the question of arms trading to the head of the international agenda. In the first book to address the arms trade in a truly global context, Laurance applies international relations theory to an issue at the heart of the contemporary state system—the transfer of military capability for the purpose of fortifying the national security of sovereign states. Laurance examines past patterns of arms transfer, and the influences of international factors on national policymakers, in order to show that the arms trade has gone far beyond the control of individual nation-states.

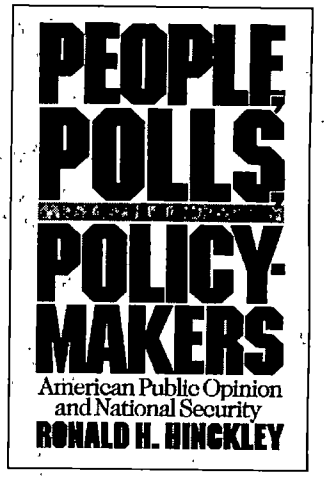
1992 0-669-19928-1 $35.00

OPERATION JUST CAUSE
The Storming of Panama

Thomas Donnelly, Margaret Roth, and Caleb Baker

"This will not only be the standard work on our Panama intervention but on how the U.S. Army fights the 'little wars' that punctuate our times. It reads like a superb thriller...It belongs in the hands of our service academy students and those citizens who wish to gain a better understanding of what the men and women in uniform do to earn their pay."

—**Ralph Peters,** Major, U.S. Army, author of *Red Army* and *The War in 2020*



1992 0-669-24975-0 $24.95

WHAT CAUSES WAR?
An Introduction to Theories of International Conflict

Greg Cashman

If one of the central goals of our time is the avoidance of war, then, as author Greg Cashman points out, one of the foremost challenges of our time is to understand its causes. In *What Causes War?*, Cashman provides students with a comprehensive examination of the theories of international conflict. He breaks them down into five categories, including those theories which seek to explain whether man is naturally war-like; small group-level theories which focus on political processes within states; theories which address national and international-level conflict; and, finally, theories which examine the world order itself and attempt to explain the big picture of global conflict.

March 1993 0-669-21215-6
$15.95 paper

PEOPLE, POLLS, AND POLICYMAKERS
American Public Opinion and National Security

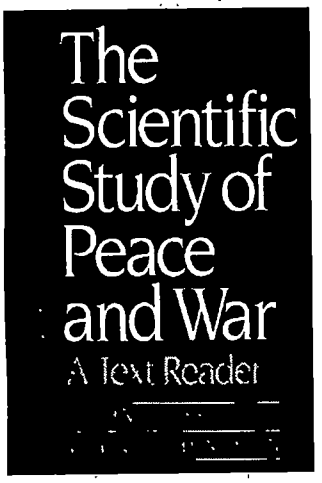
Ronald H. Hinckley

"Some researchers argue that public opinion has few consequences for policy-making. Hinckley's book will force a serious reassessment of this belief about public opinion. His book is well written and clearly argued."

—**Darrell M. West,** Brown University

1992 0-669-27282-5 $29.95

THE U.S. ECONOMY DEMYSTIFIED
The Meaning of U.S. Business Statistics and What They Portend for the Future
Third Edition



Albert T. Sommers with Lucie R. Blau, both of *The Conference Board*

"Every academic, business and government economist concerned with the course of the economy from month to month and year to year has learned to respect Al Sommers. He knows the numbers thoroughly and interprets them with perception and wisdom, based on his own understanding of the mechanisms at work, born of long experience. He tells stories with great clarity, grace, and humor—also with the humility becoming any economic pundit."

—**James Tobin,** Yale University

February 1993 0-02-930116-5

In paperback—

THE SCIENTIFIC STUDY OF PEACE AND WAR
A Text Reader

John A. Vasquez and Marie T. Henehan

In this comprehensive overview, Vasquez and Henehan bring together the best scientific work on peace and war over the last twenty-five years—by leading scholars including Jack Levy, Bruce Bueno de Mesquita, Steven Rosen, Organski and Kugler, Rassler and Thompson, Randolph Siverson, and others. Together these pieces constitute an ample body of evidence illuminating the causes and consequences of war, and reflect the real progress that has been made towards a comprehensive explanation of war and peace.

"This book fills a significant void by providing a tangible guide to the scientific analysis of war as well as offering a basis for undergraduates to read and understand qualitative studies."
—**Paul F. Diehl,** University of Illinois at Urbana-Champaign

1992 0-669-20105-7 $14.95 paper

THE PLACE OF MORALITY IN FOREIGN POLICY

Felix E. Oppenheim

Provides a thought-provoking examination of an all-too-often overlooked question central to any discussion of international relations and ethics: to what extent is morality relevant in foreign policy decisions? Written to challenge students and experts to explore in what instances morality and moral commitments really matter in international politics.

1991 0-669-21452-3 $14.95 paper

AMERICAN FEDERALISM
Competition Among Governments

Thomas R. Dye,
Florida State University

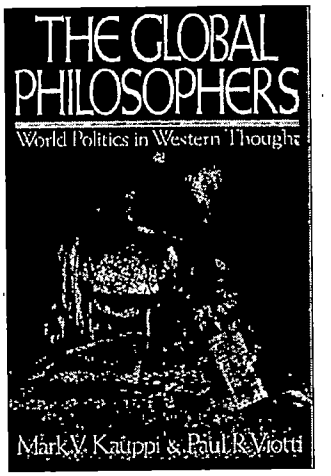
According to Dye, a competitive federalism encourages rivalry among state and local governments. Arguing that "eighty thousand governments are better than one," Dye explains why competitive government is better for the citizenry than a single, dangerously powerful, centralized government.

1989 0-669-21474-4 $16.95 paper

THE INTERNATIONALIZATION OF HUMAN RIGHTS

David P. Forsythe,
University of Nebraska

This fascinating exploration of the campaign on behalf of human rights since 1945 shows that this issue, once considered the province of states, has now become an integral part of international relations. Forsythe provocatively probes such hotly-debated questions as what constitutes a human right, whether international action for human rights is a form of cultural imperialism, and whether there can be international standards for human rights but variation among states in implementing them.



1991 0-669-21117-6 $16.95 paper

THE INTERNATIONAL POLITICS OF TELEVISION

George H. Quester,
University of Maryland

This groundbreaking book examines the impact of television's trans-national reach and its potential to dramatically influence global relations in the future.

1990 0-669-24456-2 $22.95 paper

THE GLOBAL PHILOSOPHERS
World Politics in Western Thought

Mark V. Kauppi and Paul R. Viotti

In this fresh reassessment of the intellectual sources of world politics, Kauppi and Viotti introduce readers to the work of many of those thinkers who, since classical antiquity, have influenced our understanding of international relations. Kauppi and Viotti reveal how writers from Thucydides to Weber framed the vital questions which still dominate the debate over global events.

DEATH IN THE BALANCE
The Debate Over Capital Punishment

Donald D. Hook and Lothar Kahn

"Capital punishment, perhaps more than any other perennial issue of public argument, teaches intellectual humility. No matter which side of the issue you are on, if you do not feel the weakness of your position and see the strengths of the other side, you fully understand neither...if you doubt this is true, read this valuable volume. It is a fine guide to the broad gray areas of argument."
—**George F. Will**

Eric Voegelin and the Politics of Spiritual Revolt

The Roots of Modern Ideology

Michael Franz

In *Eric Voegelin and the Politics of Spiritual Revolt,* Franz provides the first sustained examination of Voegelin's contentions that the various and diverse ideologies of the modern age are rooted in a common pattern of consciousness. Based on painstaking research in a wide range of sources, the volume contains extensive notes that refer the reader to Voegelin's publications and also provides the most impressive bibliography of secondary works yet to appear in print.

$27.50

Americanism

Revolutionary Order and Societal Self-Interpretation in the American Republic

Jürgen Gebhardt

Translated by Ruth Hein

Gebhardt's *Americanism* analyzes the origins of the American public philosophy. Through careful scrutiny of the writings of the Founding Fathers—and with a special emphasis on those of John Adams—Gebhardt studies the philosophical and Christian roots of the American ideas of republicanism and revolution. The keen and observant eye he casts on the structure of the American republic makes this a first-rate work.

$59.95

Traditions and Values in Politics and Diplomacy

Theory and Practice

Kenneth W. Thompson

In this comprehensive assessment of current issues in international politics, Thompson draws on Judeo-Christian traditions to define the relationship between philosophy, religion, and politics. Broadly informed and far-reaching, this volume is a timely and reflective analysis of the role traditions and values play in shaping change and in helping us to understand its implications.

Political Science

Practical Career Advice for Undergraduates

Revised and Expanded 5th Edition

Careers and the Study of Political Science: A Guide for Undergraduates discusses the relationship between the study of political science and careers in law, government, interest groups and associations, international organizations, business, journalism and teaching. The new edition builds upon earlier editions prepared by Mary H. Curzan, and includes contributions from Michael Brintnall, *APSA*, Mary A. Hepburn, *University of Georgia*, Joseph LaPalombara, *Yale University*, Alan Rosenthal, *Rutgers University*, and Robert H. Salisbury, *Washington University*. There is a new chapter on campaign management and polling by Candice J. Nelson, *American University*.

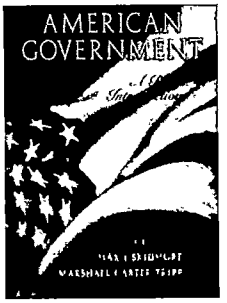
AMERICAN GOVERNMENT



AMERICAN DEMOCRACY

Third Edition

LEWIS LIPSITZ, University of North Carolina, Chapel Hill
DAVID M. SPEAK, California State Polytechnic University — Pomona, Georgia Southern University

■ A complete introduction to American government ■ Unique approach engages the student in critical thought about the degree to which American government functions democratically ■ Strong comparative emphasis; compares U.S. institutions and policies with those of other democratic countries ■ Includes chapters on political culture, political economy, mass politics, politics and community issues, and the environment ■ Features expanded coverage of civil liberties and civil rights and a major updating of policy examples

Paper/720 pp.(approx.)/February 1993
***Instructor's Manual and Test Item File* and *Study Guide* available**
Computerized *Test Item File*, classroom management software, transparencies, and two videotapes available upon adoption

AMERICAN GOVERNMENT
A Brief Introduction

Sixth Edition

MAX J. SKIDMORE, University of Missouri — Kansas City
MARSHALL CARTER TRIPP, United States Department of State

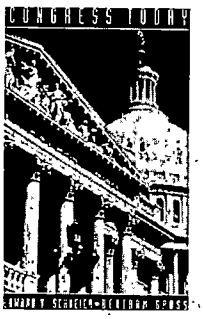
A concise book that provides an overview of all the essential topics for an introduction to American government ■ Conventional organization conforms to the structure of most syllabi

Paper/336 pp.(approx.)/January 1993
***Instructor's Manual* and *Test Item File* available**

AMERICAN GOVERNMENT
Readings on Continuity and Change

Second Edition

Edited by ROBERT HARMEL, Texas A&M University



■ Features 75 readings on American government that focus on the concept of continuity and change ■ Includes selections from the Federalist papers, Supreme Court decisions, classic essays, as well as contemporary works, drawn from a wide variety of sources ■ Contains 33 new readings

Paper/608 pp.(approx.)/January 1993
***Instructor's Manual* available**

St. Martin's Press • College Division

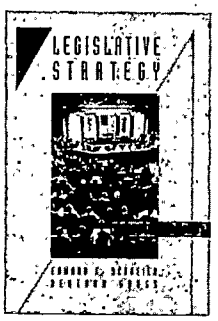
Excellence Still Matters

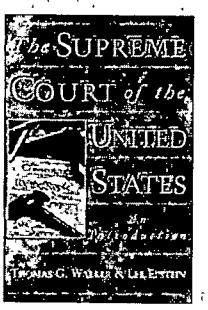


CONGRESS TODAY

EDWARD V. SCHNEIER, City College of The City University of New York
BERTRAM GROSS, City University of New York; University of California at Berkeley; St. Mary's College of California

■ A comprehensive core text that examines Congress and the politics of formulating national legislation ■ Analyzes the legislative process from three interrelated perspectives: the social and political setting, the structure and rules of Congress as an organization, and the motives of the participants ■ Encourages students to assess the strategic variables that affect the legislative process

Paper/520 pp.(approx.)/February 1993



LEGISLATIVE STRATEGY: Shaping Public Policy

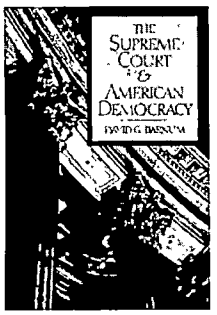
EDWARD V. SCHNEIER, City College of The City University of New York
BERTRAM GROSS, City University of New York; University of California at Berkeley; St. Mary's College of California

■ A concise, informative guide to the creation of public policy through legislative action ■ Provides vivid examples of the ways in which change and manipulation of rules are part of the policy making process ■ Examines how the political environment of Congress has an influence on legislation

Paper/288 pp.(approx.)/February 1993

THE SUPREME COURT OF THE UNITED STATES
An Introduction

THOMAS G. WALKER, Emory University
LEE EPSTEIN, Washington University



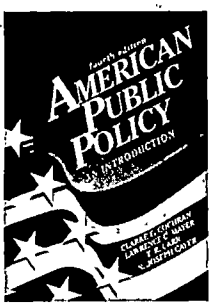
■ A concise text that helps familiarize students with the legal and political roles of the Court ■ Examines the constitutional mandate of the Court and its evolution over the course of 200 years of American history ■ Its brevity makes it ideal for a wide range of courses that require an understanding of the structure, organization, and decision-making processes of the court

Paper/207 pp./1993

St. Martin's Press • College Division
175 Fifth Avenue, Dept. JR, New York, NY 10010

SMP

Excellence Still Matters



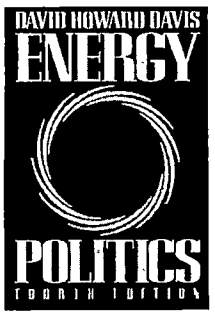
THE SUPREME COURT AND AMERICAN DEMOCRACY

DAVID G. BARNUM, DePaul University

■ A core text that assesses the Court's role in American politics ■ Examines the tension between the Court's power of judicial review and the democratic, majoritarian features of American government ■ Includes 7 case studies that demonstrate constitutional litigation in action

Paper/352 pp.(approx.)/Februaury 1993

PUBLIC POLICY



AMERICAN PUBLIC POLICY
An Introduction

Fourth Edition

CLARKE E. COCHRAN, Texas Tech University
LAWRENCE C. MAYER, Texas Tech University
T.R. CARR, Southern Illinois University at Edwardsville
N. JOSEPH CAYER, Arizona State University

■ Organized around 11 major areas of public policy ■ Combines history, description, and analysis with lively, informed debate about solutions ■ Provides new or expanded coverage of family and child welfare, the AIDS crisis, education reform, free and "hurtful" speech

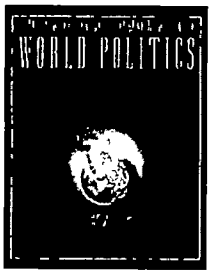
Cloth/492 pp./1993

ENERGY POLITICS

Fourth Edition

DAVID HOWARD DAVIS, The University of Toledo

■ Provides a thorough examination of U.S. energy policy ■ Organized around specific energy sources ■ Offers detailed coverage of the conflicts between business and environmental perspectives ■ Focuses on the choices the U.S. must make in providing energy for industrial and private use into the 21st century



Paper/321 pp./1993

St. Martin's Press • College Division

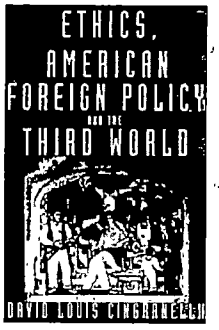
INTERNATIONAL RELATIONS AND FOREIGN POLICY

WORLD POLITICS
Trend and Transfomation

Fourth Edition

CHARLES W. KEGLEY, JR., University of South Carolina



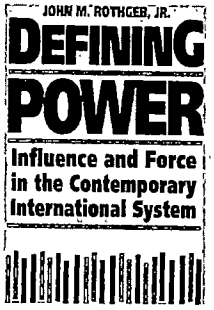
EUGENE R. WITTKOPF, Louisiana State University

■ A comprehensive introduction to the key actors and policy issues in international relations ■ Provides historical detail necessary to understand important transformations in global politics ■ Fully reflects the changes that have recently revolutionized world politics

Paper/614 pp./1993

***Instructor's Manual* available**

Computerized *Test Item File* available upon adoption



ETHICS, AMERICAN FOREIGN POLICY, AND THE THIRD WORLD

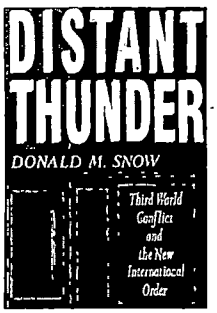
DAVID LOUIS CINGRANELLI, State University of New York at Binghamton

■ Explores the moral and ethical issues in American foreign policy toward Third World nations ■ Evaluates the goals and objectives that have guided our policy in the past and considers which should guide it in the future

Paper/250 pp./1993

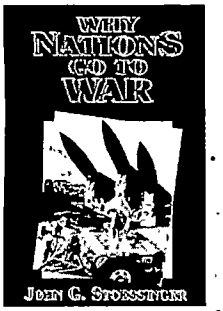
DEFINING POWER
Influence and Force in the Contemporary International System

JOHN M. ROTHGEB, JR., Miami University



■ Considers how the power relationships among members of the international system have changed since World War II ■ Identifies the new actors and issues that have come to play a major role in world politics ■ Evaluates the role of power in an environment in which influence is increasingly defined in terms of economic strength

Paper/205 pp./1993



St. Martin's Press • College Division

Guide to Federal Funding For Social Scientists

Whether your specialty is demographic anthropology, political economy or social psychology, the multidisciplinary **Guide to Federal Funding for Social Scientists**, 2nd edition, has a federal program to support your interests. Over 250 federally funded programs in the social sciences are indexed by agency and subject matter to simplify your search.

Program descriptions outline names of contacts, review processes, application procedures and deadlines, budget information, and examples of funded projects. Essays authored by agency insiders supplement the program descriptions and guide the researcher through the ins and outs of the main funding institutions. The Guide is an indispensable resource for both pre- and post-doctoral social scientists.

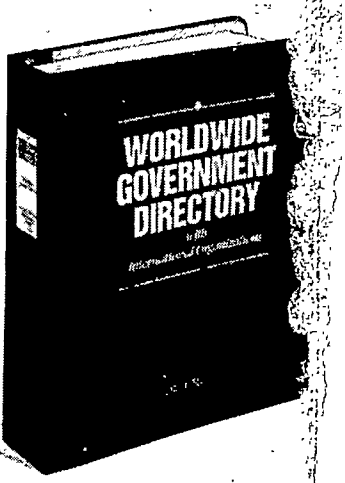
DIRECT ACCESS



TO SENIOR GOVERNMENT OFFICIALS. ANYWHERE IN THE WORLD.

HERE IS AN INDESPENSIBLE TOOL FOR ANYONE IN POLITICAL RESEARCH, POLITICAL ANALYSIS, FOREIGN POLICY, ECONOMICS, OR GOVERNMENT WHO REQUIRES QUICK AND EASY ACCESS TO HIGH-LEVEL GOVERNMENT OFFICIALS ANYWHERE IN THE WORLD.

The **Worldwide Government Directory** is a single volume 1,200 page reference guide to key elected and appointed government officials in 192 nations *including all former Soviet Republics.*

Now in its nineth edition, **WGD** allows you direct communication with more than **50,000** ministers, undersecretaries, directors, deputies, advisors, aides and other primary figures in executive, legislative, judicial branches as well as the defense and diplomatic communities.

Names, official titles, office addresses, telephone, facsimile and cable numbers are all provided, often with as many as 19 pages of information per country. **WGD** gives you organizational structures, political parties, dates of upcoming elections, currency exchange rates, 106 international organizations and much more. **Every entry is verified.**

The Worldwide Government Report

Many of you need to stay abreast of *the events that affect government personnel and organizational structures around the world.* Our biweekly newsletter— the **Worldwide Government Report**— provides indepth analysis of elections, coups, military reorganizations, political restructurings, dismissals, transfers of power, and intelligence matters. Also included are biographical profiles you just won't anywhere else. The information is obtained through regional news correspondents, regional political experts and extensive coverage of the international press by our own staff.

THE MORAL IMAGINATION AND PUBLIC LIFE

RAISING THE ETHICAL QUESTION

Thomas E. McCollough, *Duke University*

"McCollough's is a needed and welcome voice in defense of wisdom in politics and public policy. His book is a hard-hitting interdisciplinary assessment of those aspects of liberalism, pluralism, atomistic individualism that make a sound communal ethic difficult to attain."

0-934540-85-3 *pa* **Neal Riemer,** *Drew University*

POLITICS IN WESTERN EUROPE: United Kingdom, France, Germany, Italy, Sweden, and European Community

M. Donald Hancock, *Vanderbilt University,* et al.

"Excellent work! Up-to-date and analytical . . . a quality seldom found in a single text. I especially appreciate the detailed coverage of the Italian and Swedish polities which makes this book both unique and truly comparative." **Gerard F. Rutan**

0-934540-30-6 *pa* *Western Washington University*

THE POLITICS OF THE ADMINISTRATIVE PROCESS

James W. Fesler, *Yale University,* and **Donald F. Kettl,** *University of Wisconsin-Madison*

"An eclectic and valuable book that looks at public administration from a variety of explanatory perspectives. Readers will find that any one of the several chapters in this volume provides the best overview of the subject currently available."

Francis E. Rourke, *The Johns Hopkins University*

0-934540-81-0 *pa*

THE POSTMODERN PRESIDENT 2d ed.

Richard Rose, *University of Strathclyde*

"*The Postmodern President* offers much to students and teachers alike, much to ponder, much to argue with, much to reexamine in the light of a rapidly changing world. It is a very good book."

0-934540-94-2 *pa* **Stephen J. Wayne,** *Georgetown University*

THE PRESIDENT AS INTERPRETER-IN-CHIEF

Mary E. Stuckey, *University of Mississippi*

"Stuckey's perceptive study of presidential rhetoric is essential reading for presidency watchers, media scholars, and everyone who cares about the quality of American politics."

Doris A. Graber, *University of Illinois at Chicago*

0-934540-92-6 *pa*

THE WORLD OF THE POLICY ANALYST

Robert A. Heineman, *Alfred University,* **William T. Bluhm,** *University of Rochester,* et al.

"A valuable contribution to a literature that ought to grow on how we can build bridges between scholarship and practice in public affairs." **Richard P. Nathan,** *SUNY at Albany*
